FEBRUARY 2023

**CITY OF OTTAWA
PROJECT NO.: 22-12**

1.0 INTRODUCTION

David Schaeffer Engineering Limited (DSEL) has been retained to prepare a Functional Servicing Report in support zoning by-law amendment and draft plan of subdivision for the Orleans Village (OV) Phase 4 development on behalf of Caivan (Orleans Village 2) Limited (COVL).

The subject property at 245 and 275 Lamarche Avenue is located within the City of Ottawa urban boundary in the Innes Ward and is defined in the attached General Plan (DSEL, 2018) provided in **Appendix A**. The subdivision encompasses lands south of Innes Road, east of Lamarche Avenue and north of existing OV Phases 1, 2 and 3. The subject property is known as PIN 04404-1892 and is under private ownership, and measures approximately 4.5ha. The existing Orleans Village is shown in the legal plan found in **Appendix A** prepared by J.D. Barnes Limited with the subject lands referenced as Blocks 147 and 148

The subject property is zoned as a Development Reserve (DR) Zone. Per the detailed **Design Brief** prepared in November 2018 for Caivan (Orleans Village) Limited 340 Innes Road, the existing servicing infrastructure has been designed to accommodate development of 245 and 275 Lamarche Avenue. As-built engineering drawings of Lamarche Avenue are located in **Appendix A**.

The objective of this report is to provide sufficient detail to demonstrate that the proposed development area can be supported by municipal services.

1.1 Existing Conditions

The subject lands totals 4.5 hectares. The subdivision lands are currently undeveloped and are within the jurisdiction of the Rideau Valley Conservation Authority. Light industrial uses are associated with the adjacent properties to the north and east of the subject property. The subject property shares its west and south boundary with residential lots. The existing elevation within the subject property generally ranges between 88m - 92m. The topography is gently sloping from north (higher) to south (lower).

There is minimal vegetation present within the subject property with much of the property being composed of agricultural land and parking lots with few trees present. The subsurface conditions of the subject property, the subsurface conditions consist of fill and glacial till overlaying shallow limestone bedrock (Golder, November 2016). Geotechnical studies and other studies related to the Planning Act applications for the subject lands will characterize and provide management recommendations for subsurface conditions, including soil, rock, groundwater, and any nearby wells.

1.2 Development Layout

The proposed development consists of a park block, residential blocks with a mix of townhouse, rear lane townhouse, back-to-back townhomes, 18.0m right-of-way (ROW), and 14.75m ROW (see proposed draft plan in **Appendix A**)

The predicted populations currently associated with the development concept are described in Table 1.

Table 1: Development Statistics for Orleans Village Phase 4

Land Use	Total Area (ha)	Projected Residential Units	Residential Population per Unit *	Projected Population
Townhouses	1.38	74	2.7	~200
Back to Back Townhomes	0.93	92	2.7	~248
Rear Lane Townhomes	0.26	19	2.7	~51
Parks/walkways	0.28			
Local Roads	1.66			
Total	4.52	185		~499

* NOTE: Population projections may differ from population estimates used in background Transportation Studies, Planning Rationale, and other studies.

1.3 Consultation Summary

Consultation with the City of Ottawa was initiated by COVL in February 2022, under the *Planning Act* process for development applications. The City of Ottawa submitted a set of relevant engineering comments from the pre-application consultation, which are provided in **Appendix A**. The key items areas are as follow:

- Water: Service areas with a basic demand greater than 50 m³/day shall be connected with a minimum of two water services, separated by an isolation valve, to avoid creation of vulnerable service area; and a District Metering Area Chamber (DMA) is required for services 150mm or greater in diameter.
- Wastewater: DSEL to demonstrate that adequate capacity for Phase 4 has been allocated by the existing OV per the Design Brief.
- Stormwater: site is subject to Development Charges for the Gloucester Urban Center Stormwater Management Facilities; existing STM Pond 1 must be upgraded prior to the development of this site per the OV Design Brief; and RVCA to confirm quality control requirements.

1.4 Required Permits / Approvals

Once Draft Plan of Subdivision is obtained, the City of Ottawa must approve detailed engineering design drawings and reports prior to construction of the municipal infrastructure identified in this report.

FUNCTIONAL SERVICING REPORT
 CAVAN (ORLEANS VILLAGE 2) LIMITED
 PROPOSED RESIDENTIAL SUBDIVISION

The following additional approvals and permits listed in Table 2 are expected to be required prior to construction of the municipal infrastructure detailed herein. Other permits and approvals may be required, as detailed in the other studies submitted as part of the Planning Act applications (e.g. *Tree Conservation Report*, *Phase 1 Environmental Site Assessment*, etc.).

Table 2: Potential Required Permits/Approvals

Agency	Permit/Approval Required	Trigger	Remarks
MECP / City of Ottawa	Environmental Compliance Approval	Construction of new sanitary & storm sewers.	MECP is expected to review the stormwater collection system and wastewater collection system by transfer of review.
MECP	Permit to Take Water	Construction of proposed land uses (e.g. basements for residential homes) and services.	Pumping of groundwater will be required during construction, given groundwater conditions and proposed land uses/ municipal infrastructure.
City of Ottawa	MOE Form 1 – Record of Watermains Authorized as a Future Alteration	Construction of watermains.	The City of Ottawa is expected to review the watermains on behalf of the MECP.

2.0 GUIDELINES, PREVIOUS STUDIES, AND REPORTS

2.1 Existing Studies, Guidelines, and Reports

3.0 WATER SUPPLY SERVICING

3.1 Existing Water Supply Services

The subject property is located within the 2E pressure zone, as shown in the excerpt from the City of Ottawa Water Distribution Mapping in **Appendix B**. The proposed subdivision is located north of the Town's current watermain network located in the existing Orleans Village. A 400mm diameter watermain exists within the Innes Road ROW and a 300mm diameter watermain exists on the Lamarche Avenue ROW. In addition, 200mm diameter watermain stubs with dropped at the southeast corners of blocks 147 and 148.

3.2 Water Supply Servicing Design

The City of Ottawa was contacted on March 16, 2022, to obtain boundary conditions associated with the estimated water demand as indicated in the boundary request correspondence included in **Appendix B**. The City of Ottawa provided both the anticipated minimum and maximum water pressures, as well as the estimated water pressure during fire flow demand for the demands.

Figure 6 shows the proposed configuration of watermains for the subject property. The proposed system has a looped connection to the existing 300mm diameter watermain on Lamarche Avenue that connects to the existing 400mm diameter watermain on Innes Road.

The water servicing approach for the subject lands is for potable water to be supplied through pressurized local watermains on each street conforming to the **Water Supply Guidelines**.

Table 3: Water Supply Design Criteria

Design Parameter	Value
Residential Single Detached	3.4 P/unit
Residential Townhouse	2.7 P/unit
Residential Average Daily Demand	280 L/d/P
Residential Maximum Daily Demand	3 x Average Daily *
Residential Maximum Hourly*	5.5 x Average Daily *
Minimum Watermain Size	150 mm diameter
Minimum Depth of Cover	2.4 m from top of watermain to finished grade
During normal operating conditions desired operating pressure is within	350 kPa and 480 kPa
During normal operating conditions pressure must not drop below	275 kPa
During normal operating conditions pressure must not exceed	552 kPa
During fire flow operating pressure must not drop below	140 kPa

*Residential Max. Daily and Max. Hourly peaking factors per MOE Guidelines for Drinking-Water Systems Table 3-3 for 0 to 500 persons. City Guidelines used for populations greater than 500 persons.

-Table updated to reflect ISTB-2018-02

Table 4, below, summarizes the estimated domestic water and fire flow demands along with the boundary conditions provided by the City.

Table 4: Water Demand Proposed Conditions

Design Parameter	Estimated Demand ¹ (L/s)	Boundary Condition Connection 1 (m H ₂ O / kPa)	Boundary Condition Connection 2 (m H ₂ O / kPa)
Average Daily Demand	1.62	130.8 / 397.3	130.8 / 410.1
Maximum Daily Demand Fire Scenario #1	$4.70 + 166.7 = 171.4$	126.9 / 359.0	125.7 / 360.0
Maximum Daily Demand Fire Scenario #2	$4.70 + 233.3 = 238.0$	124.8 / 338.4	122.6 / 329.6
Maximum Hourly Daily Demand	6.97	127.1 / 361.0	127.1 / 373.8
<ul style="list-style-type: none"> • Water demand calculation per Water Supply Guidelines. See Appendix B for detailed calculations. • Ground elevation at Connection 1 = 90.3m • Ground elevation at Connection 2 = 89.0m 			

Fire demands were estimated to be limited 10,000 L/min for townhomes conforming to **ISTB-2014-02**. The contemplated rear lane town house units and back-to-back units had an estimated fire flow of 14,000L/min. Fire flow calculations are detailed in the **Appendix B**, calculated in accordance with the **Fire Underwriters Survey's Water Supply for Public Fire Protection Guideline** (1999) and **Technical Bulletins ISDTB-2014-02** and **ISTB-2018-02**.

The City provided both the anticipated minimum and maximum water pressures, as well as, the estimated water pressure during fire flow demand for the demands indicated by the correspondence in **Appendix B**. As shown in **Table 4**, the minimum and maximum pressures fall within the required range identified in **Table 3**.

Development statistics have evolved slightly since the original boundary condition requested, however fire flow demands remain consistent with previous requests.

3.3 Water Supply Conclusion

It is anticipated that the proposed concept plan OV Phase 4 can be adequately serviced by a network of local water mains that connects to existing infrastructure on Lamarche Avenue.

The City of Ottawa must confirm available water pressures during average, peak hourly, and fire flow demands.

The proposed water supply design will conform with all relevant City of Ottawa Guidelines and Policies.

4.0 WASTEWATER SERVICING

4.1 Existing Wastewater Services

Sanitary sewers exist west of the Phase 4 area and are located along Lamarche Avenue (see sanitary drainage plan found in **Appendix C**, extracted from the approved subdivision plans). The outlet connection to existing sewers is as follows:

- Existing 375 mm / 250 mm diameter sanitary trunk running north along Lamarche Avenue at an approximate depth of 86.5 that extends just to the southern corner of Block 148.
- Wastewater outlet for Block 147 - MH104A to MH 23A; Block 148 - MH 101A to MH22A

The subject site, Blocks 147 and 148, were considered in the **Design Brief**, which previously contemplated sanitary outflows from the subject lands. Block 147 had accounted for a population allowance of 1039 people for a 2.16-hectare area; and Block 148 had accounted for a population allowance of 1222 persons and a 2.54-hectare area.

4.2 Wastewater Design

The development is proposed to connect to the existing sanitary sewer within Lamarche Avenue. The subject property will be serviced by an internal gravity sewer system that follows the local road network and any required easements. The subject lands are tributary to Lamarche Avenue and will discharge through the existing infrastructure in accordance with the approved Master Servicing Study and subsequent background studies. The existing main described above on Lamarche Avenue will need to be extended approximately 90 m north to service the proposed Rear Lane Towns.

The Phase 4 development plan was estimated to have a population of 500. The proposed Phase 4 design anticipates a peak flow of **6.96 L/s**. Refer to calculations in **Appendix C** for details. The contemplated development plan reduces the expected wastewater contributions from the subject lands by approximately 70%. The reduction in population is not expected to have a negative impact on the receiving sewers. The as-built sanitary sewer calculation sheet is included in **Appendix C**.

Sufficient depth exists for frost cover and gravity to support the subject development.

Table 5, below, summarizes the **City Standards** to be employed in the design of the proposed wastewater sewer system.

Table 5: Wastewater Design Criteria

Design Parameter	Value
Residential – Townhome/ Semi	2.7 P/unit
Residential – Apartment / Back To Back	1.8 P/unit
Average Daily Demand	280 L/d/per
Peaking Factor	Harmon's Peaking Factor. Max 4.0, Min 2.0 Harmon's Corrector Factor 0.8
Infiltration and Inflow Allowance	0.05 L/s/ha (Dry Weather) 0.28 L/s/ha (Wet Weather) 0.33 L/s/ha (Total)
Park Flows	0.33 L/s/ha
Parking Peaking Factor	9300 L/ha/d
Sanitary sewers are to be sized employing the Manning's Equation	$Q = \frac{1}{n} AR^{2/3} S^{1/2}$
Minimum Sewer Size	200 mm diameter
Minimum Manning's 'n'	0.013
Minimum Depth of Cover	2.5 m from crown of sewer to grade
Minimum Full Flowing Velocity	0.6 m/s
Maximum Full Flowing Velocity	3.0 m/s

Extracted from Sections 4 and 6 of the City of Ottawa Sewer Design Guidelines, October 2012, and recent residential subdivisions in City of Ottawa (including revisions per ISTB Sewer-2018-01)

4.3 Wastewater Servicing Conclusions

The site is tributary to the Lamarche Avenue sewer. The subject property will be serviced by local sanitary sewers which will outlet to the existing infrastructure on Lamarche Avenue ROW. There is residual capacity in the downstream sewers there is sufficient capacity within the existing infrastructure to accommodate the flow from the proposed development.

The proposed wastewater design conforms to all relevant **City Standards**.

5.0 STORMWATER MANAGEMENT

5.1 Existing Stormwater Services

Stormwater runoff from the subject property is tributary to the City of Ottawa sewer system located on Lamarche Avenue (see **Stormwater Drainage Plan** found in **Appendix D**, extracted from the approved subdivision plans).

The existing stormwater runoff from the site area generally drains west and is collected by the existing storm sewer located on Lamarche Avenue. Stormwater is directed overland by sheet flow from north to south towards the East Urban Community Pond 1 (EUC Pond 1) North Forebay/North Main Cell as well as associated existing ditch depressions. The outlet connection to existing sewers for the Phase 4 property is as follows:

- Existing 1350 mm / 825 mm / 375 mm / 300 mm diameter stormwater outlets run north along Lamarche Avenue. Stormwater control outlet for Block 147 - MH101 to MH 13; Block 148 - MH 104 to MH15

Flows that influence the watershed in which the subject property is located are further reviewed by the conservation authority. The subject property is located within the Ottawa River watershed and is therefore subject to review by the Rideau Valley Conservation Authority (RVCA).

The subject site, comprising of blocks 147 and 148 was contemplated to have a Rational Method Runoff coefficient of 0.80 (Block 147 2.16ha @ 0.75 and Block 148 2.54ha @ 0.85). The Design Brief assumed time of concentrations of 10mins for each block for a total expected peak flow of 815L/s.

The subject property was included in the area tributary to the East Urban Community Pond 1 (EUC Pond 1). In December 2020 DSEL submitted and received approval for a Master Servicing Study to support the community wide servicing infrastructure for the Community Design Plan area, East Urban Community Phase 3. The subject lands, while outside of the Phase 3 area, were illustrated as tributary to the EUC Pond 1. See Drawing 4 extracted from the December 2020 MSS in **Appendix D**. DSEL / JFSA prepared and submitted a **SWM Report** in support of modifications to the north main cell and north forebay of EUC Pond 1 in October 2022. The subject lands were contemplated in the sizing of the modifications and had assumed an overall imperviousness of ~86%. See Figure 2 extracted from the SWM Report in **Appendix D**.

5.2 Post-Development Stormwater Management Target

Stormwater management requirements for the subject property have been carried forward from the **Design Brief** and **SWM Report**.

The following City standards are required for stormwater management within the subject property:

- Storm sewers on local roads are to be designed to provide a minimum 2-year level of service per the City's latest Technical Bulletin PIEDTB-2016-01;
- Provide Parks with a 5-year level of service;

- For less frequent storms (i.e. larger than 1:2 year minimum or 1:5 year minimum), the minor system sewer capture will be restricted with the use of inlet control devices to prevent excessive hydraulic surcharges;
- Under full flow conditions, the allowable velocity in storm sewers is to be no less than 0.80 m/s and no greater than 6.0 m/s;
- For the 100-year storm and for all roads, the maximum depth of water (static and/or dynamic) on streets, rear yards, public space and parking areas shall not exceed 0.35 m at the gutter;
- When catchbasins are installed in rear yards, safe overland flow routes are to be provided to allow the release of excess flows from such areas. A minimum of 30 cm of vertical clearance is required between the rear yard spill elevation and the ground elevation at the adjacent building envelope;
- The product of the maximum flow depths on streets and maximum flow velocity must be less than 0.60 m²/s on all roads;
- Quality Controls are addressed in the existing downstream stormwater management facility.

5.3 Proposed Minor System

The subject property is expected to be serviced by an internal gravity storm sewer system that is to generally follow the local road network and servicing easements as required.

Table 6: Storm Sewer Design Criteria

Design Parameter	Value
Minimum Minor System Design Return Period	2-Year (Local Streets), 5-Year (Collector Streets), 10-Year (Arterial Streets) – PIEDTB-2016-01; Park 5-year
Major System Design Return Period	1:100 year
Intensity Duration Frequency Curve (IDF) 2-year storm event: A = 732.951; B = 6.199; C = 0.810 5-year storm event: A = 998.071; B = 6.053; C = 0.814	$i = \frac{A}{(t_c + B)^C}$
Minimum Time of Concentration	10 minutes
Rational Method	$Q = CiA$
Storm sewers are to be sized employing the Manning's Equation	$Q = \frac{1}{n} AR^{2/3} S^{1/2}$
Runoff coefficient for paved and roof areas	0.9
Runoff coefficient for landscaped areas	0.2
Minimum Sewer Size	250 mm diameter
Minimum Manning's 'n' for pipe flow	0.013
Minimum Depth of Cover	2.0m from crown of sewer to grade
Minimum Full Flowing Velocity	0.8 m/s
Maximum Full Flowing Velocity	6.0 m/s (where velocities in excess of 3.0 m/s are proposed, provision shall be made)

	to protect against displacement of sewers by sudden movement)
Clearance from 100-Year Hydraulic Grade Line to Building Opening (USF)	0.30 m
Max. Allowable Flow Depth on Municipal Roads	35 cm above gutter (PIEDTB-2016-01)
Extent of Major System	To be contained within the municipal right-of-way or adjacent to the right-of-way provided that the water level must not touch any part of the building envelope and must remain below the lowest building opening during the stress test event (100-year + 20%) and 15cm vertical clearance is maintained between spill elevation on the street and the ground elevation at the nearest building envelope (PIEDTB-2016-01)
Stormwater Management Model	DDSWMM (release 2.1), SWMHYMO (v. 5.02) and XPSWMM (v. 10)
Model Parameters	$F_o = 76.2 \text{ mm/hr}$, $F_c = 13.2 \text{ mm hr}$, DCAY = 4.14/hr, D.Stor.Imp. = 1.57 mm, D.Stor.Per. = 4.67 mm
Imperviousness	Based on runoff coefficient (C) where Percent Imperviousness = $(C - 0.2) / 0.7 \times 100\%$.
Design Storms	Chicago 3-hour Design Storms and 24-hour SCS Type II Design Storms. Maximum intensity averaged over 10 minutes.
Historical Events	July 1st, 1979, August 4th, 1988 and August 8th, 1996
Climate Change Street Test	20% increase in the 100-year, 3-hour Chicago storm
<i>Extracted from City of Ottawa Sewer Design Guidelines, October 2012, and Technical Bulletins</i>	

See sewer design sheet included in **Appendix D**.

5.4 Hydraulic Grade Line Analysis

A detailed hydraulic grade line (HGL) modelling analysis will be completed for the proposed system at the detailed design level, based on the 100-year 3-hour Chicago, 12-hour DCD, and 24-hour SCS design storms, including historical design storms and climate change stress test as required.

5.5 Major System Design

Major system conveyance, or overland flow (OLF), will be provided to accommodate flows more than the minor system capacity. OLF is accommodated by generally storing stormwater up to the 100-year design event in road sags then routing additional surface flow along the road network and service easements towards the proposed drainage features.

The **Design Brief** and **SWM Report** assumed that the subject lands would be designed as private development blocks complete with on-site storage. Furthermore, the SWM Report assumed minor system release rates for Block 147 to be limited to the 2-year + 20% and Block 148 to the 2-year event.

The **SWM Report** estimated impervious values of 79% for Block 147 and 93% for Block 148, for a combined imperviousness of 86%. The revised draft plan has an estimated imperviousness of 66%. Refer to runoff coefficient figures included in **Figures** and summary in **Table 7**. JFSA reviewed the impacts on the downstream infrastructure of reducing the imperviousness of the site. Results of their analysis are included in **Appendix D**. JFSA concluded that Phase 4 Orleans Village will not negatively impact the operation of EUC Pond 1 or the Orleans Village storm sewer system.

Table 7: Runoff Coefficient Summary

Land Use	Total Area (ha)	C
Townhouses	1.38	0.62
Back to Back Townhomes	0.93	0.74
Rear Lane Townhomes	0.26	0.74
Parks/walkways	0.28	0.40
18.0m ROW	1.46	0.67
14.75m ROW	0.20	0.81
Total / Weighted C	4.52	0.66

5.6 Grading and Drainage Design

The following additional grading criteria and guidelines are applied to detailed design, per City of **Ottawa Guidelines**:

- Driveway slopes will have a maximum slope of 6%;
- Slope in grassed areas will be between 2% and 7%;
- Grades in excess of 7% will require terracing to a maximum of a 3:1 slope;
- Swales are to be 0.15m deep with 3:1 side slopes unless otherwise indicated on the drawings; and,
- Perforated pipe will be required for drainage swales if they are less than 1.5% in slope.

The proposed road profile will consist of a saw tooth road pattern. Roughly 500m of the proposed 18m right-of-way will be graded with a high-point to high-point at 0.2% or less. Approximately 145m³/100m of surface storage can be accommodated within a saw tooth pattern at 0.2%. Therefore, it is anticipated that 750m³ of sag storage is available within the right-of-way. See figure in **Appendix D** for additional information.

FUNCTIONAL SERVICING REPORT
CAIVAN (ORLEANS VILLAGE 2) LIMITED
PROPOSED RESIDENTIAL SUBDIVISION

Figure 3 illustrates the conceptual grading for the contemplated development. External areas north of the development will be captured by the proposed system. External lands to the east will be conveyed around the development in a cut of swale. The grading plan is consistent with approved plans for Phase 1 and 2 of Orleans Village.

Draft 14.75m and 18m cross-sections have been appended to this report.

5.7 Stormwater Servicing Conclusions

The site is tributary to the Lamarche Avenue storm sewer. The subject property will be serviced by local storm sewers which will outlet to the existing infrastructure on Lamarche Avenue ROW.

The subject site was contemplated in the design of the receiving sewers and stormwater management facility at a higher imperviousness than the current proposal.

There is residual capacity in the downstream sewers there is sufficient capacity within the existing infrastructure to accommodate the flow from the proposed development.

The contemplated design conforms to all relevant **City Standards**.

6.0 EROSION AND SEDIMENT CONTROL

Soil erosion occurs naturally and is a function of soil type, climate and topography. The extent of erosion losses is exaggerated during construction where vegetation has been removed and the top layer of soil becomes agitated. Prior to topsoil stripping, earthworks or construction, erosion and sediment controls will be implemented and will be maintained throughout construction.

Silt fencing will be installed around the perimeter of the active part of the site (and headwater features) and will be cleaned and maintained throughout construction. The silt fence will remain in place until the working areas have been stabilized and re-vegetated. Material stockpiles shall not be permitted near the existing EUC Pond 1.

Catchbasins will have catchbasin inserts installed during construction to protect from silt entering the storm sewer system.

A mud mat will be installed at the construction access to prevent mud tracking onto adjacent roads.

The following additional recommendations to the Contractor will be included in contract documents:

- Limit extent of exposed soils at any given time.
- Re-vegetate exposed areas as soon as possible.
- Minimize the area to be cleared and grubbed.
- Protect exposed slopes with plastic or synthetic mulches.
- Install silt fence to prevent sediment from entering any existing ditches.
- No refueling or cleaning of equipment near existing watercourses.
- Provide sediment traps and basins during dewatering.

The Contractor will be required to complete regular inspections and guarantee proper performance. The inspection is to include:

- Verification that water is not flowing under silt barriers.
- Clean and change inserts at catch basins.

FUNCTIONAL SERVICING REPORT
CAIVAN (ORLEANS VILLAGE 2) LIMITED
PROPOSED RESIDENTIAL SUBDIVISION

7.0 CONCLUSION AND RECOMMENDATIONS

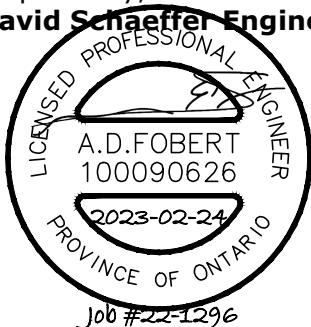

David Schaeffer Engineering Ltd. (DSEL) has been retained by Caivan (Orleans Village 2) Limited to prepare a Functional Servicing Report in support of the application for draft plan of subdivision at 245 and 275 Lamarche Avenue. The preceding report outlines the following:

- Water – a 300mm diameter water main is available to support the subject lands. Sufficient pressure is available within the City of Ottawa's desired pressure range.
- Wastewater – Sanitary sewers are available on Larmarche Avenue and were designed to sufficiently convey wastewater from the subject property.
- Stormwater – Block 147 and 148 were previously conceived to be private development blocks with on-site storage. The proposed change in land use and resulting reduction in imperviousness reduces site runoff and storage requirements. JFSA reviewed the impacts of the proposed changes to the receiving stormwater infrastructure and concluded that there are no .

The submitted materials demonstrate that the existing water, sanitary, and storm services can accommodate the contemplated development.

Site Plan/Zoning Pre-Application Consultation Notes

Date: Tuesday, February 8, 2022.

Site Location: 245, 275 Lamarche Ave

Type of Development: Residential (townhomes, stacked, singles, apartments), Office Space, Commercial, Retail, Institutional, Industrial, Other: N/A

Infrastructure

Water

Existing public services:

- Lamarche Ave – 305mm PVC

Watertmain Frontage Fees to be paid (\$190.00 per metre) Yes No

Boundary conditions:

Civil consultant must request boundary conditions from the City's assigned Project Manager prior to first submission.

- Water boundary condition requests must include the location of the service(s) and the expected loads required by the proposed developments. Please provide all the following information:
 - Location of service(s)
 - Type of development and the amount of fire flow required (as per FUS, 1999)
 - Average daily demand: ____ L/s
 - Maximum daily demand: ____ L/s
 - Maximum hourly daily demand: ____ L/s
- Fire protection (Fire demand, Hydrant Locations)

General comments

- Service areas with a basic demand greater than 50 m³/day shall be connected with a minimum of two water services, separated by an isolation valve, to avoid creation of vulnerable service area.
- A District Metering Area Chamber (DMA) is required for services 150mm or greater in diameter.

Sanitary Sewer

Existing public services:

- Lamarche Ave – 250mm PVC

Is a monitoring manhole required on private property? Yes No

General comments

- The designer must demonstrate that the proposed development is within the sanitary capacity that was allocated as part of the Orleans Village detail design servicing report:
 - Design Brief for Caivan (Orleans Village) Ltd 340 Innes Road, prepared by DSEL, project 15-881, dated Nov 2018, rev 3

Storm Sewer

Existing public services:

- Lamarche Ave – 250mm PVC

General comments

- The site is subject to the Development Charges for the Gloucester Urban Center Stormwater Management Facilities
- The existing SWM Pond 1 must be upgraded prior to the development of this site. Please refer to the Orleans Village detail design report:
 - Design Brief for Caivan (Orleans Village) Ltd 340 Innes Road, prepared by DSEL, project 15-881, dated Nov 2018, rev 3

- Stormwater Management Report for the Orleans Village Subdivision, prepared by JFSA, project 883-10, dated Jan 2018, rev Jul 2018.

Stormwater Management

Quality Control:

- Rideau Valley Conservation Authority to confirm quality control requirements.

Quantity Control:

- Site is located within the Mud (Green's) Creek Area Subwatershed Study Area draining to the Ottawa River
- Allowable flowrate: The existing subdivision servicing report should be referenced for permitted release rates and LID features to be incorporated
- When both underground and above ground storage is utilized, the release rate from the system will significantly differ than when solely one level storage is being used (i.e. greater range of head vs smaller change of head during storm event). If both levels of storage are to be accounted for then there are two options for SWM calculations: 1) use a dynamic computer model or 2) use an assumed average flow rate of half (50%) of the controlled peak flow rate of the area(s) utilizing two levels of storage.

General Service Design Comments

- Existing sewer or watermains that are not reused must be decommissioned as per City Standards. Please show all road cuts on the plans.
- The City of Ottawa Standard Detail Drawings should be referenced where possible for all work within the Public Right-of-Way.
- The subdivision agreement conditions should be referred to when preparing the application to sure all remaining noise barriers, sidewalks, infrastructure features have been included

Other

Capital Works Projects within proximity to application? Yes No

- There is currently an intersection modification occurring at Innes Rd and Lamarche Ave

References and Resources

- As per section 53 of the Professional Engineers Act, O. Reg 941/40, R.S.O. 1990, all documents prepared by engineers must be signed and dated on the seal.
- All required plans & reports are to be provided in *.pdf format (at application submission and for any, and all, re-submissions)

Hello Rubina,

I understand that Caivan Communities completed a pre-consultation with the City on February 8, 2022 for the properties at 245 & 275 Lamarche Avenue and that you have been assigned as the Infrastructure Approvals Project Manager.

We would like to request watermain boundary conditions for the subject lands to support the submission for zoning amendment and draft plan of subdivision.

Please see the attached location of proposed service connection points.

The subject lands are residential containing townhomes, rear lane townhomes, and back to back units. We anticipate the following required fire flow per ISTB-2018:

- 10,000L/min
- 14,000L/min

Average daily demand: 1.53L/s

Maximum daily demand: 4.45L/s

Maximum hourly daily demand: 6.59L/s

Let me know if you require any additional information.

Adam Fobert, P.Eng.

% Increase						59% value not to exceed 75%

Increase

5015.0 L/min

Lw = Length of the Exposed Wall

Ha = number of storeys of the adjacent structure. Max 5 stories

LH = Length-height factor of exposed wall. Value rounded up.

EC = Exposure Charge

Total Fire Flow

Fire Flow

13515.0 L/min

14000.0 L/min rounded to the nearest 1,000 L/min

Notes:

-Type of construction, Occupancy Type and Sprinkler Protection information provided by _____.

-Calculations based on City of Ottawa ISTB-2018

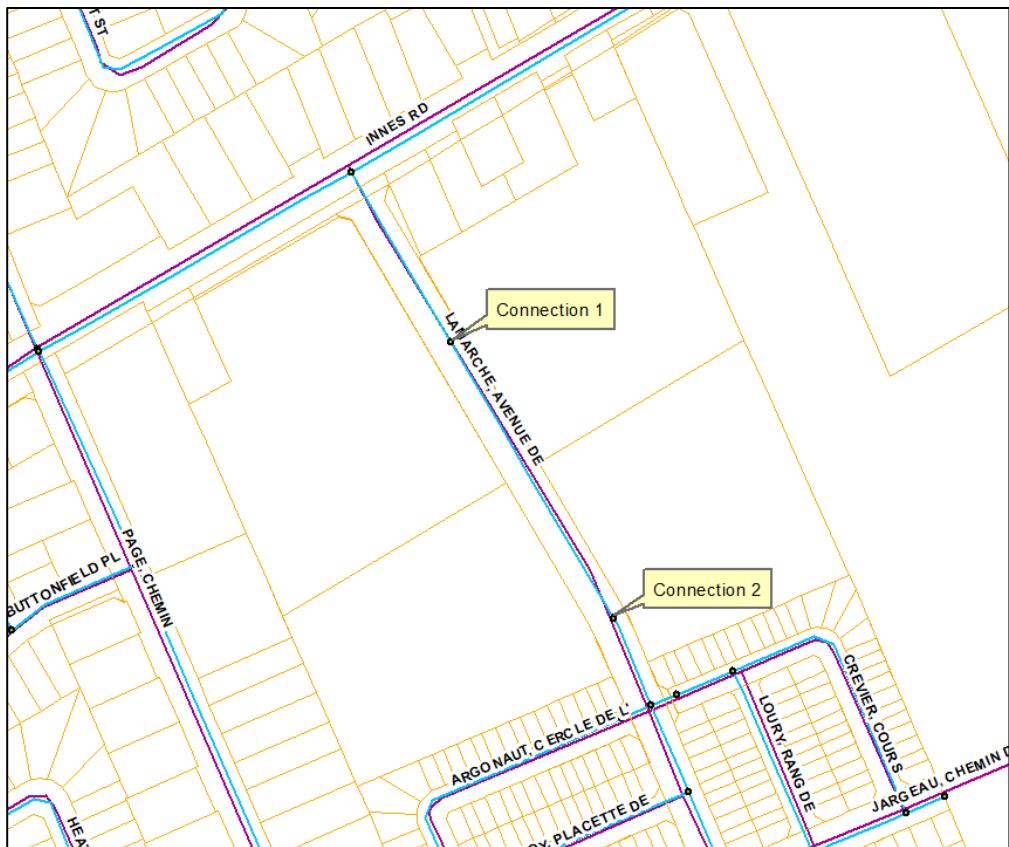

Boundary Conditions

1296 Caivan - Orleans Village Ph 4

Provided Information

Scenario	Demand	
	L/min	L/s
Average Daily Demand	92	1.53
Maximum Daily Demand	267	4.45
Peak Hour	395	6.59
Fire Flow Demand #1	10,000	166.67
Fire Flow Demand #2	14,000	233.33

Location

Results

Connection 1 – Lamarche Ave.

Demand Scenario	Head (m)	Pressure ¹ (psi)
Maximum HGL	130.8	57.6
Peak Hour	127.1	52.3
Max Day plus Fire 1	126.9	52.0
Max Day plus Fire 2	124.8	49.0

Ground Elevation = 90.3 m

Connection 2 – Lamarche Ave.

Demand Scenario	Head (m)	Pressure ¹ (psi)
Maximum HGL	130.8	59.5
Peak Hour	127.1	54.3
Max Day plus Fire 1	125.7	52.3
Max Day plus Fire 2	122.6	47.9

Ground Elevation = 89.0 m

Disclaimer

The boundary condition information is based on current operation of the city water distribution system. The computer model simulation is based on the best information available at the time. The operation of the water distribution system can change on a regular basis, resulting in a variation in boundary conditions. The physical properties of watermains deteriorate over time, as such must be assumed in the absence of actual field test data. The variation in physical watermain properties can therefore alter the results of the computer model simulation. Fire Flow analysis is a reflection of available flow in the watermain; there may be additional restrictions that occur between the watermain and the hydrant that the model cannot take into account.

Wastewater Design Flows per Unit Count
City of Ottawa Sewer Design Guidelines, 2004

Site Area 4.500 ha

Extraneous Flow Allowances

Infiltration / Inflow 1.49 L/s

Domestic Contributions

Unit Type	Unit Rate	Units	Pop
Single Family	3.4		0
Semi-detached and duplex	2.7		0
Townhouse	2.7	185	500
Stacked Townhouse	2.3		0
Apartment			
Bachelor	1.4		0
1 Bedroom	1.4		0
2 Bedroom	2.1		0
3 Bedroom	3.1		0
Average	1.8		0

Total Pop 500

Average Domestic Flow 1.62 L/s

Peaking Factor 3.38

Peak Domestic Flow 5.48 L/s

Institutional / Commercial / Industrial Contributions

Property Type	Unit Rate	No. of Units	Avg Wastewater (L/s)
Nursing / Rest homes	450 L/bed/d		0.00
Housekeeping Facilities	225 L/per/d		0.00
Dining room	125 L/per/d		0.00
Commercial floor space*	5 L/m ² /d		0.00
Hospitals	900 L/bed/d		0.00
School	70 L/student/d		0.00
Industrial - Light**	35,000 L/gross ha/d		0.00
Industrial - Heavy**	55,000 L/gross ha/d		0.00

Average I/C/I Flow 0.00

Peak Institutional / Commercial Flow 0.00

Peak Industrial Flow** 0.00

Peak I/C/I Flow 0.00

* assuming a 12 hour commercial operation

** peak industrial flow per City of Ottawa Sewer Design Guidelines Appendix 4B

Total Estimated Average Dry Weather Flow Rate	1.62 L/s
Total Estimated Peak Dry Weather Flow Rate	5.48 L/s
Total Estimated Peak Wet Weather Flow Rate	6.96 L/s

Subject: Orleans Village Phase 4 / Conceptual Design Analysis

J.F. Sabourin and Associates Inc. (JFSA) were retained by David Shaeffer Engineering Ltd. (DSEL) to evaluate the impacts of proposed revisions to the design of Phase 4 of the Orleans Village Subdivision, located within the City of Ottawa (refer to Figure 1). This memo is an update of the September 21, 2022 version.

For more details on the Orleans Village Subdivision, please refer to the July 2018 *Stormwater Management Report for the Orleans Village Subdivision* by JFSA. Refer to Figures 2 and 3 for the updated draft plan and conceptual grading plan for Phase 4 of Orleans Village, as provided by DSEL in December 2022. The areas in question are modelled as subcatchments B013DV2 and B015RE2 (refer to Figure 4) in the East Urban Community (EUC) Pond 1 model, last updated for the December 2022 *Design Brief for Pond 1 East Urban Community North Main Cell and North Forebay Modifications* by DSEL and JFSA. The December 2022 *Design Brief* model incorporates the changes made to subcatchments B013DV2 and B015RE1 in the September 21, 2022 version of this analysis:

- The imperviousness of area B013DV2 was updated from 93% to 63%;
- The imperviousness of area B015RE2 was updated from 79% to 63%;
- The minor system outlet for both drainage areas was set to MH 15 (previously split between MH 13 and MH 15); and
- On-site minor system capture and surface storage estimates were updated based on the revised imperviousness of the drainage areas.

As directed by DSEL / Caivan, the December 2022 *Design Brief* model has been further updated to increase the percent imperviousness of subcatchments B013DV2 and B015RE2 from 63% to 66%. Although this is an increase from the September 21, 2022 version of this analysis, it remains a decrease from that initially proposed in the July 2018 *Stormwater Management Report for the Orleans Village Subdivision*.

Subcatchments B013DV2 and B015RE2 were modelled with 2-year + 14% minor system capture, for a 2-year level of service plus additional capture due to increased head over the catchbasins / Inlet Control Devices (ICDs) during the 100-year storm. Excess 100-year flows are to be stored on-site. In the updated December 2022 *Design Brief* modelling, area B013DV2 is modelled with 402 L/s of minor system capture and 292 m³ of on-site storage. Similarly, area B015RE2 is modelled with 340 L/s of minor system capture and 242 m³ of on-site storage. We understand from DSEL (as of the September 21, 2022 analysis) that the available surface storage over both areas is approximately 750 m³, and as such the required surface storage volumes can be achieved.

As documented in the December 2022 *Design Brief*, with the changes to Orleans Village Phase 4 in place, all hydraulic gradeline and pond requirements are satisfied. It may therefore be concluded that the Phase 4 Orleans Village updates will not negatively impact the operations of EUC Pond 1 or the Orleans Village storm sewer system.

Yours truly,
J.F Sabourin and Associates Inc.

Laura Pipkins, P.Eng.
Project Engineer in Water Resources

REQUIRED TREE TO FOUNDATION SETBACK
BASED ON CITY OF OTTAWA TREE PLANTING
IN MARINE CLAY SOILS POLICY

1. REFERENCE THE GENERAL STANDARD CROSS-SECTION NOTES.
2. CONCRETE CURBS TO BE CONSTRUCTED AS PER CITY OF OTTAWA STANDARD DETAILS.
3. 3m-6m TYPICAL FRONT YARD SETBACK IS TO BE CLEAR AND UNENCUMBERED OF ANY SUBSURFACE BUILDING ENCROACHMENTS.
4. HYDRANTS TO BE LOCATED ON THE WATERMAIN SIDE OF THE STREET.
5. CATCH BASINS TO BE IN-ROAD, NOT CURB INLET TYPE.
6. 14.75m RIGHT-OF-WAY NOT TO BE USED ON STREETS WITH OC TRANSPO BUS SERVICES.
7. GAS MAIN SHALL HAVE A MINIMUM OF 0.6m CLEARANCE FROM STRUCTURES (e.g. CATCH BASINS AND HYDRANTS).
8. STREET LIGHTS CAN BE LOCATED ON EITHER SIDE OF THE RIGHT-OF-WAY.
9. 4 PARTY JOINT USE UTILITY TRENCH (JUT) UNDER SIDEWALK AS PER HYDRO OTTAWA UDS0049 CONSTRUCTION DETAIL, TOTAL WIDTH AT BASE = ±1635mm. EDGE OF HYDRO DUCTS PLACED 1.0m FROM EDGE OF TREE ROOT BALL.
10. GRADE LEVEL BOX (GLB) AS DRAWN SHOWS GLB3660 WITH THE FOLLOWING DIMENSIONS: 43" WIDTH AT BASE, 36" WIDTH AT SURFACE, 36" DEPTH. EXACT LOCATION TO BE CONFIRMED.
11. THIS CROSS-SECTION CANNOT BE USED WHERE A CONCRETE ENCASED HYDROELECTRIC DUCT IS REQUIRED.

14.75m ROW (WINDOW STREET) LAST MODIFIED ON 2022-05-11

1. REFERENCE THE GENERAL STANDARD CROSS-SECTION NOTES.
2. CONCRETE CURBS TO BE CONSTRUCTED AS PER CITY OF OTTAWA STANDARD DETAILS.
3. 3m-6m TYPICAL FRONT YARD SETBACK IS TO BE CLEAR AND UNENCUMBERED OF ANY SUBSURFACE BUILDING ENCROACHMENTS.
4. HYDRANTS TO BE LOCATED ON THE WATERMAIN SIDE OF THE STREET.
5. CATCH BASINS TO BE IN-ROAD, NOT CURB INLET TYPE.
6. 18m RIGHT-OF-WAY NOT TO BE USED ON STREETS WITH OC TRANSPORT BUS SERVICES.
7. GAS MAIN SHALL HAVE A MINIMUM OF 0.6m CLEARANCE FROM STRUCTURES (e.g. CATCH BASINS AND HYDRANTS).
8. STREET LIGHTS CAN BE LOCATED ON EITHER SIDE OF THE RIGHT-OF-WAY.
