**Attention: Mr. Bruce Coombe**

Dear Sir:

**Reference: Wurtemberg Tower – 101 Wurtemberg Street  
Servicing Design Brief  
Our File No.: 111013**

---

Enclosed herein is the Servicing Design Brief for the proposed residential development at 101 Wurtemberg Street, located on the east side of the intersection of Wurtemberg Street and Clarence Street. This brief is submitted in support of the rezoning and site plan applications and outlines how the site will be serviced, and demonstrates that adequate services are available for sanitary, storm and water.

Trusting this report is adequate for your purposes. Should you have any questions, or require additional information, please contact us.

Yours truly,

**NOVATECH ENGINEERING CONSULTANTS LTD.**

Greg MacDonald, P.Eng  
Senior Project Manager

### List of Appendices

- Appendix A: Excerpts from Ottawa Sewer Design Guidelines
- Appendix B: Hydrant Flow Data
- Appendix C: Servicing Study Guidelines Checklist

## 1.0 INTRODUCTION

The proposed Wurtemberg Tower residential development at 101 Wurtemberg Street is located on the east side of the intersection of Wurtemberg Street and Clarence Street in the City of Ottawa, as shown in Figure 1 - Key Plan. The proposed development will consist of an 18 storey tower with 66 condominium units. Also, a total of 54 parking spaces will be provided on 3 levels of underground parking. Refer to Figure 2 - Site Plan for details.

As identified in the City of Ottawa's Zoning By-law, this site is currently designated as R5C [926] F(2.5) – Residential Fifth Density Subzone C, Exception 926, FSI of 2.5; a mix of medium and high density residential units. The zoning amendment will revise the 926 exception to permit the proposed development, as shown in the site plan. Specific details are provided in a Planning Rationale submitted as part of the ZBL Amendment application.

The subject site consists of approximately 0.0795 ha and is currently occupied by a two-storey residential building, as shown in Figure 3 – Existing Conditions.

This servicing design brief will outline how the site will be serviced with sanitary, storm and water, as well will demonstrate that adequate municipal capacity is available to service the development.

## 2.0 SANITARY SEWER

The development will be serviced by a 200 mm dia. sanitary service that will connect to the existing 300 mm dia. sanitary sewer on Wurtemberg Street. All proposed sanitary services will be equipped with full-port backwater valves.

Proposed development flows, based on the City's guidelines for residential units, retail, and office space are presented below and are compared to the design flows based on current zoning.

### Proposed Average Sanitary Flows Under Proposed Development

#### Wurtemberg Tower

Residential:  $Q_{SAN} = 66 \text{ units} \times 1.8 \text{ persons/unit} \times 350 \text{ L/cap/day} = 41,580 \text{ L/day}$

Total Wurtemberg Tower Average Sanitary Flow = 41,580 L/day = 0.48 L/sec

Total Wurtemberg Tower Peak Sanitary Flow = 1.92 L/sec (with PF = 4.22 ∴ use 4.0 ⇒ max for residential)

Therefore,

Total Site Average Sanitary Flow = 0.48 L/sec

Total Site Peak Sanitary Flow = 1.92 L/sec (with PF)

### **Calculated Average Sanitary Flows Under Current Zoning**

Currently, the site is zoned R5C [926] F(2.5), a mix of medium and high density residential units. Zoning flows are calculated using the City's general population densities from Table 4.1 of the City of Ottawa Sewer Design Guidelines and are as follows:

Site Area = 0.0795 ha

Population Density = 1800 people/ha

Population = 0.0795 ha \* 1800 people/ha = 143 people

Average Sanitary flow = 143 people \* (350 L/person/day) / (86,400 s/day) = 0.58 L/sec

Total Sanitary flow = 2.32 L/sec (with PF = 4.20 ∴ use 4.0 ⇒ max for residential)

Therefore, the proposed development sanitary flows are less than the flows calculated under the existing zoning.

### **3.0 STORMWATER**

Stormwater flows from the site are currently conveyed to the existing storm sewer system via road catchbasins by overland flows and to the river. As part of this development, all stormwater will be controlled on site and discharged via a 200 mm dia. storm service that will connect to the existing 300 mm dia. storm sewer on Wurtemberg Street. All proposed storm services will be equipped with backwater valves.

The City will require that on-site stormwater management be implemented to control post-development stormwater discharge for both the 5 & 100 year storm events based on an allowable runoff coefficient (C) of 0.50, a time of concentration ( $t_c$ ) of 20 minutes, and 5-year storm control. Stormwater management will be achieved through the use of rooftop controls. Should surplus storage be required, stormwater management alternatives such as storage tanks will be implemented.

The site will be graded such that flows in excess of the 100-year storm event will be conveyed overland to Wurtemberg Street and the river (as per existing conditions). Erosion and sediment control measures will be implemented during all phases of construction and inspected regularly. A separate stormwater management report will also be submitted as part of the site plan application.

### **4.0 WATERMAIN**

The proposed development will be serviced by a 150 mm dia. water service that will connect to the existing 200mm dia. watermain on Wurtemberg Street. A shut off valve will be provided on the property line per City of Ottawa Specifications. The water meter will be located in the basement level mechanical room of the building. Similarly, a remote receptacle will be located at the surface near the entrance to the building on the exterior.

Estimated domestic water demands for the development are roughly the same as the proposed development sanitary flows listed above in Section 2.0.

Wurtemberg Tower

Average daily demand (L/sec):  $Q_{\text{WATER}} = 41,580 \text{ L/day} \div 86,400 \text{ sec/day}$   
 $= 0.48 \text{ L/sec}$

Using a peak factor of 2.5, the required maximum daily demand yields:

$$Q_{\text{WATER}} = 1.20 \text{ L/sec}$$

Using a peak factor of 2.2, the required maximum hour demand yields:

$$Q_{\text{WATER}} = 2.64 \text{ L/sec}$$

Estimated water demands for the development are as follows (based on fixture units):

Wurtemberg Tower

Estimated domestic demand (max peak day) = 100 igpm = 7.58 L/sec

Based on the data provided by the City, the existing watermains in the area are adequate to service this development. A copy of the watermain data is attached.

The building will be provided with standpipe and sprinkler system for fire protection. Typically the fire demand for a development of this type is in the order of 750 US gal/min (approx. 625 igpm). The available supply at 20 psi is in the neighbourhood of 2100 igpm around the site, based on the hydrant data supplied by the City.

## 5.0 CONCLUSIONS

Based on the foregoing, adequate sanitary, storm and water services are available to support this development.

**Excerpts from Ottawa Sewer Design Guidelines**

## SECTION 4

## SANITARY SEWER SYSTEMS

specifically the downtown core. The construction of new combined sewer systems is no longer permitted in the City of Ottawa other than for the replacement of existing combined sewers within the City's defined Combined Sewer Area (see Section 5.1.6).

New storm drainage systems cannot be connected to existing combined sewers except as an interim measure where sewer separation is to be ultimately implemented or where circumstances allow no other alternative.

Section 5 discusses combined sewers in greater detail since their design must consider peak storm flows.

#### 4.2.4 Private Sanitary Servicing

Private servicing consists mainly of private sewage collection and treatment systems on individual lots and do not form part of these guidelines.

### 4.3 GENERAL POPULATION DENSITIES

**Pre-zoned Land** – When lands are zoned for a specific residential use and detailed information is not available, the following population densities shall apply:

**Table 4.1 Population Densities**

Unit Type (Min Lot Area M <sup>2</sup> )	Zoning (And all similar zonings)	Persons per unit <sup>1</sup>	Units per net ha avg. <sup>2</sup>	Persons (per net ha) <sup>3</sup>	Persons (per gross ha) <sup>4</sup>
Res-Single Family (600)	R1A-B*	3.4	16.7	57	34
Res-Single Family (501)	R1C-E*	3.4	20.0	68	41
Res-Single Family (441)	R1F-H*	3.4	22.7	77	47

## SECTION 4

## SANITARY SEWER SYSTEMS

Unit Type (Min Lot Area M <sup>2</sup> )	Zoning (And all similar zonings)	Persons per unit <sup>1</sup>	Units per net ha avg. <sup>2</sup>	Persons (per net ha) <sup>3</sup>	Persons (per gross ha) <sup>4</sup>
Res-Triplex (330)	R3D-E*, H-J*, L*, N*, R4C-E*	2.3	90.9	209	127
<b>Apartments:</b>					
Low Density		1.8	100	180	
Medium Density		1.8	300	540	
High Density		1.8	1000	1800	
Very High Density <sup>5</sup>		1.8	1000 +	1800 +	

\*) former City of Ottawa zoning designation.

1) from 1996 census data.

2) new suburban construction, 5-year average (1997-2001), except apartments data which is based on site plans & duplex density which is an assumed average.

3) "net ha" refers to population densities per hectare of purely residential land (i.e. area of the building lots only including private parking and roads but excluding all public road rights-of-way and all other non-residential uses such as parks, stormwater management facilities, commercial developments, schools, community centres, etc.).

4) "gross ha" refers to population densities per hectare of residential and all other non-residential land uses such as streets, schools and parks. Numbers provided apply to large subdivision situations. For smaller residential situations the persons per gross ha will be higher, about 75% of the persons per net ha.

5) apartment densities in the downtown have been as high as 4,000 units/net ha. Proposals with a units/net ha density greater than 1000 will be evaluated on a case-by-case basis.

**Development Proposed Land** – When the number and type of housing units within a proposed development are known, the calculation of population for the proposed development shall be based on the following:

**Table 4.2 Per Unit Populations**

Unit Type	Persons Per Unit
Single Family	3.4
Semi-detached	2.7
Duplex	2.3
Townhouse (row)	2.7
<b>Apartments:</b>	
Bachelor	1.4
1 Bedroom	1.4
2 Bedroom	2.1
3 Bedroom	3.1
Average Apt.	1.8

#### 4.4.1 Calculation of Peak Design Flows

The formulae and parameters to be applied in the calculation of peak design flows (standard peak flow design parameters) for new or infill developments are illustrated in Figure 4.3 and described as follows:

**Figure 4.3 Peak Flow Design Parameters Summary**

<b>AVERAGE WASTEWATER FLOWS:</b>	
<b>Residential Average Flow:</b>	350 L/c/day
<b>Commercial Average Flow:</b>	50,000 L/gross ha/d
<b>Institutional Average Flow:</b>	50,000 L/gross ha/d
<b>Average Light Industrial Flow:</b>	35,000 L/gross ha/d
<b>Average Heavy Industrial Flow:</b>	55,000 L/gross ha/d
<b>PEAKING FACTORS:</b>	
<b>Residential Peak factor:</b>	Harmon Equation
	$P.F. = 1 + \left( \frac{14}{4 + \left( \frac{P}{1000} \right)^{\frac{1}{2}}} \right) * K$
	where: P=Population
	K=Correction Factor = 1
<b>Commercial Peak factor:</b>	1.5
<b>Institutional Peak factor:</b>	1.5
<b>Industrial Peak Factor:</b>	Per Figure in Appendix 4-B
<b>PEAK EXTRANEIOUS FLOWS: (design event)</b>	
<b>Infiltration Allowance:</b>	0.28 L/s/effective gross ha (for all areas)
<b>Less than 10 ha.</b>	
<b>Foundation Drain Allowance:</b>	5.0 L/s/gross ha (if necessary for existing partially separated and combined areas only)
<b>10 ha – 100 ha</b>	
<b>Foundation Drain Allowance:</b>	3.0 L/s/gross ha (if necessary for existing partially separated and combined areas only)
<b>Greater than 100 ha</b>	
<b>Foundation Drain Allowance:</b>	2.0 L/s/gross ha (if necessary for existing partially separated and combined areas only)

**To:** Crowder, Murray

**Subject:** Hydrant Flow Data Request (Wurtemberg Street)

**Importance:** High

Hi Murray,

We are currently working on a Site Plan located at 101 Wurtemberg Street. I send this e-mail requesting that you please provide me with hydrant flow data (static, fire flows @ 20 psi, etc.) for the following hydrants:

H125, H127, H186, H187 on Wurtemberg;  
H160, H184 on Clarence;  
H174, H185 on Heney;  
H173 on Charlotte.

Refer to attached sketch for hydrant locations, they are located on City of Ottawa grid 368-032 & 368-033.

Could you please also send me the sketch from your program showing the watermain sizes you have on file for the above-mentioned streets around the site, as you have in the past (if you have it for SAN & STM as well), thanks in advance.

I'm in a little bit of a rush for the information, so a quick response would be greatly appreciated.

Should you have any questions, or require additional information, don't hesitate to contact me.

Regards,

**Justin Gauthier, B.A.Sc.**

Adjacent street names	Y	ALL	

**Development Servicing Study Checklist**

<b>4.2 Water</b>	<b>Addressed (Y/N/NA)</b>	<b>Section</b>	<b>Comments</b>
Confirm consistency with Master Servicing Study, if available.	Y	5.0	Also refer to Appendix B for Hydrant Flow data.
Availability of public infrastructure to service proposed development.	Y		Figures 2 and 3
Identification of system constraints.	Y	4.0	
Identify boundary conditions.	Y	4.0	
Confirmation of adequate domestic supply and pressure.	Y	4.0	
Confirmation of adequate fire flow protection and confirmation that fire flow is calculated as per the Fire Underwriter's Survey. Output should show available fire flow at locations throughout the development.	Y	4.0	
Provide a check of high pressures. If pressure is found to be high, an assessment is required to confirm the application of pressure reducing valves.	Y	4.0	
Definition of phasing constraints. Hydraulic modeling is required to confirm servicing for all defined phases of the project including the ultimate design.	NA		
Address reliability requirements such as appropriate location of shut-off valves.	Y	4.0	
Check on the necessity of a pressure zone boundary modification.	NA		
Reference to water supply analysis to show that major infrastructure is capable of delivering sufficient water for the proposed land use. This includes data that shows that the expected demands under average day, peak hour and fire flow conditions provide water within the required pressure range.	Y	4.0	
Description of the proposed water distribution network, including locations of proposed connections to the existing system, provisions for necessary looping, and appurtenances (valves, pressure reducing valves, valve chambers, and fire hydrants) including special metering provisions.	Y	4.0	
Description of off-site required feeder mains, booster pumping stations, and other water infrastructure that will be ultimately required to service proposed development, including financing, interim facilities, and timing of implementation.	NA		
Confirmation that water demands are calculated based on the City of Ottawa Design Guidelines.	Y	4.0	
Provision of a model schematic showing the boundary conditions locations, streets, parcels, and building locations for reference.	N		Figure 3 shows main.

4.3 Wastewater	Addressed (Y/N/NA)	Section	Comments
Summary of proposed design criteria (Note: Wet-weather flow criteria should not deviate from the City of Ottawa Sewer Design Guidelines. Monitored flow data from relatively new infrastructure cannot be used to justify capacity requirements for proposed infrastructure).	Y	2.0	
Confirm consistency with Master Servicing Study and/or justifications for deviations.	Y	2.0	
Consideration of local conditions that may contribute to extraneous flows that are higher than the recommended flows in the guidelines. This includes groundwater and soil conditions, and age and condition of sewers.	Y	2.0	
Description of existing sanitary sewer available for discharge of wastewater from proposed development.	Y	2.0	
Verify available capacity in downstream sanitary sewer and/or identification of upgrades necessary to service the proposed development. (Reference can be made to previously completed Master Servicing Study if applicable)	Y	2.0	
Calculations related to dry-weather and wet-weather flow rates from the development in standard MOE sanitary sewer design table (Appendix 'C') format.	Y	2.0	
Description of proposed sewer network including sewers, pumping stations, and forcemains.	Y	2.0	Figures 2 and 3
Discussion of previously identified environmental constraints and impact on servicing (environmental constraints are related to limitations imposed on the development in order to preserve the physical condition of watercourses, vegetation, soil cover, as well as protecting against water quantity and quality).	NA		
Pumping stations: impacts of proposed development on existing pumping stations or requirements for new pumping station to service development.	NA		
Forcemain capacity in terms of operational redundancy, surge pressure and maximum flow velocity.	NA		
Identification and implementation of the emergency overflow from sanitary pumping stations in relation to the hydraulic grade line to protect against basement flooding.	NA		
Special considerations such as contamination, corrosive environment etc.	NA		

**Development Servicing Study Checklist**

4.4 Stormwater	Addressed (Y/N/NA)	Section	Comments
Description of drainage outlets and downstream constraints including legality of outlet (i.e. municipal drain, right-of-way, watercourse, or private property).	Y	3.0	
Analysis of the available capacity in existing public infrastructure.	Y	3.0	
A drawing showing the subject lands, its surroundings, the receiving watercourse, existing drainage patterns and proposed drainage patterns.	Y		Figures 2 and 3
Water quantity control objective (e.g. controlling post-development peak flows to pre-development level for storm events ranging from the 2 or 5 year event (dependent on the receiving sewer design) to 100 year return period); if other objectives are being applied, a rationale must be included with reference to hydrologic analyses of the potentially affected subwatersheds, taking into account long-term cumulative effects.	Y	3.0	
Water Quality control objective (basic, normal or enhanced level of protection based on the sensitivities of the receiving watercourse) and storage requirements.	NA		
Description of stormwater management concept with facility locations and descriptions with references and supporting information.	Y	3.0	
Set-back from private sewage disposal systems.	NA		
Watercourse and hazard lands setbacks.	NA		
Record of pre-consultation with the Ontario Ministry of Environment and the Conservation Authority that has jurisdiction on the affected watershed.	NA		
Confirm consistency with sub-watershed and Master Servicing Study, if applicable study exists.	Y	3.0	
Storage requirements (complete with calcs) and conveyance capacity for 5 yr and 100 yr events.	Y	3.0	
Identification of watercourse within the proposed development and how watercourses will be protected, or, if necessary, altered by the proposed development with applicable approvals.	NA		
Calculate pre and post development peak flow rates including a description of existing site conditions and proposed impervious areas and drainage catchments in comparison to existing conditions.	Y	3.0	
Any proposed diversion of drainage catchment areas from one outlet to another.	NA		
Proposed minor and major systems including locations and sizes of stormwater trunk sewers, and SWM facilities.	Y	3.0	
If quantity control is not proposed, demonstration that downstream system has adequate capacity for the post-development flows up to and including the 100-year return period storm event.	NA		

**Development Servicing Study Checklist**

4.4 Stormwater	Addressed (Y/N/NA)	Section	Comments
Identification of municipal drains and related approval requirements.	NA		
Description of how the conveyance and storage capacity will be achieved for the development.	Y	3.0	
100 year flood levels and major flow routing to protect proposed development from flooding for establishing minimum building elevations (MBE) and overall grading.	Y	3.0	
Inclusion of hydraulic analysis including HGL elevations.	N		
Description of approach to erosion and sediment control during construction for the protection of receiving watercourse or drainage corridors.	Y	3.0	
Identification of floodplains – proponent to obtain relevant floodplain information from the appropriate Conservation Authority. The proponent may be required to delineate floodplain elevations to the satisfaction of the Conservation Authority if such information is not available or if information does not match current conditions.	NA		
Identification of fill constrains related to floodplain and geotechnical investigation.	NA		

**Development Servicing Study Checklist**

4.5 Approval and Permit Requirements	Addressed (Y/N/NA)	Section	Comments
Conservation Authority as the designated approval agency for modification of floodplain, potential impact on fish habitat, proposed works in or adjacent to a watercourse, cut/fill permits and Approval under Lakes and Rivers Improvement Act. The Conservation Authority is not the approval authority for the Lakes and Rivers Improvement Act. Where there are Conservation Authority regulations in place, approval under the Lakes and Rivers Improvement Act is not required, except in cases of dams as defined in the Act.	NA		
Application for Certificate of Approval (CofA) under the Ontario Water Resources Act.	N		
Changes to Municipal Drains.	N		
Other permits (National Capital Commission, Parks Canada, Public Works and Government Services Canada, Ministry of Transportation etc.)	NA		

4.6 Conclusion	Addressed (Y/N/NA)	Section	Comments
Clearly stated conclusions and recommendations.	Y	5.0	
Comments received from review agencies including the City of Ottawa and information on how the comments were addressed. Final sign-off from the responsible reviewing agency.	NA		
All draft and final reports shall be signed and stamped by a professional Engineer registered in Ontario.	Y	5.0
