TIA Plan Reports

On 14 June 2017, the Council of the City of Ottawa adopted new Transportation Impact Assessment (TIA) Guidelines. In adopting the guidelines, Council established a requirement for those preparing and delivering transportation impact assessments and reports to sign a letter of certification.

Individuals submitting TIA reports will be responsible for all aspects of development-related transportation assessment and reporting, and undertaking such work, in accordance and compliance with the City of Ottawa's Official Plan, the Transportation Master Plan and the Transportation Impact Assessment (2017) Guidelines.

By submitting the attached TIA report (and any associated documents) and signing this document, the individual acknowledges that s/he meets the four criteria listed below.

CERTIFICATION

1. I have reviewed and have a sound understanding of the objectives, needs and requirements of the City of Ottawa's Official Plan, Transportation Master Plan and the Transportation Impact Assessment (2017) Guidelines;
2. I have a sound knowledge of industry standard practice with respect to the preparation of transportation impact assessment reports, including multi modal level of service review;
3. I have substantial experience (more than 5 years) in undertaking and delivering transportation impact studies (analysis, reporting and geometric design) with strong background knowledge in transportation planning, engineering or traffic operations; and
4. I am either a licensed¹ or registered² professional in good standing, whose field of expertise [check appropriate field(s)] is either transportation engineering or transportation planning .

1,2 License of registration body that oversees the profession is required to have a code of conduct and ethics guidelines that will ensure appropriate conduct and representation for transportation planning and/or transportation engineering works.

TIA STRATEGY REPORT

Parsons has been retained by Groupe Heafey to prepare a Transportation Impact Assessment (TIA) in support of a Zoning By-Law Amendment (ZBLA) and Site Plan Application (SPA) for a mixed-use development located at the 1740 and 1760 St. Laurent Boulevard. This document follows the current TIA process, as outlined by the City Transportation Impact Assessment (TIA) Guidelines (2017). The following report represents Step 4 – Strategy Report.

1. SCREENING FORM

The screening form confirmed the need for a TIA based on the trip generation trigger given that the development consists of approximately 672 apartment units and 2,900 m² (31,100 ft²) of ground floor commercial; location trigger given that the development is located within the St. Laurent Boulevard Arterial Mainstreet Design Priority Area (DPA) and safety trigger given that the proposed driveway is in the influence area of an adjacent intersection. The Screening Form and City correspondence has been provided in **Appendix A**.

2. SCOPING REPORT

2.1. Existing and Planned Conditions

2.1.1. Proposed Development

The proposed development is located at the municipal addresses of 1740 and 1760 St. Laurent Boulevard. The existing site is currently occupied by several commercial businesses including a hardware store, alternative gym, two restaurants and a gas station. The site is currently zoned as AM10 and AM10[1658]; the AM10 zoning (1760 St. Laurent Blvd) allows mid-rise buildings up to 9-stories or 30 meters high, while the AM10[1658] (1740 St. Laurent Blvd) allows buildings up to 50 meters in height. The site's context is displayed in **Figure 1**.

The proponent proposes four 12 to 15-storey apartment buildings containing 672 residential units and approximately 31,100 ft² of commercial retail on ground floor. A two-phased development is proposed, with the initial phase being completed by 2022 and full build out of the site assumed by 2024. Given that the site accesses will be built to full buildout by the first phase, and the access conditions will be the same for phase 2, for the purposes on the ensuing assessment, only the full buildout and full buildout plus 5 years will be analyzed.

The development proposes a full movement signalized vehicle access to St. Laurent Boulevard (located slightly south of the existing site intersection at St. Laurent) and a right-in right-out (RIRO) access located on the southernmost limit of the site. Currently, Site/St. Laurent functions as a right-in right-out intersection with a median curb which restricts full movement operations. Within this report, the potential to convert this access to a signalized full movement intersection will be explored and is assumed to be in place for all phases of development. The current Site Plan proposes a total of approximately 670 parking units, with approximately 70 above ground and the remainder of 600 underground. The latest Site Plan Concept is shown in **Figure 2**.

Figure 1: Local Context

Figure 2: Proposed Site Plan

Site Plan received March 26, 2021

2.1.2. Existing Conditions

Area Road Network

St. Laurent Boulevard is classified as an arterial roadway which extends from Sandridge Road in the north to Don Reid Drive in the south. Within the study area, St. Laurent Boulevard has a six-lane cross section with the outer lane being a bus only dedicated lane. The posted speed limit is 70 km/h within the study area.

Industrial Avenue & Innes Road is an arterial roadway which extends from Riverside Drive in the west as Industrial Avenue to St. Laurent Boulevard, where it continues as Innes Road to Dunning Road in the east. Within the study area, Industrial Avenue and Innes Road have four-lane cross sections. The posted speed limit is 60 km/h within the study area.

Smyth Road & Lancaster Road is an arterial roadway west of St. Laurent Boulevard and a collector roadway east of St. Laurent Boulevard. Smyth Road extends from Riverside Drive in the west to St. Laurent Boulevard, where it continues as Lancaster Road to Walkley Road in the east. Within the study area, Industrial Avenue and Innes Road have a four-lane cross section. The posted speed limit is 60 km/h within the study area.

Russell Rd is a northwest-southeast arterial roadway that has been cut into 4 parts over time due to ongoing major intersection modifications. Within the study area, Russell Road extends from St. Laurent Boulevard in the north to Hawthorne Road in the south, where it once again changes direction. Russell Road consists of a two-lane cross section and has a posted speed limit of 50km/h within the study area.

Belfast Road is classified as a collector roadway west of St. Laurent Boulevard and a local roadway east of St. Laurent Boulevard. Belfast Road extends from Coventry Road in the north-west to Michael Street in the east. Within the study area, Belfast Road has a two-lane cross section with a posted speed limit of 50km/h.

Bourassa Street is classified as a local roadway which extends a short distance from St. Laurent Boulevard in the west to Gladwin Crescent in the east. Within the study area, Bourassa Street has a two-lane cross section with an unposted speed limit assumed to be 50km/h.

Everest Private/Site Access is a local roadway with a two-lane cross section within the site. Approximately 110 meters from St. Laurent Boulevard, the roadway is barricaded to deter cut-through traffic between St. Laurent Boulevard and Russell Road. It is anticipated that the barricade will remain in place for the foreseeable future. Everest Private and the site access has an unposted speed limit assumed to be 50km/h.

Existing Study Area Intersections

Industrial/St. Laurent

The Industrial/St. Laurent intersection is a signalized four-legged intersection. All approaches consist of a double left-turn lane, a channelized right-turn lane and two through lanes. The northbound approach has an additional third through lane which is part of a dedicated bus only lane. A receiving lane north of Industrial Road tapers off and merges on to mixed traffic approximately 150 meters north of the intersection. A southbound bus only lane begins just south of the intersection on St. Laurent Boulevard. All movements are permitted at this location.

Site Access/St. Laurent

The Site Access/St. Laurent intersection is a three-legged intersection with a STOP control at the Site Access approach. The northbound consists of two through lanes and a transit lane. The southbound approach consists of two through lanes and a transit/right-turn lane. The eastbound approach has a right turn lane only. This intersection functions as a right-in right-out only due to the presence of a median along St. Laurent Boulevard.

Bourassa/St. Laurent

The Bourassa/St. Laurent intersection is a four-legged signalized intersection. The northbound approach consists of a left-turn lane, a channelized right-turn lane and two through lanes. North of Bourassa intersection, a third northbound lane begins and functions as a bus only lane. The southbound approach consists of a left-turn lane, a right-turn lane/transit lane. The eastbound and westbound approaches have a single all-movement lane. All movements are permitted at this intersection.

Smyth/St. Laurent

The Smyth/St. Laurent intersection is a four-legged signalized intersection. The northbound approach consists of a left-turn lane, a channelized right-turn lane and two through lanes. The southbound approach consists of a left-turn lane, a channelized right-turn lane and two through lanes. The eastbound approach consists of a double left-turn lane, a channelized right-turn lane and a single through lane. The westbound approach consists of a left-turn lane, a channelized right-turn lane and two through lanes. All movements are permitted at this intersection.

Belfast/St. Laurent

The Belfast/St. Laurent intersection is a four-legged signalized intersection. The northbound approach consists of a left-turn lane, a channelized right-turn lane and two through lanes. The southbound approach consists of a left-turn lane, a channelized right-turn lane and two through lanes. The eastbound approach consists of a left-turn lane, a channelized right-turn lane and a single through lane. The westbound approach consists of a left-turn lane and a channelized right-turn lane shared with a through lane. All movements are permitted at this intersection.

Russell/St. Laurent

The Russell/St. Laurent intersection is a three-legged signalized intersection. The northbound approach consists of a left-turn lane and two through lanes. The southbound approach consists of a channelized right-turn lane and two through lanes. The eastbound approach consists of a double left-turn lane and a channelized right-turn lane. All movements are permitted at this intersection.

Existing Driveways to Adjacent Developments

The existing driveways within 200m from each corner of the proposed site are shown in **Figure 3**, including:

- St. Laurent Boulevard West Side:
 - 1730 – There is a driveway to a surface parking lot for a commercial/office building that’s approximately 8-storeys high, located approximately 20 meters north of the site boundary
 - 1740 – Accesses to Petro-Canada gas station, within site property
 - Everest Private – functions as a driveway to local businesses. Road connection to Russell Road is physically separated by a barricade (site property).
 - 1754 – Access to a restaurant, (site property).
 - 1760 – Two accesses on north and south ends of property parcel. Provides access to parking lot for a retail store, a recreational business and a restaurant, (site property).
 - 1800 – Access to a small industrial building including warehousing, auto service and a recreational business, located approximately 15 meters south of the property boundaries
 - 1810 – Access to telecommunications maintenance buildings and an office, located approximately 175 meters south of the property boundaries
- St. Laurent Boulevard East Side:
 - 1705 & 1755 – Major driveway functioning as right-in/right-out to St. Laurent Boulevard with access to multiple retail, commercial and light industrial uses. This driveway is located on the opposite side of St. Laurent Boulevard, adjacent to the proposed site

Figure 3: Existing Driveways Adjacent to Development

Existing Area Traffic Management Measures

Below are the existing area traffic management measures within the study area:

- Channelized right turn lanes with refuge island at some intersections;
- Fully protected left turns at some intersections;
- Transit lanes along segments of St. Laurent Boulevard; and,
- Painted bike cross-rides at some intersections (further details in following section).

Pedestrian/Cycling Network

Pedestrian sidewalk facilities are provided on both sides of St. Laurent Boulevard, Industrial Avenue, Smyth Road, Lancaster Road, and Belfast Road. A multi-use pathway (MUP) is provided on the south side of Innes Road and Russell Road, while no pedestrian facilities are provided on the north side. The site access has sidewalk facilities on the south side of roadway only, while Bourassa Street has a sidewalk from St. Laurent Boulevard to the McDonalds on the north side of the roadway only. The westward continuation of the site access (Everest Private) past the concrete cinderblock barricade currently does not provide pedestrian facilities until the developments located at 257 Everest Private, where local pathways connect to Russell Road.

With regards to cycling, St. Laurent Boulevard has a 'cycle track' which consists of a bicycle only lane that is physically separated from the roadway by being elevated to curb height (similar to a sidewalk). The cycle track on St. Laurent Boulevard begins south of Industrial/St. Laurent intersection on both sides of the roadway and merges back to non-physically separated curbside on St. Laurent Boulevard at Smyth/St. Laurent for the west side of roadway and at Bourassa/St. Laurent for the east side of roadway. Cross-rides are present at the Bourassa/St. Laurent intersection for north and south bike travel lanes.

A paved MUP follows Innes Road on the south side of the roadway and continues for approximately 200 meters west of Industrial/St. Laurent intersection. The south leg of Industrial/St. Laurent intersection has a dedicated cross-rides connecting both sides of the MUP. The north side of Industrial Avenue provides a paved MUP, while the north side of Innes Road has no cycling facilities.

Smyth Road, Lancaster Road and St. Laurent Boulevard south of Smyth/St. Laurent provide curbside bike lanes with pocket lanes at some intersection approaches. Belfast Road and Russell Road provide paved shoulders.

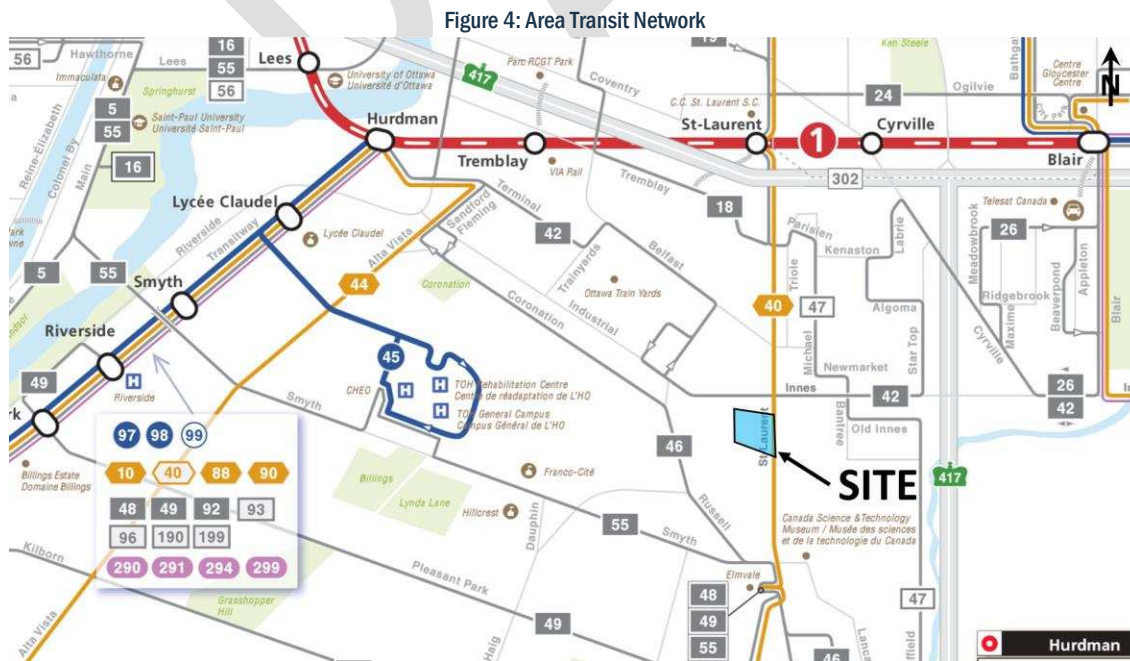

There are no bike facilities on the site access and its continuation Everest Private or Bourassa Street.

St. Laurent Boulevard, Smyth Road, Industrial Avenue, Innes Road and Russell Road are all classified as ‘spine routes’ within the TMP. **Section 2.1.3.** discusses the future Ultimate Cycling Network.

Transit Network

The transit network for the study area is illustrated in **Figure 4.** The following OC Transpo routes currently operate within 600-meter radius of the site frontage:

- **Route #40 (St. Laurent <-> Greenboro/Hurdman):** identified by OC Transpo as a “Frequent Route”, this route operates at a frequency of every 15 minutes or less on weekdays and operates 7 days a week. Route #40 provides quick connection to the Confederation LRT Line at St. Laurent Station and provides connection to Elmvale Shopping Center. Bus stops for this route are available on both sides of St. Laurent Boulevard, approximately 100 to 230 meters from the site.
- **Route #42 (Blair <-> Hurdman):** identified by OC Transpo as a “Local Route”, this route operates on customized routing and schedules, to serve local destinations with connection to the Confederation LRT Line at Blair Station and Hurdman Station and provides connection to Trainyards Shopping. Route #42 operates at an average rate of every 15 minutes during weekdays. Bus stops for this route are available on both sides of Industrial Avenue and Innes Road, approximately 180 to 215 meters from the site.
- **Route #46 (Hurdman <-> Billings Bridge):** identified by OC Transpo as a “Local Route”, this route operates on customized routing and schedules, to serve local destinations with connection to the Confederation LRT Line at Hurdman and provides connection to the BRT Transitway at Billings Bridge. Route #46 operates at an average rate of every 30 minutes during weekdays. Bus stops for this route are available on both sides of Russell Road, approximately 450 meters from the site.

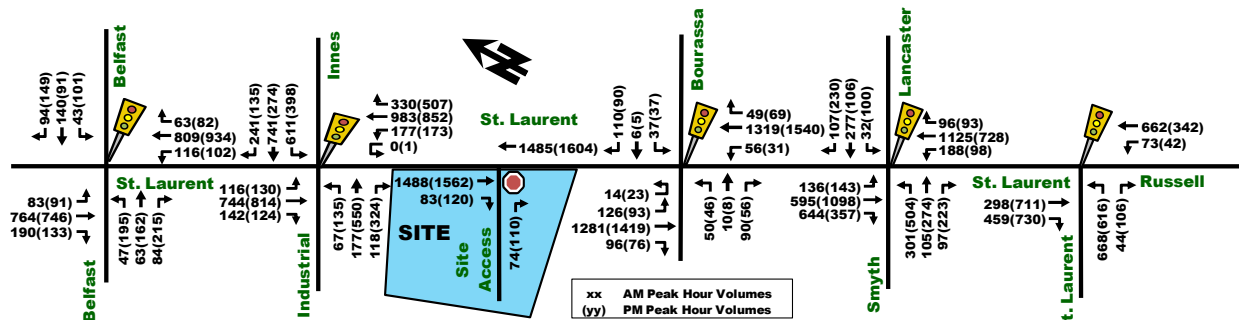

Source: <https://www.octranspo.com/images/files/maps/systemmap.pdf>

Peak Hour Travel Demands

The existing peak hour traffic volumes within the study area are illustrated in **Figure 5** and pedestrian/cyclist volumes are illustrated in **Figure 6**, were obtained from the City of Ottawa. The peak hour traffic volume count data has been provided in **Appendix B**.

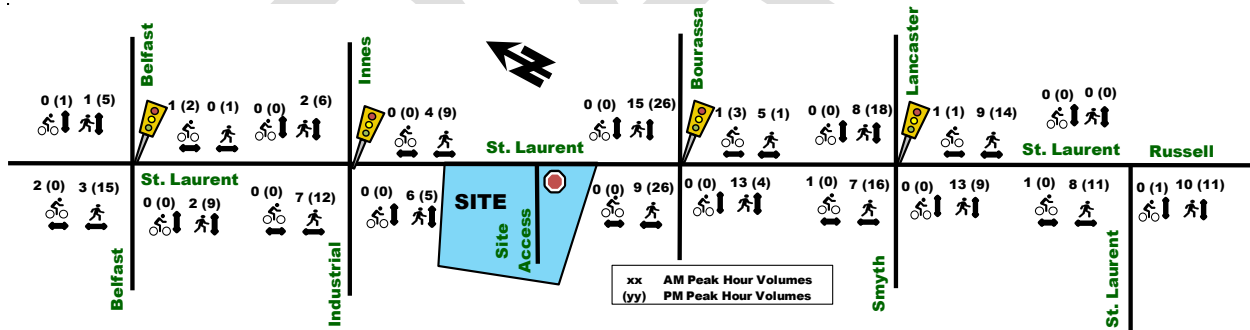

It is important to note that the data at the Industrial/St. Laurent and Bourassa/St. Laurent intersections reflect conditions after 2017 when the center median on St. Laurent Boulevard was built, eliminating full movement access to the site. Upon inspection of the counts, there is a notable number of U-turns on the southbound approach at Bourassa/St. Laurent, predominantly in the mid-day time period (~40 veh/h). Industrial/St. Laurent has very few U-turns by northbound vehicles. This is likely due to the size and complexity of the Industrial/St. Laurent intersection, and drivers choose to perform a different movement or simply forego their trip to the existing site location when approaching from the south on St. Laurent Boulevard.

Figure 5: Existing Peak Hour Traffic Volumes

Site Access/St. Laurent volumes derived from existing site uses, refer to Section 3.1

Figure 6: Existing Pedestrian/Cyclist Peak Hour Volumes

Existing Road Safety Conditions

A five-year collision history data (2014-2018, inclusive) was requested and obtained from the City of Ottawa for all intersections and road segments within the study area¹. Upon analyzing the requested collision data, the total number of collisions observed within the broader study area was 539 collisions within the past five-years. The majority of the collisions 425 (79%) resulted in property damage only, and 114 (21%) resulted in non-fatal injury. The types of impact were broken down into the following: 267 (50%) rear end, 91 (17%) sideswipes, 90 (17%) turning movement, 58 (11%) angled, 25 (5%) single vehicle other, and 8 (1%) other.

To help quantify the relative safety risk at intersections within the study area, an industry standard unit of measure for assessing collisions at an intersection was used based on the number of collisions per million entering vehicles (MEV). An MEV value greater than 1.00 indicates a relatively high frequency of collisions; however, it does not explain the type or severity of collision. A secondary analysis is done to determine the

¹ Note that more recent 2019 data added to discussion at the end of this section.

severity of collision by representing the number of personal injuries as a percentage of the total number of collisions at a given intersection.

A high propensity (MEV > 1.00 or %PIR > 30%) would signal a potential intersection design deficiency or other contributing factor, such as poor intersection geometry, blind spots, poor lighting, excessive speeds, high amount of entry/exit driveways etc.

At intersections within the study area, reported collisions have historically taken place at a rate of:

- 1.32 Collisions/MEV with total of 141 collisions, 15% causing non-fatal injury at the intersection of Industrial/St. Laurent with 86 or 61% involving rear end, likely to do with the transition from a long uninterrupted road segment such as the north and east approaches of the intersection, horizontal road curvature on the west approach and high vehicle volumes. However, it should be noted that between 2017 and 2018, St. Laurent was improved to include smart channels, a double left-turn lane, dedicated transit lanes and removal of several median breaks. These improvements are not currently reflected in the traffic operations as it has not been enough time to evaluate the impacts it had on the number of collisions at this intersection.
- No collisions were recorded at the intersection of Site Access/St. Laurent
- 0.56 Collisions/MEV with 26% causing injury at the intersection of Bourassa/St. Laurent (total of 43 collisions with 11 of them involving injury. The majority of collisions, 21 or (49%), involved rear end. There were 3 collisions involving pedestrians at this intersection, all producing reportable injuries. Of the pedestrian injuries, 2 of 3 occurred during turning movements for vehicles heading westbound.
- 0.94 Collisions/MEV with 17% causing injury at the intersection of Smyth/St. Laurent (total of 81 collisions with 14 of them involving injury. The majority of collisions, 53 or (65%), involved rear end. This intersection has a mid to high propensity to collisions; however, they tend not to result in injury.
- 1.68 Collisions/MEV with 22% causing injury at the intersection of Belfast/St. Laurent (total of 111 collisions with 24 of them involving injury. 41 or (37%) involved rear end and 35 or (32%) involved turning movements. This intersection has a high propensity to collisions and a mid-range of them causing non-fatal injury. The majority of collisions causing non-fatal injury, involve rear ends and turning movements, indicating low collision speeds.
- 1.13 Collisions/MEV with 38% causing injury at the intersection of Russel/St. Laurent (total of 55 collisions with 21 of them involving non-fatal injury. 18 or (33%) involved turning movement, 15 or (27%) angle and 15 or (27%) involved rear end. This intersection has a high propensity to collisions and a high-range causing non-fatal injury. The majority of recorded non-fatal injury collisions involve angle and turning movement. It was also recorded that 2 collisions involved pedestrians.

Other collisions within the study area include:

- There was a total of 106 collisions between intersections (mid-block segments)
- The mid-block segment between Industrial Avenue and Bourassa Street on St. Laurent Boulevard, adjacent to the site, had more collisions than the mid-block segment between Bourassa Street and Smyth Road, with 39 (64%) versus 22 (36%) respectively. However, only 4 collisions, or 7% yielded injuries between Industrial and Bourassa, while 8 or 36% of the Bourassa and Smyth segment yielded injuries. All of the collisions resulting in non-fatal injury between Bourassa and Smyth resulted from rear end collisions, and 6 of 8 (75%) were headed southbound. 33 or (31%) of mid-block collisions occurred between Belfast Road and Industrial Road on St. Laurent Boulevard, with 21 (64%) of them involving rear ends. 12 (11%) of mid-block collisions occurred between Smyth Road and Russell Road.
- 3 collisions involved cyclists: one within mid-block segment between Industrial Avenue and Bourassa Street, one at the intersection of Industrial/St. Laurent, and one at the Russell/St. Laurent intersection.

- There was a total of 9 non-fatal injury collisions involving pedestrians, 3 at the Bourassa/St. Laurent intersection, 1 at Belfast/St. Laurent intersection, 3 at Russell/St. Laurent intersection, 1 mid-block between Belfast Road and Industrial Road on St. Laurent Boulevard, and 1 between Smyth Road and Russell Road on St. Laurent Boulevard.

Supplemental data for year 2019 was obtained from Open Ottawa data platform to determine if any new trends are emerging on study area intersections. The total number of collisions data is available; however, the type and severity are unknown. Within the study area:

- Belfast/St. Laurent recorded 15 collisions in 2019, which is notably lower than the 5-year average of 22 collisions per year.
- Industrial/St. Laurent recorded 30 collisions in 2019, which is slightly higher to the 5-year average of 28 collisions per year.
- Bourassa/St. Laurent recorded 6 collisions in 2019, which is slightly lower to the 5-year average of 9 collisions per year. One of the 6 collisions in 2019 involved a cyclist at this location.
- Smyth/St. Laurent recorded 26 collisions in 2019, which is notably higher than the 5-year average of 16 collisions per year. It is possible that higher traffic using this intersection after the re-opening of the science museum nearby could be a source of the higher collision rate at this intersection.
- Russell/St. Laurent recorded 12 collisions in 2019, which is similar to the 5-year average of 11 collisions per year.
- St. Laurent between Industrial and Bourassa recorded 9 collisions in 2019, which is similar to the 5-year year average of 8 collisions per year. One of the 9 collisions in 2019 involved a cyclist at this location.

The source collision data as provided by the City of Ottawa and related analysis is provided as **Appendix C**.

2.1.3. Planned Conditions

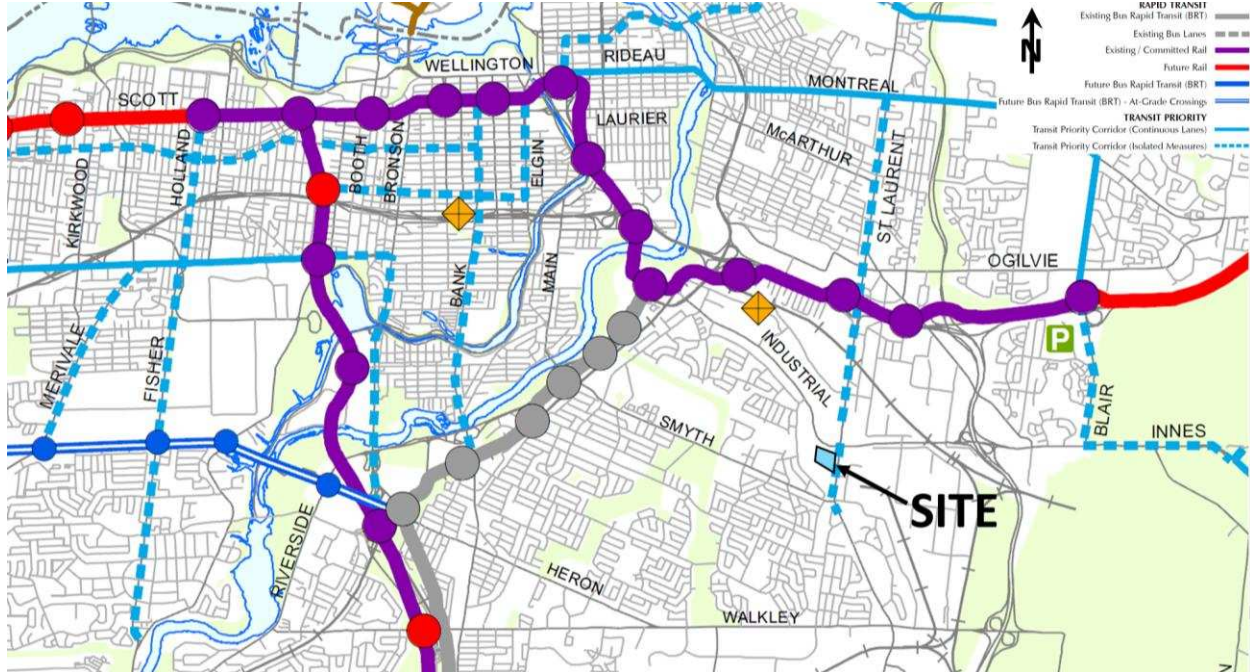

Planned Study Area Transportation Network Changes

Transit Network

The 2031 Rapid Transit and Transit Priority Network – 2031 Affordable Network within the Transportation Master Plan 2013 suggests St. Laurent Boulevard as a ‘transit priority corridor with isolated measures. This corridor extends from Montreal Road (planned continuous lane transit priority corridor) in the north to the Elmvale Shopping Center in the south.

Currently, transit lanes have been implemented between Industrial/St. Laurent to Smyth/St. Laurent heading southbound and transit lanes between Bourassa/St. Laurent and Industrial/St. Laurent heading northbound. It is anticipated that transit priority measures will be added elsewhere within the St. Laurent Boulevard Corridor over time. The transit priority corridor is anticipated to improve transit travel times between the site and the Confederation Line, as displayed in **Figure 7**.

Figure 7: 2031 Affordable Network

Source: Transportation Master Plan 2013 - 2031 Affordable Network

Cycling Network

Within the City of Ottawa Ultimate Cycling Plan, St. Laurent Boulevard, Smyth Road, Industrial Avenue and Innes Road are all classified 'spine routes' within the TMP. A future major pathway is proposed along Innes Road, connecting to the Alexandria Rail Corridor (to be converted to a MUP) and along the hydro network corridor to the west. Russell Road is classified as a local route and Lancaster Road is a local route that includes discontinuous bike lanes. **Figure 8** depicts the existing and future Ultimate Cycling Network.

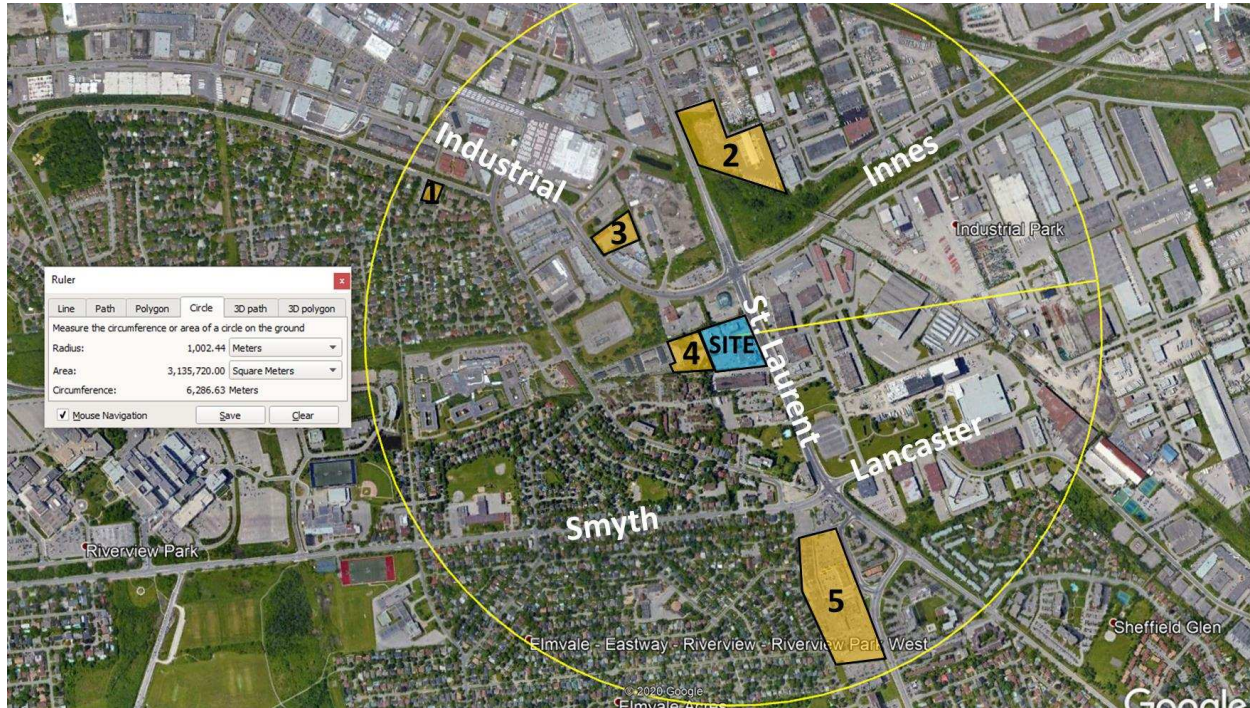

Figure 8: Existing and Future 'Ultimate Cycling Network'

Other Area Developments

The following section outlines adjacent developments in the general area that were considered in the TIA. The criteria for inclusion of other area developments are either approved developments or developments that have an active planning application in the City. **Figure 9** illustrates the location and relative size of relevant other area developments.

Figure 9: Other Area Developments

1 – 700 Coronation Avenue

The proposed development is a 4-storey residential building comprised of 35 units. No TIA report was found for this development.

2 – 1599 St. Laurent Boulevard

Reimer Properties is proposing the construction of a new truck transport terminal including a one-storey warehouse with 44 loading bays, 36 surface loading spaces and 28 employee surface parking spaces. The projected two-way vehicle trips according to a report written by IBI for this proposed development are approximately 175 total daily trips, with only about 15 veh/h during the AM and PM peak hours. Given the operating hours for the bulk of site generated trips and the limited trips during peak hours, it is not anticipated that this development will play a role in worsening traffic conditions.

3 – 851 Industrial Avenue

Dymon Storage has recently completed construction of a five-storey building consisting mainly of storage spaces and a small retail space. The development site is anticipated to generate a minimal number of person trips (less than 60 person trips during weekday peak hours). As such, this development is considered to have negligible effect on the road network within the study area.

4 – 355 / 374 Everest Private

Groupe Heafey is proposing to expand the existing residential developments by adding two 6 to 8 storey buildings consisting of approximately 293 residential units. The projected increase in two-way vehicle trips according to a report written by Parsons for this proposed residential development is approximately 85 to 90 veh/h during the AM and PM peak hours. Future volumes from this development will be layered on to background volumes.

5 - 1910 St. Laurent Boulevard

RioCan is proposing the multi-phased construction of four apartment building towers ranging from 9 to 26-storeys high and totaling 815 units by full buildout. The TIA written by Parsons projects an ultimate build out two-way vehicle trips of approximately 120 to 245 veh/h during the AM and PM peak hours. Future volumes from this development will be layered on to background volumes.

2.2. Study Area and Time Periods

Full buildout of the proposed mixed-use development is assumed to be 2024. Given that a full movement signalized intersection is assumed for both phases and conditions are anticipated to be similar, the horizon years being analyzed in this report are the more critical 2024 full buildout and 2029 (five years after full buildout) horizon years, using the weekday morning and afternoon peak hour time periods.

Proposed study area intersections and boundary roads are outlined below and highlighted in **Figure 10**.

- Industrial/St. Laurent intersection;
- Site Access/St. Laurent intersection;
- Bourassa/St. Laurent intersection;
- Russell/St. Laurent intersection;
- Smyth/St. Laurent intersection;
- Belfast/St. Laurent intersection; and,
- Along St. Laurent Boulevard adjacent to the site.

Figure 10: Study Area Boundaries and Intersections

2.3. Exemption Review

The following modules/elements of the TIA process recommended to be exempt in the subsequent steps of the TIA process, based on the City's TIA guidelines and the subject site:

Table 1: Exemptions Review Summary

Module	Element	Exemption Consideration
4.1 Development Design	4.1.3 New Streets Networks	Only required for plans of subdivision
4.2 Parking	4.2.2 Spillover Parking	Development anticipated to provide sufficient parking. This will be verified in Section 4.2.
4.6 Neighborhood Traffic Management	4.6.1 Adjacent Neighborhoods	Only required when development relies on local or collector streets for access. Driveway will have direct access to St. Laurent Boulevard (arterial)

3. FORECASTING REPORT

3.1. Development-Generated Travel Demand

3.1.1. Trip Generation and Mode Shares

The existing site has four driveways all which currently operate as RIRO. Prior to 2017, the main access between the St. Hubert and Petro Canada had a full movement, unsignalized access (for which traffic data was gathered as part of the previous study). However, since this segment of St. Laurent Boulevard has significantly changed since that time, and the available traffic data does not include turning movements from the other three RIRO driveways, then new counts at all locations. Given the on-going COVID-19 pandemic, additional data collection yielding realistic values is not feasible. For this report, existing site land uses within the ITE Trip Generation Manual were used to estimate vehicle activity to/from the existing site, with all activity consolidated into 1a single driveway for simplicity. These vehicles will later be reduced from the network prior to adding the new site generated trips. The trip rates for existing land uses are summarized in **Table 2**.

Table 2: Existing Land Uses

Land Use	Size	Data Source	Trip Rates	
			AM Peak	PM Peak
Shopping Center ₁	15,500 ft ²	ITE 820	T = 0.97(x)	T = 3.81(x)
High Turnover (Sit Down) Restaurant ₂	6,000 ft ²	ITE 932	T = 9.94(x)	T = 9.77(x)
Gasoline/Service Station	8 pumps	ITE 944	T = 10.25(p)	T = 14.00(p)

Note: T = Average Vehicle Trip Ends, x = sq. ft commercial, p = number of pumps
 1). Trip rates for Shopping Center are based on an average rate and not the fitted curve due to site size vs average study size
 2). Saint Hubert Restaurant which includes drive-thru

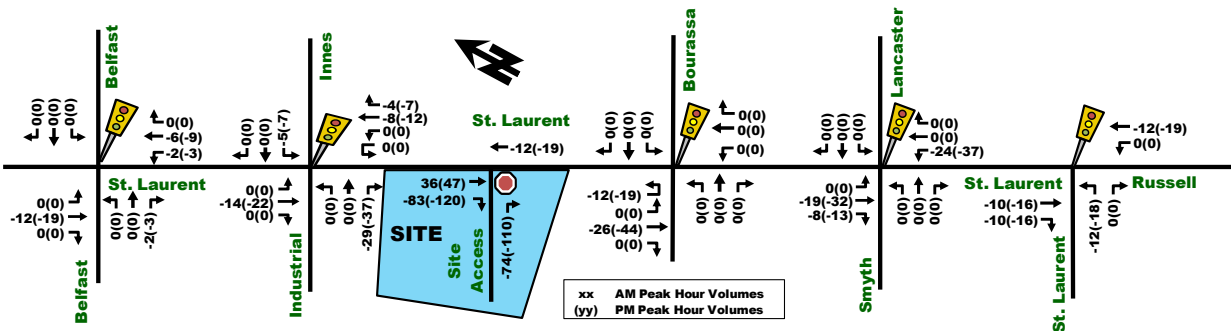

Based on the vehicle trip generation rates shown above, the existing trips to and from site can be calculated as shown in **Table 3**.

Table 3: Estimated Existing Trip Generation

Land Use	'New' Trips	AM Peak (veh/h)			PM Peak (veh/h)		
		In	Out	Total	In	Out	Total
Shopping Center	Auto Trips Generated	9	6	15	28	31	59
	Less Pass-By (-35% PM)	0	0	0	-10	-10	-20
High Turnover (Sit Down) Restaurant	Auto Trips Generated	33	27	60	36	23	59
	Less Pass-By (-40% AM -43% PM)	-12	-12	-24	-13	-13	-26
Gasoline/Service Station	Auto Trips Generated	41	41	82	56	56	112
	Less Pass-By (-58% AM -42% PM)	-24	-24	-48	-24	-24	-48
Total Auto Trips to be Removed		47	38	85	73	63	136

The estimated existing trips were then assigned to the consolidated site driveway as seen in **Figure 11** to estimate the existing performance of the Site Access/St. Laurent, and subsequently removed from the network as they will be replaced by new trips generated as discussed below.

Figure 11: Estimated Existing Site Traffic to be Removed

As mentioned in **Section 2**, a consolidated full buildout phase only will be analyzed. Future trip generation rates for the proposed residential segment of the development consisting of approximately 672 high-rise apartment units were obtained from the City’s 2009 TRANS Trip Generation – Residential Trip Rates Report², whereas the ITE Trip Generation Manual was used as the basis for the commercial component. These rates are summarized in **Table 4**. For the purpose of this study, since the commercial segment is unknown at this time, it was assumed to be a small shopping center similar to the uses across the street on St. Laurent Boulevard (1705 – 1755 St. Laurent Boulevard). Given that the average size of a shopping center for ITE is 351,000 ft² and this development is only 31,127 ft² of commercial, the average rate for shopping centers similar in size to the proposed one was used rather than the fitted curve which accounts for all sized shopping centers and is not very reflective of smaller ones.

Table 4: Future Trip Generation Rates

Land Use	Size	Data Source	Trip Rates	
			AM Peak	PM Peak
High Rise Apartments	672 Units	TRANS 222	T = 0.24(du)	T = 0.27(du)
Shopping Center ₁	25,127 ft ²	ITE 820	T = 0.96(x)	T = 3.82(x)
High Turnover (Sit Down) Restaurant ₂	6,000 ft ²	ITE 932	T = 9.94(x)	T = 9.77(x)

Note: T = Average Vehicle Trip Ends; du = dwelling units, x = sq. ft commercial
 1). Trip rates for Shopping Center are based on an average rate and not the fitted curve
 2). Assumes that the Saint Hubert restaurant with drive-thru is to be relocated within tower 1

Using the TRANS Trip Generation rates, the total amount of vehicle trips generated by the proposed 672 residential units was calculated. The results are summarized in **Table 5**.

Table 5: Projected Residential Vehicle Trip Generation – TRANS Model

Land Use	Area	AM Peak (Veh/h)			PM Peak (Veh/h)		
		In	Out	Total	In	Out	Total
High-Rise Apartments	672 units	38	123	161	139	42	181

As shown in **Table 5**, a total of 160 and 180 veh/h are projected to travel to/from the proposed development for the residential aspect of the development during the weekday morning and afternoon commuter peak hours. Using the TRANS Auto Trips projected in **Table 5** and the mode share percentages in the TRANS Trip Generation Report (Table 3.13), the total projected number of person trips by mode for the residential segment of the development are summarized in **Table 6**. The ‘person trip generation’ for the development was then converted to ‘vehicle trip generation’ using mode shares extrapolated from the OD-Survey 2011 for the Alta Vista District and are summarized in **Table 7**.

Table 6: Projected Residential Generation – Person Trip Derivation

Travel Mode	Mode Share	AM Peak (trips per mode/h)			Mode Share	PM Peak (trips per mode/h)		
		In	Out	Total		In	Out	Total
Auto Driver	37%	38	123	161	40%	139	42	181
Auto Passenger	8%	8	26	34	9%	31	9	40
Transit	41%	42	137	179	37%	129	39	168
Non-motorized	14%	14	47	61	14%	49	15	64
Total Person Trips	100%	102	333	435	100%	348	105	453

Table 7: Projected Residential Generation – Vehicle Trip Derivation

Travel Mode	AM Mode Share	AM Peak (trips per mode/h)			PM Mode Share	PM Peak (trips per mode/h)		
		In	Out	Total		In	Out	Total
Auto Driver	55%	57	183	240	60%	208	63	271
Auto Passenger	15%	16	49	65	15%	52	16	68
Transit	20%	20	67	87	15%	52	16	68
Non-motorized	10%	10	33	43	10%	35	11	46
Total People Trips	100%	103	332	435	100%	347	106	453
Total 'New' Auto Trips		57	183	240	-	208	63	271

² It is acknowledged that an updated version of the TRANS Trip Generation Manual is now available (dated October 21, 2020).

The commercial segment of the development was calculated using the ITE Trip Generation Manual based on the development size and equations provided in **Table 4**. The mode shares for the commercial aspect are relatively similar to the existing mode shares for the Alta Vista District based on the OD-Survey conducted in 2011 with a slight increase in non-motorized trips and reduction in transit trips to account for surrounding neighborhood trips. The future projected trips generated for the commercial segment are provided in **Table 8**.

Table 8: Projected Commercial Trip Generation

Travel Mode	AM Mode Share ₁	AM Peak (trips per mode/h)			PM Mode Share ₁	PM Peak (trips per mode/h)		
		In	Out	Total		In	Out	Total
Auto Driver Total	55-70%	48	36	84	55-70%	82	73	155
Auto Driver Shopping	55%	15	9	24	55%	46	50	96
Auto Driver Restaurant	70%	33	27	60	70%	36	23	59
Auto Passenger	15%	11	9	20	15%	20	19	39
Transit	5-15%	6	4	10	5-15%	14	14	28
Non-motorized	10-15%	7	5	12	10-15%	17	16	33
Total People Trips	100%	72	54	126	100%	133	122	255
Less Pass-by Shopping	0%	0	0	0	-35%	-17	-17	-34
Less Pass-by Restaurant	-40%	-12	-12	-24	-43%	-13	-13	-26
Total 'New' Auto Trips		36	24	60	-	52	43	95
<i>1.) Mode shares are approximate as slightly different values were used for the different land uses. Refer to Appendix D for more detail.</i>								

Based on the summation of **Table 7** and **Table 8**, an approximate 300 and 365 'new' two-way vehicle trips are projected for the proposed site assuming the existing mode shares for the Alta Vista District. Given the site context, refinements to the modal share assumptions are recommended and will be analyzed below.

Refined Modal Share Assumptions

Given the location of the site, near frequent bus route #40 and rapid transit corridor with isolated measures, close proximity via bus to major LRT Station at St. Laurent and close to southbound connecting Elmvale Station, a higher transit modal share is considered appropriate. Full TOD targets were not assumed as the site is not located within 600 meters walking distance to a major LRT Station, but some increase in transit and decrease in the auto mode can be anticipated due to the better than average transit availability near site compared to the greater Alta Vista District. **Table 9** illustrates future customized modal shares which reflect the site's likelier modal share based on its location within Alta Vista. Note that the custom modal shares are for residential only. It is assumed that commercial trips will remain as proposed in **Table 8**.

Table 9: Modified Modal Share Targets for Proposed Development – Residential Aspect

Travel Mode	Mode Share Target	Rationale
Transit	30%	Increase in transit from 20% for Alta Vista to 30% given the close proximity to the St. Laurent Transit Priority Corridor with isolated measures and close connectivity to St. Laurent LRT Station
Walking	5%	This is consistent with existing walking mode shares.
Biking	5%	This is consistent with existing cycling mode shares.
Auto Passenger	15%	This is consistent with existing auto passenger mode shares.
Auto Driver	45%	Decrease in auto driver from 55% to 45% to account for likelier transit users due to the location of the site relative to transit facilities.

Based on the future mode share targets for this development, the project site-generated person trips for the residential segment are outlined in **Table 10**.

Table 10: Modified Projected Residential Trip Generation

Travel Mode	Mode Share	AM Peak (trips per mode/h)			PM Peak (trips per mode/h)		
		In	Out	Total	In	Out	Total
Auto Driver	45%	47	149	196	156	47	203
Auto Passenger	15%	16	49	65	52	16	68
Transit	30%	31	99	130	104	32	136
Walk	5%	5	17	22	18	6	23
Bike	5%	5	17	22	17	5	23
Total Person Trips	100%	104	331	435	347	106	453
Total 'New' Auto Trips		47	149	196	156	47	203

The future projected residential site generated trips from **Table 10** were summed with commercial site generated trips from **Table 8** to produce the total site generated trips as seen in **Table 11**.

Table 11: Total Site Generated Trips – Commercial and Residential Combined

Travel Mode	AM Peak (trips per mode/h)			PM Peak (trips per mode/h)		
	In	Out	Total	In	Out	Total
Auto Driver	95	185	280	238	120	358
Auto Passenger	27	58	85	72	35	107
Transit	37	103	140	118	46	164
Walk	9	20	29	26	13	39
Bike	8	19	27	26	14	40
Total People Trips	176	385	561	480	228	708
<i>Less Pass-by Combined</i>	-12	-12	-24	-30	-30	-60
<i>Less Internalization Reduction (-5%)</i>	-9	-19	-28	-24	-11	-35
Total 'New' Auto Trips	74	154	228	184	79	263

As seen in **Table 11**, the combined commercial and residential site generated trips at full buildout are projected to be approximately 230 and 260 'new' two-way vehicle trips in the AM and PM peaks respectively. New two-way transit trips are projected at 140 and 165 trips, walk trips projected at 30 and 40, and cycling trips projected at 25 and 40 people trips during the AM and PM peak hours respectively.

3.1.2. Trip Distribution

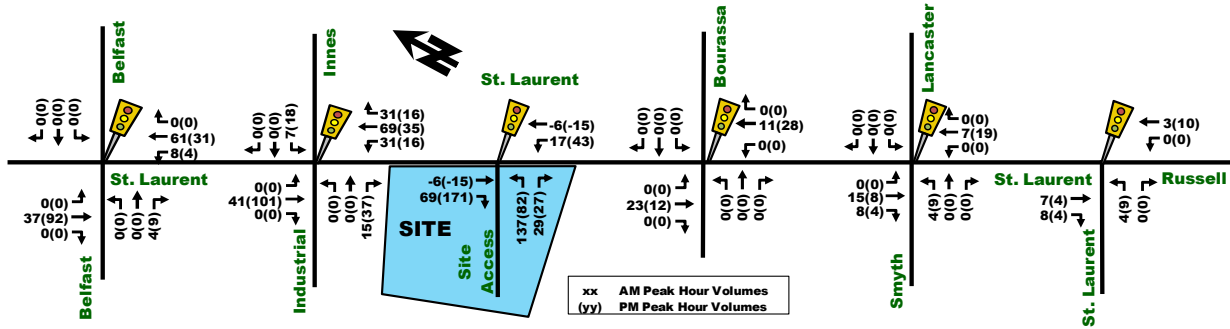

Based on the OD Mode Share Survey, existing traffic volume counts and the location of adjacent arterial roadways and neighborhoods, the distribution of site-generated traffic volumes is as follows:

- 15% to/from the east;
- 15% to/from the south;
- 25% to/from the west; and
- 45% to/from the north.

3.1.3. Trip Assignment

A full movement driveway with a new traffic signal control connection to St. Laurent Boulevard is proposed to serve the subject development. This driveway is proposed slightly south of the existing RIRO that serves Petro-Canada and St. Hubert Restaurant, approximately 150 meters south of St. Laurent Boulevard. The 'new' site-generated vehicle trips, including pass-by trips outlined in **Table 10**, were assigned to the study area network and are illustrated as **Figure 12**. The RIRO on the southern quadrant of the site is assumed as a garbage pick-up only or very low use. Note that negative numbers reflect pass-by trips.

Figure 12: 'New' Site-Generated Traffic

3.2. Background Network Travel Demands

3.2.1. Transportation Network Plans

As mentioned in **Section 2.1.3** Planned Conditions, St. Laurent Boulevard is designated as a ‘transit priority corridor with isolated measures’ from Montreal Road to Elmvale Shopping Center within the 2031 Affordable Network. Though no design is currently available, there is the potential that segments of St. Laurent Boulevard that have not received transit retrofits yet could be upgraded to provide better transit service within the corridor (segments adjacent to the site were retrofitted around 2017). Cycling improvements are also anticipated as discussed in **Section 2.1.3**.

3.2.2. Background Growth

The emphasis in the City’s recent Official Plan and Transportation Master Plan is to place priority on transit, encourage intensification around transit stations, encourage mixed-use developments and provide “complete streets” that better accommodate the active transportation needs of its residents and reduce the use of the private auto. Given the location of the site near frequent bus service within the St. Laurent transit priority corridor, close bus connectivity to the LRT Confederation Line and Elmvale Mall, the trips generated from this development as well as nearby developments will likely choose alternate modes of transportation over driving as transit infrastructure improves.

The following background traffic growth (summarized in **Table 12**) was calculated based on historical traffic count data (years 2001, 2009, 2014, 2016 and 2020) provided by the City of Ottawa at the Smyth/St. Laurent intersection near the site. Note that the year 2012 was omitted as counts were almost double any other year count and it was considered an anomaly year or miscount. Detailed background traffic growth analysis is included as **Appendix E**.

Table 12: Smyth/St. Laurent Historical Background Growth (2001-2020)

Time Period	Percent Annual Change				
	North Leg	South Leg	East Leg	West Leg	Overall
8 hrs	-0.17%	-0.13%	1.66%	0.47%	0.17%
AM Peak	-0.24%	0.00%	1.77%	0.52%	0.23%
PM Peak	-0.48%	-0.42%	1.53%	0.33%	-0.06%

As shown in **Table 12**, the Smyth/St. Laurent intersection, has experienced between 0.25% to 0% overall annual growth in traffic within recent years. A conservative growth rate of 1% annually will be added to background growth to account for future potential growth to the south and surrounding areas.

3.2.3. Other Developments

The volumes from the other area development as mentioned in **Section 2.1.3** were layered onto the existing traffic volumes for the future analysis volumes. **Figure 13** and **Figure 14** outlines the site generated volumes for 1910 St. Laurent development and 355-374 Everest development respectively.

Figure 13: 1910 St. Laurent Blvd Background Volumes

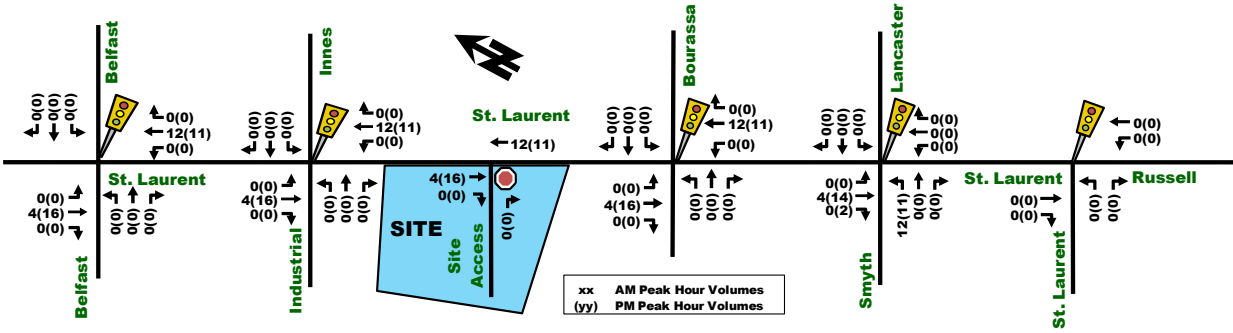

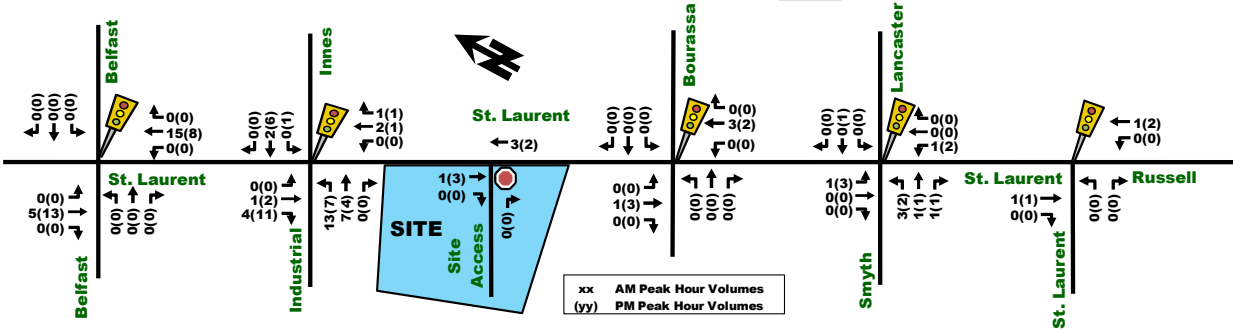

Figure 14: 355-374 Everest Background Volumes

3.3. Demand Rationalization

Figure 15 and Figure 16 display the total projected volumes for the horizon years 2024 and 2029, respectively. The volumes shown, include the projected site trip generation, other proposed development volumes and the anticipated 1% background growth volumes.

Figure 15: 2024 Future Total Projected Traffic Volumes

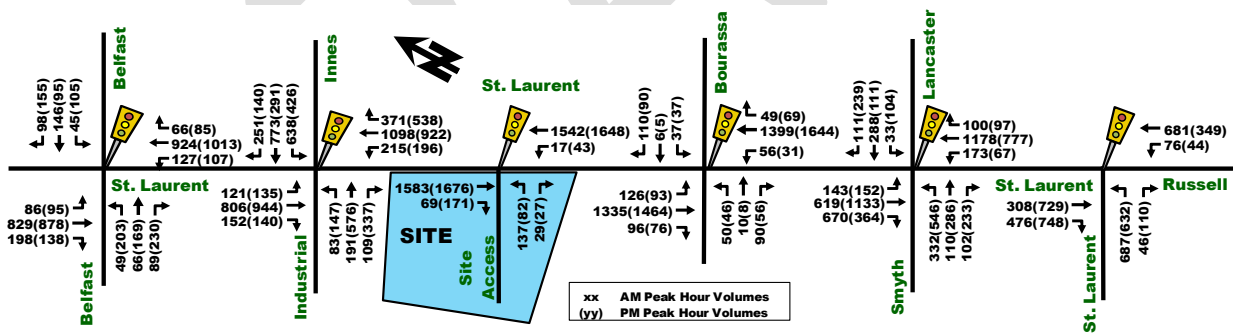

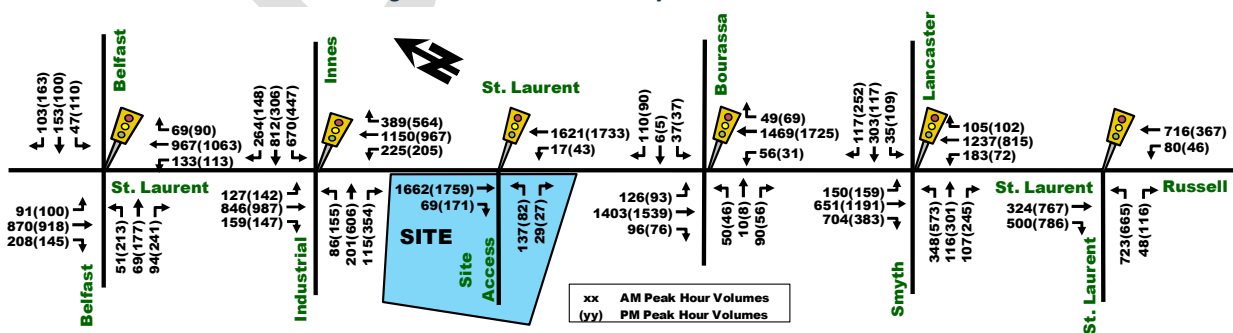

Figure 16: 2029 Future Total Projected Traffic Volumes

4. STRATEGY REPORT

4.1. Development Design

At this time, a detailed Site Plan has not been developed that provides specifics with respect to several important on-site elements, including for example bicycle parking, underground parking circulation/layout, etc. The ensuing review of the development design is therefore limited to a high-level discussion.

4.1.1. Design for Sustainable Modes

Location of Transit Facilities

The subject site is located approximately 100 to 175 meters walking distance to the existing bus stops located on St. Laurent Boulevard for route #40. Additional bus stops include Innes Road for route #42 located approximate 180 to 215 meters away and Russell Road for route #46 approximately 450 meters away. Within the City of Ottawa TMP Affordable Network, St. Laurent Boulevard is proposed to be upgraded to a 'transit priority corridor with isolated measures', which should improve travel times for route #40 going to and from site to St. Laurent Shopping Center where there is connectivity to the Confederation LRT Line.

Pedestrian/Cycling Routes and Facilities

All proposed buildings will have direct pedestrian and cycling access to St. Laurent Boulevard via internal sidewalks and paths. The private driveway access to the buildings will bisect the site in two, with two towers per side of the road. All buildings have entrances that link directly to the central private road which will have sidewalks on both sides of the road. Currently there are sidewalks on both side of St. Laurent Boulevard.

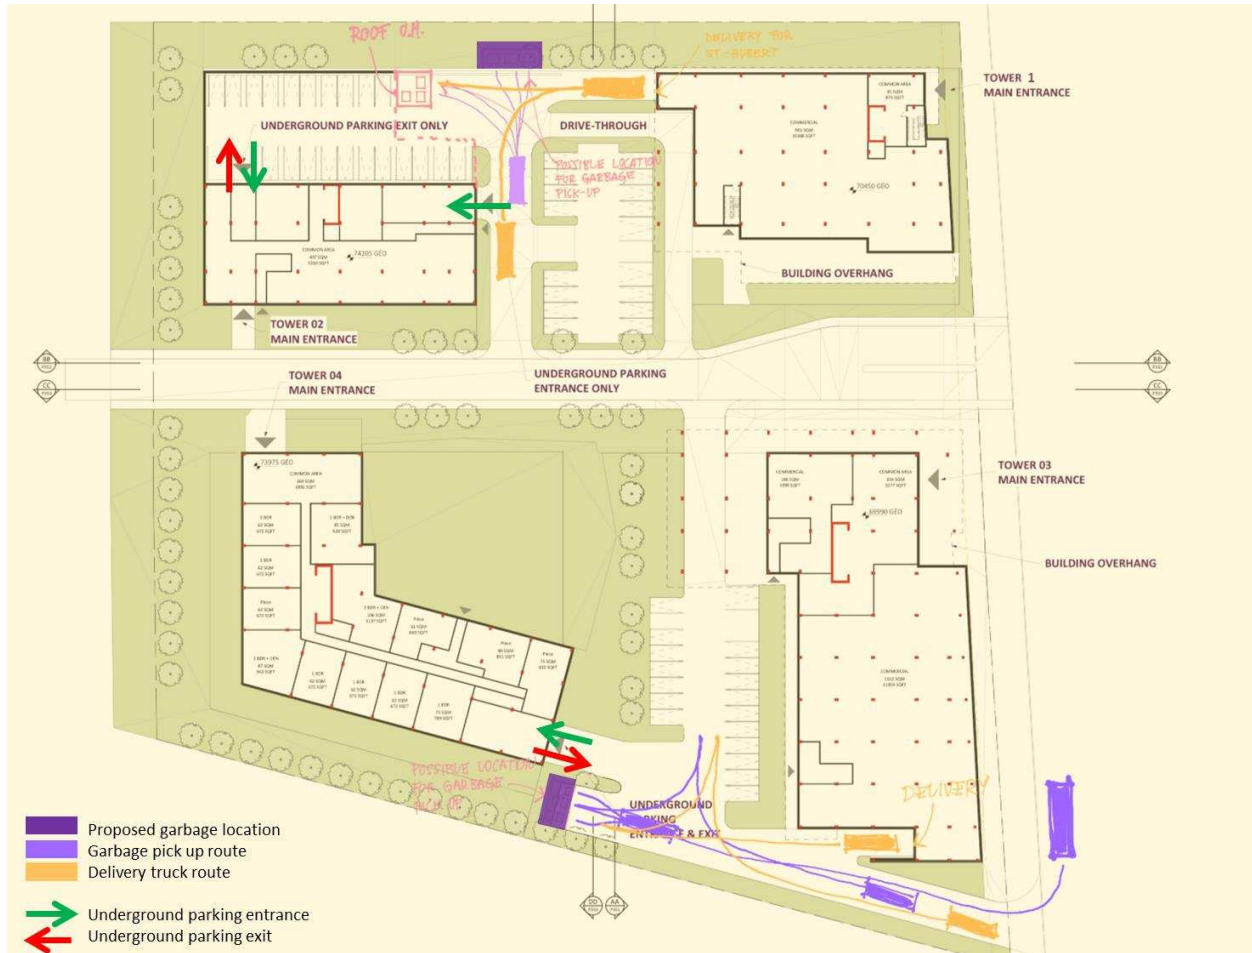

Bicycle Parking

Bicycle parking is currently proposed predominantly underground within the parking structures, located in near each of the elevator blocks for each tower, stored indoors in well-lit areas. Residents will have easy access between the bike storage rooms and the elevator shafts which have access to the main entrances and ground floor. Some outdoor bike parking spaces are also proposed, to serve visitors and commercial patron parking, however, the location has not been finalized yet. The main entrances for the Towers connect to the main full movement driveway which provides connectivity to Everest Private to the west and St. Laurent Boulevard cycle facilities to the east.

4.1.2. Circulation and Access

It is understood that vehicular access to the proposed development, the surface and underground parking will be provided via a private roadway located off St. Laurent Boulevard along the east frontage of the site. The intersection between St. Laurent Boulevard and the site access is proposed a full movement signalized intersection. A drive-thru facility is proposed as a counter-clockwise loop with a roof structure overhang pertaining to Tower 1. The underground parking garage is split into two structures: the north structure which services Towers 1 and 2 is accessed through a unidirectional entry ramp located on the east side of Tower 2 with an additional bi-directional entry and exit ramp located on the north side of Tower 2; the south structure which services Towers 3 and 4 is accessed through a ramp located on the east side of Tower 4 and functions as both entrance and exit ramp as shown conceptually in **Figure 17**.

Figure 17: Garage Accesses and Garbage Pick Up

Garbage pick-up will take place on ground floor directly north of the Tower 1 and 2 drive isle and also at the end of the right-in right-out roadway on the southern quadrant, adjacent to Tower 4.

4.1.3. New Streets Network

Exempt. See Table 1.

4.2. Parking

4.2.1. Parking Supply

According to Part 4 – Parking, Queuing and Loading Provisions for the City of Ottawa By-Laws, the site is located in Area B based on Schedule 1, Area B in Schedule 1A and is not within Rapid Transit Stations within Schedule 2B. **Table 13** summarizes the vehicle parking minimum and maximums allowed within the parking by-law. **Table 14** summarizes the bicycle parking requirements as per City of Ottawa Zoning By-Law-Part 4, sections 100-114.

Table 13: Proposed Vehicle Parking Space Supply

Land Use		Rate per Unit/Size		Required Vehicle Spaces			Proposed Spaces
		Base	Visitor	Base	Visitor	Min. Req.	
Residential	672 Units	0.5 per unit ¹	0.2 per unit ¹	330	132	462	670
Shopping Center	2,334 m ²	3.4 per 100 m ²	-	79	-	79	
High Turnover Restaurant	557 m ²	See notes ²	-	53	-	53	
Totals				462	132	594	Meets mins.
1.) First 12 units are exempt		2.) 3 per first 50 m ² and 10 per each 100 m ² subsequent for fast food GFA					

Table 14: Bicycle Parking Requirements

Land Use		Rate per Unit/Size	Required Bicycle Spaces	Proposed Spaces
Residential	672 Units	0.5 per unit	336	Unknown
Commercial	2,891 m ²	1 per 250 m ²	12	
Totals			348	

Discussions with the developer suggests a total of approximately 670 parking spaces, with approximately 70 being above ground and catered to commercial visitors while the remaining 600 are proposed underground. Towers 1 and 2 will share a 2-storey underground parking lot accessed on the east side of Tower 2 while Towers 3 and 4 will share a different 2-storey underground parking lot accessed on the south-east corner of Tower 4 (refer to **Figure 17** for more detail). It is anticipated that peak demand for commercial parking will occur at different times to residential visitor parking, allowing for the potential of shared parking. The proposed number of parking spaces is between the minimum and maximum City of Ottawa Parking Guidelines.

The bicycle parking by-laws suggest that 348 parking spaces are required. At the moment, the exact number of bike parking to be provided has not been finalized, but it is understood that the minimum requirement of bike parking will be met.

4.2.2. Spillover Parking

Exempt. See table **Table 1**.

4.3. Boundary Street Design

4.3.1. Existing Conditions

The boundary street for the development is St. Laurent Boulevard. The existing roadway geometries consist of the following features:

- *St. Laurent Boulevard:*
 - 2 vehicle and 1 bus travel lanes in each direction;
 - 2m sidewalk with 2m bike lane buffer on both sides of roadway;
 - Additional boulevard style buffer on east side of roadway;
 - More than 3,000 vehicles per day;
 - Posted speed limit is 70km/h;
 - Classified as major arterial roadway and identified as a trucking route; and,
 - Identified as a spine route and major pathway for cycling.

The proposed site is located within St. Laurent Boulevard Arterial Mainstreet segment. Multi-modal Level of Service (MMLoS) analysis for the subject road segments adjacent to the site is summarized in **Table 15** with detail analysis provided in **Appendix F**.

Table 15: MMLoS – Boundary Street Segment Existing

Road Segment	Multi-Modal Level of Service							
	Pedestrian		Bicycle		Transit		Truck	
	PLoS	Target	BLoS	Target	TLoS	Target	TkLoS	Target
St. Laurent Blvd – west side between Industrial Ave. & Bourassa Street	D	C	A	C	B	D	A	D
St. Laurent Blvd – east side between Industrial Ave. & Bourassa Street	D	C	A	C	B	D	A	D

Pedestrian

- **Both sides of St. Laurent Boulevard** do not meet pedestrian PLoS due high vehicle operating speeds. Since providing a sidewalk of greater than 2 meters wide with a 2-meter boulevard is already in place, the only remaining mitigation would be reducing speeds from 70km/h to 50-60km/h or reducing daily curb volumes to below 3,000 vehicles a day, both which are very unlikely to occur due to the roadway's function and classification.

Bicycle

- *Both sides of St. Laurent Boulevard* meet cyclist BLoS.

Transit

- *Both sides of St. Laurent Boulevard* meet transit TLoS targets.

Truck

- *Both sides of St. Laurent Boulevard* meet trucking route TkLoS targets.

4.3.2. Future Conditions

Although the existing intersection will be modified from a right-in right-out only, the road segments adjacent to the site will continue to operate the same as existing.

4.4. Access Intersection Design

There have been ongoing discussions with City staff regarding a fully movement signalized intersection for the site. Within one of the most recent briefings, the City of Ottawa indicated that three conditions be met for a signalized intersection to be considered. These conditions include:

1. There must be a fully protected left-turn lane developed into the site (NBL)
2. The traffic signals must be installed as far south as possible, away from Industrial/St. Laurent
3. The accesses for this development must be consolidated (currently 4 RIRO accesses within the site)

The intent of the ensuing section is to demonstrate the extent to which these conditions have been satisfied.

4.4.1. Location and Design of Access

The proposed access to the site includes a main driveway connecting to St. Laurent Boulevard which has smaller internal roads connecting to the drive-thru under Tower 1, access to surface parking and underground parking ramps. The main driveway is located slightly south of the existing driveway that services Petro-Canada and St. Hubert Diner, located approximately 135 meters south of Industrial/St. Laurent.

The main site access driveway aligns with Everest Private to the west, which provides connectivity to Russell Road. However, large concrete cinderblocks on Everest Private restrict vehicular access between Russell Road and St. Laurent Boulevard as a condition of site development, and therefore it is very unlikely that this configuration will change. This proposed access is located just north of the existing shopping center RIRO access across the street.

Just south of the existing shopping center RIRO access across the street, and at the southernmost extent of the site, there's a secondary minor access proposed as a RIRO. This access is predominantly envisioned as a commercial truck delivery access and garbage truck access, as illustrated in **Figure 17**.

4.4.2. Intersection Control

The current access to the site operates as an unsignalized STOP-control on the minor right-in right-out intersection. As part of this development, the intersection is proposed to be upgraded to a full movement access with traffic signal control.

A traffic signal warrant analysis was completed, and it did not trigger the need for a traffic signal, with 73% of the required 100% needed to trigger the warrant. The addition of approximately 35% more forecasted outbound left-turning vehicles from the site (approximately 80 more eastbound left-turning vehicles in the AM, PM or a combination of both totaling 80) would satisfy the signal warrant. It is possible that by moving the intersection further south to align with the RIRO on the east side of St. Laurent Boulevard (strip mall at 1705 St. Laurent), or moving the strip mall's access further north to match the site's access, that traffic volumes would be high enough to satisfy the warrant for traffic signal, albeit performance may be jeopardized as a result of the additional traffic to/from the east leg³. It is understood that if a traffic signal is not warranted, that the developer is responsible

³ Turning movement data for this driveway on the east side of St. Laurent Boulevard are not currently available to formally complete the analysis.

for the traffic signal construction costs and future maintenance costs until a traffic signal warrant is 100% met. The warrant has been provided in **Appendix G**.

The new signalized access would be approximately 150 meters south of the signalized Industrial/St. Laurent intersection and approximately 160 meters north of the signalized Bourassa/St. Laurent intersection. According to the City of Ottawa Private Approach By-Law Section 25, if a site has more than 300 parking spaces, a minimum distance between the private approach and signalized intersection is 75 meters. Given that both neighboring intersections are further than 75 meters away, this new signalized intersection would meet the minimum by-law requirements.

4.4.3. Intersection Design

Northbound left-turning vehicles would be required to cross 3 opposing traffic lanes and a cycle facility, triggering the need for a fully protected phase. In order to create a fully protected phase without interfering with northbound through traffic, an auxiliary turn lane will be required. The nominal storage length for left turns should be 38 meters or more. It is possible that a southbound right-turn lane may be required based on queues. This will be further analyzed in **Section 4.9.2.** based on Synchro queueing information.

Included in **Appendix H** is the draft Functional Design Drawing for the proposed signalized intersection.

4.5. Transportation Demand Management

4.5.1. Context for TDM

Based on the type of development, it is assumed that most trips generated by the proposed site will be residents leaving the site in the AM peak to go to work and returning from work to the proposed site in the PM peak. Sections 3.1.1 and 3.1.2 describe how many trips are anticipated per travel mode and anticipates the likely locations that they will travel to and from based on the OD-Survey 2011 for Ottawa. The site is not located within 600 meters of rapid transit; however, it is located in a transit priority corridor with isolated measures.

4.5.2. Need and Opportunity

Since the development is located in a transit priority corridor with isolated measures, measures to provide sustainable active mode shares are encouraged. Such measures are described in more detail in Section 4.5.3 below, but can include reduced parking, more aggressive Multi-Modal Levels of Service (MMLoS) as described in Section 4.3 and 4.9 and safe and efficient connectivity to public transit as described in Section 4.7, to name a few.

4.5.3. TDM Program

The TDM infrastructure checklist and TDM Measures are attached as **Appendix I**.

Regarding the TDM Supportive Development Design and Infrastructure Checklist:

- All ten (10) Required measures related to Walking and Cycling (facilities and bicycle parking) and Vehicle Parking have been satisfied
- At least nine (9) of fourteen (14) Basic measures related to Walking and Cycling, Transit, Ridesharing and Parking have been satisfied or are not applicable
- Two (2) of the of the seven (7) candidate Better measures are also proposed or are non-applicable, namely:
 - Separate long-term and short-term parking areas

Regarding the TDM Measures Checklist, the developer has indicated there is a willingness to consider the following measures:

- Designate a TDM program coordinator
- Display walking and cycling information at major entrances
- Display transit information at major entrances
- Unbundle parking costs from monthly rent; and

4.6. Neighborhood Traffic Management

4.6.1. Adjacent Neighborhoods

This section is technically exempt as the access driveway will operate as a private approach driveway given that there will be no connectivity to the local roadway just west of the site, Everest Private.

4.7. Transit

4.7.1. Route Capacity

With less than 200 'new' two-way transit passenger trips per hour generated for the AM and PM peak hours, it is not anticipated that this development will place buses at capacity. Given the transit priority isolated measures planned for St. Laurent Boulevard, it is anticipated that the future transit network will have sufficient capacity to accommodate the subject development transit demand⁴. Additionally, added capacity is available on local bus routes on Russell Road and Industrial Avenue.

4.7.2. Transit Priority

Given that the site proposes a new signalized intersection at Site Access/St. Laurent, it is possible that slight delays may occur for buses traveling on the bus only lanes on St. Laurent Boulevard. By coordinating the traffic signals between Industrial/St. Laurent, Site Access/St. Laurent and Bourassa/St. Laurent, an efficient bus corridor can be maintained without majorly affecting transit priority. The bus only lanes are not anticipated to be removed once the new intersection is built. According to Synchro analysis for year 2029, the northbound and southbound through movements for the AM and PM peaks are all less than 20 second delays for the Site Access/St. Laurent intersection. Note that this estimate does not take into consideration the benefit of the shoulder bus lanes that would reduce any transit delays (these lanes are not explicitly replicated within Synchro).

4.8. Review of Network Concept

The approximate 165 units above allowable zoning would create approximate 110 more peak hour person trips than the equivalent volume permitted by established zoning. Since 110 peak hour person trips is lower than 200 as suggested by the TIA Guidelines, then the remainder of this step can be exempt.

4.9. Intersection Design

4.9.1. Intersection Control

A new signalized intersection is proposed for the Site Access/St. Laurent intersection. A cycle of 120 seconds was initially assumed to match nearby intersections for coordination (with the exception of Industrial/St. Laurent which runs independently), whereas the minimum timing splits were determined using walking speeds, roadway speeds and clearing distances. Additional timing was allocated to the northbound left-turn which will require a fully protected phase.

4.9.2. Intersection Design

Multi-Modal Level of Service

As stated in the MMLoS Guidelines, only signalized intersections are considered for the intersection Level of Service measures. The future proposed Site Access/St. Laurent is considered, as is Industrial/St. Laurent given its proximity to the site and alternate bus routes (although no changes to the existing and future MMLoS are expected). The MMLoS analysis is summarized in **Table 16**, with detailed analyses provided in **Appendix J**.

Table 16: MMLoS - Existing and Future Adjacent Signalized Intersections

Road Segment	Multi-Modal Level of Service							
	Pedestrian		Bicycle		Transit		Truck	
	PLoS	Target	BLoS	Target	TLoS	Target	TkLoS	Target
Site Access/St. Laurent ¹	F	C	C	C	C	D	C	D
Industrial/St. Laurent	F	C	A	C	F	D	A	D

1.) Future Site Access/St. Laurent is based on the latest plans available - subject to change

⁴ Data from OC Transpo has been requested to determine existing route capacity; data still pending.

Pedestrian

- For both intersections, pedestrians must cross at least 7 lanes of traffic due to the St. Laurent Boulevard cross-section. There are no options that can help improve the PLoS significantly enough to come anywhere near achieving the target PLoS 'C'.

Bicycle

- For both intersections, the bicycle BLoS target was met given that the bicycle lane arrangements on approach consist of physically separated bike lanes. For cyclists turning left at Industrial/St. Laurent, they can use the bicycle phase and cross as a two-stage process with refuge on the channelized right-turn islands.

Transit

- Transit TLoS targets were not met at Industrial/St. Laurent intersection as it relies on average signal delay. To reach the target goal, buses must wait no longer than 30 seconds at the intersection. Since the existing cycle is in the magnitude of 140-150 seconds, buses are anticipated to wait longer than 30 seconds. The Site Access/St. Laurent is anticipated to have delays of less than 20 seconds for NB-SB movement, which meets the desired TLoS. More extensive modelling would be required to explicitly model any forecasted delay to transit.

Truck

- Truck target level of service was met for both intersections

Existing Intersection Performance

The following **Table 17** provides a summary of the existing traffic operations at the study area intersection based on the Synchro (V10) traffic analysis software. The subject intersections were assessed in terms of the volume-to-capacity (v/c) ratio and the corresponding Level of Service (LoS) for the critical movement(s). The Synchro model outputs of existing conditions are provided within **Appendix K** and the volumes used were obtained from **Figure 5**.

Table 17: Existing Intersection Performance

Intersection	Weekday AM Peak (PM Peak)					
	Critical Movement			Intersection		
	LoS	max. v/c or avg. delay (s)	Movement	Delay (s)	LoS	v/c
Signalized Intersections						
Industrial/St. Laurent	E(D)	0.98(0.83)	WBL(EBT)	46.4(46.2)	D(C)	0.82(0.78)
Bourassa/St. Laurent	D(D)	0.81(0.88)	EBT(NBT)	20.6(24.5)	C(D)	0.75(0.83)
Smyth/St. Laurent	D(E)	0.89(1.00)	SBR(EBL)	38.9(47.2)	D(D)	0.83(0.88)
Belfast/St. Laurent	C(D)	0.79(0.81)	WBT(WBT)	24.4(29.4)	A(B)	0.55(0.70)
Russell/St. Laurent	C(C)	0.76(0.73)	EBL(EBL)	15.5(15.3)	B(C)	0.68(0.73)
Unsignalized Intersections						
Site Access/St. Laurent ₁	C(D)	20(26)	EB(EB)	1(1)	A(A)	-
Note: Analysis of signalized intersections assumes a PHF of 0.9 and a saturation flow rate of 1800 veh/h/lane.						
1.) Based on existing trip generation obtained from Table 3						

As seen in **Table 17** all intersections operate overall at acceptable LoS 'D' or better with critical movements operating at LoS 'E' or better during the existing conditions.

Background Conditions 2029

The future background 2029 conditions represent the impact of additional development and forecasted growth in background volumes. Since 2029 background has the same intersection layouts as 2024 and is the more critical of the two scenarios, only 2029 will be analyzed. The future projected 2029 background volumes are

illustrated in **Figure 18** with projected operation outputs in **Table 18**. The detailed Synchro results can be found in **Appendix L**.

Figure 18: 2029 Background Projected Volumes

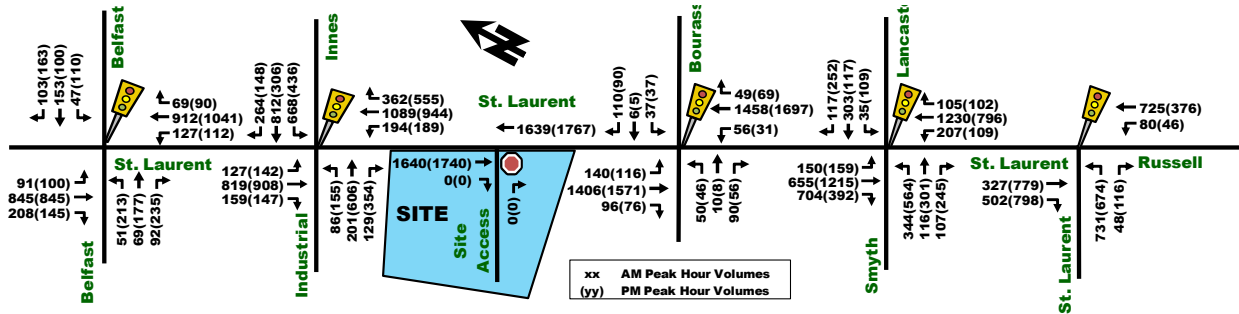

Table 18: 2029 Background Intersection Performance

Intersection	Weekday AM Peak (PM Peak)					
	Critical Movement			Intersection		
	LoS	max. v/c or avg. delay (s)	Movement	Delay (s)	LoS	v/c
Signalized Intersections						
Industrial/St. Laurent	E(D)	0.96(0.85)	WBL(EBT)	46.3(48.3)	D(C)	0.81(0.77)
Bourassa/St. Laurent	C(D)	0.75(0.82)	EBT(NBT)	22.4(22.2)	C(C)	0.71(0.78)
Smyth/St. Laurent	E(E)	0.91(0.95)	EBL(EBL)	41.6(42.2)	D(D)	0.85(0.87)
Belfast/St. Laurent	C(D)	0.78(0.83)	WBT(WBT)	24.5(29.8)	A(B)	0.55(0.70)
Russell/St. Laurent	C(C)	0.75(0.73)	EBL(EBL)	15.3(15.0)	B(C)	0.67(0.72)
Unsignalized Intersections						
Site Access/St. Laurent ₁	C(C)	20(24)	EB(EB)	1(1)	A(A)	-

Note: Analysis of signalized intersections assumes a PHF of 1.0 and a saturation flow rate of 1800 veh/h/lane.
 1.) Based on existing trip generation obtained from **Table 3** and existing intersection layout

As seen in **Table 18**, all intersections operate overall at acceptable LoS 'D' or better with critical movements operating at LoS 'E' or better during the 2029 background volumes. Operations are similar with existing intersection performance.

Future Conditions 2024 - Full Buildout

The future full build-out 2024 volumes were derived by superimposing background 2024 volumes which include other area developments and background growth, with future site-generated volumes. The future projected 2024 volumes are illustrated in **Figure 19** with projected operation outputs in **Table 19**. The detailed Synchro results can be found in **Appendix M**.

Figure 19: 2024 Total Projected Volumes

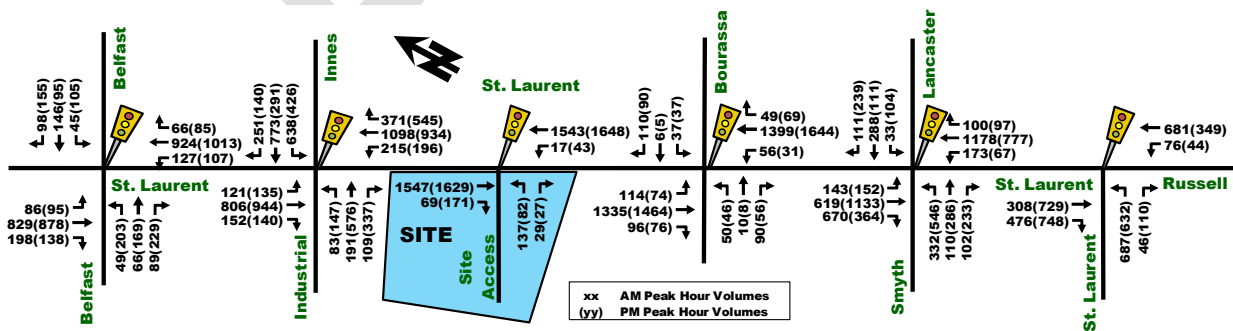

Table 19: 2024 Full Build-out Intersection Performance

Intersection	Weekday AM Peak (PM Peak)					
	Critical Movement			Intersection		
	LoS	max. v/c or avg. delay (s)	Movement	Delay (s)	LoS	v/c
Signalized Intersections						
Industrial/St. Laurent	E(D)	0.94(0.84)	WBL(WBL)	47.7(48.1)	C(C)	0.79(0.78)
Site Access/St. Laurent	B(C)	0.68(0.72)	EBL(SBT)	14.7(15.4)	B(B)	0.65(0.70)
Bourassa/St. Laurent	C(C)	0.75(0.78)	EBT(NBT)	21.7(20.7)	B(C)	0.68(0.74)
Smyth/St. Laurent	D(D)	0.84(0.90)	EBL(EBL)	37.7(37.4)	C(C)	0.80(0.76)
Belfast/St. Laurent	C(D)	0.77(0.81)	WBT(WBT)	23.8(29.2)	A(B)	0.53(0.68)
Russell/St. Laurent	C(C)	0.73(0.71)	EBL(EBL)	15.0(14.4)	B(B)	0.65(0.70)

Note: Analysis of signalized intersections assumes a PHF of 1.0 and a saturation flow rate of 1800 veh/h/lane.

As seen in **Table 19**, all study area intersections are expected to operate similarly to existing conditions with acceptable delays.

Future Conditions 2029 – Full Buildout + 5 Years

The future full build-out 2029 volumes were derived by superimposing background 2029 volumes which include other area developments and background growth, with future site-generated volumes. The future projected 2029 volumes are illustrated in **Figure 20** with projected operation outputs in **Table 20**. The detailed Synchro results can be found in **Appendix M**.

Figure 20: 2029 Total Projected Volumes

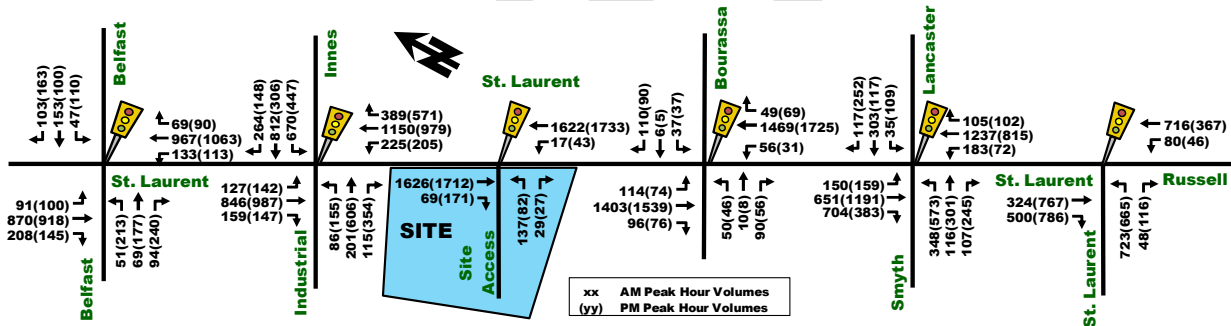

Table 20: 2029 Full Build-out Intersection Performance

Intersection	Weekday AM Peak (PM Peak)					
	Critical Movement			Intersection		
	LoS	max. v/c or avg. delay (s)	Movement	Delay (s)	LoS	v/c
Signalized Intersections						
Industrial/St. Laurent	E(D)	0.97(0.85)	WBL(EBT)	54.7(50.3)	D(D)	0.84(0.81)
Site Access/St. Laurent	B(C)	0.68(0.75)	EBL(SBT)	15.8(17.5)	B(C)	0.68(0.73)
Bourassa/St. Laurent	C(D)	0.75(0.82)	EBT(NBT)	22.2(21.7)	C(C)	0.71(0.78)
Smyth/St. Laurent	D(E)	0.90(0.95)	SBR(EBL)	40.7(39.8)	D(C)	0.84(0.80)
Belfast/St. Laurent	C(D)	0.78(0.83)	WBT(WBT)	24.4(30.3)	A(C)	0.57(0.72)
Russell/St. Laurent	C(C)	0.75(0.73)	EBL(EBL)	15.3(14.9)	B(C)	0.67(0.72)

Note: Analysis of signalized intersections assumes a PHF of 1.0 and a saturation flow rate of 1800 veh/h/lane.

As seen in **Table 20**, all study area intersections are expected to operate similarly to existing conditions with acceptable delays.

Queuing Assessment

Analyses were completed to determine if the new signalized intersection will pose queueing concerns at adjacent intersections. **Table 21** summarizes the available storage capacity as well as the projected 95th percentile queue based on the findings of both Synchro and SimTraffic software.

Table 21: 95th Percentile Queue for Intersections Adjacent to Site/St. Laurent

Intersection - Movement	Available Storage (m)	95 th Percentile Queue AM (PM) (m)	
		Synchro	Sim Traffic
Industrial/St. Laurent - NBL	100	55 (47)	-
Industrial/St. Laurent - NBT	135	221 (161)	155 (138)
Site/St. Laurent - SBT	135	190 (217)	126 (186)
Site/St. Laurent - NBL	40 ₁	12 (25)	30 (30)
Site/St. Laurent - NBT	150	134 (153)	173 (112)
Bourassa/St. Laurent - SBT	150	156 (172)	212 (141)

1.) Modelled and illustrated within draft design as 40 meters

As seen in **Table 21**, the through movements upstream and downstream on St. Laurent Boulevard of the new proposed signalized intersection are anticipated to produce queues which exceed their available storage capacities. This means that some vehicles may need to stop on a green light at the new intersection so as to leave the intersection clear of standing vehicles. Upon further visual analysis of Sim Traffic simulations, it appears that most vehicles clear the new intersection and the subsequent intersection once they are given a green light. The new proposed northbound left-turn lane on the Site Access/St. Laurent intersection is expected to have sufficient capacity at a length of 40 meters. Providing a short southbound right-turn lane (tapered lines within the bus only lanes) significantly reduces queue lengths, from 270 meters in the PM to 196 meters with the addition of a 15-meter auxiliary lane. The Sim Traffic results have been included in **Appendix N**.

Possible Mitigation Strategies

Move Proposed Signal Further South

Consideration was given to moving the signalized intersection to the southernmost extent of the property, which would create an approximate additional 85 meters distance separation from the Industrial/St. Laurent intersection. This would maximize the separation between the two intersections at approximately 220 meters, and should alleviate most of the queueing concerns north of the driveway, but would make the queueing concerns between the Site Access/St. Laurent and Bourassa/St. Laurent intersection more prevalent. Furthermore, moving the access to the southernmost quadrant of the site would place the new intersection at around 65-meter separation to Bourassa/St. Laurent intersection, which would not meet the City's minimum required separation. This option is not recommended.

Modify Signal Timing/Coordinate Signals

The study area network was analyzed with a coordinated time plan with varying cycle lengths ranging between 120 to 150 seconds. A general pattern emerged where a higher cycle length improved v/c performance but resulted increased vehicle queues, whereas lower cycle lengths resulted in worse v/c performance but reduced vehicle queues. Overall, the modified signal timing plans did not fully mitigate the queue spillback observed between Industrial Avenue and Bourassa Street.

Sensitivity analysis confirmed that if north-south through traffic volumes on this section of St. Laurent Boulevard in the peak hour periods were reduced by approximately 20%, vehicular queue lengths would be accommodated within the available storage capacity; therefore, it is reasonable to expect queue spillback will be isolated to the peak hour periods.

Connect to Alternative Access Location

Choosing an alternate access could provide new alternatives that do not rely on creating the signalized intersection at the proposed location. Some alternative access locations could include:

1. Obtain a connection to the east via Everest Private roadway, thereby providing full access to Russell Road. This option has been discussed previously and dismissed as it is not supported by the adjacent property owners / Condo Board.
2. Obtain a connection through the property to the south at 1800 St. Laurent Boulevard, either through purchase or come to an agreement to construct a driveway via through this parcel. It provides access to the signalized Bourassa/St. Laurent intersection.
3. Obtain a connection to the north via the office building located at 1730 St. Laurent, which would introduce additional demand through the Industrial/St. Laurent intersection and the unsignalized intersection located less than 100m to the west.

Revert Back to RIRO

Consideration was given to maintaining the existing RIRO operation and forcing left-turn movements to/from the site to occur as U-turn movements at the adjacent Industrial/St. Laurent and Bourassa/St. Laurent intersections. Preliminary analysis indicates that performance at these intersections is diminished to LoS 'E' conditions from previously forecasted 'C' and 'D' in future 2029 conditions with the intersection modelled as a signalized intersection. Note that a level of service 'E' is still within acceptable performance.

Future Conditions if Custom Mode Share not Met

Figure 21 shows the projected network volumes if the custom mode shares from Table 9 are not met. The projected intersection performance for the critical scenario 2029 with Alta Vista Area mode shares is shown in Table 22 with detailed output in Appendix O.

Figure 21: 2029 Total if Custom Mode Share not Met Projected Volumes

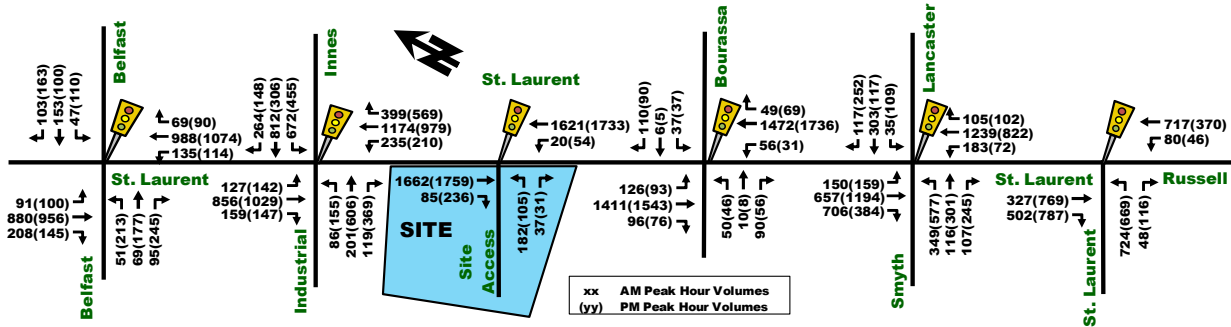

Table 22: Intersection Performance if Custom Mode Shares not Met

Intersection	Weekday AM Peak (PM Peak)					
	Critical Movement			Intersection		
	LoS	max. v/c or avg. delay (s)	Movement	Delay (s)	LoS	v/c
Signalized Intersections						
Industrial/St. Laurent	E(D)	0.97(0.87)	WBL(WBL)	56.9(51.6)	D(D)	0.85(0.83)
Site Access/St. Laurent	C(C)	0.77(0.77)	EBL(SBT)	19.2(20.0)	C(C)	0.71(0.75)
Bourassa/St. Laurent	C(D)	0.75(0.82)	EBT(NBT)	22.3(21.8)	C(C)	0.71(0.78)
Smyth/St. Laurent	D(E)	0.90(0.95)	EBL(EBL)	40.8(39.9)	D(D)	0.85(0.81)
Belfast/St. Laurent	C(D)	0.78(0.83)	WBT(WBT)	24.3(30.6)	A(C)	0.58(0.72)
Russell/St. Laurent	C(C)	0.75(0.73)	EBL(EBL)	15.3(14.9)	B(C)	0.67(0.72)

Note: Analysis of signalized intersections assumes a PHF of 1.0 and a saturation flow rate of 1800 veh/h/lane.

As seen in **Table 22**, most intersections operate the same with or without the custom mode shares for year 2029, implying that the site plays a minor role in worsening conditions.

5. FINDINGS AND RECOMMENDATIONS

Based on the results summarized herein the following findings and recommendations are provided:

Existing Conditions

- The site is currently occupied by commercial uses and is zoned as AM10 and AM10[1658]
- The site is located in a transit priority corridor with isolated measures
- Overall, there were 539 collisions recorded within 5 years for the study area. 39 of them occurred between Industrial Avenue and Bourassa Street on St. Laurent Boulevard.
- The site is currently accessed by four right-in right-out driveways to/from southbound St. Laurent Boulevard
- Existing intersections operate at good overall LoS 'D' or better with some critical movements approaching capacity at LoS 'E' or better during the weekday peak hours.

Proposed Development

- The proposed development will comprise of approximately 672 residential units and 31,100 ft² of ground floor commercial/retail in four 12 to 15-storey buildings.
- TDM measures include all required measures, some basic and better measures and provides additional policy measures like program coordinator, displaying active transportation routes and unbundling of parking costs to monthly rent.
- The proposed development is projected to generate approximately 140 to 160 'new' transit trips during the AM and PM peak hour periods, which can be accommodated by route 40 which operates on St. Laurent transit priority corridor. Additional capacity is available on local bus available within 450-meter walk or less.
- A total of 670 parking spaces are proposed which would meet the City's minimum and maximum parking requirements for this development.
- The proposed development is projected to generate 'new' vehicle volumes of approximately 230 to 260 veh/h two-way total during the weekday morning and afternoon peak hours.
- The access to the site proposes to convert the main right-in right-out driveway into a new full movement intersection off St. Laurent Boulevard with traffic signal controls. With greater than 75m to the nearest signalized intersection, it meets City By-Law requirements. A secondary RIRO is proposed on the southernmost quadrant of the site and is meant to be predominantly used by delivery or garbage trucks.

Future Conditions

- Other nearby developments and a 1% growth rate were applied to existing volumes to estimate 2029 background conditions. The 2029 background overall intersection performance of all study area intersections was LoS 'D' or better and with critical movement of 'E' or better which is similar to existing.
- The MMLOS road segment analysis shows that existing and future conditions on boundary streets do not meet MMLOS area targets for pedestrians due to high vehicular volumes, however, all other targets are met.
- The MMLOS intersection analysis shows that truck target goals and bicycle target goals are met at all intersections. Given the fast-operating speeds and number of lanes crossed, it is not possible to meet

pedestrian desirable target goals. The transit TLoS was not met for Industrial/St. Laurent given the existing and anticipated delay times.

- The new site vehicle access was modelled as a signalized 3-legged intersection with a new northbound left-turn lane to incorporate a protected NBL phase. An auxiliary NBL storage lane of approximately 40 meters is sufficient to service the site.
- A short 15-meter segment of shared bus and southbound right-turn lane at Site Access/St. Laurent significantly reduces queue lengths for the southbound movement.
- Future conditions with the addition of pedestrians, cyclists, transit patrons and site vehicle traffic performed at acceptable levels of service with respect to v/c and delay resulting in overall LoS 'D' or better and with critical movement of 'E' or better.
- Queueing concerns were noted as a result of the new Site Access/St. Laurent signalized intersection for both north and southbound through movements. Spillback through adjacent intersection is forecasted at times during the morning and afternoon peak hours, however, it is anticipated that most vehicles would clear during each cycle.
- A number of mitigation measures were considered to alleviate the projected queueing issues resulting from the proposed traffic signal, including refinements to the placement of the signal, timing parameters, etc. None of the measures were found to dramatically improve the forecasted queuing through adjacent intersections, other than elimination of the signal altogether that would result in RIRO operation to/from St. Laurent Boulevard. A number of alternative access locations through properties to the north, west and south were also identified, all of which would require additional property acquisition and agreements.
- Despite the aforementioned queuing concerns during peak times, the three conditions stipulated by the City of Ottawa, for traffic signal control to be considered, have been substantially satisfied, namely: fully protected left-turn lane developed into the site (NBL); signals located as far south as possible; and consolidated access.

Based on the foregoing findings, the proposed development located at 1740 – 1760 St. Laurent Boulevard is recommended from a transportation perspective.

SCREENING FORM & CITY CORRESPONDANCE

City of Ottawa 2017 TIA Guidelines

Date

15-Jul-20

TIA Screening Form

Project

1740 -1760 St Laurent

Project Number

477563-01000

Results of Screening	Yes/No
Development Satisfies the Trip Generation Trigger	Yes
Development Satisfies the Location Trigger	Yes
Development Satisfies the Safety Trigger	Yes

Module 1.1 - Description of Proposed Development

Municipal Address	1740-1760 St. Laurent Boulevard, Ottawa, ON
Description of location	Approximately 150m south of St. Laurent Blvd on the west side
Land Use	Mixed-use (residential with ground commercial)
Development Size	672 units and approximately 2,891 sqm commercial
Number of Accesses and Locations	1 on to St. Laurent Boulevard. Potential new traffic signal to upgrade right-in right-out to full movement intersection
Development Phasing	2 Phases
Buildout Year	2022 / 2024
Sketch Plan / Site Plan	See attached

Module 1.2 - Trip Generation Trigger

Land Use Type	Townhomes or Apartments
Development Size	672 Units
Trip Generation Trigger Met?	Yes

Module 1.3 - Location Triggers

Development Proposes a new driveway to a boundary street that is designated as part of the City's Transit Priority, Rapid Transit, or Spine Bicycle Networks (See Sheet 3)	Yes	St. Laurent currently has a cycle-track adjacent to the site and is considered a Spine Cycle route under the Ultimate Cycling Network
Development is in a Design Priority Area (DPA) or Transit-oriented Development (TOD) zone. (See Sheet 3)	Yes	St. Laurent Arterial Mainstreet DPA
Location Trigger Met?	Yes	

Module 1.4 - Safety Triggers

Posted Speed Limit on any boundary road	<80	km/h
Horizontal / Vertical Curvature on a boundary street limits sight lines at a proposed driveway	No	
A proposed driveway is within the area of influence of an adjacent traffic signal or roundabout (i.e. within 300 m of intersection in rural conditions, or within 150 m of intersection in urban/ suburban conditions) or within auxiliary lanes of an intersection;	Yes	Within 150 meters of St. Laurent/Industrial
A proposed driveway makes use of an existing median break that serves an existing site	No	
There is a documented history of traffic operations or safety concerns on the boundary streets within 500 m of the development	No	
The development includes a drive-thru facility	No	
Safety Trigger Met?	Yes	

10 August 2020

Development Review Services

110 Laurier Avenue West

Ottawa, ON K1P 1J1

Attention: Josiane Gervais, P.Eng.

Dear Josian:

Re: 1740 – 1760 St. Laurent
Step 2 – Comment and Response Form

The following response form has been prepared to address City of Ottawa comments received on August 7th, 2020. City comments are noted in black with the corresponding responses from Parsons in **Green**.

Transportation Engineering Services

- Element 2.1.1 - Proposed Development
 - Please replace Figure 2, text showing aisle width dimensions is illegible. **Figure updated**
- Element 2.1.2 - Existing Conditions
 - include cycling and pedestrian volumes during the peak hour, as TIA guidelines require existing peak hour travel demands by mode. **Noted, added as new figure 6**
 - Revise description of St Laurent Blvd: “Don Reid Drive in the south.” **Noted, text updated**
- Element 2.2.1 - Study Area
 - The St-Laurent Blvd/Belfast Rd and St-Laurent Blvd/Russell Rd intersections are also within the 1km radius and should be included within the study area for analysis of auto demand (cycling and pedestrian review of these intersections can be excluded as they are beyond 600m). **Noted.**
 - Typically, the TIA analysis must be completed for each development phase. Section 2.1.1 mentions that the potential for converting the access to a signal will be explored. Ensure the subsequent TIA steps outline when this is proposed to take place (i.e. 2022 or 2024) and how this affects warrants/operations. Assuming a single build-out time horizon for this site may be appropriate for this TIA (depending on assumptions), however it is possible that analysis for both phases be requested as part of future circulations. **It is understood that the traffic signals will be constructed for the first phase of development**
- Because this TIA is in support of a re-zoning application, the TIA must address the worst-case scenario for traffic generation based upon the zoning sought and compare this to the traffic generated under the current zoning. **Noted, will be discussed in Step 4 for Network Concept**
- Module 2.3 - Exemptions Review:
 - Should it be determined in Section 4.2 that parking supply is 15% below unconstrained demand, Module 4.2.2 will be required. **Noted, will be discussed in Step 4.**

- Will the barricade remain on Everest Private to prevent cut-through traffic between St-Laurent Blvd and Russell Road? If not, then Module 4.6 is required as Russell Road is a collector street. **It is understood at this time that the barricade will remain on Everest Private**

16 July 2021

City of Ottawa

Development Review Services

110 Laurier Avenue West

Ottawa, ON K1P 1J1

Attention: Josiane Gervais, P.Eng.

Dear Josiane:

Re: 1740 – 1760 St. Laurent
Step 3 – Comment and Response Form

The following response form has been prepared to address City of Ottawa comments received on September 23rd, 2020. City comments are noted in black with the corresponding responses from Parsons in **Green**.

Transportation Engineering Services

Section 3.1.1 Trip Generation and Mode Shares:

1. Consider using the average rate Land Use Code 820 rather than the fitted curve equation. While it is generally preferred to use the fitted curve when the sample size is large enough, the size of the commercial development (31,127 ft²) versus the average size of the shopping centres surveyed (327,000 ft²) may lead to an overly conservative estimate. **Noted, average rate used instead**
2. Justify the pass-by rate of 35% for the AM Peak for the commercial development. The Trip Generation Handbook, 3rd Edition, only provides data for the PM Peak. **Noted, pass-by for AM removed**
3. Consider applying an internalization reduction as this is a mixed-use development. **Noted**
4. An estimate of the existing site-generated trips should be provided in the absence of counts in order to deduct the existing development trips from the new two-way vehicle trips. **Noted, included in trip generation segment**
5. The proposed reduction in auto mode share is supported but will require TOD strategies to encourage the shift to alternative modes. Consider the needs of transit users in the Strategy review. **Noted, will be included in section 4.5**
6. The site plan shows a drive-through included within Tower 1 (even though the screening form claims no drive-through facility is proposed). A drive-through should not be approximated as "Shopping Center". **Screening form updated and drive-through trip generation included separate from shopping center**

Section 3.1.2 Trip Distribution:

7. Justify the trip distribution. The location of this development within the context of the Alta Vista TAZ makes 20% to/from east and 25% to/from south seem high. **Noted, distribution adjusted to reflect 'trips from area' closer than trips going to area to more closely resemble residents leaving for work and then returning home.**

Section 3.2.2 Background Growth:

8. In the future, consult with Tim Wei (tim.wei@ottawa.ca) to obtain a snapshot of the Long-Range Transportation Model to inform the development of background growth rates. **Noted**

Site Plan considerations:

9. An RMA will be required for any proposed intersection modifications on the boundary roads. All road modification costs will be at the expense of the applicant. Any full-movement access will require a protected intersection on St-Laurent Blvd. **Noted, RMA to be included and Synchro to be modelled as protected access**
10. Annex 1 of the OP protects a 44.5m ROW for St. Laurent Boulevard adjacent to the site. Show the ROW measurement from the centreline of St. Laurent Boulevard, and indicate any additional property (ROW) that needs to be provided to the City. **Noted**
11. The site is disconnected from Everest Private to the west (see adjacent site plan on DevApps, D07-12-19-0135), with through access provided for pedestrians, cyclists, and emergency vehicles only. This site plan should include a space for vehicles to turnaround west of Tower 3 and Tower 4. **Noted, will advice developers**

Traffic Signal Operations

12. Collision analysis indicates that site access area is currently problematic and would be likely to remain so. Further collision analysis may be required. **It is anticipated that once a traffic signal is added to the site intersection, collision patterns will significantly change, and existing collision data will no longer be valid. If no traffic signal is added at the site access, then further collision analysis will be conducted.**
13. Analysis of impacts to auxiliary lanes on St. Laurent Blvd will be required in subsequent submissions. If the new proposed signal on St-Laurent Blvd is shown to impact adjacent signalized intersections, then alternatives to full-movement at Everest should be considered. **Noted, will be included in section 4.9**
14. Provide traffic signal warrant analysis. **Noted, will be included in section 4.4.2**

Transit Services

15. Agree that 30% transit mode share seems a reasonable target assuming transit supportive TDM measures are included. In addition, we support the reduction of parking to be in line with the targeted mode shares. **Noted, will include TDM measures in Step 4, will advice developer of parking reduction suggestion**
16. There are no direct impacts to bus stops from the proposed site plan. However, the proposed new signalized intersection would create additional delay for transit in both directions and would undermine previous transit priority efforts (signal timing, dedicated lanes). **Noted**
17. The signalized intersection would also create additional start-stop for buses, which erodes passenger comfort. For example: southbound buses would serve the stop at Innes, accelerate only slightly to then stop at the new signal, then accelerate slightly again towards Bourassa, and possibly stop again at the signal before serving the next stop on the far side of the intersection. This would be a big change from the current conditions which are almost free flow along this stretch. **Noted**
18. Finally, a new signalized intersection would also not provide any measurable benefit for pedestrian access to/from bus stops. Stops on the east side of St-Laurent Blvd are located at the Bourassa and Innes intersections, so pedestrians can use the west sidewalk to go north or south first before crossing at the existing intersections. **Noted**

Development Review – Transportation

- Should allowing access through Everest (at Russell Rd) be considered, perhaps as an alternative access scenario as mentioned above, then this additional intersection should be assessed. **Noted, to be discussed with developer**
- Please include comments/responses from Steps 2 and 3 within Appendix of the Strategy report. **Noted, will include both**

If the above comments can be incorporated within the next submission, please proceed to Step 4: Strategy.

Please submit the Strategy Report and digital files of ICA outputs (Synchro/Sidra/Rodel, if applicable) for circulation. **To be included**

Please note that I strongly encourage the submission of the draft Strategy and functional plan for staff review and comment prior to submission of the application. If you choose to omit this step, all documents required for Step 5 (TIA report, drawings, and/or monitoring plan, as required) need to be included to deem an application complete. All costs and delays resulting from the choice to omit Step 4 for staff review before proceeding to Step 5 are the responsibility of the applicant. **Noted**

APPENDIX G

TRAFFIC SIGNAL WARRANT

St. Laurent/Site - (peak hour signal warrant)

Signal Warrant	Description	Minimum Requirement for Two-Lane Roadways	Compliance			
		Restricted Flow - Operating Speed Less Than 70 km/h	Sectional %	Entire %	Warrant	
Intersection	1. Minimum Vehicular Volume	(1) A Vehicle Volume, All Approaches for Each of the Heaviest 8 Hours of on Average Day, and	900	204%	27%	73% No
		(4) B Vehicle Volume, Along Minor Streets for Each of the Same 8 Hours	255	27%		
	2. Delay to Cross Traffic	(1) A Vehicle Volume, Along Major Street for Each of the Heaviest 8 Hours of an Average Day, and	900	197%	73%	
		(2) B Combined Vehicle and Pedestrian Volume <u>Crossing</u> the Major Street for Each of the Same 8 Hours	75	73%		

Notes

- 1 Vehicle Volume Warrants (1A), (2A) and (5B) for Roadways Having Two or More Moving Lanes in one Direction Should Be 25% Higher Than Values Given Above **Yes**
- 2 For Definition of Crossing Volume Refer to Note 4 on the Signal Warrant Analysis Form B2.03.08
- 3 The Lowest Sectional Percentage Governs the Entire Warrant
- 4 For "T" Intersections the Warrant Values for Minor Street Should be Increased by 50% (Warrant 1B only) **Yes**

APPENDIX H

DRAFT DESIGN: NEW SIGNALIZED INTERSECTION

APPENDIX I

TDM MEASURES

TDM-Supportive Development Design and Infrastructure Checklist:
Residential Developments (multi-family or condominium)

Legend	
REQUIRED	The Official Plan or Zoning By-law provides related guidance that must be followed
BASIC	The measure is generally feasible and effective, and in most cases would benefit the development and its users
BETTER	The measure could maximize support for users of sustainable modes, and optimize development performance

TDM-supportive design & infrastructure measures: <i>Residential developments</i>		Check if completed & add descriptions, explanations or plan/drawing references
1. WALKING & CYCLING: ROUTES		
1.1 Building location & access points		
BASIC	1.1.1 Locate building close to the street, and do not locate parking areas between the street and building entrances	<input checked="" type="checkbox"/> Most of parking underground
BASIC	1.1.2 Locate building entrances in order to minimize walking distances to sidewalks and transit stops/stations	<input checked="" type="checkbox"/> All main entrances abut sidewalks
BASIC	1.1.3 Locate building doors and windows to ensure visibility of pedestrians from the building, for their security and comfort	<input checked="" type="checkbox"/> modern building design with windows
1.2 Facilities for walking & cycling		
REQUIRED	1.2.1 Provide convenient, direct access to stations or major stops along rapid transit routes within 600 metres; minimize walking distances from buildings to rapid transit; provide pedestrian-friendly, weather-protected (where possible) environment between rapid transit accesses and building entrances; ensure quality linkages from sidewalks through building entrances to integrated stops/stations (<i>see Official Plan policy 4.3.3</i>)	<input checked="" type="checkbox"/> main entrances connect to sidewalks on both sides of the site access which connects to sidewalks on St. Laurent Blvd and transit stops
REQUIRED	1.2.2 Provide safe, direct and attractive pedestrian access from public sidewalks to building entrances through such measures as: reducing distances between public sidewalks and major building entrances; providing walkways from public streets to major building entrances; within a site, providing walkways along the front of adjoining buildings, between adjacent buildings, and connecting areas where people may congregate, such as courtyards and transit stops; and providing weather protection through canopies, colonnades, and other design elements wherever possible (<i>see Official Plan policy 4.3.12</i>)	<input checked="" type="checkbox"/> refer to comment 1.2.1.

TDM-supportive design & infrastructure measures: <i>Residential developments</i>		Check if completed & add descriptions, explanations or plan/drawing references
REQUIRED	1.2.3 Provide sidewalks of smooth, well-drained walking surfaces of contrasting materials or treatments to differentiate pedestrian areas from vehicle areas, and provide marked pedestrian crosswalks at intersection sidewalks (<i>see Official Plan policy 4.3.10</i>)	<input checked="" type="checkbox"/> sidewalks to be built to City Standards
REQUIRED	1.2.4 Make sidewalks and open space areas easily accessible through features such as gradual grade transition, depressed curbs at street corners and convenient access to extra-wide parking spaces and ramps (<i>see Official Plan policy 4.3.10</i>)	<input checked="" type="checkbox"/> sidewalks to be built to City Standards
REQUIRED	1.2.5 Include adequately spaced inter-block/street cycling and pedestrian connections to facilitate travel by active transportation. Provide links to the existing or planned network of public sidewalks, multi-use pathways and on-road cycle routes. Where public sidewalks and multi-use pathways intersect with roads, consider providing traffic control devices to give priority to cyclists and pedestrians (<i>see Official Plan policy 4.3.11</i>)	<input checked="" type="checkbox"/> internal sidewalks to connect to existing pedestrian and cycling infrastructure on St. Laurent Blvd. Additional connection to Everest Private for pedestrians and cyclists only
BASIC	1.2.6 Provide safe, direct and attractive walking routes from building entrances to nearby transit stops	<input checked="" type="checkbox"/> refer to comment in 1.2.5.
BASIC	1.2.7 Ensure that walking routes to transit stops are secure, visible, lighted, shaded and wind-protected wherever possible	<input checked="" type="checkbox"/> St. Laurent has existing road lighting
BASIC	1.2.8 Design roads used for access or circulation by cyclists using a target operating speed of no more than 30 km/h, or provide a separated cycling facility	<input type="checkbox"/>
1.3 Amenities for walking & cycling		
BASIC	1.3.1 Provide lighting, landscaping and benches along walking and cycling routes between building entrances and streets, sidewalks and trails	<input type="checkbox"/>
BASIC	1.3.2 Provide wayfinding signage for site access (where required, e.g. when multiple buildings or entrances exist) and egress (where warranted, such as when directions to reach transit stops/stations, trails or other common destinations are not obvious)	<input type="checkbox"/>

TDM-supportive design & infrastructure measures: <i>Residential developments</i>		Check if completed & add descriptions, explanations or plan/drawing references
2. WALKING & CYCLING: END-OF-TRIP FACILITIES		
2.1 Bicycle parking		
REQUIRED	2.1.1 Provide bicycle parking in highly visible and lighted areas, sheltered from the weather wherever possible (see <i>Official Plan policy 4.3.6</i>)	<input checked="" type="checkbox"/> Majority of bike parking proposed underground
REQUIRED	2.1.2 Provide the number of bicycle parking spaces specified for various land uses in different parts of Ottawa; provide convenient access to main entrances or well-used areas (see <i>Zoning By-law Section 111</i>)	<input checked="" type="checkbox"/> Developer suggests that at least the minimum required will be met
REQUIRED	2.1.3 Ensure that bicycle parking spaces and access aisles meet minimum dimensions; that no more than 50% of spaces are vertical spaces; and that parking racks are securely anchored (see <i>Zoning By-law Section 111</i>)	<input checked="" type="checkbox"/> bicycle parking to meet by-law standards
BASIC	2.1.4 Provide bicycle parking spaces equivalent to the expected number of resident-owned bicycles, plus the expected peak number of visitor cyclists	<input type="checkbox"/>
2.2 Secure bicycle parking		
REQUIRED	2.2.1 Where more than 50 bicycle parking spaces are provided for a single residential building, locate at least 25% of spaces within a building/structure, a secure area (e.g. supervised parking lot or enclosure) or bicycle lockers (see <i>Zoning By-law Section 111</i>)	<input checked="" type="checkbox"/> Majority of bike parking proposed in underground parking structure
BETTER	2.2.2 Provide secure bicycle parking spaces equivalent to at least the number of units at condominiums or multi-family residential developments	<input type="checkbox"/>
2.3 Bicycle repair station		
BETTER	2.3.1 Provide a permanent bike repair station, with commonly used tools and an air pump, adjacent to the main bicycle parking area (or secure bicycle parking area, if provided)	<input type="checkbox"/>
3. TRANSIT		
3.1 Customer amenities		
BASIC	3.1.1 Provide shelters, lighting and benches at any on-site transit stops	<input type="checkbox"/> no on-site transit stops
BASIC	3.1.2 Where the site abuts an off-site transit stop and insufficient space exists for a transit shelter in the public right-of-way, protect land for a shelter and/or install a shelter	<input type="checkbox"/> no on-site transit stops
BETTER	3.1.3 Provide a secure and comfortable interior waiting area by integrating any on-site transit stops into the building	<input type="checkbox"/> no on-site transit stops

TDM-supportive design & infrastructure measures: <i>Residential developments</i>		Check if completed & add descriptions, explanations or plan/drawing references
4. RIDESHARING		
4.1 Pick-up & drop-off facilities		
BASIC	4.1.1 Provide a designated area for carpool drivers (plus taxis and ride-hailing services) to drop off or pick up passengers without using fire lanes or other no-stopping zones	<input type="checkbox"/>
5. CARSHARING & BIKESHARING		
5.1 Carshare parking spaces		
BETTER	5.1.1 Provide up to three carshare parking spaces in an R3, R4 or R5 Zone for specified residential uses (<i>see Zoning By-law Section 94</i>)	<input type="checkbox"/>
5.2 Bikeshare station location		
BETTER	5.2.1 Provide a designated bikeshare station area near a major building entrance, preferably lighted and sheltered with a direct walkway connection	<input type="checkbox"/>
6. PARKING		
6.1 Number of parking spaces		
REQUIRED	6.1.1 Do not provide more parking than permitted by zoning, nor less than required by zoning, unless a variance is being applied for	<input checked="" type="checkbox"/> current parking proposed meets min/max allowed
BASIC	6.1.2 Provide parking for long-term and short-term users that is consistent with mode share targets, considering the potential for visitors to use off-site public parking	<input checked="" type="checkbox"/> surface parking for visitors separate from underground
BASIC	6.1.3 Where a site features more than one use, provide shared parking and reduce the cumulative number of parking spaces accordingly (<i>see Zoning By-law Section 104</i>)	<input checked="" type="checkbox"/> surface parking to be shared by commercial and residential visitors
BETTER	6.1.4 Reduce the minimum number of parking spaces required by zoning by one space for each 13 square metres of gross floor area provided as shower rooms, change rooms, locker rooms and other facilities for cyclists in conjunction with bicycle parking (<i>see Zoning By-law Section 111</i>)	<input type="checkbox"/>
6.2 Separate long-term & short-term parking areas		
BETTER	6.2.1 Provide separate areas for short-term and long-term parking (using signage or physical barriers) to permit access controls and simplify enforcement (i.e. to discourage residents from parking in visitor spaces, and vice versa)	<input checked="" type="checkbox"/> residential underground parking separate from surface visitor parking

TDM Measures Checklist:
Residential Developments (multi-family, condominium or subdivision)

Legend	
BASIC	The measure is generally feasible and effective, and in most cases would benefit the development and its users
BETTER	The measure could maximize support for users of sustainable modes, and optimize development performance
★	The measure is one of the most dependably effective tools to encourage the use of sustainable modes

TDM measures: Residential developments		Check if proposed & add descriptions
1. TDM PROGRAM MANAGEMENT		
1.1 Program coordinator		
BASIC	★ 1.1.1	Designate an internal coordinator, or contract with an external coordinator <input checked="" type="checkbox"/>
1.2 Travel surveys		
BETTER	1.2.1	Conduct periodic surveys to identify travel-related behaviours, attitudes, challenges and solutions, and to track progress <input type="checkbox"/>
2. WALKING AND CYCLING		
2.1 Information on walking/cycling routes & destinations		
BASIC	2.1.1	Display local area maps with walking/cycling access routes and key destinations at major entrances <i>(multi-family, condominium)</i> <input checked="" type="checkbox"/>
2.2 Bicycle skills training		
BETTER	2.2.1	Offer on-site cycling courses for residents, or subsidize off-site courses <input type="checkbox"/>

TDM measures: <i>Residential developments</i>		Check if proposed & add descriptions
3. TRANSIT		
3.1 Transit information		
BASIC	3.1.1 Display relevant transit schedules and route maps at entrances (<i>multi-family, condominium</i>)	<input checked="" type="checkbox"/>
BETTER	3.1.2 Provide real-time arrival information display at entrances (<i>multi-family, condominium</i>)	<input type="checkbox"/>
3.2 Transit fare incentives		
BASIC ★	3.2.1 Offer PRESTO cards preloaded with one monthly transit pass on residence purchase/move-in, to encourage residents to use transit	<input type="checkbox"/>
BETTER	3.2.2 Offer at least one year of free monthly transit passes on residence purchase/move-in	<input type="checkbox"/>
3.3 Enhanced public transit service		
BETTER ★	3.3.1 Contract with OC Transpo to provide early transit services until regular services are warranted by occupancy levels (<i>subdivision</i>)	<input type="checkbox"/>
3.4 Private transit service		
BETTER	3.4.1 Provide shuttle service for seniors homes or lifestyle communities (e.g. scheduled mall or supermarket runs)	<input type="checkbox"/>
4. CARSHARING & BIKESHARING		
4.1 Bikeshare stations & memberships		
BETTER	4.1.1 Contract with provider to install on-site bikeshare station (<i>multi-family</i>)	<input type="checkbox"/>
BETTER	4.1.2 Provide residents with bikeshare memberships, either free or subsidized (<i>multi-family</i>)	<input type="checkbox"/>
4.2 Carshare vehicles & memberships		
BETTER	4.2.1 Contract with provider to install on-site carshare vehicles and promote their use by residents	<input type="checkbox"/>
BETTER	4.2.2 Provide residents with carshare memberships, either free or subsidized	<input type="checkbox"/>
5. PARKING		
5.1 Priced parking		
BASIC ★	5.1.1 Unbundle parking cost from purchase price (<i>condominium</i>)	<input type="checkbox"/>
BASIC ★	5.1.2 Unbundle parking cost from monthly rent (<i>multi-family</i>)	<input checked="" type="checkbox"/>

TDM measures: <i>Residential developments</i>		Check if proposed & add descriptions
6. TDM MARKETING & COMMUNICATIONS		
6.1 Multimodal travel information		
BASIC ★	6.1.1 Provide a multimodal travel option information package to new residents	<input type="checkbox"/>
6.2 Personalized trip planning		
BETTER ★	6.2.1 Offer personalized trip planning to new residents	<input type="checkbox"/>
