Memorandum

To/Attention	Mike Giampa - City of Ottawa Transportation Project Manager	**Date**	February 16, 2021
From	David Hook	**Project No**	127391
cc	Mike Boucher – DCR Phoenix		
Subject	1154-1208 Old Montreal Road - Transportation Impact Assessment Update		

1.0 Introduction

IBI Group was retained by DCR Phoenix Development Corporation Ltd. to prepare a Transportation Impact Assessment (TIA) Update to address outstanding transportation-related comments regarding the proposed residential development to be located at 1154-1208 Old Montreal Road. A TIA report was previously prepared by WSP Global Inc. in March 2018 and submitted to the City of Ottawa for circulation and review. Circulation comments have since been received and the proposed Plan of Subdivision has been revised in response to these comments. The purpose of this Update is to summarize the changes to the Plan of Subdivision since the previous submission and provide the results of a revised technical analysis based on the latest development plan.

The following items will be discussed as part of this TIA Update:

1. Summarize the revised Plan of Subdivision;
2. Identify the proposed on-site pedestrian and cycling facilities;
3. Review historical collision data;
4. Summarize the expected number of new site-generated trips during the weekday morning and afternoon peak hours based on the revised land use statistics;
5. Summarize the projected future background and total traffic conditions;
6. Discuss the projected site-generated transit demand and identify any potential capacity issues;
7. Review traffic signal and roundabout warrants;
8. Complete intersection capacity analyses under future background and total traffic conditions;
9. Calculate Multi-Modal Level of Service (MMLOS) for all signalized study area intersections and the segment of Old Montreal Road adjacent to the site;
10. Complete auxiliary lane warrant analyses at all study area intersections; and

11. Review the proposed private approaches to confirm their compliance with applicable by-laws and guidelines (e.g. Private Approach By-law, Geometric Design Guide for Canadian Roads, etc.)

2.0 Proposed Development

Since the submission of the TIA by WSP Global Inc. in March 2018, the Plan of Subdivision for the proposed development has undergone significant revisions. The previous plan was primarily composed of mid-rise apartment buildings with a small number of semi-detached and townhome units. Four private approaches were previously proposed on Old Montreal Road, two of which were to be restricted to right-in/right-out.

In response to the circulation comments, the Plan of Subdivision has been revised to include just two access intersections on Old Montreal Road - one of which will be restricted to inbound traffic only. The revision also includes a reduction in apartment units and an increase in lower-density residential units. **Table 1** provides a summary of the current dwelling unit breakdown as compared with the previous submission.

Table 1 - Land Use Statistics

<table>
<tr><th rowspan="2">Plan of Subdivision</th><th rowspan="2">Apartment Units</th><th colspan="4">Low-Density Units</th><th rowspan="2">Total Units</th></tr>
<tr><th>Townhome</th><th>Semi-Detached</th><th>Urban Townhome</th><th>Back-to-back Terrace</th></tr>
<tr><td rowspan="2">Previous</td><td rowspan="2">432</td><td>5</td><td>16</td><td>30</td><td>0</td><td rowspan="2">483</td></tr>
<tr><td colspan="4">51</td></tr>
<tr><td rowspan="2">Current</td><td rowspan="2">380</td><td>37</td><td>0</td><td>43</td><td>32</td><td rowspan="2">492</td></tr>
<tr><td colspan="4">112</td></tr>
</table>

As illustrated above, the overall number of units has increased only marginally, however there have been notable changes in the unit mix.

On-site circulation within the proposed development will be accommodated via two new roads each accessed from Montreal Road:

- **Street One** is a private road and will intersect with Old Montreal Road at the Old Montreal/Famille Laporte intersection. The road will provide 4.25m pavement width at the approach to the intersection and be restricted to inbound traffic only. The basis for this access configuration is that the addition of outbound traffic would trigger the need for traffic signals but would not meet the technical warrants. The remainder of the road will be 6m wide and allow two-way traffic flow throughout the site. On-street parallel parking stalls will be provided along the 6m wide portion.
- **Street Two** is a local public road with an 18m ROW and 8.5m pavement width, intersecting Old Montreal Road approximately 200m east of the Famille Laporte/Street One intersection. Beyond the turning circle near the southeast corner of the site, Street Two becomes a private road with 7m of pavement width, providing access to the planned townhouse units in Blocks 12 through 18.

The current Plan of Subdivision has been provided in **Appendix A**.

3.0 Proposed Pedestrian and Cycling Facilities

Based on the current Plan of Subdivision, the following pedestrian and cycling facilities will be provided within the limits of the subject site:

- Concrete sidewalks on both sides of Street One and the Street One private approach;
- A concrete sidewalk on the west side of Street Two between Old Montreal Road and Street One;
- Concrete sidewalks around the two back-to-back terrace home buildings (Blocks 10 & 11);
- A 3.0m wide pedestrian pathway connecting Street One to Street Two; and
- A 3.0m wide multi-use path along the southern boundary of the property with a connection to Street Two forming part of the City's Major Pathway network.

In addition to the above, the following pedestrian and cycling facilities are proposed with the Old Montreal Road right of way:

- A pedestrian crossover (PXO) on the east leg of the Old Montreal Road & Famille-Laporte Avenue / Street One intersection;
- Continuous on-road bicycle lane/paved shoulder (eastbound only) along the site frontage;
- A 1.5m wide temporary asphalt sidewalk on the south side of Old Montreal Road along the site frontage with connections to the urban townhomes fronting onto the street;

The above pedestrian and cycling facilities are illustrated in **Exhibit 1**. These facilities will provide pedestrian and cyclist connectivity to the adjacent transportation network and throughout the site. It should be noted that, given the significant grade on Street Two, a sidewalk is not possible on the planned public segment of this road. Although there are no pathways directly connecting the proposed park with Old Montreal Road, a pedestrian route is provided from the primary site access (Famille Laporte intersection) along the western edge of the site and along Street Two Private.

Cycling Plan

PROJECT No. 127391
DATE: February 2021
SCALE: N.T.S.

Mike Giampa - City of Ottawa Transportation Project Manager – February 16, 2021

4.0 Collision Data

The summary of collision trends described in the March 2018 TIA was reviewed for accuracy. Based on a review of the data provided by the City of Ottawa, the interpretation of results of the collision analysis is reasonable. Historical collision data for the period of January 2012 to December 2016 is provided in **Appendix B**.

5.0 Trip Generation

Person-trips generated by the proposed development were calculated using the residential trip generation rates, mode shares and directional splits described in the 2009 TRANS Trip Generation Study and followed the same methodology described in the March 2018 TIA. The revised number of trips generated by the apartment units were estimated using the 'mid-rise apartment' rate while the trips generated by the lower-density units were estimated using the 'townhome' rate. **Table 2** illustrates the estimated number of development-generated person-trips comparing the previous and current Plans of Subdivision.

Table 2 - Development-Generated Person-Trips

Plan of Subdivision	AM			PM		
	In	Out	Total	In	Out	Total
Previous	169	292	457	256	227	483
Current	98	263	361	264	186	450

Under the current Plan of Subdivision, the overall number of development-generated person-trips is expected to be reduced despite the small increase in the total number of units. This is a result of the specific trip generation rates for each unit type and has been calculated to a finer degree of accuracy based on the 2009 TRANS Trip Generation Study. Relevant extracts from this study are provided in **Appendix C**.

Revised development-generated person-trips were subdivided by mode in accordance with the mode share targets described in the March 2018 TIA:

- Auto Driver: 60%
- Auto Passenger: 15%
- Transit: 20%
- Bicycle: 5%
- Walk: 0%

Mike Giampa - City of Ottawa Transportation Project Manager – February 16, 2021

Table 3 summarizes the projected number of development-generated trips by mode of transportation.

Table 3 – Development-Generated Trips by Mode

Mode	AM			PM		
	In	Out	Total	In	Out	Total
Auto Driver	59	158	217	158	112	270
Auto Passenger	15	39	54	40	28	68
Transit	19	53	72	53	37	90
Bike	5	13	18	13	9	22
Walk	0	0	0	0	0	0

The March 2018 TIA projected a total of 305 and 323 two-way vehicle-trips and a total of 102 and 108 two-way transit-trips during the weekday morning and afternoon peak hours, respectively. As such, under the current Plan of Subdivision, the overall trip generation of the proposed development is expected to be reduced and is directly attributable to the trip generation characteristics of the revised unit mix.

Exhibit 2 illustrates the distribution and assignment of site-generated vehicle-trips to the study area intersections in accordance with the methodology described in the March 2018 TIA.

Site-Generated Traffic

PROJECT No. 127391
DATE: February 2021
SCALE: N.T.S.

6.0 Transit Demand and Capacity Review

Table 4 summarizes the projected transit demand generated by the full build-out of the proposed development and the adjacent Cardinal Creek (Phases 1 to 7).

Table 4 – Transit Demand per Development (Ultimate)

Development	AM			PM		
	In	Out	Total	In	Out	Total
Cardinal Creek Village[1]	136	292	628	524	144	812
1154-1208 Old Montreal Road	19	53	72	53	37	90
Total	**155**	**345**	**700**	**577**	**181**	**902**

Notes:

[1] – Transit trips were calculated based on the trip generation assumptions described in the Cardinal Creek Village Phase 1-7 Transportation Impact Study (IBI Group, October 2013)

As illustrated above, the combined transit demand of these two developments is expected to be in the order of 700 to 900 passengers during the weekday morning and afternoon peak hours upon full build-out of each. It should be noted that the proposed development transit demand represents only 10% of the adjacent Cardinal Creek demand at full build-out.

Route #221 is a weekday peak period transit route that operates between the Village of Cumberland and Blair Station with four westbound trips in the morning and four eastbound trips in the afternoon and is currently the only transit route within close proximity of the proposed development. Based on pre-pandemic information provided by OC Transpo, Route #221 was found to be operating at 36% and 27% of its available passenger capacity during the weekday morning and afternoon peak hours, respectively. While there are no formal plans to add trips on Route #221 at this time, OC Transpo continually tracks the status of developments and ridership trends and will be reviewing these in the near future in conjunction with the introduction of light rail transit (LRT) service to Trim Station. Service adjustments are made as needed to accommodate growing ridership. The current route capacity, however, will be sufficient to accommodate the projected transit demand of the proposed development.

Should an increased number of residents choose to use the Trim Park and Ride, OC Transpo has indicated that the facility was found to have a peak utilization of only 57-59% in January/February 2020, with a total parking supply of 1,065 spaces. As part of the Stage 2 LRT project, this facility will see a slight increase in parking supply to 1,111 spaces as a result of the station reconfiguration.

Based on the existing transit route capacity and utilization of the Trim Station Park and Ride facility described above, the transit demands of the proposed development will be easily accommodated.

To accommodate the projected transit demand of the proposed development, consideration has given on how transit users will be able to access transit services. Transit users coming from the west will be able to disembark on the south side of Old Montreal Road and access the site without crossing the road. Transit users heading towards the west, however, will be required to cross Old Montreal Road to access one of the westbound bus stops. As there is no existing controlled pedestrian crossing at the Famille-Laporte intersection, analysis has been conducted to determine

whether a pedestrian crossover (PXO) is warranted at this location. As noted in subsequent sections of this report, full traffic signalization at the Old Montreal/Street One/Famille Laporte intersection is not warranted.

Based on OTM Book 15, there are four criteria that are used to determine whether a PXO is warranted:

- Are traffic signals not warranted for pedestrians?
- Do the vehicular and pedestrian volumes exceed the thresholds outlines in the guideline?
- Is there a requirement for system connectivity or is the location on a pedestrian desire line?
- Is the site less than 200m from another traffic control device?

Based on the results of the analysis, a PXO was found to be appropriate at this location as traffic signals are not warranted, there is a requirement for system connectivity, and it is over 200m to the nearest traffic control device. Additionally, the future eight-hour vehicular and pedestrian volumes are also likely to meet the volume threshold.

OTM Book 15 also provides a selection matrix for determining which PXO configuration is appropriate for any given context. At the Famille-Laporte intersection, Old Montreal Road experiences eight-hour traffic volumes between 4,500 and 6,000 vehicles/8-hours, has a 60 km/h posted speed limit and has a width of three lanes (two through lanes and an auxiliary left-turn lane). Based on these parameters, a Level 2, Type 'B' PXO is appropriate for this location.

It should be noted that corridor-wide pedestrian and cycling facility improvements on Old Montreal Road (by others) would also provide future residents an opportunity to walk or bike to the Trim Park & Ride rather than use a private vehicle. Given the distance, however, walking is not expected to represent a significant proportion of the mode share while the cyclist mode share may only increase slightly following any potential upgrade from the existing paved shoulders to an exclusive facility (by others). Direct access to transit therefore represents the most effective measure for reducing the automobile dependence of the site. With the suitability of a PXO, it is recommended that OC Transpo give consideration towards the implementation of an additional (eastbound) bus stop on the east side of Famille Laporte Avenue to further-increase the convenience of transit for residents of the proposed development.

7.0 Future Background and Total Traffic Volumes

Based on the 2013 Transportation Master Plan (TMP), there are currently no planned road network or transit network improvements within the timeframe of this study that are expected to have an impact on local traffic patterns or the mode share distribution. The O-Train Confederation Line extension to Trim Road is expected to be open for full revenue service by the end of 2024, however, given the distance between the future Trim Station and the proposed development it has been conservatively assumed that this extension will not have a significant impact on local mode shares. Furthermore, the proposed development is outside the future Trim Station Transit-Oriented Development (TOD) zone.

The TMP indicates that Old Montreal Road and Ottawa Road 174 east of Trim Road may both be widened to four lanes, while west of Trim Road, Ottawa Road 174 may be widened to six lanes. The Rapid Transit & Transit Priority 2031 Network Concept from also indicates that the O-Train Confederation Line may be extended further east along Old Montreal Road. As these network modifications are not likely to occur within the 2027 horizon year of this study, they have not been considered in the analysis.

The most significant network change expected within the timeframe of this study is the planned connection of Cardinal Creek Village to Ottawa Road 174. Although the specific timing is unknown,

this connection is required for upcoming phases of the subdivision development and will result in a reduction of volumes on Old Montreal Road along the frontage of the proposed development.

The latest intersection traffic counts were obtained at the following intersections to ensure that traffic volumes were as up to date as possible:

- Trim Road & St Joseph Boulevard / Old Montreal Road (April 2017, City of Ottawa)
- Old Montreal Road & Dairy Drive / Aveia Private (December 2019, City of Ottawa)

Given the ongoing COVID-19 pandemic, new intersection traffic counts could not be collected due to the impact it has on commuter traffic volumes during the weekday peak hours. Reliable traffic data at the primary site access (Montreal Road / Famille Laporte / Street One intersection) could not be obtained, and therefore the revised analysis has been based on the Cardinal Creek Village Phase 1-7 Transportation Impact Study (IBI Group, October 2013) and the approximated status of the development at the time the counts were undertaken.

A historical traffic count was also obtained for the Old Montreal Road & Dairy Drive / Aveia Private (December 2014, City of Ottawa) intersection to verify the background growth rate used in the March 2018 TIA. Based on this review, the 1.8% background traffic growth rate is confirmed to be appropriate for estimating background traffic growth from outside the study area.

The intersection traffic counts are provided in **Appendix D**.

Traffic generated by all known adjacent developments within the study area was accounted for explicitly in the analysis. There have been no new development applications within the study area since the submission of the March 2018 TIA.

Exhibits 3 to 6 illustrate the Future (2022 & 2027) Background & Total Traffic volumes at each study area intersection.

8.0 Intersection Control

Traffic Signal Warrants

A traffic signal warrant analysis was completed for all stop-controlled study area intersections. The results of the analysis indicate that none of the intersections warrant traffic signals under Future (2022 & 2027) Background or Total Traffic conditions, including the Old Montreal/Dairy intersection and the Old Montreal/Famille Laporte/Street One intersection. It should be noted that the results of this analysis differ from the March 2018 TIA as they have been based on more recent (2019) data at the Old Montreal/Dairy intersection. The results of the traffic signal warrant analysis are provided in **Appendix E**.

Roundabout Analysis

The City's Roundabout Implementation Policy indicates that intersections that satisfy any of the following criteria should be screened utilizing the Roundabout Initial Feasibility Screening Tool:

- At any new City intersection;
- Where traffic signals are warranted; and
- At intersections where capacity or safety problems are being experienced.

As noted in subsequent sections of this report, the Old Montreal Road & Dairy Drive / Aveia Private intersection is expected to experience capacity issues under future traffic conditions. Based on a review of the feasibility of a roundabout at this location, it has been determined that a roundabout would be appropriate at this location and will therefore be considered as a potential means of addressing the capacity issues.

The results of the roundabout feasibility analysis are provided in **Appendix F**.

9.0 Intersection Capacity Analysis

Based on the revised background and total traffic projections, intersection capacity analysis was completed at all study area intersections under Future (2022 & 2027) Background & Total Traffic conditions. All signalized and stop-controlled intersection were analysed using Synchro v11 while roundabouts were analysed using SIDRA Intersections v6.1. The results of the intersection capacity analysis are provided in **Appendix G**.

Analysis Criteria

Signalized Intersections

In qualitative terms, Level of Service (LOS) describes a user's perceived operational conditions of a transportation facility. For vehicular LOS, these conditions are generally defined in terms of delay, speed and travel time, freedom to manoeuvre, traffic interruptions, safety, comfort and convenience. LOS can also be related to the ratio of the volume to capacity (v/c) which is simply the relationship of the traffic volume (either measured or forecast) to the capability of the intersection or road section to accommodate a given traffic volume. This capability varies depending on the factors described above. LOS is given letter designation from A to F. LOS 'A' represents the best operating conditions and LOS 'E' represents the level at which the intersection or an approach to the intersection is carrying the maximum traffic volume that can, practicably, be accommodated. LOS 'F' indicates that the facility is operating beyond its theoretical capacity.

Mike Giampa - City of Ottawa Transportation Project Manager – February 16, 2021

Table 5 - LOS Thresholds (Signalized)

LEVEL OF SERVICE	VOLUME TO CAPACITY (V/C) RATIO
A	0 to 0.60
B	0.61 to 0.70
C	0.71 to 0.80
D	0.81 to 0.90
E	0.90 to 1.00
F	> 1.00

The City of Ottawa has developed a set of thresholds as part of the Transportation Impact Assessment Guidelines which directly relate the volume to capacity (v/c) ratio of a signalized intersection to a LOS designation, as indicated in **Table 5**.

The intersection capacity analysis technique provides an indication of the LOS for each movement at the intersection under consideration and for the intersection as a whole. The overall v/c ratio for an intersection is defined as the sum of equivalent volumes for all critical movements at the intersection divided by the sum of capacities for all critical movements.

The Level of Service calculation is based on locally-specific parameters as described in the TIA Guidelines and incorporates existing signal timing plans obtained from the City of Ottawa. The analysis of future conditions considers optimized signal timing plans and the use of a Peak Hour Factor (PHF) of 1.0 to recognize peak spreading beyond a 15-minute period in congested conditions.

Unsignalized Intersections

The capacity of an unsignalized intersection can also be expressed in terms of the Level of Service it provides. For an unsignalized intersection, the LOS is described in terms of the average movement delays at the intersection. Delay is defined as the total elapsed time from when a vehicle stops at the end of the queue until the vehicle departs from the stop line; this includes the time required for a vehicle to travel from the last-in-queue position to the first-in-queue position. The average delay for any particular minor movement at an unsignalized intersection is a function of the capacity of the approach and the degree of saturation. The overall intersection LOS is representative of the approach with the highest degree of delay.

The Highway Capacity Manual 2010 (HCM), prepared by the Transportation Research Board, includes the following Levels of Service criteria for unsignalized intersections, related to average movement delays at the intersection, as indicated in **Table 6**.

Table 6 - LOS Thresholds (Unsignalized)

LEVEL OF SERVICE	DELAY (SECONDS / VEHICLE)
A	<10
B	>10 and <15
C	>15 and <25
D	>25 and <35
E	>35 and <50
F	>50

The unsignalized intersection capacity analysis technique included in the HCM and used in the current study provides an indication of the Level of Service for each movement of the intersection under consideration. By this technique, the performance of the unsignalized intersection can be compared under varying traffic conditions, using the Level of Service concept in a qualitative sense. One unsignalized intersection can be compared with another unsignalized intersection using this concept. Level of Service 'E' represents the capacity of the movement under consideration and generally, in large urban areas, Level of Service 'D' is considered to represent an acceptable operating condition (Level of Service 'E' is considered an acceptable operating condition for planning purposes for intersections located within Ottawa's Urban Core, Transit-

Oriented Development Zones or Traditional Mainstreet/Design Priority Areas). Level of Service 'F' indicates that the movement is operating beyond its design capacity.

Future (2022) Background Traffic

An intersection capacity analysis has been undertaken using the Future (2022) Background Traffic volumes presented in **Exhibit 3**, yielding the following results:

Table 7 - Intersection Capacity Analysis: Future (2022) Background Traffic

INTERSECTION	TRAFFIC CONTROL	AM PEAK HOUR		PM PEAK HOUR	
		OVERALL LOS (V/C OR DELAY)	CRITICAL MOVEMENTS (V/C OR DELAY)	OVERALL LOS (V/C OR DELAY)	CRITICAL MOVEMENTS (V/C OR DELAY)
Trim Road & St Joseph Boulevard / Old Montreal Road	Roundabout	D (28.7s)	WBTL (28.7s)	**F (112.9s)**	**SBTL (112.9s)**
Old Montreal Road & Dairy Drive / Aveia Private	Unsignalized	C (21.7s)	SBL (21.7s)	**F (50.8s)**	**SBL (50.8s)**
	Signalized [1]	A (0.46)	WBTR (0.49)	A (0.54)	SBL (0.60)
	Roundabout	B (14.3s)	WBTRL (14.3s)	C (19.3s)	EBTRL (19.3s)
Old Montreal Road & Famille-Laporte Avenue	Unsignalized	B (14.7s)	SBRL (14.7s)	B (11.3s)	SBRL (11.3s)

Notes:

[1] – Includes fully protected eastbound and westbound left-turn phase.

The results of the analysis indicate that the southbound approach of the Trim Road & St Joseph Boulevard / Old Montreal Road roundabout is expected to exceed its theoretical capacity during the weekday afternoon peak hour. As the roundabout was constructed within the past 5 years, it is anticipated that it will remain in its current configuration within the timeframe of this study. As such, subsequent intersection capacity analyses have assumed that no intersection modifications will be implemented at this location.

The Old Montreal Road & Dairy Drive / Aveia Private intersection is also expected to exceed its theoretical capacity during the weekday afternoon peak hour. The implementation of both traffic signals and a roundabout was considered at this intersection, although it should be noted that only a roundabout satisfies the technical warrants at this location. Based on the results of this analysis, the intersection would operate at an acceptable Level of Service (i.e. LOS 'D' or better) under either configuration. Given that there is a bi-directional cycling facility on the northbound leg of the Old Montreal Road & Dairy Drive / Aveia Private intersection, it is recommended that the eastbound and westbound left-turn movements be fully protected in order to minimize vehicle-bicycle conflicts if the intersection were to be signalized.

The intersection of Old Montreal Road & Famille-Laporte Avenue is expected to operate at an acceptable Level of Service (LOS 'D' or better) under Future (2022) Background Traffic conditions as a 3-legged intersection.

Mike Giampa - City of Ottawa Transportation Project Manager – February 16, 2021

Future (2027) Background Traffic

An intersection capacity analysis has been undertaken using the Future (2027) Background Traffic volumes presented in **Exhibit 4**, yielding the following results:

Table 8 - Intersection Capacity Analysis: Future (2027) Background Traffic

INTERSECTION	TRAFFIC CONTROL	AM PEAK HOUR		PM PEAK HOUR	
		OVERALL LOS (V/C OR DELAY)	CRITICAL MOVEMENTS (V/C OR DELAY)	OVERALL LOS (V/C OR DELAY)	CRITICAL MOVEMENTS (V/C OR DELAY)
Trim Road & St Joseph Boulevard / Old Montreal Road	Roundabout	D (31.3s)	WBTL (31.3s)	**F (127.7s)**	**SBTL (127.7s)**
Old Montreal Road & Dairy Drive / Aveia Private	Unsignalized	C (16.9s)	SBL (16.9s)	D (26.5s)	SBL (26.5s)
	Signalized [1]	A (0.36)	WBTR (0.38)	A (0.42)	SBL (0.60)
	Roundabout	A (9.9s)	WBTRL (9.9s)	B (11.6s)	EBTRL (11.6s)
Old Montreal Road & Famille-Laporte Avenue	Unsignalized	B (12.3s)	SBTRL (12.3s)	B (10.3s)	SBTRL (10.3s)

Notes:

[1] – Includes fully protected eastbound and westbound left-turn phase.

By 2027, it is expected that a new major collector road will connect Old Montreal Road to Ottawa Road 174 through the Cardinal Creek Village subdivision. Based on the Cardinal Creek Village Phase 1-7 TIS (IBI Group, October 2013), this will result in a redistribution in traffic generated by the Cardinal Creek development which will reduce overall demand on Old Montreal Road. As such, traffic operations at both the Dairy Drive / Aveia Private intersection and the Famille-Laporte Avenue intersection are expected to improve relative to Future (2022) Background Traffic conditions. Intersection Level of Service at the Trim Road & St Joseph Boulevard / Old Montreal Road is expected to deteriorate relative to Future (2022) Background Traffic conditions, however, due to growth on Trim Road which will be less impacted by the new connection to Ottawa Road 174.

Mike Giampa - City of Ottawa Transportation Project Manager – February 16, 2021

Future (2022) Total Traffic

An intersection capacity analysis has been undertaken using the Future (2022) Total Traffic volumes presented in **Exhibit 5**, yielding the following results:

Table 9 - Intersection Capacity Analysis: Future (2022) Total Traffic

INTERSECTION	TRAFFIC CONTROL	AM PEAK HOUR		PM PEAK HOUR	
		OVERALL LOS (V/C OR DELAY)	CRITICAL MOVEMENTS (V/C OR DELAY)	OVERALL LOS (V/C OR DELAY)	CRITICAL MOVEMENTS (V/C OR DELAY)
Trim Road & St Joseph Boulevard / Old Montreal Road	Roundabout	**E (37.1s)**	**WBTL (37.1s)**	**F (152.1s)**	**SBTL (152.1s)**
Old Montreal Road & Dairy Drive / Aveia Private	Unsignalized	D (29.0s)	SBL (29.0s)	**F (148.4s)**	**SBL (148.4s)**
	Signalized [1]	A (0.56)	WBTR (0.60)	B (0.64)	EBTR (0.68)
	Roundabout	C (22.3s)	WBTRL (22.3s)	**E (35.4s)**	**EBTRL (35.4s)**
Old Montreal Road & Famille-Laporte Avenue / Street One	Unsignalized	C (17.7s)	SBTRL (17.7s)	B (12.3s)	SBTRL (12.3s)
Old Montreal Road & Street Two	Unsignalized	C (21.9s)	NBRL (21.9s)	D (34.7s)	NBRL (34.7s)

Notes:

[1] – Assumes fully protected eastbound and westbound left-turn phase will be provided.

Under Future (2022) Total Traffic conditions, the addition of site generated traffic to the Trim Road & St Joseph Boulevard / Old Montreal Road roundabout is expected to exacerbate the weekday peak hour capacity issues observed under background traffic conditions.

As observed under Future (2022) Background Traffic conditions, the Old Montreal Road & Dairy Drive / Aveia Private intersection is expected to experience capacity issues as a stop-controlled intersection. Signalization of the intersection is shown to improve Level of Service to LOS 'D' or better. Replacing the intersection with a roundabout is also shown to improve overall traffic operations, however, the eastbound approach during the afternoon peak hour will begin approaching its theoretical capacity. The overall delay on that approach is just above the threshold for LOS 'E' therefore it is expected that small reductions in traffic volumes would be sufficient to achieve a LOS of 'D'. As such, both traffic signals or a roundabout are considered effective means of addressing the capacity issues anticipated at this intersection.

Both site access intersections are anticipated to operate at an acceptable Level of Service (LOS 'D' or better) under Future (2022) Total Traffic conditions.

Mike Giampa - City of Ottawa Transportation Project Manager – February 16, 2021

Future (2027) Total Traffic

An intersection capacity analysis has been undertaken using the Future (2027) Total Traffic volumes presented in **Exhibit 6**, yielding the following results:

Table 10 - Intersection Capacity Analysis: Future (2027) Total Traffic

INTERSECTION	TRAFFIC CONTROL	AM PEAK HOUR		PM PEAK HOUR	
		OVERALL LOS (V/C OR DELAY)	CRITICAL MOVEMENTS (V/C OR DELAY)	OVERALL LOS (V/C OR DELAY)	CRITICAL MOVEMENTS (V/C OR DELAY)
Trim Road & St Joseph Boulevard / Old Montreal Road	Roundabout	**E (41.3s)**	**WBTL (41.3s)**	**F (168.5s)**	**SBTL (168.5s)**
Old Montreal Road & Dairy Drive / Aveia Private	Unsignalized	C (21.7s)	SBL (21.7s)	**F (52.7s)**	**SBL (52.7s)**
	Signalized [1]	A (0.45)	WBTR (0.48)	A (0.52)	SBL (0.65)
	Roundabout	B (13.6s)	WBTRL (13.6s)	C (16.8s)	EBTRL (16.8s)
Old Montreal Road & Famille-Laporte Avenue / Street One	Unsignalized	B (14.2s)	SBTRL (14.2s)	B (11.1s)	SBTRL (11.1s)
Old Montreal Road & Street Two	Unsignalized	C (17.3s)	NBRL (17.3s)	C (24.7s)	NBRL (24.7s)

Notes:

[1] – Assumes fully protected eastbound and westbound left-turn phase will be provided.

As discussed previously, by 2027 it is anticipated that Cardinal Creek Drive will provide a connection between Old Montreal Road and Ottawa Road 174 through the Cardinal Creek Village subdivision. This is expected to result in a redistribution of traffic from this subdivision, resulting in an overall reduction in traffic volumes on Old Montreal Road. As such, traffic operations at the Dairy Drive / Aveia Private intersection and both site access intersections is expected to improve relative to Future (2022) Total Traffic conditions. Traffic operations at the Trim Road & St Joseph Boulevard / Old Montreal Road intersection is anticipated to deteriorate, however, due to traffic growth on Trim Road.

As illustrated above, as a stop-controlled intersection the Old Montreal Road & Dairy Drive / Aveia Private is expected to exceed its theoretical capacity during the afternoon peak hour. Signalization of the intersection or implementing a roundabout is expected to address these capacity issues.

Mike Giampa - City of Ottawa Transportation Project Manager – February 16, 2021

Summary of Results

Trim Road & St Joseph Boulevard / Old Montreal Road:

This intersection is currently configured as a two-lane roundabout with auxiliary right-turn slip-lanes on the eastbound and westbound approaches. The intersection capacity analysis indicates that the roundabout is expected to exceed its theoretical capacity under Future (2022 & 2027) Background & Total Traffic conditions. As the roundabout was constructed relatively recently, it is not expected that it will be modified within the timeframe of this study and any improvements can be considered beyond the scope of this study.

Old Montreal Road & Dairy Drive / Aveia Private:

The intersection is currently configured as a two-way stop-controlled intersection with auxiliary left-turn lanes on the eastbound and westbound approaches. Under both Future (2022) Background & Total Traffic conditions, the intersection is expected to exceed its theoretical capacity during the afternoon peak hour. Either signalization of the intersection or the implementation of a roundabout is expected to bring the intersection to an acceptable Level of Service.

By 2027, the planned extension of Cardinal Creek Drive from Old Montreal Road to Ottawa Road 174 is anticipated to be complete resulting in a redistribution of traffic from the Cardinal Creek Village subdivision that will reduce overall traffic volumes on Old Montreal Road. As such, under Future (2027) Background Traffic conditions the intersection will operate at an acceptable Level of Service (i.e. LOS ‘D’ or better). The addition of site-generated traffic will negate some of the reductions expected from the new connection resulting in a similar Level of Service as observed under Future (2022) Background Traffic conditions. Traffic signals or a roundabout are again shown to address the capacity issues.

Given that the intersection meets the suitability criteria for a roundabout and does not meet the traffic signal warrants, it is recommended that consideration be given to implementing a roundabout at this location despite its slightly diminished overall performance as compared to traffic signals. It is important to note that the capacity issues at this location are an existing condition primarily the result of background traffic volumes associated with the Trim Park and Ride as well as extensive development in the broader area.

Old Montreal Road & Famille-Laporte Avenue / Street One:

Under Future (2022 & 2027) Background Traffic conditions, this intersection is anticipated to operate at an acceptable Level of Service (i.e. LOS ‘D’ or better) as an unsignalized intersection. Under Future (2022 & 2027) Total Traffic conditions, the addition of site-generated traffic is expected to slightly increase delays at the intersection, however the intersection is anticipated to continue operating at an acceptable Level of Service (i.e. LOS ‘D’ or better) as an unsignalized intersection.

Old Montreal Road & Street Two:

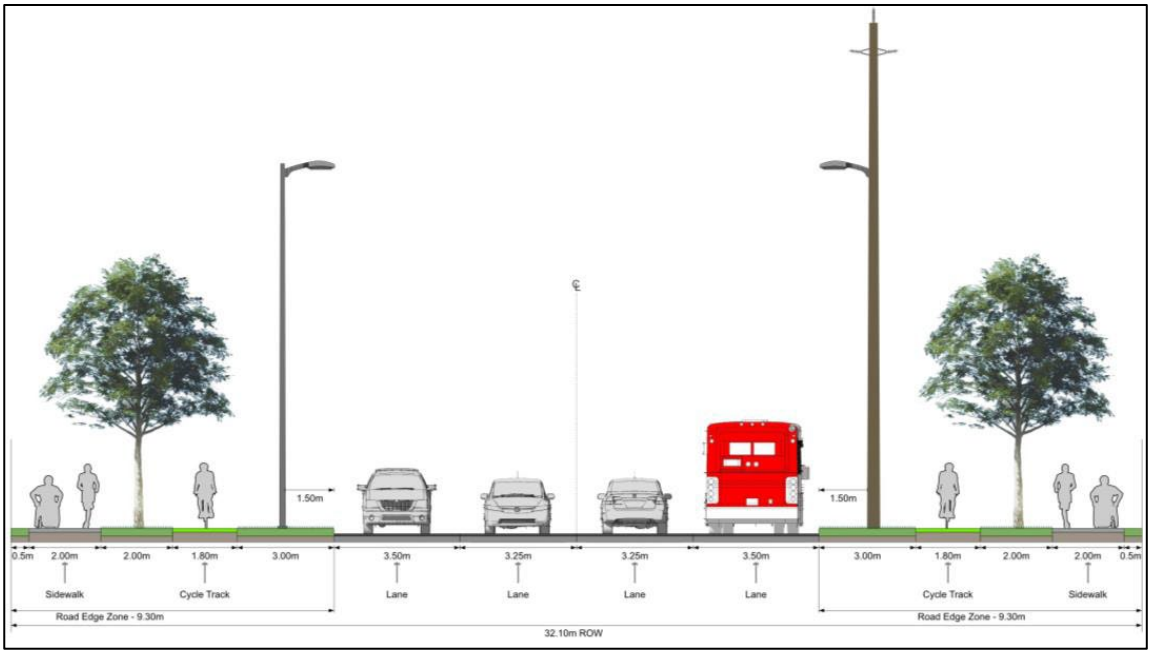
The intersection capacity analysis indicates that this intersection is expected to operate at an acceptable Level of Service (i.e. LOS ‘D’ or better) as an unsignalized intersection under all future scenarios.

Mike Giampa - City of Ottawa Transportation Project Manager – February 16, 2021

10.0 Multi-Modal Level of Service

Segment-based Multi-Modal Level of Service (MMLOS) analysis was completed for the segment of Old Montreal Road adjacent to the site under Existing (2020), Future (2027) and Ultimate (Beyond 2031) conditions. Under Future (2027) conditions, a 1.5m wide (site frontage only) asphalt sidewalk and continuous on-road cycling facility will be provided along the south side of Old Montreal Road, while the roadway cross-section illustrated in **Figure 1** will be implemented on Old Montreal Road beyond the City's 2031 ultimate planning horizon year.

Figure 1 - City of Ottawa Arterial Road Concept



The results of the segment-based MMLOS analysis are summarized in **Table 11**. Details of the MMLOS analysis are provided in **Appendix H**.

Table 11 - Segment-Based MMLOS Results

SCENARIO	LEVEL OF SERVICE BY MODE			
	PEDESTRIAN (PLOS) TARGET: C	BICYCLE (BLOS) TARGET: C	TRANSIT (TLOS) TARGET: N/A[1]	TRUCK (TkLOS) TARGET: D
Existing (2020)	F	E	D	C
Future (2027)	E	E	D	C
Ultimate (Beyond 2031)	D	A	D	A

Notes:

[1] – Old Montreal Road is not identified as a transit priority corridor in the TMP therefore there is no TLOS target.

As indicated above, both the PLOS and BLOS targets are not met under Existing (2020) conditions as a result of limited active transportation facilities. Under Future (2027) conditions, the addition

of a sidewalk and a continuous on-road bicycle facility on the south side of Old Montreal Road along the site frontage is anticipated to improve the PLOS, however, further improvements would be required to reach the PLOS target, in particular system connectivity along the extent of Old Montreal Road corridor. Following the four-lane widening of Old Montreal Road, it is anticipated that all MMLOS targets will be met with the exception of the PLOS target. Based on the analysis, a reduction in operating speeds on Old Montreal Road to 60 km/h or less would result in a PLOS of 'C'.

11.0 Auxiliary Lane Warrant Analysis

Auxiliary left-turn lane warrant analysis was completed for both the Street One access intersection and the Street Two access intersection. As westbound left-turn volumes at both intersections represent less than 1% to 2% of approach volumes, an auxiliary left-turn lane is not warranted at either location.

The Transportation Association of Canada (TAC) suggests that auxiliary right-turn lanes should be considered "when the volume of decelerating or accelerating vehicles compared with through vehicles causes undue hazard." Consideration for auxiliary right-turn lanes is typically given when the right-turning traffic exceeds 10% of the through volume and is at least 60 vehicles per hour. Based on projected Future (2027) Traffic volumes, an auxiliary right-turn lane on the eastbound approach of the Old Montreal & Street Two intersection will be required as the volume of right-turning traffic is expected to be in the order of 90 vehicles during the weekday afternoon peak hour. Based on a design speed of 70 km/h (posted speed limit plus 10 km/h) and 3.5m lane widths, the auxiliary right-turn lane would require a taper length of 60m and a parallel lane of 20m. This has been shown in the attached functional design drawings in **Appendix I**.

12.0 Site Access Review

The proposed development will provide one (1) one-way private approach on Old Montreal Road (Street One) as well as a two-way local road (Street Two). Street Two will become a public roadway and, as such, the requirements of the City of Ottawa Private Approach By-law are not applicable. The proposed Street One access, however, is a private roadway and has been designed in conformance with the City of Ottawa Private Approach By-law 2003-447, with particular confirmation of the following items:

- Width: A private approach shall have a minimum width of 2.4m and a maximum width of 9.0m.
    - The Street One private approach at the Old Montreal/Famille Laporte intersection will be 4.25m wide, appropriate for one-way flow. ✓
- Quantity and Spacing of Private Approaches: For sites with frontage between 46 and 150 metres, one (1) two-way private approach and two (2) one-way private approaches, or two (2) two-way private approaches are permitted. For each additional 90m of frontage in excess of 150m, an additional two-way approach or two (2) additional one-way approaches are permitted. Any two private approaches must be separated by at least 9.0m and can be reduced to 2.0m in the case of two one-way driveways. On lots that abut more than one roadway, these provisions apply to each frontage separately.
    - The frontage on Old Montreal Road is approximately 264m, therefore the one (1) one-way private approach is compliant with the by-law. ✓
- Distance from Property Line: Private approaches must be at least 3.0m from the abutting property line, however this requirement can be reduced to 0.3m provided that the access

is a safe distance from the access serving the adjacent property, sight lines are adequate and that it does not create a traffic hazard.

  - The proposed Street One private approach will be more than 3.0m from the abutting property line. ✓

- Distance from Nearest Intersecting Street Line: For apartment buildings with more than 300 parking spaces located on a parcel adjacent to or within 46m of an arterial or major collector, all private approaches must be a minimum of 60m from the nearest intersecting street line.

  - The Street One private approach is directly opposite of Famille-Laporte Avenue and therefore the distance to this roadway can be disregarded. The next nearest intersecting street line is more than 60m away. ✓

- Distance from Any Other Private Approach: For apartment buildings with more than 300 parking spaces located on a parcel adjacent to or within 46m of an arterial or major collector, all two-way private approaches must be a minimum of 60m from the any other private approach.

  - There are several other private approaches within 60m of the proposed private approach, however, as they are all associated with single-family homes it is anticipated that this will not result in any safety or operational issues. ✓

The Geometric Design Guide for Canadian Road indicates the clear throat length required for apartment complexes based on the number of apartment units. The two parking garage entrances on the Street One approach provide access to half of the parking spaces of the four apartment blocks adjacent to Old Montreal Road, and as such provide parking for approximately 95 apartment units. For less than 100 apartment units, a minimum clear throat length of 15m is recommended which is less than the 22m provided on Street One.

As both site access intersections require modifications to public roadways, draft Roadway Modification Approval (RMA) drawings have been prepared and presented in **Appendix I**.

Mike Giampa - City of Ottawa Transportation Project Manager – February 16, 2021

13.0 Conclusion

A Transportation Impact Assessment (TIA) was previously prepared by WSP Global Inc. in March 2018 in support of the proposed residential development at 1154-1208 Old Montreal Road. Based on the circulation comments from the City of Ottawa, the Plan of Subdivision has been since revised. IBI Group was retained by DCR Phoenix Development Corporation Ltd. to prepare a TIA Update to address the outstanding transportation-related comments to support the approval of this development application.

The revised Plan of Subdivision now includes only two access intersections on Old Montreal Road, one of which is restricted to inbound traffic only, and has reduced the number of apartment units while doubling the number of low-density residential units. Pedestrian and cycling facilities have been provided throughout the development in the form of concrete and asphalt sidewalks, pedestrian pathways and a 3.0m wide multi-use pathway along the southern boundary of the property. In addition to this, cycling and pedestrian facilities have been proposed along the Old Montreal Road frontage, including a continuous on-road bicycle facility and a pedestrian crossover (PXO) to facilitate access to public transportation.

Based on the current Plan of Subdivision, the number of person-trips generated by the proposed development is anticipated to be in the order of 360 and 450 two-way person-trips during the weekday morning and afternoon peak hour. This represents a decrease of approximately 30 to 100 person-trips relative to the previous submission. Approximately 220 to 270 two-way vehicle-trips and 70 to 90 two-way transit-trips are expected to be generated by the proposed development during the weekday morning and afternoon peak hours.

Future (2022 & 2027) Background & Total Traffic volumes were developed using the latest intersection traffic counts available from the City of Ottawa. Based on these revised traffic projections, none of the study area intersections were found to meet the technical warrants for signalization, however, the Old Montreal Road & Dairy Drive / Aveia Private intersection was found to meet the criteria for the implementation of a roundabout.

Significant capacity issues were observed under Future (2022) Background & Total Traffic conditions at the Old Montreal Road & Dairy Drive / Aveia Private intersection which were shown to be addressed by the implementation of a roundabout at this location. By 2027, Cardinal Creek Drive is expected to be extended from Old Montreal Road to Ottawa Road 174 resulting in a redistribution of traffic from the Cardinal Creek Village subdivision. This will reduce overall traffic volumes on Old Montreal Road; however, the addition of site-generated traffic will negate any operational benefits that this will provide. Although traffic signals are shown to provide better operational performance, they do not meet the minimum warrants. It is therefore recommended that a roundabout be considered by the City as an alternate mitigation measure to address the existing capacity issues and future traffic demand at the Old Montreal Road & Dairy Drive / Aveia Private intersection.

The Trim Road & St Joseph Boulevard / Old Montreal Road intersection was also shown to exceed its theoretical capacity under all traffic conditions. Given that the roundabout was only constructed within the past 5 years, it is not expected that it will be modified within the timeframe of this study.

Both site access intersections were found to operate at an acceptable Level of Service (i.e. LOS ‘D’ or better) under Future (2022 & 2027) Total Traffic conditions. In order to facilitate access to nearby transit stops and provide a safe crossing for developments on both sides of Old Montreal Road, it is recommended that a PXO be provided at the intersection of Old Montreal Road & Famille-Laporte Avenue / Street One and that an additional bus stop be located on Famille Laporte Avenue in the northbound direction.

Mike Giampa - City of Ottawa Transportation Project Manager – February 16, 2021

A review of pre-pandemic transit ridership and park-and-ride capacity confirmed that the projected demand generated by the proposed development can be accommodated. Multi-Modal Level of Service (MMLOS) analysis was completed for the segment of Old Montreal Road adjacent to the site and at all intersections where traffic signals are operationally required. The results of the segment-based MMLOS analysis largely mirrors the MMLOS results reported in the March 2018 TIA. Potential measures to address MMLOS deficiencies were identified. It should be noted that these deficiencies are not expected to be exacerbated by the addition of site-generated traffic.

Auxiliary lane analysis indicated that the following new auxiliary lanes will be required to accommodate future (2027) total traffic conditions:

- An eastbound right-turn lane with a 60m taper and 20m of parallel lane is warranted at the Old Montreal Road & Street Two intersection.

The Street One private approach was assessed to determine its conformance with applicable by-laws and design guidelines. Based on this review, no adjustments to the private approach are required to conform to by-laws or design guidelines.

Based on the findings of this study, it is the overall opinion of IBI Group that the proposed development will integrate well with and can be safely accommodated by the adjacent transportation network with the recommended actions and modifications in place.

IBI GROUP MEMORANDUM

Mike Giampa - City of Ottawa Transportation Project Manager – February 16, 2021

Appendix C – Trip Generation Data

Table 3.12: Person Trip Generation Rates – (all households with residents not older than 55 years of age)

Person Trip Generation Rates
All Households with persons 55 years of age or less
AM and PM Peak Hours

Dwelling Unit Types \ Geographic Areas		Core Area Person Trip Rate	Core Area %▽	Urban Area (Inside the greenbelt) Person Trip Rate	Urban Area %▽	Suburban (Outside the greenbelt) Person Trip Rate	Suburban %▽	Rural Person Trip Rate	Rural %▽	All Areas Person Trip Rate
Single detached:	AM	0.85	- 7%	0.99	+ 9%	0.94	+ 3%	0.78	- 14%	0.91
	PM	0.74	- 3%	0.75	- 1%	0.79	+ 4%	0.71	- 7%	0.76
Semi-detached:	AM	0.79	- 10%	0.97	10%	0.89	+ 1%	0.64	- 27%	0.88
	PM	0.74	- 1%	0.68	- 9%	0.82	+ 9%	0.60	- 20%	0.75
Row Townhouse:	AM	0.71	- 3%	0.78	+ 7%	0.67	- 8%	0.74	+ 1%	0.73
	PM	0.62	- 3%	0.60	- 6%	0.69	+ 8%	0.56	- 13%	0.64
Apartment:	AM	0.48	- 4%	0.51	+ 2%	0.53	+ 6%	0.36	- 28%	0.50
	PM	0.45	0%	0.42	- 7%	0.52	+ 16%	0.52	+ 16%	0.45
All Types:	AM	0.62	- 23%	0.82	+ 2%	0.86	+ 8%	0.76	- 5%	0.80
	PM	0.57	- 16%	0.63	- 7%	0.75	+ 10%	0.69	+ 1%	0.68

Note: 5 % (+ or -) represents the percentage delta change in trip rate when compared against the average trip rate across all geographic areas

Table 3.13: Mode Shares - (all households with residents not older than 55 years of age)

Reported Mode Shares
All Households with persons 55 years of age or less
AM and PM Peak Hours

Dwelling Unit Types \ Geographic Areas		Core Area Vehicle Trips	Core Area Transit Share	Core Area Non-Motorised	Urban Area (Inside the greenbelt) Vehicle Trips	Urban Area Transit Share	Urban Area Non-Motorised	Suburban (Outside the greenbelt) Vehicle Trips	Suburban Transit Share	Suburban Non-Motorised	Rural * Vehicle Trips	Rural * Transit Share	Rural * Non-Motorised	All Areas Vehicle Trips	All Areas Transit Share	All Areas Non-Motorised
Single - Detached:	AM	35%	20%	33%	51%	26%	11%	55%	25%	9%	60%	27%	4%	54%	25%	10%
	PM	45%	11%	32%	58%	19%	13%	64%	19%	6%	73%	13%	2%	63%	17%	8%
Semi-Detached:	AM	38%	30%	26%	44%	35%	10%	52%	24%	12%	64%	27%	5%	49%	28%	12%
	PM	36%	20%	34%	51%	27%	13%	62%	17%	7%	77%	12%	1%	58%	20%	10%
Row / Townhouse:	AM	33%	22%	40%	45%	34%	10%	55%	27%	8%	73%	15%	3%	49%	30%	11%
	PM	39%	15%	42%	53%	28%	8%	61%	22%	6%	74%	15%	1%	57%	24%	9%
Apartment:	AM	27%	27%	43%	37%	41%	14%	44%	34%	13%	76%	8%	16%	36%	35%	23%
	PM	23%	29%	42%	40%	37%	14%	44%	33%	9%	48%	4%	17%	35%	33%	23%
All Types:	AM	32%	24%	38%	47%	31%	11%	54%	26%	9%	61%	26%	4%	51%	27%	11%
	PM	34%	21%	38%	53%	24%	12%	62%	20%	6%	73%	13%	2%	59%	20%	10%

Note: Percentages do not necessarily sum to 100% as the proportion of automobile passengers have not been tabulated. Vehicle trips reflect the percentage of vehicle drivers.
* - Rural area sample size is extremely low and mode shares are highly influenced by school types where public transportation levels are high during the AM versus the PM peaks.

Table 6.1: Vehicle Trip Generation Rates

Vehicle Trip Generation Rates AM and PM Peak Hours						
ITE Land Use Code	Dwelling Unit Type / Data Source		Vehicle Trip Generation Rate			
			2008 Count Data	ITE	OD Survey	Blended Rate
210	Single-detached dwellings	AM	0.66	0.75	0.56	0.66
		PM	0.89	1.01	0.53	0.81
224	Semi-detached dwellings, townhouses, rowhouses	AM	0.40	0.70	0.46	0.52
		PM	0.64	0.72	0.46	0.61
231	Low-rise condominiums (1 or 2 floors)	AM	0.53	0.67	0.21	0.47
		PM	0.41	0.78	0.18	0.46
232	High-rise condominiums (3+ floors)	AM	0.53	0.34	0.21	0.36
		PM	0.41	0.38	0.18	0.32
233	Luxury condominiums	AM	0.53	0.56	0.21	0.43
		PM	0.41	0.55	0.18	0.38
221	Low-rise apartments (2 floors)	AM	0.19	0.46	0.21	0.29
		PM	0.21	0.58	0.18	0.32
223	Mid-rise apartments (3-10 floors)	AM	0.19	0.30	0.21	0.23
		PM	0.21	0.39	0.18	0.26
222	High-rise apartments (10+ floors)	AM	0.19	0.30	0.21	0.23
		PM	0.21	0.35	0.18	0.25

Table 6.2: Recommended Vehicle Trip Directional Splits

Comparison of Directional Splits (Inbound/Outbound) AM and PM Peak Hours								
ITE Land Use Code	Area Dwelling Unit Type / Data Source		2008 Count Data		ITE		Blended Rate	
			Inbound	Outbound	Inbound	Outbound	Inbound	Outbound
210	Single-detached dwellings	AM	33%	67%	25%	75%	29%	71%
		PM	60%	40%	63%	37%	62%	39%
224	Semi-detached dwellings, townhouses, rowhouses	AM	40%	60%	33%	67%	37%	64%
		PM	55%	45%	51%	49%	53%	47%
231	Low-rise condominiums (1 or 2 floors)	AM	36%	64%	25%	75%	31%	70%
		PM	54%	46%	58%	42%	56%	44%

Table 6.3: Recommended Vehicle Trip Generation Rates for Residential Land Uses with Transit Bonus

Recommended Vehicle Trip Generation Rates with Transit Bonus AM and PM Peak Hours									
ITE Land Use Code	Dwelling Unit Type / Geographic Area		Vehicle Trip Rate						
			Core		Urban (Inside the Greenbelt)		Suburban (Outside the Greenbelt)		Rural
			Base Rate	< 600m to Rapid Transit	Base Rate	< 600m to Rapid Transit	Base Rate	< 600m to Rapid Transit	Base Rate
210	Single-detached dwellings	AM	0.40	0.31	0.67	0.50	0.70	0.49	0.62
		PM	0.60	0.33	0.76	0.57	0.90	0.63	0.92
224	Semi-detached dwellings, townhouses, rowhouses	AM	0.34	0.34	0.51	0.50	0.54	0.39	0.62
		PM	0.39	0.38	0.51	0.51	0.71	0.51	0.67
231	Low-rise condominiums (1 or 2 floors)	AM	0.34	0.34	0.50	0.50	0.60	0.60	0.71
		PM	0.29	0.29	0.49	0.49	0.66	0.66	0.72
232	High-rise condominiums (3+ floors)	AM	0.26	0.26	0.38	0.38	0.46	0.46	0.54
		PM	0.20	0.20	0.34	0.34	0.46	0.46	0.50
233	Luxury condominiums	AM	0.31	0.31	0.45	0.45	0.55	0.55	0.65
		PM	0.24	0.24	0.40	0.40	0.55	0.55	0.59
221	Low-rise apartments (2 floors)	AM	0.21	0.21	0.31	0.31	0.37	0.37	0.44
		PM	0.20	0.20	0.34	0.34	0.46	0.46	0.50
223	Mid-rise apartments (3-10 floors)	AM	0.17	0.17	0.24	0.24	0.29	0.29	0.35
		PM	0.16	0.16	0.28	0.28	0.37	0.37	0.41
222	High-rise apartments (10+ floors)	AM	0.17	0.17	0.24	0.24	0.29	0.29	0.35
		PM	0.16	0.16	0.27	0.27	0.36	0.36	0.39

Note: The transit bonus was only applied to geographic areas and dwelling unit types where the reported transit mode shares were less than the transit mode share reported for residential development located within the 600m proximity to a rapid transit station. It is noted that condominium and apartment housing categories reported similar levels of transit mode shares independent of location to rapid transit stations.

6.5 Future Data Collection

While the rates presented in were prepared by blending the vehicle trip rates from ITE, the OD Survey and the 2008 local trip generation studies, it is important to stress the importance and need for ongoing local trip generation surveys to monitor changes in travel behaviour. The 2008 trip generation studies undertaken to support this study provide insight into local travel patterns and a well organized ongoing annual data collection program aimed at trip generation surveys of key land uses or requirement for data collection by local developers will continue to provide recent and accurate local trip generation rates. For example the high-rise apartment category of dwelling units reported the lowest peak hour vehicle trip rates.

6:00 PM	3	389	5	1	180	11	2	3	1	46	1	24	1

** Number of pedestrians crossing the major road*

Notes:

1. Vehicle volume warrant (1A) and (2A) for intersections of roadways having two or more moving lanes in one direction should be 25% higher than the values given above.

1 Lane per Direction

2. Warrant values for free flow apply when the 85th percentile speed of artery traffic equals or exceeds 70 km/h or when the intersection lies within the built-up area of an isolated community having a population of less than 10,000. Warrant values for restricted flow apply to large urban communities when the 85th percentile speed of artery traffic does not exceed 70 km/h.

Free Flow

3. The lowest sectional percentage governs the entire warrant.

4. For "T" intersections the warrant values for the minor road should be increased by 50% (Warrant 1B only).

4-legged Intersection

5. All flow values for Justification 1 and 2 are to be increased by 20% in the case of new intersections, Justification 3 is to only be used for existing intersections and all flow values for Warrant 1 and Warrant 2 of Justification 7 are to be increased by 20% for existing intersections and by 50% in the case of new intersections.

Existing Intersection

6. The crossing volumes are defined as the sum of:
   - (a) Left-turns from both minor road approaches.
   - (b) The heaviest through volume from the minor road.
   - (c) 50% of the heavier left turn movement from major road when both of the following are met:
     - (i) the left-turn volume >120 vph
     - (ii) the left-turn volume plus the opposing volume >720 vph
   - (d) Pedestrians crossing the main road.

CONCLUSION: The intersection does NOT meet the minimum warrants for traffic control signals.

** Number of pedestrians crossing the major road*

Notes:

1. Vehicle volume warrant (1A) and (2A) for intersections of roadways having two or more moving lanes in one direction should be 25% higher than the values given above.

1 Lane per Direction

2. Warrant values for free flow apply when the 85th percentile speed of artery traffic equals or exceeds 70 km/h or when the intersection lies within the built-up area of an isolated community having a population of less than 10,000. Warrant values for restricted flow apply to large urban communities when the 85th percentile speed of artery traffic does not exceed 70 km/h.

Free Flow

3. The lowest sectional percentage governs the entire warrant.

4. For "T" intersections the warrant values for the minor road should be increased by 50% (Warrant 1B only).

3-legged Intersection

5. All flow values for Justification 1 and 2 are to be increased by 20% in the case of new intersections, Justification 3 is to only be used for existing intersections and all flow values for Warrant 1 and Warrant 2 of Justification 7 are to be increased by 20% for existing intersections and by 50% in the case of new intersections.

Existing Intersection

6. The crossing volumes are defined as the sum of:
   - (a) Left-turns from both minor road approaches.
   - (b) The heaviest through volume from the minor road.
   - (c) 50% of the heavier left turn movement from major road when both of the following are met:
     - (i) the left-turn volume >120 vph
     - (ii) the left-turn volume plus the opposing volume >720 vph
   - (d) Pedestrians crossing the main road.

CONCLUSION: **The intersection does NOT meet the minimum warrants for traffic control signals.**

6:00 PM	0	377	46	3	162	0	53	0	3	0	0	0	0

** Number of pedestrians crossing the major road*

Notes:

1. Vehicle volume warrant (1A) and (2A) for intersections of roadways having two or more moving lanes in one direction should be 25% higher than the values given above.

1 Lane per Direction

2. Warrant values for free flow apply when the 85th percentile speed of artery traffic equals or exceeds 70 km/h or when the intersection lies within the built-up area of an isolated community having a population of less than 10,000. Warrant values for restricted flow apply to large urban communities when the 85th percentile speed of artery traffic does not exceed 70 km/h.

Free Flow

3. The lowest sectional percentage governs the entire warrant.

4. For "T" intersections the warrant values for the minor road should be increased by 50% (Warrant 1B only).

3-legged Intersection

5. All flow values for Justification 1 and 2 are to be increased by 20% in the case of new intersections, Justification 3 is to only be used for existing intersections and all flow values for Warrant 1 and Warrant 2 of Justification 7 are to be increased by 20% for existing intersections and by 50% in the case of new intersections.

New Intersection

6. The crossing volumes are defined as the sum of:
   - (a) Left-turns from both minor road approaches.
   - (b) The heaviest through volume from the minor road.
   - (c) 50% of the heavier left turn movement from major road when both of the following are met:
     - (i) the left-turn volume >120 vph
     - (ii) the left-turn volume plus the opposing volume >720 vph
   - (d) Pedestrians crossing the main road.

CONCLUSION: The intersection does NOT meet the minimum warrants for traffic control signals.

IBI GROUP MEMORANDUM

Mike Giampa - City of Ottawa Transportation Project Manager – February 16, 2021

Appendix F – Roundabout Feasibility

City of Ottawa
Roundabout Initial Feasability Screening Tool

The intent of this screening tool is to provide a relatively quick assessment of the feasibility of a roundabout at a particular intersection in comparison to other appropriate forms of traffic control or road modifications including all-way stop control, traffic signals, auxiliary lanes, etc. The intended outcome of this tool is to provide enough information to assist staff in deciding whether or not to proceed with an Intersection Control Study to investigate the feasibility of a roundabout in more

1	Project Name:	1154-1208 Old Montreal Road
2	Intersection:	Old Montreal Road & Dairy Drive / Aveia Private
3	Location and Description of Intersection: Lane Configuration, total or approach AADT, distance to nearby intersection(s), etc. Attach or sketch a diagram and include existing and/or horizon-year turning movements. If an existing intersection then indicate type of control	The intersectio is currently configured as a two-way stop-controlled intersection with a left-turn lane on the eastbound, westbound and southbound approaches.
4	What traditional modifications are proposed? All-way stop control, traffic signals, auxiliary lanes, etc. Attach or sketch a diagram if necessary.	Traffic signals
5	What size of roundabout is being considered? Describe, and attach a Roundabout Traffic Flow Worksheet	Single lane roundabout
6	Why is a roundabout being considered?	To address capacity issues

7 Are there contra-indications for

If "Yes" is indicated for one or more of the contra-indications then a roundabout may be problematic at the subject intersection. That is not to say that a roundabout is not possible, just that there may be difficulties or high

No.	Contra-Indication	Outcome
1	Is there insufficient property at the intersection (i.e. less than 44 metres diameter if considering a single-lane roundabout, and less than 60 metres if considering a two-lane roundabout) or property constraints that would require demolition of adjacent	Yes ☐ No ☒
2	Are there any instances where stopping sight distance (SSD) of a roundabout yield line may not be attainable (i.e. the intersection is on a crest vertical curve)?	Yes ☐ No ☒
3	Is there an existing uncontrolled approach with a grade in excess of 4 percent?	Yes ☐ No ☒
4	Is the intersection located within a coordinated signal system?	Yes ☐ No ☒
5	Is there a closely-spaced traffic signal or railway crossing that could not be controlled with a nearby roundabout?	Yes ☐ No ☒
6	Are significant differences in directional flows or any situations of sudden high demand expected?	Yes ☒ No ☐
7	Are there known visually-impaired pedestrians that cross this intersection?	Yes ☐ No ☒

8 Are there suitability factors for a roundabout?

If "Yes" is indicated for two or more of the suitability factors then a roundabout should be technically feasible at the subject intersection..

No.	Suitability Factor	Outcome
1	Does the intersection currently experience an average collision frequency of more than 1.5 injury crashes per year, or a collision rate in excess of 1 injury crash per 1 million vehicles entering (MVE)?	Yes ☐ No ☒
2	Has there been a fatal crash at the intersection in the last 10 years?	Yes ☐ No ☒
3	Are capacity problems currently being experienced, or expected in the future?	Yes ☒ No ☐
4	Are traffic signals warranted, or expected to be warranted in the future?	Yes ☐ No ☒
5	Does the intersection have more than 4 legs, or unusual geometry?	Yes ☐ No ☒
6	Will Planned modifications to the intersection require that nearby structures be widened (i.e. to accommodate left-turn lanes)?	Yes ☐ No ☒
7	Is the intersection located at a transition between rural and urban environments (i.e. an urban boundary) such that a roundabout could act as a means of speed transition?	Yes ☒ No ☐

9	Conclusions/recommendation whether to proceed with an Intersection Control Study:	Although there may be significant directional flows, capacity issues are anticipated at this intersection and a roundabout could act as a means of speed transition and therefore should be considered as a potential means of traffic control for this intersection.

City of Ottawa
Mini-Roundabout Screening Criteria

Mini roundabouts are best suited and most effective when they meet the following conditions;

No.	Criteria	Outcome
1	Located at minor collector road intersecting a minor collector road or a local residential road	Yes [ ] No [X]
2	ADT lesser than 15,000 (estimated ADT in case of new development area)	Yes [X] No [ ]
3	At least 10% of the total traffic has generated from minor road (estimated in case of new development area)	Yes [X] No [ ]
4	Operating speed <55km/hr or posted speed ≤ 50km/hr in a new development area	Yes [ ] No [X]
5	A right of way wide enough to accommodate a 13 m to 27 m Inscribed Circle Diameter roundabout and adjacent sidewalks	Yes [X] No [ ]
6	Situated on a non truck route or roads without heavy truck movements	Yes [ ] No [X]
7	Intersections with no more than four legs	Yes [X] No [ ]

Conclusion

This location does not meet several of the screening criteria, therefore, a mini-roundabout is not recommended for this location.

Level of Service (LOS) Method: Delay & v/c (HCM 2010).
Roundabout LOS Method: Same as Sign Control.
Lane LOS values are based on average delay and v/c ratio (degree of saturation) per lane.
LOS F will result if v/c > irrespective of lane delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all lanes (v/c not used as specified in HCM 2010).
Roundabout Capacity Model: US HCM 2010.
HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.
Gap-Acceptance Capacity: Traditional M1.
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Level of Service (LOS) Method: Delay & v/c (HCM 2010).
Roundabout LOS Method: Same as Sign Control.
Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement
LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010).
Roundabout Capacity Model: US HCM 2010.
HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.
Gap-Acceptance Capacity: Traditional M1.
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Level of Service (LOS) Method: Delay & v/c (HCM 2010).
Roundabout LOS Method: Same as Sign Control.
Lane LOS values are based on average delay and v/c ratio (degree of saturation) per lane.
LOS F will result if v/c > irrespective of lane delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all lanes (v/c not used as specified in HCM 2010).
Roundabout Capacity Model: US HCM 2010.
HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.
Gap-Acceptance Capacity: Traditional M1.
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Level of Service (LOS) Method: Delay & v/c (HCM 2010).
Roundabout LOS Method: Same as Sign Control.
Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement
LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010).
Roundabout Capacity Model: US HCM 2010.
HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.
Gap-Acceptance Capacity: Traditional M1.
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Level of Service (LOS) Method: Delay & v/c (HCM 2010).
Roundabout LOS Method: Same as Sign Control.
Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement
LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010).
Roundabout Capacity Model: US HCM 2010.
HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.
Gap-Acceptance Capacity: Traditional M1.
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Level of Service (LOS) Method: Delay & v/c (HCM 2010).
Roundabout LOS Method: Same as Sign Control.
Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement
LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010).
Roundabout Capacity Model: US HCM 2010.
HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.
Gap-Acceptance Capacity: Traditional M1.
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Level of Service (LOS) Method: Delay & v/c (HCM 2010).
Roundabout LOS Method: Same as Sign Control.
Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement
LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010).
Roundabout Capacity Model: US HCM 2010.
HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.
Gap-Acceptance Capacity: Traditional M1.
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Level of Service (LOS) Method: Delay & v/c (HCM 2010).
Roundabout LOS Method: Same as Sign Control.
Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement
LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010).
Roundabout Capacity Model: US HCM 2010.
HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.
Gap-Acceptance Capacity: Traditional M1.
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Level of Service (LOS) Method: Delay & v/c (HCM 2010).
Roundabout LOS Method: Same as Sign Control.
Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement
LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010).
Roundabout Capacity Model: US HCM 2010.
HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.
Gap-Acceptance Capacity: Traditional M1.
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.
