LIST OF FIGURES

1 INTRODUCTION AND SITE DESCRIPTION

LRL. Associates LTD. was retained by Serco Realty Group to prepare a functional serviceability report to support the Official Plan Amendment and Zoning By-law amendment application for the property located at 1400 Bank Street within the City of Ottawa.

The subject site is within the Capital Ward, located on the west side of Bank Street and has an approximate area of 0.1814 ha, south of Belanger Avenue and north of Rockingham Street. The land is currently occupied by a one storey retail building with a paved parking area, brick walkway and some grass. The subject site can be seen below in figure 1.

Figure 1: Arial View of Subject Lands

Under the City of Ottawa Zoning by-law, the existing land is currently zoned Arterial Mainstreet, AM, Exception 1913 (AM1, [1913]). This servicing study has been prepared to support an Official Plan amendment and Zoning By-law amendment required to add a high-rise building as a permitted use on the Subject Property which is further expanded in in the planning documentation accompanying the submission.

The serviceability review summarized in this document has been completed to further investigate the potential for this property to be redeveloped to accommodate a 16-storey mixed use residential building with approximately 160 residential units and 6 commercial and office units. The concept site plan prepared by Figurr Architects, illustrating the proposed development can be found in appendix A at the back of this report.

Following the Official Plan Amendment and Zoning By-law amendment application, a detailed design will advance with intentions for full Site Plan Control application submission.

2 EXISTING SITE AND AVAILABLE SERVICES

J. D. Barnes Limited prepared a topographic survey of the subject property in January of 2020 which has been included in appendix B for reference. Based on the topography information available, the general elevation of the land is relatively flat.

Utilizing the GeoOttawa mapping portal as well as plan and profile drawings provided by the City of Ottawa indicate the following services are running along Bank Street and Belanger Avenue within the right-of-way in front of the property boundary.

Bank Street:

- 375 mm Sanitary Sewer
- 205 mm Water Main
- 305 mm Storm Sewer

Belanger Avenue:

- 300 mm Sanitary Sewer
- 305 mm Water Main
- 375 mm Storm Sewer

The existing building located central on the site is currently serviced to meet the domestic demand; however, these will be abandoned to accommodate the proposed development of a greater population.

3 WATER SUPPLY SERVICING

The site is intended to be services through a new 150 mm diameter water service connecting to the existing 305 mm PVC watermain within Bank Street.

Bases on the location and available data form the city, the subject property lies within the 2C pressure zone of the water distribution system.

3.1 Domestic Water Demands

Proposed populations have been interpreted from the architectural drawings. Based on the number of residential units within the building combined with the City of Ottawa design guidelines for population projection, the number of units translates to approximately 309 residents. Table 1 below summarizes the proposed population count based on the residential units as interpreted using table 4.1 of the City of Ottawa design guidelines.

Table 1: Development Residential Population Estimate

Proposed Unit Type	Persons Per Unit	Number of Units	Total Population
1 Bedroom unit	1.8	91	163.8
2 Bedroom Unit	2.1	69	144.9
		Total Residential Population	308.7

Table 2 below summarizes the water supply guidelines which must be employed during detailed design and sizing of the service to the building.

Table 2: Water Supply Guidelines

Design Parameter	Value
Residential Average Dailey Demand	280 L/person/Day
Maximum Dailey Peaking Factor (As per MOE Table 3-3)	7.3
Peak Hour Factor (As per MOE Table 3-3)	10.9
Minimum Depth of Cover	2.4m
Desired operating pressure range during normal operating conditions	350 kPa and 480 kPa
During normal operating conditions pressure must not drop below	275 kPa
During normal operating conditions pressure shall not exceed	552 kPa
During fire flow operating conditions pressure must not drop below	140 kPa

The required water supply requirements for the residential units in the proposed building have been calculated using the following formula:

Where:

$$Q = (q \times P \times M)$$

q = average water consumption (L/capita/day)
P = design population (capita)
M = Peak factor

Using a calculated Maximum Day Factor and Peak Hour factor of *3.8* and *5.6* respectively as per Table 3-3 in the *MOE Design Guidelines*, anticipated demands were calculated as follows:

- Average daily domestic water demand is **1.00** L/s,
- Maximum daily demand is **3.56** L/s, and
- Maximum hourly demand is **18.93** L/s.

Additionally, the proposed development comprises of commercial space equivalent to approximately 549 m^2 on the first floor and office space equivalent to approximately 498m^2 on the second floor. According to the City of Ottawa Guidelines, the average water demand for commercial use is **2,500 L/(1000 m^2/d)**, and the daily and hourly peak factors are approximately **1.5** and **2.7**, respectively. The peak design commercial water demands were calculated as follows:

$$Q = q \times A \times M$$

Where:
q = Average water demand (L/m^2/d)
A = Total site area (m^2)
M = Peak factor

Therefore, for the commercial and office area have an average daily demand of **0.030 L/s**, maximum daily is **0.045 L/s**, and maximum hourly is **0.082 L/s**. Adding the water demands from domestic and commercial uses, the total required water supply becomes **1.031 L/s** for average daily demand, **3.606 L/s** for maximum daily demand, and **19.011 L/s** for maximum hourly demand.

Based on maximum hourly rate of 19.011 L/s a minimum of 150 mm dia. servicing is required. Refer to *Appendix C* for water demand calculations.

During the detailed design which will take place during the site plan control process, it is recommended that the City of Ottawa is contacted to obtain boundary conditions associated with the final calculated water demands. At that time, further review will take place to ensure that pressures of the water network remain within the pressure ranges outlined in Table 2 above.

3.2 Fire Protection

The estimated fire flow for the proposed buildings was calculated in accordance with *ISTB-2018-02*. The following parameters were assumed during this functional serviceability review, with detailed input from the building Architect to be requested during the Site Plan Design stage.

- Type of construction – Non-Combustible/Concrete etc.
- Occupancy type – Combustible
- Sprinkler Protection – Automatic Fully Supervised Sprinkler System.

The estimated fire flow demand was estimated to be **4 000 L/min**, see *Appendix C* for details

There are four (4) existing fire hydrants in close proximity to the proposed buildings that are available to provide fire flow demands of approximately 22 000 L/min. Refer to *Appendix C* for fire hydrant locations. Table 3 below summarizes the aggregate fire flow of the contributing hydrants in close proximity to the proposed development based on Table 18.5.4.3 of *ISTB-2018-02*.

Table 3: Fire Protection Summary Table

Building	Fire Flow Demand (L/min)	Fire Hydrants(s) within 75m	Available Combined Fire Flow (L/min)
Proposed 6 Storey Building	TBD During Detailed Design (assumed 10 000 L/min)	4	(4 x 5678) = 22 000

The total available fire flow from contributing hydrants is equal to approximately 22,000 L/min which is sufficient to provide adequate fire flow for the proposed development. A certified fire protection system specialist will need to be employed to design the building's fire suppression system and confirm the actual fire flow demand.

4 SANITARY SERVICE

There is an existing 375 mm sanitary within Bank Street running across the frontage of the subject site ultimately conveying flow in the north-west direction.

The post development total sanitary effluent was calculated to be is **4.0 L/s** as a result of proposed residential population, commercial uses and a small portion of infiltration. Refer to Appendix *D* for further information on the calculated sanitary flows.

Based on existing as-built information (Refer to Appendix E), the existing 375 mm dia. sanitary sewer is sloped at 1.26% and is calculated to have a maximum capacity of approximately 211 L/s. The proposed increase in total wastewater flow from the increased population represents approximately 1.9% of the existing maximum capacity in the single sanitary sewer. Given that typical design principles are to design with a capacity contingency, and that the overall increase in flow is less than 2%, it is anticipated that the existing local sewer network has sufficient capacity to accommodate the proposed development.

5 STORMWATER MANAGEMENT

The existing site has a large portion of impervious area which will be mostly mimicked in post development conditions. A slight increase is expected in post development conditions as a result of a larger building footprint minimizing a portion of the landscaped area along the south border of the property.

At the time of detailed design, stormwater quantity will be dealt with to ensure that the post-development runoff discharge from the site is controlled to not exceed the 5-year storm release rate.

Given that the development concept is to have the building take up a large portion of the site boundary, there will be little opportunity for any overland drainage or storage. In order to control the quantity of runoff from the site, storage within the building (cistern) or the rooftop is intended.

Additionally, it is noted that the proposed site plan results in only a slightly higher runoff coefficient than that in the pre-development conditions. This is summarized in table 4 below.

Table 4: Pre-Development and Post-Development Runoff Coefficients

Pre-Development Conditions			Post-Development Conditions		
Grass Area (C=0.2)	Building Area/Asphalt (C=0.9)	Combined C Value	Grass Area (C=0.2)	Building Area/Asphalt (C=0.9)	Combined C Value
120m^2	1694m^2	0.85	50m^2	1764m^2	0.88

6 CONCLUSIONS AND SERVICEABILITY CONSIDERATIONS

This evaluation is limited to assessing the technical feasibility of servicing the site described within this document to support an Official Plan Amendment and Zoning By-law Amendment.

Based on the forgoing the conclusions in relation to the serviceability of the site are as follows:

- Water:
  - Total water (domestic and commercial) demands from the proposed high rise building are expected to be in the range of **1.031 L/s** for the Average daily demand, **3.606 L/s** for the maximum daily and **19.011 L/s** for maximum hourly.
  - 4 fire hydrants within 75m are expected to provide the required fire flow.
  - During detailed design, pressures available along Bank Street are to be investigated as it is expected to be serviced from the existing 205 mm PVC watermain.
- Sanitary Sewage:
  - The post development total sanitary effluent was calculated to be is **4.0 L/s** as a result of proposed residential population, commercial uses and a small portion of infiltration.
  - The flow from this development would make up a very small percentage (Less than 2.0 %) of the flow capacity of the existing 375 mm sanitary sewer in Bank Street.
- Stormwater
  - The small increase in impervious area along with strict quantity control requirements outlined by the City of Ottawa will require the site to implement a stormwater quantity management system.
  - Storage could be achieved via a cistern or rooftop storage on site to ensure flow is regulated to not release more than the allowable release rate.

7 CLOSURE

This document was prepared by LRL Associates Ltd. For exclusive use by Serco Realty Group. It may only be distributed in accordance and agreement with Serco.

HYDRANTS WITHIN 75 M

Table 18.5.4.3 Maximum Fire Hydrant Fire Flow Capacity

Distance to Building[a]		Maximum Capacity[b]	
(ft)	(m)	(gpm)	(L/min)
≤ 250	≤ 76	1500	5678
> 250 and ≤ 500	> 76 and ≤ 152	1000	3785
> 500 and ≤ 1000	> 152 and ≤ 305	750	2839

[a]Measured in accordance with 18.5.1.4 and 18.5.1.5.
[b]Minimum 20 psi (139.9 kPa) residual pressure.

APPENDIX D

Sanitary Service Calculations

LRL File No. 210617
Project: Apartment Building
Location: 1400 Bank Street, Ottawa
Date: October 26, 2021

Sanitary Design Parameters

Average Daily Flow = 280 L/p/day
Commercial & Institutional Flow = 50000 L/ha/day
Light Industrial Flow = 35000 L/ha/day
Heavy Industrial Flow = 55000 L/ha/day
Maximum Residential Peak Factor = 4.0
Commercial & Institutional Peak Factor = 1.5
Industrial Peak Factor = as per Appendix 4-B = 7
Extraneous Flow = 0.33L/s/gross ha

Pipe Design Parameters

Minimum Velocity = 0.60 m/s
Manning's n = 0.013

- Date of television inspection Oct 12, 1990 & March 1, 1995
- This plan supersedes (in whole or in part) plan •

Watermain Notes:

1. All watermain materials and construction methods shall be in accordance with the latest edition of the R M O C Environment Section Specifications and Standard Drawings
2. All connections of new watermains to existing watermains and all blankings of existing mains and services shall be performed by R M O C staff. The Contractor shall provide excavation, backfilling and reinstatement
3. All copper services (19mm to 51mm) shall be installed by R M O C staff after the watermain has been successfully disinfected
4. All new water services shall be installed at 2.4m cover
5. All new water services that conflict with sanitary and storm sewers at crossings shall be installed under the sewers unless otherwise directed by the Regional Project Manager
6. The proposed watermain shall be insulated at specified locations per R M O C Specification WSD 21 and 23
7. A minimum 2.0m separation is required between all new water services and catch basins or open structures and shall be insulated per R M O C Specification WSD-23 as applicable
8. A minimum 2.0m separation is required between all new hydrants and catch basins or open structures and shall be insulated per R M O C Specification WSD 23 as applicable
9. The Contractor shall be responsible to determine via excavation, the exact location and elevation of the existing watermains as required for all connections relocations and blankings
