1.0 PROJECT DESCRIPTION

1.1 Purpose

McIntosh Perry (MP) has been retained by CSV Architects to prepare this Servicing and Stormwater Management Report in support of the Site Plan Control process for the proposed development located at 56 Capilano Drive within the City of Ottawa.

The main purpose of this report is to present a servicing and stormwater management design for the development in accordance with the recommendations and guidelines provided by the City of Ottawa (City), the Rideau Valley Conservation Authority (RVCA), and the Ministry of the Environment, Conservation and Parks (MECP). This report will address the water, sanitary and storm sewer servicing for the development, ensuring that existing and available services will adequately service the proposed development.

This report should be read in conjunction with the following drawings:

- COO-23-3325, C101 Lot Grading, Drainage, Servicing, Erosion & Sediment Control Plan
- CCO-23-3325, PRE Pre-Development Drainage Plan (Appendix E)
- COO-23-3325, POST Post-Development Drainage Plan (Appendix F)

1.2 Site Description

Figure 1: Site Map

The subject property, herein referred to as "the site", is located at 56 Capilano Drive within the Knoxdale-Merivale Ward. The site covers approximately 0.28 ha and is located along Capilano Drive between Kerry Crescent and Gilbey Drive. The site is zoned for Residential Fourth Density (P4Z). See Ste Location Plan in Appendix 'A' for more details.

1.3 Proposed Development and Statistics

The proposed development consists of the addition of a 4-unit townhouse block and a 4-storey mixed use building, complete with surface parking and street access from Capilano Drive. The proposed mixed use building will contain 54 residential units, with office space located in the basement. The apartment building is proposed to be constructed during Phase 1 of the project, while the townhouses will be constructed at a later date during Phase 2. The development is proposed within 0.28 ha of the site. Pefer to Ste Plan prepared by CSV Architects and included in Appendix B for further details.

1.4 Existing Conditions and Infrastructures

The site previously contained a two-storey building and attached curling rink, which have since been demolished. Presently, the site is undeveloped.

Sewer and watermain mapping collected from the City of Ottawa indicate that the following services exist across the property frontages within the adjacent municipal rights-of-way(s):

Capilano Drive

- 152 mm diameter Cl watermain, a
- 200 mm diameter AC sanitary sewer, and a
- 375 mm diameter concrete storm sewer, tributary to the Rideau Waterway approximately 3.7km downstream.

1.5 Approvals

The proposed development is subject to the City of Ottawa site plan control approval process. Ste plan control requires the City to review, provided concurrence and approve the engineering design package. Permits to construct can be requested once the City has issued a site plan agreement.

An Environmental Compliance Approval (ECA) through the Ministry of Environment, Conservation and Parks (MECP) is not required for Phase 1 of the development since the proposed storm sewer system services one parcel of land and industrial use is not proposed. Based on consultation with the MECP included in Appendix 'B', an ECA will be required during Phase 2 as the proposed stormwater management system will be servicing two parcels.

2.0 BACKROUND STUDIES, STANDARDS, AND REFERENCES

2.1 Background Reports / Reference Information

As-built drawings of existing services, provided by the City of Ottawa Information centre, within the vicinity of the proposed site were reviewed in order to identify infrastructure available to service the proposed development.

A topographic survey (V22200) of the site was completed by Fairhall, Moffat & Woodland and dated July 21st, 2016.

The Ste Plan (A100) was prepared by CSV Architects (Ste Plan).

2.2 Applicable Guidelines and Standards

Oty of Ottawa:

- ♦ Ottawa Sewer Design Guidelines, City of Ottawa, SDG002, October 2012. (Ottawa Sewer Guidelines)
 - Technical Bulletin ISTB-2014-01 City of Ottawa, February 2014. (ISTB-2014-01)
 - Technical Bulletin PIEDTB-2016-01 City of Ottawa, September 2016. (PIEDTB-2016-01)
 - Technical Bulletin ISTB-2018-01 City of Ottawa, January 2018. (ISTB-2018-01)
 - Technical Bulletin ISTB-2018-04 City of Ottawa, March 2018. (ISTB-2018-04)
 - Technical Bulletin ISTB-2019-02 City of Ottawa, February 2019. (ISTB-2019-02)

 - Technical Bulletin ISTB-2018-02 City of Ottawa, March 2018. (ISTB-2018-02)
 - Technical Bulletin ISTB-2021-03 City of Ottawa, August 2021. (ISTB-2021-03)

Ministry of Environment, Conservation and Parks:

- ◆ Stormwater Planning and Design Manual, Ministry of the Environment, March 2003. (MECP Stormwater Design Manual)
- ◆ Design Guidelines for Sewage Works, Ministry of the Environment, 2008. (MECP Sewer Design Guidelines)

Other:

Water Supply for Public Fire Protection, Fire Underwriters Survey, 2020. (FUS Guidelines)

3.0 PRE-CONSULTATION SUMMARY

A pre-consultation meeting was held with City staff on December 16th, 2021 regarding the proposed site servicing. Specific design parameters to be incorporated within this design include the following:

- > Pre-development and post-development flows shall be calculated using a time of concentration (Tc) no less than 10 minutes.
- Control 100-year post-development flows to the 2-year pre-development flow with a combined C value to a maximum of 0.50.

Based on further discussion with City staff included in Appendix B, the pre-development C value can be based on the previously developed condition, up to a maximum of 0.5.

4.0 WATERMAIN

4.1 Existing Watermain

The site is located within the ME pressure zone, as per the Water Distribution System mapping included in Appendix C. There are two municipal fire hydrants available to service the proposed development, located at the corner of Capilano Drive and Kerry Crescent, and at the corner of Capilano Drive and Gilbey Drive.

4.2 Proposed Watermain

It is proposed to service the property with a dual 150 mm diameter water service connected to the existing 152 mm diameter watermain within Capilano Drive. The townhouse block will be serviced by a 50 mm diameter water lateral connected to the new 150 mm diameter water service within the site limits. A dual 150 mm diameter water service connection is proposed to provide redundancy due to the number of units on the site.

Table 1, below, summarizes the water supply design criteria obtained from the Ottawa Water Guidelines and utilized for the water analysis.

Ste Area	0.28 ha
Townhouse Block	4 Units
Apartment Building	54 Studio Apartments
Residential	280 L/day/person
Residential Apartment – 1 Bedroom/ Studio	1.4 person/unit
Townhouse	2.7 person/unit
Max Day Peaking Factor - Residential	7.3 x avg. day
Peak Hour Peaking Factor - Residential	11.0 x avg. day
Commercial	28,000 L/ gross ha/ d
Commercial Peaking Factor – Max Day	1.5 x avg. day
Commercial Peaking Factor – Peak Hour	1.8 x max. day
Average Day Demand	0.28 L/s
Max Day Demand	2.06 L/s
Peak Hour Demand	3.11 L/s

Table 1: Water Supply Design Criteria

The OBC and Fire Underwriters Survey 2020 (FUS) methods were utilized to estimate the required fire flow for the proposed building and townhouse block. Fire flow requirements were calculated per City of Ottawa Technical Bulletin ISTB-2018-02. The following parameters were utilized for the calculations:

FUS:

- Type of construction Non-Combustible Construction (Apartment), Wood Frame (Townhouse Block)
- Occupancy Type Limited Combustible (Apartment and Townhouse Block)
- Sprinkler Protection Standard Sprinkler System (Apartment), Non-Sprinklered (Townhouse Block)

OBC:

- Type of construction Non-Combustible Construction (Apartment), Combustible Construction (Townhouse Block)
- Occupancy Type: Group C
- ❖ Water Supply Coefficient (K): 16 (Apartment), 23 (Townhouse Block)

The results of the FUS calculations yielded a maximum required fire flow of 7,000 L/min (116.67 L/s), and the results of the OBC calculations yielded a maximum required fire flow of 9,000 L/min (150.0 L/s). The detailed calculations for the FUS and OBC can be found in Appendix C.

The City provided the estimated water pressures at both the average day scenario, peak hour scenario, and the max day plus fire flow scenario for the demands indicated by the correspondence in Appendix C. The resulting pressures for the boundary conditions results are shown in Table 2, below.

Scenario	Proposed Demands (L/S)	Connection 1 HGL (m H₂O)*/kPa		
Average Day Demand	0.31	65.1 / 638.6		
Maximum Daily + Fire Flow Demand (FUS)	118.77	51.3 / 503.3		
Peak Hourly Demand	3.17	53.7 / 526.8		
* Adjusted for an estimated top of watermain elevation of 93.2m				

Table 2: Summary of Estimated Water Demand

Please note that while the estimated demands have increased slightly since the initial boundary condition request because of the office space that was not previously accounted for, this is not expected to impact the validity of the boundary condition results as the increase is less than 2% of the original demands.

The normal operating pressure range is anticipated to be 526.8 kPa to 638.6 kPa and will not be less than 275 kPa (40 psi) or exceed 689 kPa (100 psi). The proposed watermains will meet the minimum required 20 psi (140 kPa) from the Ottawa Water Guidelines at the ground level under maximum day demand and fire flow conditions. Further coordination with the mechanical designer

may be required to determine if a pressure reducing valve is required, as the pressure is expected to exceed 80 psi (551 kpa) during the average day scenario.

To confirm the adequacy of fire flow to protect the proposed development, existing hydrants within 150 m of the proposed building were analysed per City of Ottawa ISTB 2018-02 Appendix I Table 1. The results are summarized below. A hydrant coverage figure can be found in Appendix C.

Table 3: Available Fire Flow Based on Hydrant Spacing

Building Location	Fire Flow Demand (L/ min.)	Fire Hydrant(s) within 75m (5,700 L/ min)	Fire Hydrant(s) within 150m (3,800 L/ min)	Fire Flow Contribution (L/ min)
56 Capilano Drive	9,000 (OBC) 7,000 (FUS)	1 Public 1 Private (Proposed)	1 Public	15,200

5.0 SANITARY DESIGN

5.1 Existing Sanitary Sewer

There is an existing 200 mm diameter asbestos cement sanitary sewer located within Capilano Drive available to service the proposed development.

5.2 Proposed Sanitary Sewer

A new 150 mm diameter PVC gravity sanitary service will be extended from the 200 mm diameter sanitary main within Capilano Drive to service the proposed apartment building. The townhouse block will be serviced via a 135 mm diameter service connection to the new 150 mm diameter sanitary service within the site limits. Refer to drawing C102 for a detailed servicing layout.

Table 4, below, summarizes the wastewater design criteria identified by the Ottawa Sewer Guidelines.

Table 4: Sanitary Design Criteria

Design Parameter	Value
Ste Area	0.28 ha
Residential	280 L/person/day
1 Bedroom Apartment	1.4 persons/unit
Townhouse	2.7 persons/unit
Residential Peaking Factor	3.61
Commercial / Amenity	2,800 L/(1000m ² /d)
Commercial Peaking Factor	1.0
Commercial / Amenity Area	1146 m ²
Extraneous How Allowance	0.33 L/s/ha
Estimated Population	87 persons

Table 5, below, summarizes the estimated wastewater flow from the proposed development. Refer to Appendix D for detailed calculations.

Table 5: Summary of Estimated Sanitary Flow

Design Parameter	Total How (L/s)
Total Estimated Average Dry Weather Flow	0.33
Total Estimated Peak Dry Weather Flow	1.07
Total Estimated Peak Wet Weather Flow	1.15

As noted above, the development is proposed to be serviced via a proposed 150 mm sanitary service connection to the 200 mm asbestos cement sanitary sewer within Capilano Drive.

The full flowing capacity of a 150 mm diameter service at 1.0% slope is estimated to be 15.89 L/s. Per Table 5, a peak wet weather flow of 1.15 L/s will be conveyed within the 150 mm diameter service, therefore the proposed system is sufficiently sized for the development.

The full flowing capacity of the existing 200 mm diameter sanitary sewer at 0.42% slope is estimated to be 22.17 L/s. Per Table 5, the proposed development will only occupy 5.2% of the sewer capacity, therefore capacity issues are not anticipated. Due to the complexity of the downstream network the City will need to advise of any downstream constraints.

6.0 STORM SEWER DESIGN

6.1 Existing Storm Sewers

Stormwater runoff from the existing site flows overland towards the Capilano Drive ROW. Runoff is then collected by municipal infrastructure, and travels approximately 3.7km downstream before discharging into the Rideau Waterway.

6.2 Proposed Storm Sewers

The proposed development will be serviced through a new 300 mm storm service connection to the existing 375 mm diameter concrete storm sewer within Capilano Drive.

Runoff collected on the roof of the proposed apartment building will be stored and controlled internally using 2 roof drains. The roof drains will be used to limit the flow from the roof to the specified allowable release rate. Roof drainage will be directed to the proposed maintenance hole MH2. For calculation purposes a Watts Accutrol roof drain in the ¾ open position was used to estimate a reasonable roof flow. Other products may be specified at detailed building design provided that the proposed release rates and storage volumes are achieved.

Runoff from the townhouse block and surface parking lot will be restricted by Tempest inlet control devices (ICD) located within structures CB1 and CB3. The restricted flow will discharge through the proposed 300 mm diameter storm service to the 375 mm diameter storm sewer within Capilano Drive.

Foundation drainage for the townhouse block is proposed to be conveyed via a 150 mm diameter storm lateral connected to the new 300 mm diameter storm service.

Foundation drainage for the apartment building is proposed to be conveyed via a 200 mm storm lateral connected to the proposed maintenance hole MH2, complete with a backwater valve.

See CCO-23-3325 - POST include in Appendix F of this report for more details. The Stormwater Management design for the subject property will be outlined in Section 7.0 of this report.

7.0 PROPOSED STORM WATER MANAGEMENT

7.1 Design Criteria and Methodology

As per Section 6.2, stormwater management for the proposed development will be provided by surface and roof storage. The controlled stormwater flow will be directed to the existing 375 mm diameter storm sewer within Capilano Drive.

In summary, the following design criteria have been employed in developing the stormwater management design for the site as directed by the RVCA and City:

Quality Control

• Based on coordination with City Staff included in Appendix B, quality controls are not required based on the distance to the outlet.

Quantity Control

- Any storm events greater than the 2-year, up to, and including the 100-year storm event must be detained on site.
- Post-development flow to be restricted to the 2-year storm event, based on a calculated time of concentration of at least 10 minutes and a combined maximum rational method coefficient of 0.50. Refer to Section 7.2 for further details.
- Based on coordination with City Staff included in Appendix B, the runoff coefficient can be based upon the previously developed site condition, up to a maximum of 0.5.

7.2 Runoff Calculations

Runoff calculations presented in this report are derived using the Rational Method, given as:

Q = 2.78 CIA (L/s)

Where: C = Runoff coefficient

I = Rainfall intensity in mm/hr (City of Ottawa IDF curves)

A = Drainage area in hectares

It is recognized that the Pational Method tends to overestimate runoff rates. As a result, the conservative calculation of runoff ensures that any SWM facility sized using this method is expected to function as intended. The following coefficients were used to develop an average Cfor each area:

Poofs/Concrete/Asphalt	0.90
Undeveloped and Grass	0.20

As per the City of Ottawa - Sewer Design Guidelines, the 5-year balanced 'C' value must be increased by 25% for a 100-year storm event to a maximum of 1.0.

7.3 Pre-Development Drainage

It has been assumed that the pre-development area contains no stormwater management controls for flow attenuation. The estimated pre-development peak flows for the 2-, 5-, and 100-year events are summarized below in Table 6. See CCO-23-3325 - PRE in Appendix E and Appendix G for calculations.

Q(L/s)С Drainage Area 2/5 & 100-Area (ha) 2-Year 5-Year 100-Year Year 0.64 / 0.72 37.93 0.28 Α1 51.45 99.39 0.28 37.93 **Total** 51.45 99.39

Table 6: Pre-Development Runoff Summary

7.4 Post-Development Drainage

To meet the stormwater objectives, the development will contain flow attenuation via rooftop and surface storage. Table 7, below, summarizes the required restricted flow for the site.

Drainage	Area	C	Q (L/s)
Area	(ha)	(2-Year)	2-Year
A1	0.28	0.50	29.62

Table 7: Required Restricted Flow

Based on the criteria listed in Section 7.1, the development will be required to restrict flow to the 2-year storm event with a maximum runoff coefficient of 0.50. It is estimated that the target release rate during the 100-year event will be 29.62 L/s. See Appendix G for calculations.

The proposed site drainage limits are demonstrated on the Post-Development Drainage Area Plan. See COO-23-3325 - POST in Appendix F of this report for more details. A summary of the postdevelopment runoff calculations can be found below.

Table 8: Post-Development Controlled Runoff Summary

Unrestricted Flow Restricted Flow Storage Required Storage Provided (m³) Drainage (L/S) (L/S) (m^3) Area 100-Year 5-year 100-Year 5-Year 100-Year 5-Year 5-Year 100-Year B1 20.21 38.49 1.83 3.15 16.45 32.01 17.57 32.95 39.71 7.30 7.44 24.66 B2 20.64 8.33 23.47 9.16 21.24 **B**3 11.06 5.78 5.91 3.17 10.04 3.59 11.30 В4 6.53 6.53 13.05 13.05 112.49 27.95 65.52 Total 58.45 21.44 29.56 30.32 68.91

7.4.1 Post-Development Drainage Areas

Runoff from area B1 will be controlled and stored on the roof of the proposed building (B1) using two (2) roof drains. The roof drains will be used to limit the flow from the roof to the specified allowable release rate. For calculation purposes a Watts Accutrol roof drain in the ¾ open position was used to estimate a reasonable roof flow. Other products may be specified at detailed building design provided release rates and storage volumes are respected.

Punoff for areas B2 and B3 is comprised of surface runoff from the parking and landscaped areas, and roof runoff from the townhouse block.

Runoff for area B2 will be directed towards the proposed catch basin CB1. How will be restricted by a Tempest LMF80 ICD in the outlet of CB1 to a maximum release rate of 7.44 L/s, allowing for a proposed 24.66 m³ of storage.

Runoff for area B3 will be directed towards the proposed catch basin CB3. Flow will be restricted by a Tempest LMF75 ICD in the outlet of CB3 to a maximum release rate of 5.91 L/s, allowing for a proposed 11.30 m³ of storage.

Runoff for area B4 will be unrestricted and compensated for in areas with flow restriction.

As seen in Table 9 below, roof runoff will be restricted to a maximum release rate of 3.15 L/s, allowing for a proposed roof storage volume of 32.95 m³, resulting in a maximum drawdown time of 169 minutes. Emergency roof scuppers have been proposed to ensure roof ponding does not exceed 150 mm.

Storage Volume Total How Rate Drawdown Time # of Drainage Area (m^3) (L/s)Roof (min) Area (ha) Drains 5-Year 100-Year 5-Year 100-Year 5-Year 100-Year 80.0 2 16.45 32.01 1.83 3.15 150 169 B1 2 32.01 1.83 Total 80.0 16.45 3.15 150 169

Table 9: Roof Drainage Summary

7.5 Quality Control

As noted in Section 7.1, quality controls are required based on coordination with City Staff. Correspondence can be found in Appendix B.

8.0 EROSION AND SEDIMENT CONTROL

8.1 Temporary Measures

Before construction begins, temporary silt fence, straw bale or rock flow check dams will be installed at all-natural runoff outlets from the property. It is crucial that these controls be maintained throughout construction and inspection of sediment and erosion control will be facilitated by the Contractor or Contract Administration staff throughout the construction period.

Sit fences will be installed where shown on the final engineering plans, specifically along the downstream property limits. The Contractor, at their discretion or at the instruction of the City, Conservation Authority or the Contract Administrator shall increase the quantity of sediment and erosion controls on-site to ensure that the site is operating as intended and no additional sediment finds its way off site. The rock flow, straw bale & silt fence check dams and barriers shall be inspected weekly and after rainfall events. Care shall be taken to properly remove sediment from the fences and check dams as required. Fibre roll barriers are to be installed at all existing curb inlet catch basins and filter fabric is to be placed under the grates of all existing catch basins and manholes along the frontage of the site and any new structures immediately upon installation. The measures for the existing/proposed structures are to be removed only after all areas have been paved. Care shall be taken at the removal stage to ensure that any silt that has accumulated is properly handled and disposed of. Removal of silt fences without prior removal of the sediments shall not be permitted.

Although not anticipated, work through winter months shall be closely monitored for erosion along sloped areas. Should erosion be noted, the Contractor shall be alerted and shall take all necessary steps to rectify the situation. Should the Contractor's efforts fail at remediating the eroded areas, the Contractor shall contact the City and/or Conservation Authority to review the site conditions and determine the appropriate course of action. As the ground begins to thaw, the Contractor shall place silt fencing at all required locations as soon as ground conditions warrant. Please see the Ste Grading, Drainage and Sediment & Erosion Control Plan for additional details regarding the temporary measures to be installed and their appropriate OPSD references.

8.2 Permanent Measures

It is expected that the Contractor will promptly ensure that all disturbed areas receive topsoil and seed/sod and that grass be established as soon as possible. Any areas of excess fill shall be removed or levelled as soon as possible and must be located a sufficient distance from any watercourse to ensure that no sediment is washed out into the watercourse. As the vegetation growth within the site provides a key component to the control of sediment for the site, it must be properly maintained once established. Once the construction is complete, it will be up to the landowner to maintain the vegetation and ensure that the vegetation is not overgrown or impeded by foreign objects.

9.0 SUMMARY

- A new 4-storey 775 m² mixed use building and 4-unit townhouse block are proposed to be constructed at 56 Capilano Drive. The development is proposed within 0.28 ha of the site.
- It is proposed to service the new building through a new dual 150 mm diameter water service and 150 mm diameter sanitary service. A new 300 mm diameter storm service is proposed to collect and control drainage within the development area.
- It is proposed to service the townhouse block with a new 50 mm diameter water service, 135 mm diameter sanitary service, and 150 mm diameter storm service. Services for the townhouse block will be connected to the proposed 150 mm diameter water, 150 mm diameter sanitary, and 300 mm diameter storm services.
- It is proposed to manage stormwater for the development area via surface and roof storage. The storm system will connect to the existing 375 mm diameter concrete storm sewer located within Capilano Drive
- Storage for the 5- through 100-year storm events will be provided on the roof and in the parking area.
- Quality controls are not required based on coordination with City staff.

16

10.0 RECOMMENDATION

Based on the information presented in this report, we recommend that City of Ottawa approve this Servicing and Stormwater Management report in support of the proposed development at 56 Capilano Drive.

This report is respectfully being submitted for approval.

Regards,

McIntosh Perry Consulting Engineers Ltd.

11.0 STATEMENT OF LIMITATIONS

This report was produced for the exclusive use of <u>CSV Architects</u>. The purpose of the report is to assess the existing stormwater management system and provide recommendations and designs for the post-construction scenario that are in compliance with the guidelines and standards from the Ministry of the Environment, Parks and Climate Change, City of Ottawa and local approval agencies. McIntosh Perry reviewed the site information and background documents listed in Section 2.0 of this report. While the previous data was reviewed by McIntosh Perry and site visits were performed, no field verification/measures of any information were conducted.

Any use of this review by a third party, or any reliance on decisions made based on it, without a reliance report is the responsibility of such third parties. McIntosh Perry accepts no responsibility for damages, if any, suffered by any third party as a result of decisions or actions made based on this review.

The findings, conclusions and/or recommendations of this report are only valid as of the date of this report. No assurance is made regarding any changes in conditions subsequent to this date. If additional information is discovered or becomes available at a future date, McIntosh Perry should be requested to re-evaluate the conclusions presented in this report, and provide amendments, if required.

APPENDIX A KEY PLAN

APPENDIX B BACKGROUND DOCUMENTS

Pre-Application Consultation Meeting Notes

Property Address: 56 Capilano Drive PC2021-0425 December 16th, 2021

Attendees:

Applicant Team -

Bria Aird (Fotenn)
Haris Khan (Fotenn)
Brian Casagrande (Fotenn)
Daryl Hood (CSV Architecture)
Patrick McDonald (McDonald Brothers Construction)
Allessandro Guarna (McDonald Brothers Construction)

City Staff -

Molly Smith (Planning)
Abi Dieme (Infrastructure)
Pat McMahon (Transportation)
Louise Cerveny (Parks)
Adrian van Wyk (Urban Design)

Subject: 56 Capilano Drive

Meeting notes:

Overview of proposal

- A rezoning to facilitate future development, either a low-rise or low-mid-rise apartment building. Access will be shared from Capilano Drive with the existing driveway serving the City View Curling facility.
- Formerly there was a curling facility, was demolished and building moved, lot severed (flag lot).
- Considering a range of options and interested in flexibility for a range of uses.
- Looking into the possibility of working with OCH, seeking to reduce the parking rate and pursue a AM zone with height restriction.

Preliminary comments and questions from staff and agencies:

- Planning
 - Applicant seeking to rezone (Major Rezoning) the property from L1 to AM or R4.
 - Subject to public consultation provide notice to all property owners within 120m of the site.
 Application goes to Council and is subject to an appeal process.
 - Under the old Official Plan, the designation is General Urban Area.
 - Under the new Official Plan, the site is designated Outer Urban Transect Evolving Neighbourhood Overlay.
 - When preparing the planning rationale, both OP's need to be reviewed. If the application is submitted before Ministry adoption, whichever provisions are more restrictive between the old and new OP will apply.
 - In the new OP, sections and policies that are relevant to the proposal are:
 - Section 5.3.1 speaks to low to mid-density development

- Lot must be able to provide suitable transition to abutting low-rise areas, in which case only low-rise development shall be permitted.
- Section 5.3.3(3) speaks to building heights
- Section 5.6.1.1 150m from the boundary of a Mainstreet (evolving overlay for intensification)
- Table 3A for minimum density requirements (page 131/138)
- ROW protection 24m
- Size zoned as L1 Community Leisure Facility Zone
- Seeking a rezoning to either R4 or AM
 - R4 permits low-rise apartment building
 - AM would need to be along Merivale Road or provide other policies that would justify AM zoning
 - R4 is more appropriate based on local context and OP policies.
- Parking Area C
 - Low-rise, mid-rise apartment: 1.2 per dwelling unit
 - Visitor parking: 0.2 per dwelling unit
 - Bicycle parking: 0.5 per dwelling unit, more is encouraged especially if a parking reduction is sought.
- Great to see possible partnership with OCH.
- The main building entrance should be along Capilano Drive.
- Continue the pathway to the parking lot from Capilano, ensure pathways are well thought of and connected.
- Include trees and increased landscaping along Capilano.
- It would be great to see shared parking with the Curling Club.
- Keeping in mind that the adjacent property on Merivale could change in the future, the building should be flipped to be along the east side.
- It is recommended to reach out the Councillor Egli to discuss the proposal.

Urban Design

- A scoped Urban Design Brief will be required as part of a complete application. Please see the attached Terms of Reference for requirements.
- The applicant is encouraged to consider shared parking arrangements with the neighbouring curling club, as well as to provide a space for car sharing.
- The building should have a street-fronting main entrance off Capilano Drive.
- The proposal should consider and respond to the possible future redevelopment of the
 neighbouring property to the west. The applicant should consider flipping the building so that
 its long side is along the east elevation and an amenity area can be created on the west
 side. Please see the illustration attached for reference.
- The planting of street trees along Capilano Drive is strongly encouraged.
- Please consider the Urban Design Guidelines for Low-rise Infill.

Engineering

- Infrastructure Information All existing and proposed utilities (municipal pipes) must be shown on the servicing plans
- Water:
- District Plan No. ME
- Verify with ROW Approvals Unit if frontage charges apply (\$190.00 per metre)
 ☑ Yes
- Connection point: 152mm CI watermain on Capilano Drive

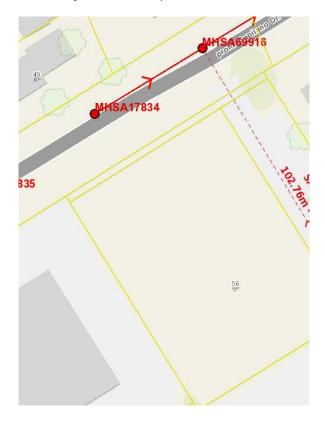

- Submission documents must include:
 - Boundary conditions (civil consultant to request boundary conditions from the City's
 assigned Project Manager, Development Review). Water boundary conditions request must
 include the location of the service and the expected loads required by the proposed
 development. Please provide all the following information:
 - Location of service (show on a plan or map)
 - Type of development and the amount of fire flow required.
 - Average daily demand: I/s.
 - Maximum daily demand: I/s.
 - Maximum hourly daily demand: I/s.
 - Supporting Calculations for all demands listed above and required fire flow per Ontario Building Code (OBC) method or Fire Underwriter Surveys if the OBC method yields a fire flow of 9000 L/min.
- Watermain system analysis demonstrating adequate pressure per section 4.2.2 of the Water Distribution Guidelines.
- Fire protection (Fire demand, Hydrant Locations). A hydrant coverage table and map demonstrating adequate fire protection shall be included. Please review Technical Bulletin ISTB-2018-02, Appendix I table 1 – maximum flow to be considered from a given hydrant

Further note that:

 Rresidential buildings with a basic day demand greater than 50 m3/day shall be connected with a minimum of two water services, separated by an isolation valve, to avoid the creation of a vulnerable service area

Sanitary:

Connection Point: 200mm AC sanitary main on Capilano Drive

Is a monitoring manhole required on private property? ☐ Yes ☐ No

- Provide an analysis to demonstrate that there is adequate residual capacity in the receiving and downstream wastewater system to accommodate the proposed development
- Please apply the wastewater design flow parameters in Technical Bulletin PIEDTB-2018-01.

Storm:

Connection Point: 375mm Conc storm sewer on Capilano Drive.

Stormwater Management:

- Quality Control:
 - o Rideau Valley Conservation Authority to provide criteria.
- Quantity Control:
 - Design storm for receiving sewer: 2-year design storm
 - o Runoff coefficient (C): C=0.5 or C=pre-development, whichever is less
 - o Time of concentration (Tc): To be calculated, min Tc=10mins
 - Allowable flow rate: Control the 100-year event to the 2-year event

Please note that SWM calculations using the modified rational method is acceptable, however, if a combination of surface ponding and underground storage is used, the consultant is reminded to either: (a) use a dynamic computer model or (b) use the modified rational method assuming an average release rate of 50% of the area-specific peak flow rate where above and below ground storage is provided.

Additional Notes:

- No Capital Works Projects that would impact the application has been identified.
- No moratorium that would impact the applications has been identified.
- Any easement identified should be on all plans.

Transportation

- Review the TIA Screening Form. If the property is deemed not part of the Design Priority Area, no TIA will be required. However, the applicant is encouraged to complete both Transportation Demand Management Checklists and include measures to help rationalize the need for less parking.
- Noise Impact Study may be required if exposed mechanical equipment is present due to the proximity to noise-sensitive land uses.
- As the site proposed is residential, AODA legislation applies for all areas accessible to the public (i.e. outdoor pathways, parking, etc.).
- Consider using the City's Accessibility Design Standards.
- Capilano has a protected right of way of 24m. Show this on the plan, a widening is likely required.
- Providing at least one bicycle space per unit is encouraged particularly if a reduction in parking is sought to encourage sustainable transportation.

For future site plan:

- Clear throat required for an apartment of less than 100 units on a collector road is 8m.
- On future site plan:
 - Show all details of the roads abutting the site up to and including the opposite curb; include such items as pavement markings, accesses and/or sidewalks.
 - Turning templates will be required for all accesses showing the largest vehicle to access
 the site; required for internal movements and at all access (entering and exiting and
 going in both directions).
 - Show all curb radii measurements; ensure that all curb radii are reduced as much as possible
 - Show lane/aisle widths.

Environmental

TCR requirements:

- A Tree Conservation Report (TCR) must be supplied for review along with the suite of other plans/reports required by the City
 - o an approved TCR is a requirement of Site Plan approval.
 - The TCR may be combined with the LP provided all information is supplied
- As of January 1 2021, any removal of privately-owned trees 10cm or larger in diameter, or publicly (City) owned trees of any diameter requires a tree permit issued under the Tree Protection Bylaw (Bylaw 2020 – 340); the permit will be based on an approved TCR and made available at or near plan approval.
- The Planning Forester from Planning and Growth Management as well as foresters from Forestry Services will review the submitted TCR
 - If tree removal is required, both municipal and privately-owned trees will be addressed in a single permit issued through the Planning Forester
 - Compensation may be required for city owned trees if so, it will need to be paid prior to the release of the tree permit
- The TCR must list all trees on site, as well as off-site trees if the CRZ extends into the developed area, by species, diameter and health condition
- Please identify trees by ownership private onsite, private on adjoining site, city owned, coowned (trees on a property line)
- The TCR must list all trees on adjacent sites if they have a critical root zone that extends onto the development site

- If trees are to be removed, the TCR must clearly show where they are, and document the reason they cannot be retained
- All retained trees must be shown and all retained trees within the area impacted by the development process must be protected as per City guidelines available at <u>Tree Protection</u> Specification or by searching Ottawa.ca
- The location of tree protection fencing must be shown on a plan
- Show the critical root zone of the retained trees
- If excavation will occur within the critical root zone, please show the limits of excavation
- The City encourages the retention of healthy trees; if possible, please seek opportunities for retention of trees that will contribute to the design/function of the site.
- For more information on the process or help with tree retention options, contact Mark Richardson mark.richardson@ottawa.ca or on City of Ottawa

LP tree planting requirements:

For additional information on the following please contact tracy.smith@Ottawa.ca

Minimum Setbacks

- Maintain 1.5m from sidewalk or MUP/cycle track.
- Maintain 2.5m from curb
- Coniferous species require a minimum 4.5m setback from curb, sidewalk or MUP/cycle track/pathway.
- Maintain 7.5m between large growing trees, and 4m between small growing trees. Park or open space planting should consider 10m spacing.
- Adhere to Ottawa Hydro's planting guidelines (species and setbacks) when planting around overhead primary conductors.

Tree specifications

- Minimum stock size: 50mm tree caliper for deciduous. 200cm height for coniferous.
- Maximize the use of large deciduous species wherever possible to maximize future canopy coverage
- Tree planting on city property shall be in accordance with the City of Ottawa's Tree Planting Specification; and include watering and warranty as described in the specification (can be provided by Forestry Services).
- Plant native trees whenever possible
- No root barriers, dead-man anchor systems, or planters are permitted.
- No tree stakes unless necessary (and only 1 on the prevailing winds side of the tree)

Hard surface planting

- Curb style planter is highly recommended
- No grates are to be used and if guards are required, City of Ottawa standard (which can be provided) shall be used.
- Trees are to be planted at grade

Soil Volume

Please ensure adequate soil volumes are met:

Tree	Single Tree Soil	Multiple Tree Soil
Type/Size	Volume (m3)	Volume (m3/tree)

Ornamental	15	9
Columnar	15	9
Small	20	12
Medium	25	15
Large	30	18
Conifer	25	15

Sensitive Marine Clay

Please follow the City's 2017 Tree Planting in Sensitive Marine Clay guidelines

Parks

- Parks and Facilities Planning will require 10% cash-in-lieu of Parkland based on the total developable area for this project.
- Will a parking agreement be in place for the shared use of the parking lot at the Curling Club?
- The proposed L- shape building would benefit from reorientation towards Capilano. This would provide a welcoming presence in the neighborhood, a sense of openness toward the street and parking area and the opportunity to plant trees in the front yard, along Capilano and the driveway entrance.

City Surveyor

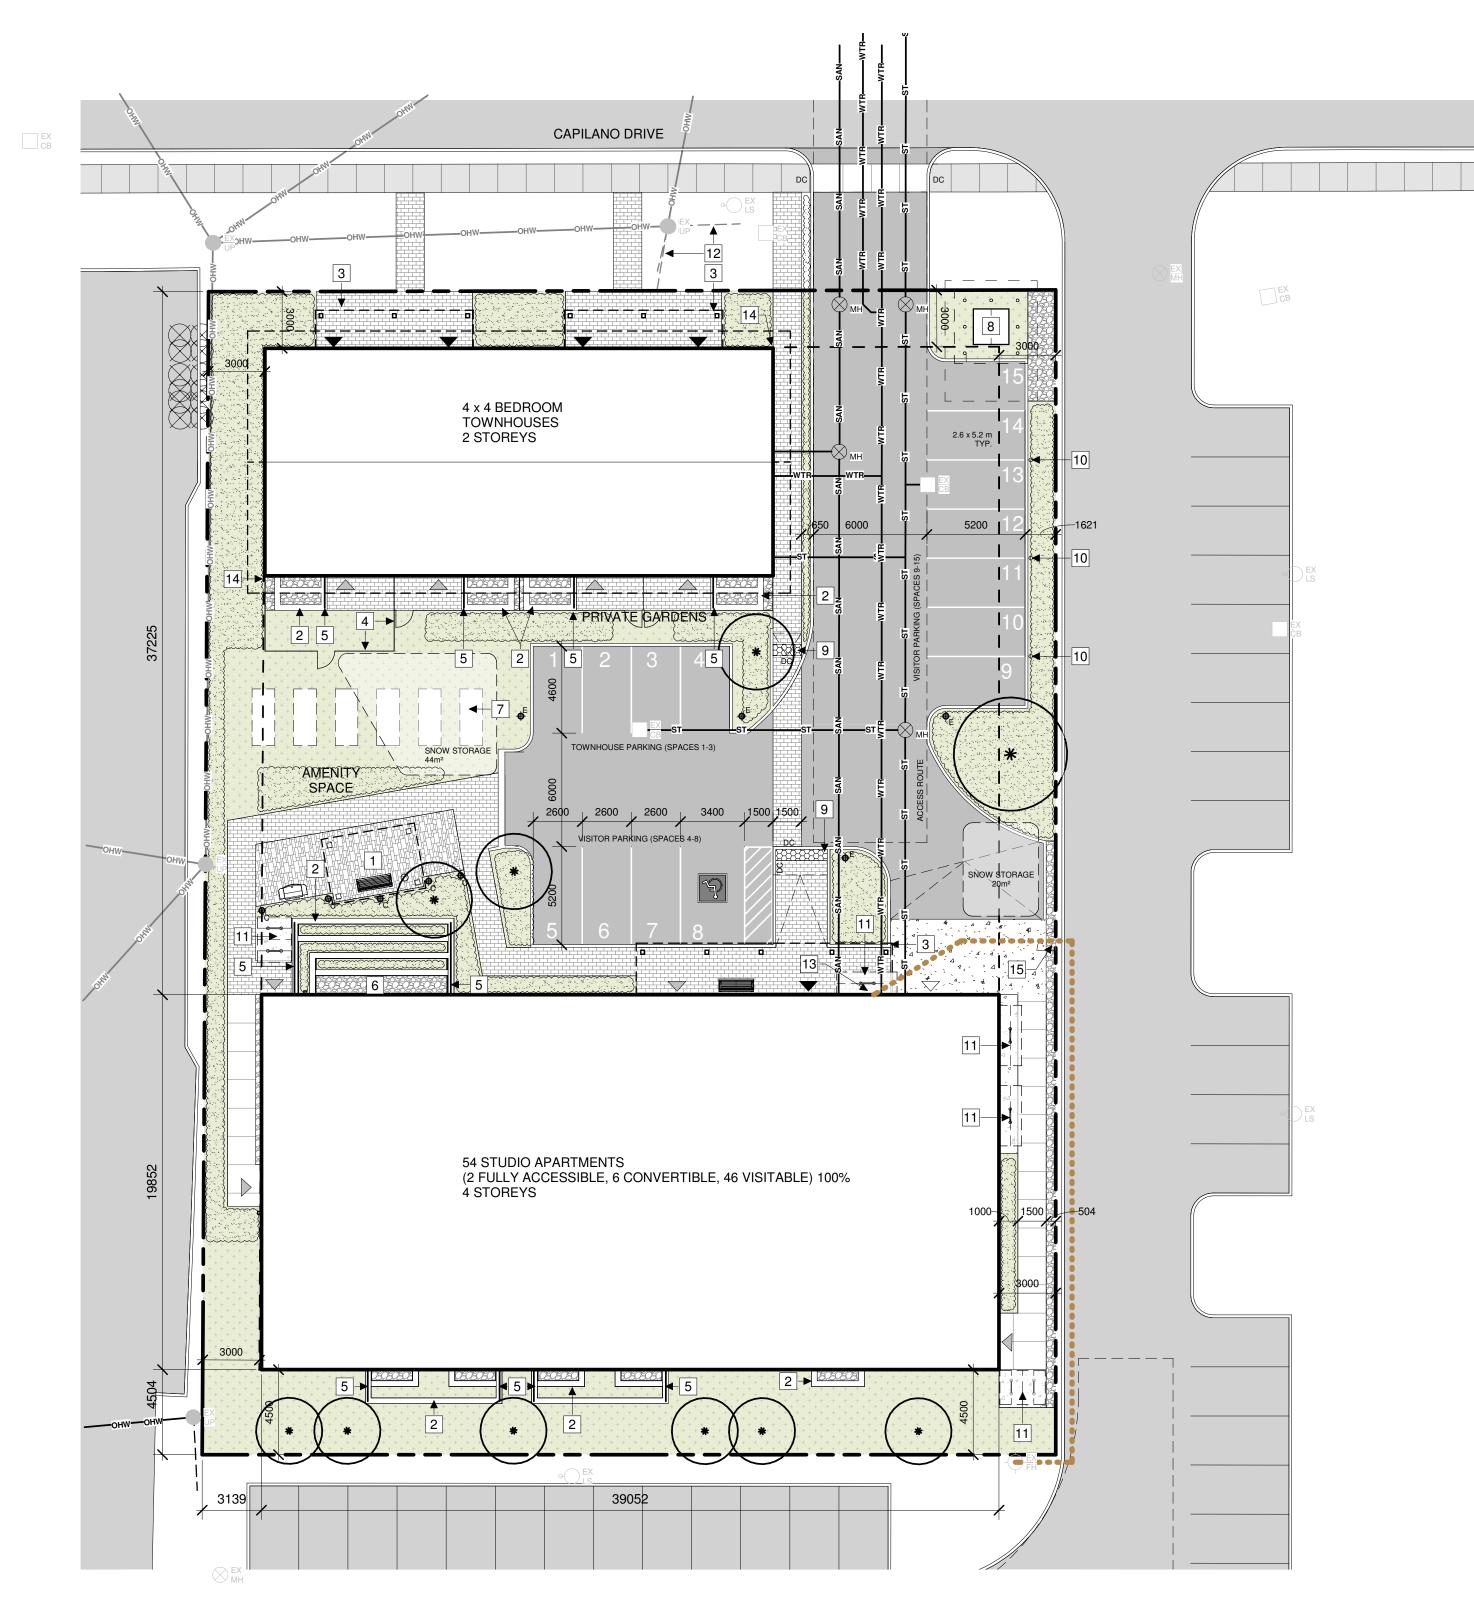

- The determination of property boundaries, minimum setbacks and other regulatory constraints are a critical component of development. An Ontario Land Surveyor (O.L.S.) needs to be consulted at the outset of a project to ensure properties are properly defined and can be used as the geospatial framework for the development.
- Topographic details may also be required for a project and should be either carried out by the O.L.S. that has provided the Legal Survey or done in consultation with the O.L.S. to ensure that the project is integrated to the appropriate control network.

Questions regarding the above requirements can be directed to the City's Surveyor, Bill Harper, at Bill.Harper@ottawa.ca

Other

- Plans are to be standard A1 size (594 mm x 841 mm) sheets, utilizing an appropriate Metric scale (1:200, 1:250, 1:300, 1:400 or 1:500).
- All PDF submitted documents are to be unlocked and flattened.
- Please refer to the links to the <u>guide to preparing studies and plans</u> and <u>development application</u> <u>fees</u> for general information. Additional information is available related to <u>building permits</u>, development charges, and the Accessibility Design Standards. Be aware that other fees and

- permits may be required, outside of the development review process. You may obtain background drawings by contacting informationcentre@ottawa.ca.
- These pre-consultation comments are valid for one year. If you submit a development application(s) after this time, you may be required to meet for another pre-consultation meeting and/or the submission requirements may change. You are as well encouraged to contact us for a follow-up meeting if the plan/concept will be further refined.

Hi Curtis and Nicholas,

The City agrees that the predevelopment C value can be based on the 2015 hardscape up to a maximum of 0.5 however we will need the system to be controlled to the 2-year pre-development release rate.

Regards, Abi

Hi Abi,

I'm just checking in on this one to see if you've reviewed the storm calculations/servicing layout?

We'd like to finalize and have it ready for site plan submission ASAP since there is also funding tied to timing of documents.

Can you give us an update whenever you get a moment?

Thanks,

Curtis Melanson, C.E.T.

Hi Abi,

We are working on this site and providing the civil engineering documents for a site plan control submission.

Would you be available to discuss the servicing on this site?

See attached preliminary concept for servicing. Let me know when you are available to discuss.

Thanks,

Curtis Melanson, C.E.T.

Hi Abi,

I followed the pipe network and I believe our site bypasses Gilbey pond/park.

See below sketch, the 750 from Gilbey turns into a 1050 from MHST18464 to MHST1843, continues west and bypasses OUT12225 into Gilbey pond.

Therefore, I don't think quality control should be required. Can you please have a quick look and let me know if this changes the requirement.

Thanks,

Curtis Melanson, C.E.T.

To: Curtis Melanson < c.melanson@mcintoshperry.com >

Subject: RE: 23-3325 - Quality Control Requirement - 56 Capilano Drive

Hi Curtis,

As discussed, quality control requirements are no longer within the CA's purview for projects that do not have hazard lands. This site is tributary to the Gilbey pond which is not a treatment pond but rather a stormwater attenuation pond for peak flow control, and therefore quality control is required. Since it is within the City's purview now, 80% TSS removal will be our requirement going forward.

Regards, Abi

Subject: RE: 23-3325 - Quality Control Requirement - 56 Capilano Drive

Hi Francis.

I would concur that based on the information provided, the RVCA would not require Water Quality Control measures for the project and site design. However please note, that water quality review is now ultimately subject to the municipality.

Thank you,

Eric Lalande, MCIP, RPP Planner, RVCA 613-692-3571 x1137

From: Francis Valenti < F. Valenti@McIntoshPerry.com>

Sent: Friday, March 3, 2023 12:11 PM To: Eric Lalande <eric.lalande@rvca.ca>

Cc: Nicholas Vachon < n.vachon@mcintoshperry.com >

Subject: 23-3325 - Quality Control Requirement - 56 Capilano Drive

Hi Eric,

See attached site plan for a project that we're working on at 56 Capilano Drive. The site was previously developed with a commercial building but is currently undeveloped. The proposed development consists of a 4-storey apartment building and a 4-unit townhouse block, complete with surface parking with street access from Capilano Drive. Fifteen Parking spaces are proposed.

Surface runoff will be collected by two catch basins, each restricted by an ICD. Hows in excess of the allowable release rate will be stored in the parking area. Runoff from the roof of the proposed building will be stored and controlled using roof drains. As seen in the attached Drainage Path figure, runoff from the site will be conveyed to the 300mm diameter storm sewer within Capilano Drive before discharging to the Rideau Waterway approximately 3.7km downstream.

Based on the distance to the outlet quality controls are not anticipated to be required, but can you please review and confirm?

Thanks,

Francis Valenti, EIT

You don't often get email from emily.diamond@ontario.ca. Learn why this is important

Good Morning Curtis,

Thank you for the email.

I agree to this course of action for the proposed project.

You may use this email as a record of pre-consultation.

If you have any further questions, please do not hesitate to reach out.

Thanks.

Emily Diamond

Environmental Officer Ministry of the Environment, Conservation and Parks Ottawa District Office 2430 Don Reid Drive Ottawa, Ontario, K1H 1E1

CAUTION -- EXTERNAL E-MAIL - Do not click links or open attachments unless you recognize the sender.

Hi Emily,

My apologies, I thought I had sent this but it was sitting in my drafts.

As discussed during our meeting, the site is being severed into 2 properties. The apartment building at the back of the site will be one property (complete with landscape area/ parking drive aisle) whereas the townhouses will be on the other newly created property.

At this time, the apartment building is proceeding as part of the first phase. There is currently no timeline for the townhouses in terms of when they may be constructed and therefore, the area will remain in a vegetated/grass state until funds are available to bring it to construction which could be years.

As the development does not consist of industrial uses and there is no threat of industrial effluent leaving/impacting the site, I believe an ECA would not be required during this first phase of construction (the apartment building only). However, when the townhouses are to be constructed there will be multiple properties sharing a stormwater management system and therefore, an ECA would be required at that time.

Can you please confirm this approach is acceptable to MECP?

If you'd like to discuss further or have any questions/concerns please don't hesitate to let me know.

Cheers, Curtis

Hi Emily,

I just left a voice message about the above project. See attached site plan.

Can you let me know when you would have some time to discuss? The city is holding up permits until we're able to provide them information so if you have time in the next little bit that would be greatly appreciated (recognizing how busy you are).

Thank you for your time!

Cheers, Curtis

Adjustable Accutrol Weir

Adjustable Flow Control for Roof Drains

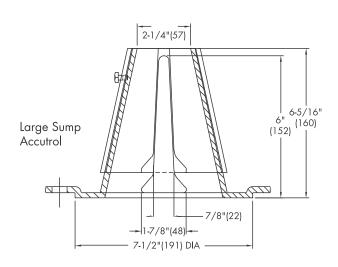

ADJUSTABLE ACCUTROL (for Large Sump Roof Drains only)

For more flexibility in controlling flow with heads deeper than 2", Watts Drainage offers the Adjustable Accutrol. The Adjustable Accutrol Weir is designed with a single parabolic opening that can be covered to restrict flow above 2" of head to less than 5 gpm per inch, up to 6" of head. To adjust the flow rate for depths over 2" of head, set the slot in the adjustable upper cone according to the flow rate required. Refer to Table 1 below. Note: Flow rates are directly proportional to the amount of weir opening that is exposed.

EXAMPLE:

For example, if the adjustable upper cone is set to cover 1/2 of the weir opening, flow rates above 2"of head will be restricted to 2-1/2 gpm per inch of head.

Therefore, at 3" of head, the flow rate through the Accutrol Weir that has 1/2 the slot exposed will be: [5 gpm (per inch of head) \times 2 inches of head] + 2-1/2 gpm (for the third inch of head) = 12-1/2 gpm.

APPENDIX H
CITY OF OTTAWA DESIGN CHECKLIST

McINTOSH PERRY

City of Ottawa

4. Development Servicing Study Checklist

The following section describes the checklist of the required content of servicing studies. It is expected that the proponent will address each one of the following items for the study to be deemed complete and ready for review by City of Ottawa Infrastructure Approvals staff.

The level of required detail in the Servicing Study will increase depending on the type of application. For example, for Official Plan amendments and re-zoning applications, the main issues will be to determine the capacity requirements for the proposed change in land use and confirm this against the existing capacity constraint, and to define the solutions, phasing of works and the financing of works to address the capacity constraint. For subdivisions and site plans, the above will be required with additional detailed information supporting the servicing within the development boundary.

4.1 General Content

Oriteria Criteria Cri	Location (if applicable)
☐ Executive Summary (for larger reports only).	N/A
☐ Date and revision number of the report.	On Cover
Location map and plan showing municipal address, boundary, and layout of proposed development.	Appendix A
☐ Plan showing the site and location of all existing services.	Ste Servicing Plan (C102)
 Development statistics, land use, density, adherence to zoning and official plan, and reference to applicable subwatershed and watershed plans that provide context to which individual 	1.1 Purpose 1.2 Ste Description
developments must adhere.	6.0 Stormwater Management
Summary of pre-consultation meetings with City and other approval agencies.	Appendix B
☐ Reference and confirm conformance to higher level studies and reports (Master Servicing Studies, Environmental Assessments,	1.1 Purpose
Community Design Plans), or in the case where it is not in conformance, the proponent must provide justification and	1.2 Ste Description
develop a defendable design criteria.	6.0 Stormwater Management
Statement of objectives and servicing criteria.	3.0 Pre-Consultation Summary

☐ Identification of existing and proposed infrastructure available in the immediate area.	N/A
☐ Identification of Environmentally Significant Areas, watercourses and Municipal Drains potentially impacted by the proposed development (Reference can be made to the Natural Heritage Studies, if available).	Ste Grading Plan (C101)
Concept level master grading plan to confirm existing and proposed grades in the development. This is required to confirm the feasibility of proposed stormwater management and drainage, soil removal and fill constraints, and potential impacts to neighbouring properties. This is also required to confirm that the proposed grading will not impede existing major system flow paths.	Ste Grading Plan (C101)
☐ Identification of potential impacts of proposed piped services on private services (such as wells and septic fields on adjacent lands) and mitigation required to address potential impacts.	N/A
Proposed phasing of the development, if applicable.	N/ A
Reference to geotechnical studies and recommendations concerning servicing.	Section 2.0 Background Studies, Standards and References
 All preliminary and formal site plan submissions should have the following information: Metric scale North arrow (including construction North) Key plan Name and contact information of applicant and property owner Property limits including bearings and dimensions Existing and proposed structures and parking areas Easements, road widening and rights-of-way Adjacent street names 	Ste Grading Plan (C101)

4.2 Development Servicing Report: Water

Oriteria	Location (if applicable)
☐ Confirm consistency with Master Servicing Study, if available	N/A
Availability of public infrastructure to service proposed development	N/A
☐ Identification of system constraints	N/A
☐ Identify boundary conditions	Appendix C
☐ Confirmation of adequate domestic supply and pressure	N/A
 Confirmation of adequate fire flow protection and confirmation that fire flow is calculated as per the Fire Underwriter's Survey. Output should show available fire flow at locations throughout the development. 	Appendix C
 Provide a check of high pressures. If pressure is found to be high, an assessment is required to confirm the application of pressure reducing valves. 	N/A
Definition of phasing constraints. Hydraulic modeling is required to confirm servicing for all defined phases of the project including the ultimate design	N/A
Address reliability requirements such as appropriate location of shut-off valves	N/ A
☐ Check on the necessity of a pressure zone boundary modification.	N/ A
Reference to water supply analysis to show that major infrastructure is capable of delivering sufficient water for the proposed land use. This includes data that shows that the expected demands under average day, peak hour and fire flow conditions provide water within the required pressure range	Appendix C, Section 4.2

Description of the proposed water distribution network, including locations of proposed connections to the existing system, provisions for necessary looping, and appurtenances (valves, pressure reducing valves, valve chambers, and fire hydrants) including special metering provisions.	Ste Servicing Plan (C101)
Description of off-site required feedermains, booster pumping stations, and other water infrastructure that will be ultimately required to service proposed development, including financing, interim facilities, and timing of implementation.	N/A
Confirmation that water demands are calculated based on the City of Ottawa Design Guidelines.	Appendix C
Provision of a model schematic showing the boundary conditions locations, streets, parcels, and building locations for reference.	N/A

4.3 Development Servicing Report: Wastewater

Oriteria	Location (if applicable)
Summary of proposed design criteria (Note: Wet-weather flow criteria should not deviate from the City of Ottawa Sewer Design Guidelines. Monitored flow data from relatively new infrastructure cannot be used to justify capacity requirements for proposed infrastructure).	N/A
Confirm consistency with Master Servicing Study and/or justifications for deviations.	N/A
Consideration of local conditions that may contribute to extraneous flows that are higher than the recommended flows in the guidelines. This includes groundwater and soil conditions, and age and condition of sewers.	N/A
Description of existing sanitary sewer available for discharge of wastewater from proposed development.	Section 5.2 Proposed Sanitary Sewer

☐ Verify available capacity in downstream sanitary sewer and/or identification of upgrades necessary to service the proposed development. (Reference can be made to previously completed Master Servicing Study if applicable)	Section 5.3 Proposed Sanitary Design
☐ Calculations related to dry-weather and wet-weather flow rates from the development in standard MOE sanitary sewer design table (Appendix 'C') format.	N/ A
 Description of proposed sewer network including sewers, pumping stations, and forcemains. 	Section 5.2 Proposed Sanitary Sewer
Discussion of previously identified environmental constraints and impact on servicing (environmental constraints are related to limitations imposed on the development in order to preserve the physical condition of watercourses, vegetation, soil cover, as well as protecting against water quantity and quality).	N/ A
Pumping stations: impacts of proposed development on existing pumping stations or requirements for new pumping station to service development.	N/A
Forcemain capacity in terms of operational redundancy, surge pressure and maximum flow velocity.	N/A
Identification and implementation of the emergency overflow from sanitary pumping stations in relation to the hydraulic grade line to protect against basement flooding.	N/A
Special considerations such as contamination, corrosive environment etc.	N/A

4.4 Development Servicing Report: Stormwater Checklist

Oriteria	Location (if applicable)
Description of drainage outlets and downstream constraints including legality of outlets (i.e. municipal drain, right-of-way, watercourse, or private property)	Section 6.0 Stormwater Sewer Design & Section 7.0 Proposed Stormwater Management
☐ Analysis of available capacity in existing public infrastructure.	N/A
A drawing showing the subject lands, its surroundings, the receiving watercourse, existing drainage patterns, and proposed drainage pattern.	Pre & Post-Development Plans
Water quantity control objective (e.g. controlling post-development peak flows to pre-development level for storm events ranging from the 2 or 5-year event (dependent on the receiving sewer design) to 100-year return period); if other objectives are being applied, a rationale must be included with reference to hydrologic analyses of the potentially affected subwatersheds, taking into account long-term cumulative effects.	Section 6.0 Stormwater Sewer Design & Section 7.0 Proposed Stormwater Management
☐ Water Quality control objective (basic, normal or enhanced level of protection based on the sensitivities of the receiving watercourse) and storage requirements.	Section 6.0 Stormwater Sewer Design & Section 7.0 Proposed Stormwater Management
Description of the stormwater management concept with facility locations and descriptions with references and supporting information.	Section 6.0 Stormwater Sewer Design & Section 7.0 Proposed Stormwater Management
Set-back from private sewage disposal systems.	N/A
☐ Watercourse and hazard lands set backs.	N/A
Record of pre-consultation with the Ontario Ministry of Environment and the Conservation Authority that has jurisdiction on the affected watershed.	N/A
Confirm consistency with sub-watershed and Master Servicing Study, if applicable study exists.	N/A
Storage requirements (complete with calculations) and conveyance capacity for minor events (1:5-year return period) and major events (1:100-year return period).	Appendix G

☐ Identification of watercourses within the proposed development and how watercourses will be protected, or, if necessary, altered by the proposed development with applicable approvals.	Ste Grading Plan
Calculate pre-and post development peak flow rates including a description of existing site conditions and proposed impervious areas and drainage catchments in comparison to existing conditions.	Section 7.0 Proposed Stormwater Management Appendix G
Any proposed diversion of drainage catchment areas from one outlet to another.	Section 6.0 Stormwater Sewer Design & Section 7.0 Proposed Stormwater Management
Proposed minor and major systems including locations and sizes of stormwater trunk sewers, and stormwater management facilities.	Section 6.0 Stormwater Sewer Design & Section 7.0 Proposed Stormwater Management
If quantity control is not proposed, demonstration that downstream system has adequate capacity for the post-development flows up to and including the 100-year return period storm event.	N/ A
☐ Identification of potential impacts to receiving watercourses	N/A
Identification of municipal drains and related approval requirements.	N/A
Descriptions of how the conveyance and storage capacity will be achieved for the development.	Section 6.0 Stormwater Sewer Design & Section 7.0 Proposed Stormwater Management
100-year flood levels and major flow routing to protect proposed development from flooding for establishing minimum building elevations (MBE) and overall grading.	Ste Grading Plan (C101)
☐ Inclusion of hydraulic analysis including hydraulic grade line elevations.	N/A

Description of approach to erosion and sediment control during construction for the protection of receiving watercourse or drainage corridors.	Section 8.0 Sediment & Erosion Control
Identification of floodplains – proponent to obtain relevant floodplain information from the appropriate Conservation Authority. The proponent may be required to delineate floodplain elevations to the satisfaction of the Conservation Authority if such information is not available or if information does not match current conditions.	N/A
☐ Identification of fill constraints related to floodplain and geotechnical investigation.	N/A

4.5 Approval and Permit Requirements: Checklist

The Servicing Study shall provide a list of applicable permits and regulatory approvals necessary for the proposed development as well as the relevant issues affecting each approval. The approval and permitting shall include but not be limited to the following:

Oriteria Criteria	Location (if applicable)
Conservation Authority as the designated approval agency for modification of floodplain, potential impact on fish habitat, proposed works in or adjacent to a watercourse, cut/fill permits and Approval under Lakes and Rivers Improvement Act. The Conservation Authority is not the approval authority for the Lakes and Rivers Improvement Act. Where there are Conservation Authority regulations in place, approval under the Lakes and Rivers Improvement Act is not required, except in cases of dams as defined in the Act.	N/A
Application for Certificate of Approval (CofA) under the Ontario Water Resources Act.	N/A
☐ Changes to Municipal Drains.	N/A
Other permits (National Capital Commission, Parks Canada, Public Works and Government Services Canada, Ministry of Transportation etc.)	N/A

4.6 Conclusion Checklist

Oriteria Criteria Cri	Location (if applicable)
Gearly stated conclusions and recommendations	Section 9.0 Summary
	Section 10.0 Recommendations
Comments received from review agencies including the City of Ottawa and information on how the comments were addressed. Final sign-off from the responsible reviewing agency.	All are stamped
All draft and final reports shall be signed and stamped by a professional Engineer registered in Ontario	All are stamped
