1. INTRODUCTION

The purpose of this report is to provide a review of the adequacy of public services needed to support development of the subject property. Conceptual design of the site has been undertaken in accordance with the following reports:

- Kanata West Master Servicing Study prepared by Stantec Consulting CCL/IBI Group, June 2006.
- Site Servicing Report, Stormwater Management Plan and Erosion and Sediment Control Plan, Arcadia – Kanata West Phases 1 & 2, prepared by IBI Group, November 2010.
- Signature Ridge Pump Station – Sanitary Sewer Emergency Overflow Analysis prepared by Stantec Consulting, June 2008.
- Supplementary Geotechnical Investigation – Arcadia-Kanata West Lands, Huntmar Road to Carp River, Ottawa (Kanata), Ontario, prepared by Paterson Group Inc. July 2007.
- Arcadia Stormwater Management Report and Interim SWMF Design Brief prepared by IBI Group, July 2011.
- Signature Ridge Pump Station Hydraulic Grade Line Analysis prepared by IBI Group, July 2011.

The Arcadia mixed use lands are identified on the key plan Figure 1. Assuming that Huntmar Road runs approximately north/south, then the site is bounded by the Campeau Drive extension to the north, Carp River to east, Feedmill Creek to the south and Huntmar Road to the west. The site consists of multi use residential commercial and office building with the future transitway corridor passing through the site. The proposed Arcadia residential subdivision is located immediately north of the Campeau Drive extension.

2. WATER DISTRIBUTION

2.1 Existing Water System

Water supply for this development is provided by a 610 mm diameter trunk watermain on the future Campeau Drive right-of-way. As part of this overall Arcadia development, the watermain will be extended from Didsbury Road across the Carp River ending at Huntmar Road.

2.2 Water Demand Parameters

Water consumption rates are taken from the Ottawa Design Guidelines – Water Distribution for subdivisions 501 to 3,000 persons and are summarized as follows.

Average Day Demand

▪ Residential	350 L/c/d
▪ Commercial (Business Park)	35,000 L/gross ha/d
▪ Industrial (Employment Area)	50,000 L/gross ha/d

Maximum Daily Demand

▪ Residential	875 L/c/day
▪ Commercial (Business Park)	52,500 L/gross ha/d
▪ Industrial (Employment Area)	75,000 L/gross ha/d

Peak Hour Demand

▪ Residential	1,925 L/c/day
▪ Commercial (Business Park)	94,500 L/gross ha/d
▪ Industrial (Employment Area)	135,000 L/gross ha/d

In addition, the following fire flow demands are used based on examples from the “Water Supply for Public Fire Protection” by the Fire Underwriters Survey.

Single Family	6,000 l/min (100 l/s)
Townhouses	8,000 l/min (133.3 l/s)
Industrial, Commercial	13,000 l/min (216.7 l/s)

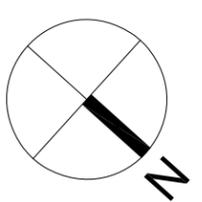

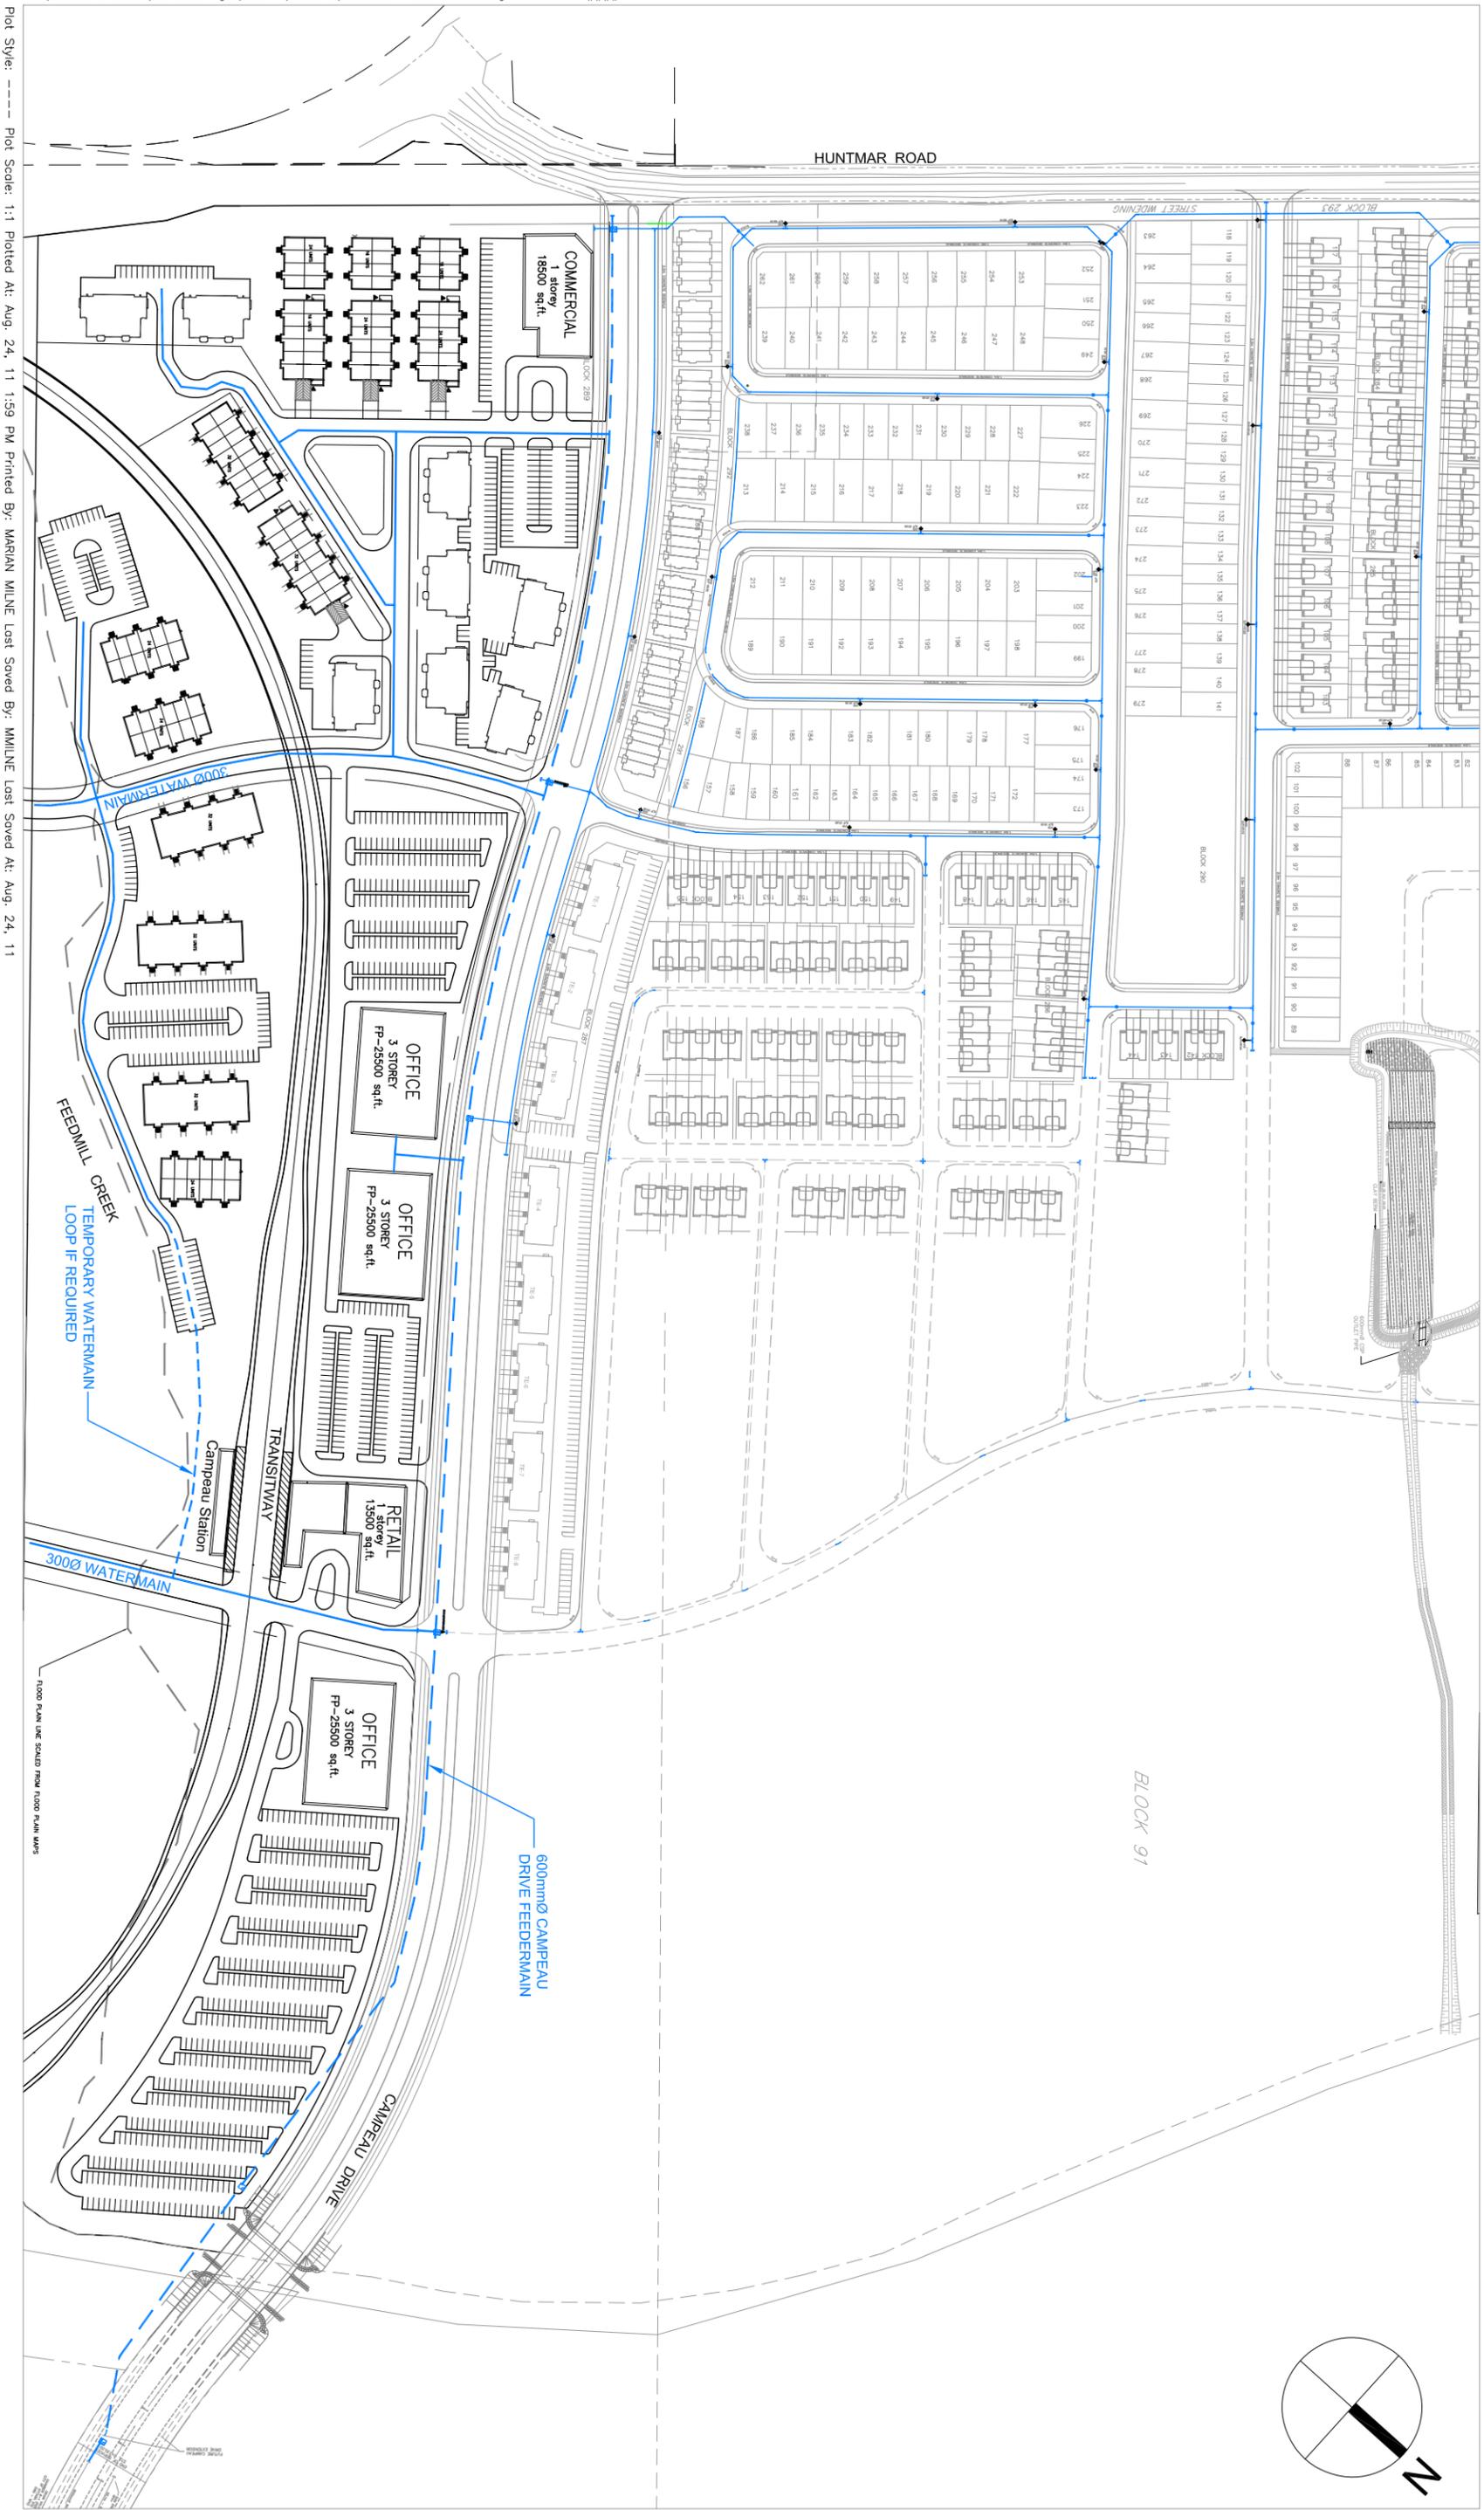

The fire flows are added to the maximum daily demands at each node to confirm the system’s fire fighting capabilities.

The projected water sub-areas and calculated demands for all nodes are tabulated in Appendix A.

2.3 Hydraulic Modelling

A computer model of the water distribution network for the Arcadia subdivision and expanded to include the mixed use lands was developed using the H20MAP water program provided by MWH Soft Inc. Water demands as described in Section 2.2 and boundary conditions were incorporated into the model.

Pipe sizes of the watermain network were confirmed by analyzing repeated interactions of the model to provide sufficient hydraulic grade line to ensure a minimum of 275 kPa during maximum hourly event and a minimum of 140 kPa during the maximum daily and fire flow events.

FIGURE 2

Plot Style: ----- Plot Scale: 1:1 Plotted At: Aug. 24, 11 1:59 PM Printed By: MARIAN MILNE Last Saved By: MMILNE Last Saved At: Aug. 24, 11

The City has provided the following hydraulic grade line (HGL) boundary conditions at the intersection of Campeau Drive and Terry Fox Drive.

Max Pressure Check	161.5 m
Max Day with Fire	154.6 m
Peak Hour	152.9 m

Three connections to the Campeau Drive trunk watermain are proposed as shown on Figure 2. As per the Master Servicing Study, the easterly and westerly connections are extended to service the lands to the south which will create a watermain loop. Depending on timing, a temporary watermain loop can be provided by extending the watermain between the Transitway and Feedmill Creek; the hydraulic modeling was carried out with the temporary loop.

Results of the hydraulic modelling are included in Appendix A. Peak hour pressures are above 275 kPa and fire flow criteria is met at all nodes. Basic day pressures exceed 550 kPa at ground level at all locations requiring pressure reducing valves.

3.4 Emergency Overflow

As outlined in the Signature Ridge Pump Station – Hydraulic Grade Line Analysis Report, an emergency overflow is required from the sanitary sewer system to the stormwater pond. The report includes the mixed use development to the south. Based on the ground evaluations all building slabs and underside of footing elevations in the mixed use lands will be above the emergency sanitary hydraulic grade line with adequate free board.

ARCADIA MIXED USE LANDS

STORM SEWER PLAN

FIGURE 4

An allowance for Huntmar Road drainage from a future four lane arterial section is included in the design. The storm sewer drainage area plan for the mixed use lands along with a storm sewer design sheet is included in Appendix C.

4.4 Major System

Stormwater flows in excess of the 5 year storm frequency will be stored on the mixed use lands site and released into the minor system after the storm event. Storage will be accomplished by ponding on parking lots and rooftops by restricting flow into the minor system with inlet control devices on catchbasins and roof drains. Parking lots and roads will be graded to allow a maximum depth of ponding of 0.3 m. The site will also be graded to direct the storm water away from buildings should the ponding areas over top.

4.5 Hydraulic Grade Line

In the design of the permanent and interim stormwater management pond, the obvert of the storm sewer outletting into the pond will be above the 100 year water level. This will ensure that the 100 year hydraulic grade line in the minor system will be below the obvert of the sewers. As per City of Ottawa guidelines, the minimum underside of footing for each residential unit is 0.3 m above the obvert of the connecting storm sewer.

4.6 Fill Constraints

The geotechnical report for this development identifies a grade raise restriction. At the east end of the site, where the existing ground is the lowest, it is not possible to drain the parking area into the pond without exceeding the maximum grade raise. The same condition applies to a portion of Campeau Drive adjacent to the Carp River. While it is possible to grade the parking area to drain in the storm sewer by preloading the site or providing lightweight fill, it is also possible to drain this area to the adjacent Carp River. As per the Stormwater Management report, water quality treatment will be required but quantity control will not. The quality treatment could be provided for both the parking area and portion of Campeau Drive in the form of a stormceptor system of a small pond.

5. SEDIMENT AND EROSION CONTROL PLAN

5.1 General

During construction, existing stream and conveyance systems can be exposed to significant sediment loading. Although construction is only a temporary situation, it is propped to introduce a number of mitigative construction techniques to reduce unnecessary construction sediment loadings. These will include:

- Until the local storm sewer and storm pond are constructed, groundwater in trenches will be pumped into a filter mechanism prior to release to the environment. After construction of the storm water facility, any construction dewatering will be routed to the nearest storm sewer;
- bulkhead barriers will be constructed in any temporary drainage ditches;
- seepage barriers will be constructed in any temporary drainage ditches;
- filter cloths will remain on open surface structures such as maintenance holes and catchbasins until these structures are commissioned and put into use; and
- silt fence on the site perimeter.

5.2 Trench Dewatering

Although little groundwater is expected during construction of municipal services, any trench dewatering using pumps will be discharged into a filter trap made up of geotextile filters and straw bales similar in design to the OPSD 219.240 Dewatering Trap. These will be constructed in a bowl shape with the fabric forming the bottom and the straw bales forming the sides. Any pumped groundwater will be filtered prior to release to the existing surface runoff. The contractor will inspect and maintain the filters as needed, including sediment removal and disposal and material replacement as needed.

5.3 Bulkhead Barriers

Although the storm sewers eventually outlet into a sediment forebay, a ½ diameter bulkhead will be constructed over the lower half of the outletting sewers to reduce sediment loadings during construction. These bulkheads will trap any sediment laden flows, thus preventing any construction-related contamination into existing sewers. The bulkheads will be inspected and maintained including periodic sediment removal as needed.

5.4 Seepage Barriers

In order to further reduce sediment loading to the stormwater management facility, seepage barriers will be installed on any surface water course at appropriate locations that may become evident during construction. These barriers will be similar to either the Light Duty Straw Bale Barrier as per OPSD 219.100 or the Light Duty Silt Fence Barrier as per OPSD 219.110. They are typically made of layers of straw bales or geotextile fabric staked in place. All seepage barriers will be inspected and maintained as needed.

5.5 Surface Structure Filters

All catchbasins, and to a lesser degree, manholes, convey surface water to sewers. However, until the surrounding surface has been completed, these structures should be covered in some fashion to prevent sediment from entering the minor sewer system.

Until streets are asphalted and curbed, all catchbasins and manholes will be constructed with a geotextile filter fabric between the structure frame and cover. These will stay in place and be maintained during construction and build until it is appropriate to remove same.

6. CONCLUSIONS

As demonstrated in this report, the water, wastewater and stormwater systems are adequate to allow development of the mixed use lands.

Adherence to the sediment and erosion control plan during construction will minimize harmful impacts on surface water.

Subject: RE: 2009-07-30 Kanata West Master Servicing Study - Watermain analysis for Arcadia

The following are boundary conditions, HGL, for hydraulic analysis at the intersection of Campeau Drive and Terry Fox Drive. The analysis was done at the end of the 610 mm, the watermain reduces in size to a 406 watermain on Campeau Drive west of Terry Fox Drive and terminates at Didsbury Road. This analysis assumes that the pressure zone will be extended west to Huntmar Road.

Max_Day + FF = 154.6 m assumed a flow of 225 l/s

Peak_Hour = 152.9.4 m

Max Pressure Check = 161.5 m, the estimated ground elevation is 95.9 m, the maximum pressure is estimated to be 94 PSI which is greater than 80 PSI. A pressure check at completion of construction is recommended to determine if pressure control is required.

These are for current conditions and are based on computer model simulation.

Disclaimer: The boundary condition information is based on current operation of the city water distribution system. The computer model simulation is based on the best information available at the time. The operation of the water distribution system can change on a regular basis, resulting in a variation in boundary conditions. The physical properties of watermains deteriorate over time, as such must be assumed in the absence of actual field test data. The variation in physical watermain properties can therefore alter the results of the computer model simulation.

Subject: 2009-07-30 Kanata West Master Servicing Study - Watermain analysis for Arcadia

We are completing the detailed design of the first two phases of the Arcadia site located east of Huntmar Road and north of the Campeau Drive extension as shown on the attached. For the watermain analysis could we get a boundary condition for the 610 mm watermain on Campeau Drive.

Thank You

Where Q = average daily per capita flow (350 l/cap.d.) or (0.0041 l/sec./cap)
 I = Unit of peak extraneous flow (0.28 l/sec/ha)
 M = Residential Peaking factor = Harmon Peaking Factor, $M = 1 + (14 / (4 + P^{0.5}))$, where P = population in thousands
 Population Density = 3.4 per single family, 2.7 per semi-detached and row townhouse units and 2.3 per multi residential unit
 Industrial, Employment Area - Average flow 50,000 l/day/ha (0.579 l/s/ha) with Peaking Factor = 1.5
 Commercial, Business Park - Average flow 35,000 l/day/ha (0.405 l/s/ha) with Peaking Factor = 1.5
 Gross Residential Lands = 60 persons/gross hectare
