re: Sentinel Well Groundwater Monitoring Program

Kanata North Urban Expansion
Proposed Residential Development

March Road - Ottawa

to: Novatech Engineering Consultants - Mr. John Riddell - J.Riddell@novatech-eng.com

date: October 31, 2019

file: PG3975-MEMO.01 Revision 2

Further to your request, Paterson Group (Paterson) conducted a sentinel well groundwater monitoring program at the Kanata North Urban Expansion Area (KNUEA) along March Road at the aforementioned site. A summary of the field program and results have been provided below.

# **Background Information**

Paterson completed a Hydrogeological Existing Conditions Report (PH2223-3R4 dated May 18, 2016) for the KNUEA, as per the scope set out by the KNUEA Environmental Management Plan (EMP) Terms of Reference. Based on Paterson's findings, it was recommended in the Existing Conditions Report, and subsequently, the EMP, that a sentinel well groundwater monitoring program be completed prior to development in order to establish baseline conditions as a basis for evaluating potential impacts once construction commenced.

The field program consisted of the installation of ten monitoring wells at five locations on December 15 to 21, 2016. Each location consisted of a pair of monitoring wells extending to a depth of 6 and 12 m below ground surface (bgs). The wells were distributed in a manner to provide general coverage of the proposed development taking into consideration site features and access.

# Field Survey

The locations of all monitoring wells, as well as geodetic elevations of the ground surface elevation at all monitoring well locations, were provided by Novatech Engineering Consultants. The survey was performed using high accuracy (0.02 m) GPS survey equipment. The locations are presented on Drawing PG3975-1 Test Hole Location Plan attached to the current report.

Mr. John Riddell Page 2 PG3975-MEMO.01 Revision 2

#### **Subsurface Profile**

The subsurface profile at the monitoring well locations generally consisted of overburden thickness ranging from 0.7 to 3.0 m followed by poor to excellent quality limestone with some shale partings. Reference should be made to the Soil Profile and Test Data sheets attached to this report for specific details of the overburden and bedrock profile encountered at the monitoring well locations.

# **Monitoring Well Installation**

Typical monitoring well construction details are described below:

1.5 m of slotted 51 mm diameter PVC screen at the base of the aforementioned
boreholes.
51 mm diameter PVC riser pipe from the top of the screen to ground surface.
No.3 silica sand backfill within annular space around screen.
Bentonite hole plug placed directly above PVC slotted screen extending to the existing ground surface.
The 51 mm diameter PVC riser extending above the ground surface was covered with a protective steel monitoring well casing.

Specific details of the installation of each monitoring well are further included in the Soil Profile and Test Data Sheets attached to the current report.

# **Sentinel Well Groundwater Monitoring**

On December 22, 2016, each monitoring well at the subject site was equipped with a Van Essen Instrument Mini-Diver Water Level Logger to accurately monitor fluctuations in the groundwater levels. In addition, a Van Essen Instruments Baro-Diver was installed in BH2-DW to monitor the changes in atmospheric pressure. The Mini-Divers were programmed to continuously measure and record groundwater levels throughout the subject site at a fixed rate of 1 reading every 30 minutes for a period of 29 months. The installation depths and Mini-Diver ID for each respective monitoring well is summarized in Table 1 below.

On October 23, 2019, a raw water sample was taken at each sentinel well location within the subject site for the purpose of obtaining baseline water quality information prior to the commencement of construction activities and in accordance with Paterson Report PH2223-MEMO.01 dated June 24, 2016. The samples were submitted for analytical testing (subdivision package and E.Coli/Total Coliforms) at an accredited laboratory (Eurofins Environmental Testing). The data loggers were re-deployed at the monitoring well locations on October 23, 2019 to provide further monitoring with a similar rate of data recording and depth of monitoring.

The results of the groundwater fluctuations and correlated precipitation events for each monitoring well location between December 22, 2016 and May 16, 2019 have been summarized in Figure 1 through Figure 5 attached to the current memo. The laboratory analyses reports for the water samples obtained from the sentinel wells at the subject site have been attached to the current memo.

Table 1 - Water Level Logger S	Summary - Kanata North	
Monitoring Well	Mini-Diver ID	Depth (m BGS)
BH1-DW	W0117	9.05
BH1-SW	W0155	5.84
BH2-DW	T2446	9.16
BH2-SW	T2452	5.86
BH3-DW	T2438	10.00
BH3-SW	V3833	5.71
BH4-DW	V3856	9.08
BH4-SW	V3662	5.75
BH5-DW	V3894	9.17
BH5-SW	V3816	5.70

# **Discussion**

The data presented in Figure 1 through Figure 5 show the difference in seasonal groundwater elevation within the shallow wells at each well location vary from 1.1 to 2.3 m bgs, while the deep wells varied from 1.4 to 2.8 m bgs. The seasonal low and high groundwater elevations at each well location have been summarized in Table 2 below. Water sample results were not compared to provincial water quality guidelines or aesthetic objectives, but rather to establish baseline water quality information prior to the commencement of construction and in accordance with Paterson Report PH2223-MEMO.01.

Table 2 - Seasona	Table 2 - Seasonal Groundwater Elevations - Kanata North											
Monitoring Well	Ground Surface Elevation	Low Groundwater Elevation	High Groundwater Elevation	Difference in Groundwater Depth								
BH1-SW	73.08	71.8 m	72.9 m	1.1 m								
BH1-DW	73.08	71.9 m	73.3 m	1.4 m								
BH2-SW	82.95	81.0 m	83.3 m	2.3 m								
BH2-DW	82.95	80.7 m	83.0 m	2.3 m								
BH3-SW	88.84	85.4 m	87.7 m	2.3 m								
BH3-DW	88.84	83.6 m	86.4 m	2.8 m								
BH4-SW	89.34	87.3 m	89.6 m	2.3 m								
BH4-DW	89.34	88.2 m	90.5 m	2.3 m								
BH5-SW	84.22	82.0 m	84.0 m	2.0 m								
BH5-DW	84.22	82.4 m	85.1 m	2.7 m								

## **Conclusions**

Based on the results from the sentinel well monitoring program, groundwater levels were measured in both the elevation of the overburden layers and shallow bedrock, illustrating similar fluctuation patterns across the site. This suggests the shallow and deeper bedrock units are considered hydraulically connected. At the majority of the locations, groundwater elevations were within the elevation of the overburden layers, or above ground surface. This suggests that the upper bedrock layer is fully saturated, and that overburden soils are acting as a confining layer. Based on our results from the sentinel well monitoring program and previous investigations, it is our understanding that the long-term groundwater table at the site boundaries are within the overburden and/or shallow bedrock.

# **Additional Monitoring - Water Wells**

Subsequent to the sentinel well groundwater monitoring program at the subject site, a baseline well survey program was implemented for the proposed development area of the KNUEA as recommended in Paterson Report PH2223-3R4 and noted in the Kanata North Community Design Plan dated June 28, 2016.

The overall monitoring area will consist of a 500 m buffer around the KNUEA and will include the majority of lots within adjacent country estate lot subdivisions. The well monitoring program will be comprised of sampling residential wells, for a standard 'subdivision package' suite of parameters and a verbal interview regarding the details of the existing well supply and on-site sewage system.

Mr. John Riddell Page 5 PG3975-MEMO.01 Revision 2

We trust that this information satisfies your requirements.

Best Regards,

Paterson Group Inc.

Nicholas Zulinski, P.Geo.

Michael S. Killam, P.Eng.
