1.0 EXECUTIVE SUMMARY

WSP Canada Inc. (WSP) was retained by Theia Partners Inc. (Theia) to conduct a Phase Two Environmental Site Assessment (Phase Two ESA) of the property located at 30 Cleary Avenue, Ottawa, Ontario ("Site"). The Site location and plan are provided in Figure 1.

WSP previously completed a Phase One Environmental Site Assessment (Phase One ESA) for the Site, the results of which were documented in the report titled "*Phase One Environmental Site Assessment, 30 Cleary Avenue, Ottawa, Ontario*", dated November 2023. Based on the findings of the Phase One ESA, WSP completed this Phase Two ESA investigation.

The analytical results from the sampling and analysis program indicate that the reported concentrations of barium in soil at the Phase Two Property do not meet the applicable Ministry of Environment, Conservation and Parks (MECP) Table 7 site condition standards (residential/institutional land use, coarse textured soil)[1].

The reported results for sodium adsorption ratio (SAR) and electrical conductivity (EC) also exceeded the MECP Table 7 standards. However, both of these exceedances are considered to be due to the application of salt products to the ground for de-icing and safety and are therefore not considered as an exceedance of MECP Table 7 standards as per O. Reg 153/04 section 49.1.

The reported concentrations of all other parameters tested in soil and groundwater were below the Table 7 site condition standards.

The exceedance of barium is considered to be most likely of natural origin. However, given that it is in fill it may be attributed to the importation of fill to the Site. As such, the fill at this location may need to be managed separately from the remaining fill during development. Given the nature of the contaminant which is commonly found across the city at these concentrations in natural soils and the expectation that the fill will likely be excavated to accommodate the development, no further investigation is recommended.

2.0 INTRODUCTION

2.1 Site Description

WSP was retained by Theia to conduct a Phase Two Environmental Site Assessment (Phase Two ESA) of the following property:

Municipal Address	Part of 30 Cleary Avenue, Ottawa
Property Identification Number	04751-0119
Legal Description	Not available
Size of the Phase Two Property	1.09 hectares

Note: legal description obtained from ####.

The location of the Phase Two Property is provided in Figure 1. The boundaries of the Phase Two Property are provided in Figure 2.

[1] *Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act*, Ministry of the Environment, April 15, 2011 (PIBS# 7382e01)

2.2 Property Ownership

The Phase Two Property is owned by the First Unitarian Congregation of Ottawa. Authorization to proceed with this investigation was received on August 1, 2023, from Scott Bentley, Capital Projects Director for Theia Partners Inc., acting on behalf of the Site Owner as the Phase Two ESA Site Representative. The contact information for Scott Bentley is as follows:

Client	Address	Contact Information
Theia Partners Inc.	1554 Carling Ave, Suite 55 Ottawa, Ontario, K1Z 7M4	Telephone: 343-596-7596 bentley@theiapartners.com

2.3 Current and Proposed Future Uses

The Phase Two Property is currently developed with a parking lot (partially gravel, partially paved), reportedly constructed in 1982. The proposed future use of the Phase Two Property is residential.

2.4 Applicable Site Condition Standard

The analytical results were compared to the Table 7 generic site condition standards for shallow soils in a non-potable groundwater condition (residential property use, coarse soil texture) presented in the MECP document "*Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act*", dated April 15, 2011. The applicable site condition standards were selected based on the following rationale:

- The Phase Two Property and all other properties located, in whole or in part, within 250 metres of the Phase Two Property are supplied by the City of Ottawa municipal drinking water system. No wells were identified that are used or intended for use as a source of potable water.
- The Phase Two Property is not located in an area designated in a municipal official plan as a well-head protection area or other designation identified by the municipality for the protection of ground water.
- More than two thirds of the soil materials are considered to be coarse-textured (Section 6.4).
- The closest permanent water body is the Ottawa River, located 130 metres ("m") north of the Phase Two Property.
- No features have been identified at the Phase Two Property that would meet the conditions of an environmentally sensitive site, as described in Section 41 of O. Reg 153/04.
- The pH of surface soil meets the requirement that 5≤pH≤9 (Section 6.4).
- The intended use of the Phase Two Property is residential.
- The overburden thickness is less than 2 metres over more than two-thirds of the Phase Two Property. The reported depth to water is greater than 3 metres over the entire Phase Two Property.

3.0 BACKGROUND INFORMATION

This section presents the background conditions of the Phase Two Property including a description of the physical setting and a summary of past investigations conducted.

The objectives of the Phase Two ESA were to obtain information about environmental conditions in the soil and groundwater on, in or under the Site. The objectives of this Phase Two ESA were achieved by:

- Developing an understanding of the geological and hydrogeological conditions at the Phase Two Property.
- Conducting field sampling for all contaminants of potential concern ("COPCs") associated with each area of potential environmental concern ("APEC").

3.1 Physical Setting

The nearest surface water body is the Ottawa River, located 130 m north of the Phase Two Property. There are no areas of natural significance within the Phase Two Study area. Land uses surrounding the Phase Two Property include parkland, institutional, residential, and commercial, as shown in Figure 2.

Based on geological mapping, the regional overburden around the Phase Two Property is stone-poor, sandy silt to silty sand-textured till on Paleozoic terrain.

The Phase Two Property is located on a topographic flat area with an elevation of approximately 62 m above sea level (masl). The Site is sloping slightly down to the north from Richmond Rd, with the gravel parking area to the south being higher elevation than the paved portion of the parking area to the north. There are no surface water drainage features on the Site.

3.2 Past Investigations

3.2.1 Phase One ESA

WSP conducted a Phase One ESA entitled, "*Phase One Environmental Site Assessment, 30 Cleary Avenue, Ottawa, Ontario*", dated November 2023, to assess the likelihood of soil and/or groundwater contamination resulting from historical or present activities at the Site and surrounding area. This included a review of available historical information on the Site and surrounding area, interviews with persons familiar with the Site and a Site reconnaissance. The APECs identified in the 2023 Phase One ESA are summarized in the following table:

Area of Potential Environmental Concern (APEC)[1]	Location of APEC on Phase One Property	PCA No.[2]	PCA – on-site or off-site	Contaminants of Potential Concern (COPCs)[3]	Media Potentially Impacted
APEC-1 Southeast gravel parking area - Former railway on-site - Multiple gasoline service stations off-site - Auto repair shop off-site	Southeast corner of Property.	46, 28, 10,	On-site and off-site	PHCs BTEX PAHs Metals	Soil and Groundwater
APEC-2 Entire Phase One Property - Fill material of unknown quality - Application of salt to parking areas for de-icing purposes[1]	Entire Phase One Property	30	On-site	PHCs BTEX PAHs Metals Inorganics	Soil

Area of Potential Environmental Concern (APEC)[1]	Location of APEC on Phase One Property	PCA No.[2]	PCA – on-site or off-site	Contaminants of Potential Concern (COPCs)[3]	Media Potentially Impacted
APEC-3 Southwest corner of Property - Multiple gasoline USTs and ASTs off-site - Multiple gasoline service stations off-site	L-shaped section in the southwest corner of the Property, extending halfway up the western boundary and the same distance along a portion of the southern boundary.	28	Off-site	PHCs BTEX	Soil and Groundwater

1 - Based on information gathered through historical information review, WSP understands that the Site is not used, and has not been used, for manufacturing, processing, or bulk storage of salt. Further, Golder understands that salt has been applied to surfaces for the safety of vehicular or pedestrian traffic under conditions of snow or ice or both within the parking lot at the Site. It is therefore the Qualified Person's opinion, as per Section 49(1) of O. Reg. 153/04, as amended, that the site condition standards for electrical conductivity and sodium adsorption ratio are considered not to be exceeded within the Phase Two Property. Salt application to the parking lot has been included as an APEC for completeness.

This report was prepared by a Qualified Person and will be relied upon for the Phase Two investigation.

4.0 SCOPE OF THE INVESTIGATION

4.1 Overview of Site Investigation

The Phase Two ESA investigation activities were completed between carried out over August 24, August 25, September 5, September 29, and October 12, 2023, and included the following tasks:

- **Health and Safety Plan**: Preparation of a Health and Safety Plan for internal and subcontractor use prior to initiating any field work at the Site.
- **Utility Clearances**: Coordination of utility clearances with local utility companies along with retaining the services of a private locator to assess for possible services in the areas of the proposed test locations.
- **Borehole Advancement and Monitoring Well Installation**: The borehole drilling and monitoring well installation program included drilling of nine boreholes and the installation of four groundwater monitoring wells, which were used for groundwater sampling at the Site. The locations of the boreholes and monitoring wells are provided in Figure 5. The monitoring well construction details are presented in Appendix A.
- **Soil Sampling**: Soil samples were collected on August 24th and 25th, 2023 from six of the boreholes. Selected soil samples were submitted for analysis of the COPCs (Table 1).
- **Groundwater Monitoring and Sampling**: Groundwater samples were collected on September 5th, 2023, and October 12th, 2023. Groundwater samples were submitted for analysis of the COPCs (Table 2).
- **Surveying**: An elevation survey for boreholes and monitoring wells was completed using a Trimble R8.
- **Reporting**: WSP compiled and assessed the field and laboratory results from the above noted activities into this report.

The Phase Two investigation was carried out in general accordance with WSP's standard operating procedures, which conform to the requirements of Ontario Regulation 153/04 (O. Reg. 153/04). The data from the Phase Two ESA investigation completed by WSP were incorporated into a single Phase Two ESA report following the Phase Two ESA report format required by O. Reg. 153/04.

There were no impediments or access limitations that in the opinion of the Qualified Person would affect the conclusions of this Phase Two ESA report.

4.2 Media Investigated

The Phase Two ESA included sampling and analysis of soil and groundwater. No sediment was present and therefore sediment sampling was not required. Summaries of the sampling and analysis completed for soil and groundwater are provided in Tables 1 and 2.

4.3 Phase One Conceptual Site Model

The following key Site features (where applicable) are presented in Figures 1, 2, 3 and 4:

As part of the requirements of Part V in Schedule D of O. Reg. 153/04, a phase one conceptual site model (CSM) was developed as part of the review and evaluation.

The phase one CSM consists of a figure and narrative descriptions that are intended to illustrate the results of the Phase One ESA and to provide a basis of further work if required.

The phase one CSM is illustrated in Figures 3 and 4. The narrative is provided below, in accordance with the mandatory requirements of Table 1 of Schedule D.

4.3.1 Areas of PCAs Potentially Affecting the Phase One Property

Refer to Section 7.2 for a description of areas of PCAs identified on the Phase One Property and in the Phase One Study Area. Refer to Section 7.3 for a description of APECs on the Phase One Property based on the identified PCAs.

4.3.2 Potential Influence of Underground Utilities

COPCs have the potential to preferentially migrate in utility backfills at and surrounding the Phase One Property. It is possible that potential impacts associated with off-site PCAs could be intercepted by intervening underground utilities, however; they remain a concern due to their proximity to the Phase One Property and potential for impacts that may extend deeper than utility trenches.

4.3.3 Regional or Site Specific Geological/Hydrogeological Information

Based on the records review the following is likely true of the Phase One Property:

- Based on geological mapping, the Phase One Property overburden is stone-poor, sandy silt to silty sand-textured till on Paleozoic terrain. The thickness of this till ranges from approximately 0.3 – 1.7 m. Monitoring well records associated with the Phase One Property indicate that unconsolidated material beneath the Phase One Property consists primarily of packed till materials.
- Bedrock is expected to be Middle Ordovician limestone and shale from the Ottawa and Simcoe Groups and the Shadow Lake Formation.

- The Phase One Property is located on a topographic flat area with and elevation of approximately 62 m above sea level (masl). The Site is sloping down to the north from Richmond Rd, with the gravel parking area to the south being higher elevation than the paved portion of the parking area to the north.
- Based on monitoring wells developed as part of this Phase Two ESA, depth to groundwater ranges from approximately 3.39 to 3.59 mbgs.
- There are no permanent surface water bodies or areas of standing water on the Phase One Property. The nearest open water body is the Ottawa River, which is to the north and west of the Property. The closest part of the river to the Site is about 130 metres to the north.
- Surface runoff is directed to five storm sewer manholes located on the Phase One Property.
- Based on topography and orientation of surface water bodies shallow groundwater at the Site is expected to flow toward the northwest. However, shallow groundwater flow on the Phase One Property and in the Phase One Study Area may be variable and influenced by the presence of subsurface utilities. Regional groundwater flow is expected to be toward the Ottawa River, located to the northwest of the Phase One Property.

4.3.4 Uncertainties Associated with CSM

Uncertainties associated with the Phase One ESA are identified in Section 7.3.3 of the Phase One report and can also be considered for the phase one CSM.

Additional uncertainties to consider from the context of the CSM include:

- Site utilities and unknown effect of utilities on migration patterns of COPCs.

4.4 Impediments

No physical impediments to the Phase Two ESA investigation were encountered. Access to the Phase Two Property was not denied or restricted.

5.0 INVESTIGATION METHOD

5.1 General

The following sections describe the field investigation methodology employed during the Phase Two ESA. The field work was carried out over August 24, August 25, September 5, September 29, and October 12, 2023

Prior to initiating the field work, WSP developed and implemented Site-specific protocols to protect the health and safety of its employees and subcontractors through the preparation of a Site-specific Health and Safety Plan. An assessment of potential health and safety hazards at the Phase Two Property and those associated with the proposed work was completed each day of the field program. A health and safety tail gate meeting was held with WSP's subcontractors each day prior to completion of the field work. The document was reviewed and signed on-Site by field personnel prior to commencing work. Additionally, prior to any intrusive investigations, including drilling, WSP completed public and private utility clearances.

5.2 Drilling

Borehole drilling and monitoring well installation were completed on August 24, August 25, and September 29, 2023, by Downing using a CME-75 truck mounted drill. A power auger was used to bore through fill material at all locations. At locations where bedrock was also drilled (BH23-01, BH23-05, and BH23-07), a rotary diamond drill was used for that portion of the drilling. Nine boreholes were advanced with depths ranging from 1.30 to 7.99 metres below ground surface (mbgs). Drilling depth was based on the geotechnical requirements as the investigation was being conducted in combination with the geotechnical investigation for the development.

5.3 Soil: Sampling

At each borehole location, regular soil samples were collected using a 0.6 m split spoon sampler for field screening (including visual inspection and field measurement of headspace concentration), soil sample collection, and stratigraphic logging by a WSP field supervisor. A portion of each soil sample was placed in a sealed plastic bag, as well as a pre-cleaned laboratory-supplied sample container for potential laboratory analysis. Soil headspace concentrations of samples were measured using a photoionization detector (PID) and a combustible gas detector, calibrated using isobutylene and hexane, respectively, to determine total organic vapour and combustible gas concentrations.

One soil sample representing “worst-case” conditions at each sampling location was selected for laboratory analysis based on the field headspace screening measurements, visual observations (e.g., staining, discoloration and/or free product, if any), and olfactory observations (if any). Soil samples were submitted to the analytical laboratory under chain of custody procedures. A summary of the soil samples submitted for analysis is provided in Table 1.

Geologic descriptions, visual and olfactory observations, and results of field headspace measurements are presented in the borehole logs (Appendix A).

A description of the quality assurance/quality control measures taken to minimize the potential for cross-contamination between sampling locations is provided in Section 5.12.

5.4 Field Screening Measurements

Field measurements of sample headspace concentration were made using the following equipment:

Equipment	Parameters Detected	Detection Limit	Precision	Accuracy	Calibration Standard
RKI Eagle 2	Combustible gas	0-50,000 ppm	NA	±5%	Hexane (100 ppm)
RKI Eagle 2	Total organic vapour	0-2,000 ppm	NA	±5%	Isobutylene (100 ppm)

Instruments were calibrated before use with daily calibration checks.

5.5 Groundwater: Monitoring Well Installation

Monitoring wells were installed in two boreholes (BH23-05 and BH23-07), each adjacent to the off-Site PCAs upgradient of the Phase Two Property to the south-southeast and southwest. A total of four monitoring wells were installed. At both BH23-05 and BH23-07, two wells were installed, one shallower and one deeper to get information on groundwater quality at different depths. Both shallower wells at each location were found to be dry and therefore not sampled from for groundwater. Monitoring wells were constructed of 32 millimetre inside diameter (ID) Schedule 40 polyvinyl chloride (PVC) casings equipped with Schedule 40 PVC well screens (1.5 m in length, #10 slot size). The sand pack surrounding the screen was constructed using #3 silica sand. A bentonite seal consisting of bentonite solids (e.g., Holeplug™) was placed above the filter pack with a minimum thickness of 0.6 m. Each monitoring well was completed at ground surface with a flush-mount protective casing set in concrete and the casing was sealed with a PVC j-plug. Monitoring wells were developed on September 5 and 29, 2023. Well construction details are provided in Appendix A.

5.6 Groundwater: Sampling

Groundwater samples were collected from all new monitoring wells on September 5 and October 12, 2023. Depths to water were determined using an electric water level meter. Groundwater monitoring was completed by purging three well volumes of groundwater from each monitoring well using dedicated Waterra® inertial samplers and collecting groundwater samples into pre-cleaned laboratory-supplied sample containers.

Groundwater samples were placed in laboratory-prepared containers and stored in a cooler until delivery to the analytical laboratory under chain of custody procedures. A summary of the groundwater samples submitted for analysis is presented in Table 2.

5.7 Analytical Testing

Two analytical laboratories were used during this Phase Two ESA. The contact information for Bureau Veritas Laboratories is: 36 Antares Dr., Nepean, Ontario, K2E 7W5, 613-274-0573. The contact information for AGAT Laboratories is: 1690 Woodward Dr., unit 1630, Ottawa, Ontario, 613-225-8668.

Both analytical laboratories are accredited in accordance with the International Standard ISO/IEC 17025 (General Requirement for the Competence of Testing and Calibration Laboratories, May 5, 2005, as amended) and the standards for proficiency testing developed by the Standards Council of Canada, the Canadian Association for Laboratory Accreditation or another accreditation body accepted by the MECP.

5.8 Residue Management Procedures

All residues produced during the investigation (e.g., soil cuttings from drilling, groundwater from well development purging, wash water from equipment decontamination) were placed in sealed drums and stored at the Phase Two Property for disposal by the owner.

5.9 Elevation Surveying

WSP used a Trimble R8 to complete a geodetic survey of each drilling location. The survey included the location and elevation (both the top of the flush-mounted well cap and the top of the riser pipe) for each monitoring well.

5.10 Quality Assurance and Quality Control Measures

WSP's quality assurance program for environmental investigations was implemented to ensure that analytical data obtained by the investigation were valid and representative. The quality assurance program included the following measures:

- The use of standard operating procedures for all field investigation activities.
- All monitoring wells were developed following installation to remove fine particles from the filter pack and any fluids introduced during drilling.
- Monitoring wells were appropriately purged prior to groundwater sample collection to remove stagnant water from the well bore and improve sample representativeness, minimizing sample agitation and aeration to the extent practicable.
- Daily checks of calibration were completed for field equipment using a standard of known concentration.
- Soil and groundwater samples were handled and stored in accordance with the sample collection and preservation requirement of the MECP "*Protocol for Analytical Methods Used in the Assessment of Properties Under Part XV.I of the Environmental Protection Act and Excess Soil Quality*", July 1, 2011 (as amended February 19, 2021). Samples were collected directly into pre-cleaned, laboratory-supplied sample containers with the appropriate preservative for the analyte group. Upon collection, samples were placed in insulated coolers with ice for storage and transport to the analytical laboratory under chain of custody protocols.
- Dedicated sampling equipment (tubing and foot valves) and clean disposable Nitrile™ gloves were used at each sampling location to prevent cross-contamination. All non-dedicated sampling equipment (e.g., water level meters, split spoons) was decontaminated between sampling locations. Sampling equipment in contact with soil, groundwater, or sediment was: cleaned by mechanical means; washed with a phosphate-free, laboratory-grade detergent and, if necessary, an appropriate desorbing wash solution; and thoroughly rinsed with analyte-free water.
- Detailed field records documenting the methods and circumstances of collection for each field sample were prepared at the time of sample collection. Each sample was assigned a unique sample identification number recorded in the field notes, along with the date and time of sample collection, the sample matrix, and the requested analyses.
- The submission of samples to the analytical laboratory in accordance with standard chain of custody procedures.

Below is a summary of the soil and groundwater samples.

Date Sampled	Sample Location	Sample ID	Media
August 24, 2023	BH23-01	1-1	Soil
August 24, 2023	BH23-05	5-2	Soil
August 24, 2023	BH23-09	9-2	Soil
August 25, 2023	BH23-03	3-1	Soil

Date Sampled	Sample Location	Sample ID	Media
August 25, 2023	BH23-04	4-1	Soil
August 25, 2023	BH23-07	7-2	Soil
September 5, 2023	BH23-05	23-05A and 23-05A (field duplicate of 23-05)	Groundwater
October 12, 2023	BH23-07	BH23-07	Groundwater

6.0 REVIEW AND EVALUATION

This section of the report presents a review and evaluation of the results of the drilling, monitoring and sampling activities conducted as part of the Phase Two ESA.

6.1 Geology

The soil and bedrock conditions encountered during the borehole drilling programs are presented in the borehole logs (Appendix A). The following presents a summary of the subsurface soil conditions encountered during the investigation.

In general, the soil conditions encountered in the boreholes consisted of 1-3 inches of asphalt, underlain by a layer of fill material, followed by a layer of native silty sand to clayey silt and glacial till, followed by limestone and shale bedrock. The fill material generally consisted of sand and gravel, which ranged from depths of approximately 0 to 0.86 mbgs. The native soil layer consisted of silty sand to sandy silt mixed with compact glacial till, which ranged from depths of 0.25 to 2.44 mbgs. The limestone and shale bedrock layer was drilled at three borehole locations (BH23-01, BH23-05, and BH23-07) and the start of the bedrock was found at 0.86, 1.93, and 2.43 mbgs, respectively.

6.2 Groundwater: Elevations, Hydraulic Gradients, and Flow Direction

Water level measurements were obtained from two of the on-Site monitoring wells on September 5 (BH23-05) and October 12 (BH23-07), 2023 using a Solinst water level meter. The depth to groundwater ranged from 3.39 mbgs (BH23-05) to 3.59 mbgs (BH23-07). The elevation of the water table was 58.74 meters above sea level (masl) at BH23-05 and 59.79 masl at BH23-07.

The approximate horizontal gradient of the water table between BH23-05 and BH23-07 is 0.015 m/m. As shown on Figure 5, BH23-05 is to the north of BH23-07. Therefore, it can be inferred that the groundwater flow at the Property is northerly.

Any temporary fluctuation in water levels on the Phase Two Property is not anticipated to affect the conclusions of the Phase Two ESA. Seasonal fluctuation in water levels should be expected. Given the limited number of monitoring events, seasonal trends could not be identified; however shallow groundwater water levels are typically highest following the spring recharge and decline throughout the summer and fall months into the winter.

Vertical hydraulic gradients were not determined since the reported concentrations of all COPCs in groundwater met the applicable site condition standards and shallow wells were dry at the time of sampling.

6.3 Coarse Soil Texture and pH

Based on field observations, more than 50% of particles (by mass) in the soil were equal to or greater than 75 µm in mean diameter. Accordingly, soil at the Phase Two Property is considered to be coarse-textured.

Soil samples were collected from surface soil and submitted to AGAT laboratories for pH determination. A summary of the test results is presented below.

Location ID	Sample ID	Sample Depth (mbgs)	Surface/ Subsurface Soil	pH
BH23-01	1-1	0.02-0.3	Surface soil	7.05
BH23-03	3-1	0.06-0.3	Surface soil	7.11
BH23-04	4-1	0.08-0.6	Surface soil	7.20
BH23-05	5-2	0-0.6	Surface soil	7.12
BH23-07	7-2	0.6-1.2	Surface soil	7.16
BH23-09	9-2	0.7-1.3	Surface soil	7.09

The reported pH of all samples of surface soil meets the requirement that 5≤pH≤9.

6.4 Soil: Field Screening

gas vapour ranged from 0 to 85 ppm (highest reading at BH23-07 between 0.6-1.2 mbgs) and organic vapour measurements were 0 ppm at all locations.

6.5 Soil: Quality

A list of soil samples submitted for laboratory analysis is provided in Table 1. The analytical results for soil samples are summarized in Tables 3 to 5. Certificates of analysis are provided in Appendix B.

The reported concentrations of all soil samples met the applicable site condition standards with the exception of the following:

- **BH23-01**—The reported concentration of barium in soil sample BH23-01 1-1 (410 µg/g) was above the Table 7 standard (390 µg/g).
- **BH23-04**—The sodium adsorption ratio (SAR) of soil sample BH23-04 4-1 (6.82) was above the Table 7 standard (5).
- **BH23-07**—The reported electrical conductivity of soil sample BH23-07 7-2 (0.785 mS/cm) was above the Table 7 standard (0.7 mS/cm). The sodium adsorption ratio (SAR) of soil sample BH23-07 7-2 (9.17) was above the Table 7 standard (5).
- **BH23-09**—The reported electrical conductivity of soil sample BH23-09 9-2 (1.17 mS/cm) was above the Table 7 standard (0.7 mS/cm). The sodium adsorption ratio (SAR) of soil sample BH23-09 9-2 (15.9) was above the Table 7 standard (5).

Sodium adsorption ratio (SAR) and electrical conductivity (EC) are considered to be due to the application of salt products to the ground for de-icing and safety and are therefore not considered as an exceedance of MECP Table 7 standards as per O. Reg 153/04 section 49.1. They are referenced above for consideration with respect to future excavation and off-site management where the EC and SAR may need to be considered.

6.6 Groundwater: Quality

The analytical results for groundwater samples are summarized in Table 6. Certificates of analysis are provided in Appendix B.

The reported concentrations of all groundwater samples met the applicable site condition standards.

In addition to the numerical standards, the MECP sets out aesthetic standards relating to the presence of petroleum hydrocarbon product. Specifically, a property does not meet the site condition standards if there is evidence of free product, including but not limited to, visible petroleum hydrocarbon film or sheen present on groundwater, surface water or in any groundwater or surface water samples. Monitoring for free phase product was conducted during groundwater sample collection. No evidence of free product or sheen in groundwater was observed.

A property does not meet an applicable potable ground water site condition standard unless the qualified person has determined that there is no indication of objectionable petroleum hydrocarbon odour and taste associated with the ground water. There was no evidence of objectionable petroleum hydrocarbon odour or taste associated with groundwater.

6.7 Data Quality Review

The quality assurance assessment of the groundwater field duplicate sample results was conducted according to the MECP document "*Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act and Excess Soil Quality*", March 9, 2004 (amended February 19, 2021) ("Analytical Protocol"). The laboratories' data quality review findings are presented in the Certificates of Analysis, found in Appendix B. WSP calculated the Relative Percent Difference (RPD) between the groundwater duplicate and parent samples, and found the RPD to be within acceptable criteria limits. Based on this review, the analytical data generated during the investigation are valid and may be used in this Phase Two ESA without further qualification.

All certificates of analysis or analytical reports received pursuant to clause 47(2)(b) of O. Reg. 153/04 comply with subsection 47(3). A certificate of analysis or analytical report has been received for each sample submitted for analysis and is provided in Appendix B.

6.8 Phase Two Conceptual Site Model

The Phase Two conceptual site model is presented in the following sections. The location of the Phase Two Property is provided in Figure 1.

POTENTIAL SOURCES OF CONTAMINATION

Potentially Contaminating Activities

Based on the information obtained as part of the Phase One ESA, the following potentially contaminating activities ("PCAs") were identified. The location of each PCA is provided in Figure 3. Given the high volume of PCAs in the

Phase One Study Area, those that have been carried forward in consideration of APECs have been shaded light grey.

Potentially Contaminating Activity	Address	Rationale for Potential Contribution of the PCA to an APEC
From approximately the late 1940s to mid 1960s, a rail track traversed the southeast portion of the Phase One Property, adjacent to a row of northeast-southwest oriented rectangular commercial buildings on the far side of the rail track.	Phase One Property	The PCA is located on the Phase One Property and must be identified as an APEC. (APEC 1)
Fill quality is unknown and therefore of concern. Multiple redevelopments of Site have happened in the past, fill quality not documented.	Phase One Property	The PCA is located on the Phase One Property and must be identified as an APEC. (APEC 2)
Gasoline UST (4540 L) and coal yard - Leafloor Bros Coal and Wood Dave Rennie's Auto Repair shop	801 Richmond Rd	PCA is upgradient of Site. Given nature of chemicals used in auto garages, and former storage of coal, PCA is carried forward as contributing to APEC 1.
Fuel Oil UST (9080 L) – Unitarian Church of Ottawa	Unitarian Church of Ottawa (adjacent to east of Property)	UST is cross gradient/downgradient location with respect to groundwater flow direction. As such, PCA is not considered to result in an APEC.
Two gasoline USTs – Gasoline Service Station (unnamed)	775 Richmond Rd	PCA is in close proximity and is upgradient of Site. PCA is carried forward as contributing to APEC 1.
Ottawa Electric Railway – streetcar public transit system. Ran parallel to Richmond Rd, adjacent to Byron Ave.	Between Richmond Rd and Byron Ave	Given distance from the Site and relatively immobile nature of the contaminants associated with this PCA (railway fill), this PCA is not considered to result in an APEC. As well, this infrastructure has been removed as part of the current LRT construction.
Four gasoline storage tanks (total 13,000 gal, unspecified whether AST or UST), three fuel oil tanks (total 1000+ gal, two are USTs), one waste oil tank (1000 gal) – Gasoline Service Station - Sunoco Energy Inc.	75 Cleary Ave	PCA is upgradient of Site with respect to groundwater flow direction. Given high volume of contaminant storage, PCA is carried forward as contributing to APECs 1.
Hydraulic oil leak from crane (Kiewit Eurovia Vinci (KEV))	Kichi Zībī Mīkan Parkway and Cleary Ave	Spill is downgradient of Site with respect to groundwater flow direction. As such, spill is not considered to result in an APEC.
Gasoline ASTs (Sunlight Oil Co.)	851 Richmond Rd	PCA is cross gradient/upgradient of Site with respect to groundwater flow direction. Given large quantities of gasoline USTs, PCA is carried forward as contributing to APECs 3.

Potentially Contaminating Activity	Address	Rationale for Potential Contribution of the PCA to an APEC
Three gasoline USTs (three 13,620 L tanks) - BP Canada Gas Station		
Two USTs (unknown product type or size) – BP Canada Gas Station	865 Richmond	Based on groundwater flow direction and distance from the Site, this PCA is not considered to result in an APEC.
Spill - 5L hydraulic oil spill to ground (KEV) Spill - 2L diesel exhaust fluid spill to soil (KEV) Spill - 20L hydraulic oil spill to rock floor of tunnel (KEV) Spill - 1L diesel spill to soil (KEV)	Sherbourne Rd and Byron Ave	Given distance from the Site and small quantities of spills, these are not considered to result in an APEC.
Multiple gasoline and fuel oil USTs – Shell Gas Station Dry cleaning depot (unnamed)	747 Richmond Rd	Based on distance from the Site and cross gradient location with respect to groundwater flow direction, these PCAs are not considered to result in an APEC.
Spill - 0.5L unknown hydrocarbons (KEV)	Just east of 75 Cleary Ave	Given low quantity of spill and distance from Site, spill is not considered to result in an APEC.
Spill - 20L hydraulic oil to land (Lehigh Hanson Canada ULC)	2122 Wayne Ave	Given low quantity of spill and distance from Site, spill is not considered to result in an APEC.
Spill - 1L hydraulic oil to soil and rock (KEV)	Byron Park to the east across from 851 Richmond Rd	Given low quantity of spill and distance from Site, spill is not considered to result in an APEC.
Two USTs (unknown product type or size) – Unnamed Gasoline Service Station	739 Richmond Rd	Based on the distance from the Site and cross gradient location with respect to groundwater flow direction, this PCA is not considered to result in an APEC.
Spill - 100L diesel to ground (no client name given) Spill - 20L hydraulic oil to asphalt and walkway (unnamed client) Spill - 1L grease spill (KEV) Spill - 5L hydraulic oil to ground (KEV)	Clearly Ave and Richmond Rd	Based on distance from sit and quantity of spills, these are not considered to result in an APEC. As well, any spill reported in the last 15 years would have required action by MECP.
Spill - 2L hydraulic oil to excavated pit with snow melt (KEV)	Near 100 Byron Ave	Given low quantity of spill and distance from Site, spill is not considered to result in an APEC.
Three gasoline USTs – Capital City Gas Gasoline Service Stations:	875 Richmond Rd	Based on distance from the Site and cross gradient location relative to groundwater

Potentially Contaminating Activity	Address	Rationale for Potential Contribution of the PCA to an APEC
- Saveway Gas Little Oil Company Ltd.		flow direction, these PCAs are not considered to result in an APEC.
Spill - 1L hydraulic oil spill	Richmond Rd and Redwood Ave	Given low quantity of spill and distance from Site, this spill is not considered to result in an APEC.

Areas of Potential Environmental Concern

The following APECs were identified at the Phase Two Property. The location of each APEC is presented in Figure 4.

Area of Potential Environmental Concern (APEC)[1]	Location of APEC on Phase One Property	PCA No.[2]	PCA – on-site or off-site	Contaminants of Potential Concern (COPCs)[3]	Media Potentially Impacted
APEC-1 Southeast gravel parking area - Former railway on-site - Multiple gasoline service stations off-site - Auto repair shop off-site	Southeast corner of Property.	46, 28, 10,	On-site and off-site	PHCs BTEX PAHs Metals	Soil and Groundwater
APEC-2 Entire Phase One Property - Fill material of unknown quality - Application of salt to parking areas for de-icing purposes[1]	Entire Phase One Property	30	On-site	PHCs BTEX PAHs Metals Inorganics	Soil
APEC-3 Southwest corner of Property - Multiple gasoline USTs and ASTs off-site - Multiple gasoline service stations off-site	L-shaped section in the southwest corner of the Property, extending halfway up the western boundary and the same distance along a portion of the southern boundary.	28	Off-site	PHCs BTEX	Soil and Groundwater

1 - Based on information gathered through historical information review, WSP understands that the Site is not used, and has not been used, for manufacturing, processing, or bulk storage of salt. Further, Golder understands that salt has been applied to surfaces for the safety of vehicular or pedestrian traffic under conditions of snow or ice or both within the parking lot at the Site. It is therefore the Qualified Person's opinion, as per Section 49(1) of O. Reg. 153/04, as amended, that the site condition standards for electrical conductivity and sodium adsorption ratio are considered not to be exceeded within the Phase Two Property. Salt application to the parking lot has been included as an APEC for completeness.

Subsurface Structures and Utilities

With the exception of sewers and other buried utilities, there are no known below ground structures at the Phase One Property.

PHYSICAL SETTING

Geological Characteristics

In general, the subsurface soil conditions encountered in the boreholes consisted of 1-3 inches of asphalt, underlain by a layer fill material, followed by a layer of native silty sand to clayey silt and glacial till, followed by limestone and shale bedrock. The fill material generally consisted of sand and gravel, which ranged from depths of approximately 0 to 0.86 mbgs. The native soil layer consisted of silty sand to sandy silt mixed with compact glacial till, which ranged from depths of 0.25 to 2.44 mbgs. The limestone and shale bedrock layer was drilled at three borehole locations (BH23-01, BH23-05, and BH23-07) and the start of the bedrock was found at 0.86, 1.93, and 2.43 mbgs, respectively.

Hydrogeological Characteristics

Based on topography and orientation of surface water bodies shallow groundwater at the Site is expected to flow toward the northwest. However, shallow groundwater flow on the Phase One Property and in the Phase One Study Area may be variable and influenced by the presence of subsurface utilities. Regional groundwater flow is expected to be toward the Ottawa River, located to the northwest of the Phase One Property.

The approximate horizontal gradient of the water table between BH23-05 and BH23-07 is 0.015 m/m. As shown on Figure 5, BH23-05 is to the north of BH23-07. Therefore, it can be inferred that the groundwater flow at the Property is northerly.

Depth to groundwater ranges from approximately 3.39 to 3.59 mbgs.

Non-potable Standards (Section 35)

The Phase Two Property, and all other properties located, in whole or in part, within 250 metres of the boundaries of the Property, are supplied by a municipal drinking water system. The intended use of the Property does not include agricultural use.

The Property is not located in an area designated in the municipal official plan as a well-head protection area or other designation identified by the municipality for the protection of groundwater. There are no wells at the Property or one of the properties in the phase one study area that are used or intended for use as a source of water for human consumption or agriculture. According, there is no requirement to submit written notice to the City of Ottawa of the owner's intention to apply non-potable standards.

Environmentally Sensitive Areas (Section 41)

The Qualified Person is not aware of any conditions by which section 41 of the Regulation applies to the Property. No areas of natural significance were identified on or within 30 m of the Property. At the locations tested the pH of surface soil meets the requirement that 5≤pH≤9. Accordingly, Section 41 of O. Reg. 153/04 does not apply to the RSC Property.

Shallow Soil Property or Water Body (Section 43.1)

Bedrock was encountered at depths of 0.86 – 2.43 mbgs. The Property does not include all or part of a water body and is not adjacent to a water body or include land that is within 30 metres of a water body. Accordingly, Section 43.1 of the Regulation does not apply to the Property.

Excess Soil

No soil has been brought from another property and placed on, in or under the Property as part of the Phase Two ESA.

Site Condition Standards

The analytical results were compared to Table 7 site condition standards (residential property use, coarse textured soil) listed in the Ministry of the Environment, Conservation and Parks ("MECP") document *"Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act"*, April 2011.

Proposed Buildings and Other Structures

It is understood that the Property is to be redeveloped as two multi-story residential buildings. It is noted that the proposed development plan is subject to change.

DELINEATION OF CONTAMINANT IMPACTS

APEC Where Contaminants are Present at a Concentration Above the Applicable Site Condition Standard

APEC 1 – The investigation included the collection of one soil sample and one groundwater sample from APEC 1. The reported concentrations of all COPCs met the applicable site condition standards.

APEC 2 – The investigation included the collection of six soil samples and two groundwater samples from APEC 2. The reported concentrations of all COPCs met the applicable site condition standards with the exception of the reported barium concentration at BH23-01.

APEC 3 - The investigation included the collection of two soil samples and one groundwater sample from APEC 3. The reported concentrations of all COPCs met the applicable site condition standards.

Contaminant Distribution

The only contaminant present at levels higher than the applicable site standards was barium at BH23-01.

Potential Reason for Discharge into the Environment at the Site

No discharge of contaminants has occurred on, in or under the Phase Two property which has resulted in impacts at concentrations greater than the applicable site condition standards.

Contaminant Migration

None of the contaminants of potential concern were detected in groundwater samples at concentrations exceeding the applicable site condition standards and therefore contaminant migration in groundwater is not relevant to the Site.

Meteorological and Climatic Considerations

Seasonal fluctuation in water levels on the Site should be expected. Given the limited number of monitoring events seasonal trends could not be identified; however shallow groundwater water levels are typically highest following the spring recharge and decline throughout the summer and fall months into the winter.

POTENTIAL EXPOSURE PATHWAYS AND RECEPTORS

The one barium concentration exceedance at the Site is considered to be most likely of natural origin, therefore potential release and transport mechanisms, exposure pathways and human and ecological receptors are not considered further.

NON-STANDARD DELINEATION

Non-standard delineation conducted in accordance with section 7.1 of Schedule E was not part of preparing the phase two environmental site assessment report.

STANDARDS DEEMED TO BE MET

The reported concentrations of electrical conductivity and sodium adsorption ratio in soil samples collected from BH23-04, BH23-07, and BH23-09 exceed the applicable site condition standards. In accordance with paragraph 1 of section 49.1, the Qualified Person has determined that salt application to surfaces for the safety of vehicular or pedestrian traffic under conditions of snow or ice or both is solely responsible for these exceedances due to the use of the Property as a parking lot for several years.

Accordingly, the applicable site condition standards for electrical conductivity and sodium adsorption ratio in soil are deemed not to be exceeded.

The Phase Two ESA investigated the three APECs identified in the 2023 Phase One ESA.

The reported concentrations of all groundwater samples met the applicable site condition standards. Monitoring for free phase product was conducted during groundwater sample collection. No evidence of free product or sheen in groundwater was observed.

The reported concentrations of all soil samples met the applicable site condition standards with the exception of the following:

- **BH23-01**—The reported concentration of barium in soil sample BH23-01 1-1 (410 µg/g) was above the Table 7 standard (390 µg/g).
- **BH23-04**—The sodium adsorption ratio (SAR) of soil sample BH23-04 4-1 (6.82) was above the Table 7 standard (5).
- **BH23-07**—The reported electrical conductivity of soil sample BH23-07 7-2 (0.785 mS/cm) was above the Table 7 standard (0.7 mS/cm). The sodium adsorption ratio (SAR) of soil sample BH23-07 7-2 (9.17) was above the Table 7 standard (5).
- **BH23-09**—The reported electrical conductivity of soil sample BH23-09 9-2 (1.17 mS/cm) was above the Table 7 standard (0.7 mS/cm). The sodium adsorption ratio (SAR) of soil sample BH23-09 9-2 (15.9) was above the Table 7 standard (5).

Sodium adsorption ratio (SAR) and electrical conductivity (EC) are considered to be due to the application of salt products to the ground for de-icing and safety and are therefore not considered as an exceedance of MECP Table 7 standards as per O. Reg 153/04 section 49.1. They are referenced above for consideration with respect to future excavation and off-site management where the EC and SAR may need to be considered.

The exceedance of barium is considered to be most likely of natural origin. However, given that it is in fill it may be attributed to the importation of fill to the Site. As such, the fill at this location may need to be managed separately from the remaining fill during development. Given the nature of the contaminant which is commonly found across the city at these concentrations in natural soils and the expectation that the fill will likely be excavated to accommodate the development, no further investigation is recommended.

The data presented in this report follows the O. Reg. 153/04 Phase Two ESA report format.

8.0 LIMITATIONS

This report was prepared for the exclusive use of Theia and First Unitarian Congregation of Ottawa. The report, which specifically includes all tables, figures and appendices, is based on data and information, collected during conducting the Phase Two ESA, and is based solely on the conditions of the property at the time of conducting investigations, supplemented by historical information and data obtained by WSP Canada Inc. as described in this report.

The assessment of environmental conditions at this Site has been made using the results of field screening techniques and chemical analysis of soil and groundwater samples at a limited number of locations. The Site conditions between sampling locations have been inferred based on conditions observed at the sampling locations. Conditions may vary from these sample locations. Additional study, including further investigation, can reduce the inherent uncertainties associated with this type of study. However, it is never possible, even with exhaustive sampling and testing, to dismiss the possibility that part of a Site may be contaminated and remain undetected.

The services performed as described in this report were conducted in a manner consistent with that level of care and skill normally exercised by other members of the engineering and science professions currently practicing under similar conditions, subject to the time limits and financial and physical constraints applicable to the services.

Any use which a third party makes of this report, or any reliance on, or decisions to be made based on it, are the responsibilities of such third parties. WSP Canada Inc. accepts no responsibility for damages, if any, suffered by any third party (other than as noted above) as a result of decisions made or actions based on this report.

The content of this report is based on information collected during the drilling, soil and groundwater sampling activities, our present understanding of the Site conditions, and our professional judgement in light of such information at the time of this report. This report provides a professional opinion and therefore no warranty is expressed, implied, or made as to the conclusions, advice and recommendations offered in this report. This report does not provide a legal opinion regarding compliance with applicable laws. With respect to regulatory compliance issues, it should be noted that regulatory statutes and the interpretation of regulatory statutes are subject to change.

The findings and conclusions of this report are valid only as of the date of this report. If new information is discovered in future work, including excavations, borings or other studies, WSP Canada Inc. should be requested to re-evaluate the conclusions of this report, and to provide amendments as required.

The monitoring wells installed as part of this project have been constructed using licensed drilling/well contractors employing licensed well technicians. It is owner's responsibility to have a licensed well technician properly abandon all monitoring wells, if required.

9.0 SIGNATURES

The undersigned Qualified Person confirms that he/she was responsible for conducting and/or supervising this Phase Two ESA and the associated findings and conclusions.

We trust that you will find the contents of this report satisfactory for your current needs. Should you require clarification of the information provided, please do not hesitate to contact the undersigned.

1 and 2 Methlynaphthalene	µg/g	0.99	0.05	<0.05	<0.05	<0.05	<0.05	<0.05	<0.05

Notes:
µg/g = microgram per gram.
Results are based on the dry weight of the soil.
The result for Benzo(b)Fluoranthene is the total of the Benzo(b)&(j)Fluoranthene isomers because the isomers co-elute on the GC co
2- and 1-Methyl Naphthalene is a calculated parameter. The calculated value is the sum of 2-Methyl Naphthalene and 1-Methyl Naphthalene.

MECP Table 7	Table 7: Generic Site Condition Standards for Shallow Soils in a Non-Potable Ground Water Condition, coarse soils, residential/industrial land use, of the MECP document “Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act”, April 2011.
Bolded	Parameter concentration exceeds applicable criteria.
RDL	Laboratory Reported Detection Limit.
"<"	Indicates parameter analyzed was below laboratory Reported Detection Limit (RDL).
NV	No value given in standards.

PAGES (INCLUDING COVER): **13**

VERSION*: **1**

Should you require any information regarding this analysis please contact your client services representative at (905) 712-5100

*Notes

Disclaimer:

- *All work conducted herein has been done using accepted standard protocols, and generally accepted practices and methods. AGAT test methods may incorporate modifications from the specified reference methods to improve performance.*
- *All samples will be disposed of within 30 days after receipt unless a Long Term Storage Agreement is signed and returned. Some specialty analysis may be exempt, please contact your Client Project Manager for details.*
- *AGAT's liability in connection with any delay, performance or non-performance of these services is only to the Client and does not extend to any other third party. Unless expressly agreed otherwise in writing, AGAT's liability is limited to the actual cost of the specific analysis or analyses included in the services.*
- *This Certificate shall not be reproduced except in full, without the written approval of the laboratory.*
- *The test results reported herewith relate only to the samples as received by the laboratory.*
- *Application of guidelines is provided "as is" without warranty of any kind, either expressed or implied, including, but not limited to, warranties of merchantability, fitness for a particular purpose, or non-infringement. AGAT assumes no responsibility for any errors or omissions in the guidelines contained in this document.*
- *All reportable information as specified by ISO/IEC 17025:2017 is available from AGAT Laboratories upon request.*
- *For environmental samples in the Province of Quebec: The analysis is performed on and results apply to samples as received. A temperature above 6°C upon receipt, as indicated in the Sample Reception Notification (SRN), could indicate the integrity of the samples has been compromised if the delay between sampling and submission to the laboratory could not be minimized.*

DATE RECEIVED: 2023-08-31 **DATE REPORTED: 2023-09-08**

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard: Refers to Table 3: Full Depth Generic Site Condition Standards in a Non-Potable Ground Water Condition - Soil - Residential/Parkland/Institutional Property Use - Coarse Textured Soils
Guideline values are for general reference only. The guidelines provided may or may not be relevant for the intended use. Refer directly to the applicable standard for regulatory interpretation.

5256368-5256373 EC was determined on the DI water extract obtained from the 2:1 leaching procedure (2 parts DI water:1 part soil). pH was determined on the 0.01M CaCl2 extract prepared at 2:1 ratio. SAR is a calculated parameter.

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard: Refers to Table 3: Full Depth Generic Site Condition Standards in a Non-Potable Ground Water Condition - Soil - Residential/Parkland/Institutional Property Use - Coarse Textured Soils
Guideline values are for general reference only. The guidelines provided may or may not be relevant for the intended use. Refer directly to the applicable standard for regulatory interpretation.

5256368-5256373 Results are based on the dry weight of the soil.
Note: The result for Benzo(b)Fluoranthene is the total of the Benzo(b)&j)Fluoranthene isomers because the isomers co-elute on the GC column.
2- and 1-Methyl Naphthalene is a calculated parameter. The calculated value is the sum of 2-Methyl Naphthalene and 1-Methyl Naphthalene.

SAMPLED BY:

O. Reg. 153(511) - PHCs F1 - F4 (with PAHs) (Soil)

DATE RECEIVED: 2023-08-31 **DATE REPORTED: 2023-09-08**

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard: Refers to Table 3: Full Depth Generic Site Condition Standards in a Non-Potable Ground Water Condition - Soil - Residential/Parkland/Institutional Property Use - Coarse Textured Soils
Guideline values are for general reference only. The guidelines provided may or may not be relevant for the intended use. Refer directly to the applicable standard for regulatory interpretation.

5256368-5256373 Results are based on sample dry weight.
The C6-C10 fraction is calculated using toluene response factor.
Xylenes total is a calculated parameter. The calculated value is the sum of m&p-Xylene and o-Xylene.
C6–C10 (F1 minus BTEX) is a calculated parameter. The calculated value is F1 minus BTEX.
The calculated parameters are non-accredited. The parameters that are components of the calculation are accredited.
The C10 - C16, C16 - C34, and C34 - C50 fractions are calculated using the average response factor for n-C10, n-C16, and n-C34.
Gravimetric Heavy Hydrocarbons are not included in the Total C16-C50 and are only determined if the chromatogram of the C34 - C50 hydrocarbons indicates that hydrocarbons >C50 are present.
The chromatogram has returned to baseline by the retention time of nC50.
Total C6 - C50 results are corrected for BTEX and PAH contributions.
C>10 – C16 (F2- Naphthalene) is a calculated parameter. The calculated value is F2 - Naphthalene.
C>16 - C34 (F3-PAH) is a calculated parameter. The calculated value is F3-PAH (PAH: sum of Phenanthrene, Benzo(a)anthracene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Benzo(a)pyrene, Fluoranthene, Dibenzo(a,h)anthracene, Indeno(1,2,3-c,d)pyrene and Pyrene).
This method complies with the Reference Method for the CWS PHC and is validated for use in the laboratory.
nC10, nC16 and nC34 response factors are within 10% of their average.
C50 response factor is within 70% of nC10 + nC16 + nC34 average.
Linearity is within 15%.
Extraction and holding times were met for this sample.

Comments: NA signifies Not Applicable.
pH duplicates QA acceptance criteria was met relative as stated in Table 5-15 of Analytical Protocol document.
Duplicate NA: results are under 5X the RDL and will not be calculated.

*Notes

Disclaimer:

- All work conducted herein has been done using accepted standard protocols, and generally accepted practices and methods. AGAT test methods may incorporate modifications from the specified reference methods to improve performance.
- All samples will be disposed of within 30 days after receipt unless a Long Term Storage Agreement is signed and returned. Some specialty analysis may be exempt, please contact your Client Project Manager for details.
- AGAT's liability in connection with any delay, performance or non-performance of these services is only to the Client and does not extend to any other third party. Unless expressly agreed otherwise in writing, AGAT's liability is limited to the actual cost of the specific analysis or analyses included in the services.
- This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
- The test results reported herewith relate only to the samples as received by the laboratory.
- Application of guidelines is provided "as is" without warranty of any kind, either expressed or implied, including, but not limited to, warranties of merchantability, fitness for a particular purpose, or non-infringement. AGAT assumes no responsibility for any errors or omissions in the guidelines contained in this document.
- All reportable information as specified by ISO/IEC 17025:2017 is available from AGAT Laboratories upon request.
- For environmental samples in the Province of Quebec: The analysis is performed on and results apply to samples as received. A temperature above 6°C upon receipt, as indicated in the Sample Reception Notification (SRN), could indicate the integrity of the samples has been compromised if the delay between sampling and submission to the laboratory could not be minimized.

O. Reg. 153(511) - PHCs F1 - F4 (Water)

DATE RECEIVED: 2023-09-05

DATE REPORTED: 2023-09-08

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard

5263884-5263958 The C6-C10 fraction is calculated using Toluene response factor.
Xylenes total is a calculated parameter. The calculated value is the sum of m&p-Xylene and o-Xylene.
C6–C10 (F1 minus BTEX) is a calculated parameter. The calculated value is F1 minus BTEX.
The calculated parameters are non-accredited. The parameters that are components of the calculation are accredited.
The C10 - C16, C16 - C34, and C34 - C50 fractions are calculated using the average response factor for n-C10, n-C16, and nC34.
Gravimetric Heavy Hydrocarbons are not included in the Total C16 - C50 and are only determined if the chromatogram of the C34 - C50 Hydrocarbons indicated that hydrocarbons >C50 are present.
The chromatogram has returned to baseline by the retention time of nC50.
Total C6-C50 results are corrected for BTEX contribution.
This method complies with the Reference Method for the CWS PHC and is validated for use in the laboratory.
nC6 and nC10 response factors are within 30% of Toluene response factor.
nC10, nC16 and nC34 response factors are within 10% of their average.
C50 response factor is within 70% of nC10 + nC16 nC34 average.
Linearity is within 15%.
Extraction and holding times were met for this sample.
Fractions 1-4 are quantified with the contribution of PAHs. Under Ontario Regulation 153/04, results are considered valid without determining the PAH contribution if not requested by the client.
NA = Not Applicable

Sediment parameter is comment only based on visual inspection of the sample prior to extraction and is not an accredited test.
Legend: 1 = no sediment present; 2 = sediment present; 3 = sediment present in trace amounts

Remarks:

Bureau Veritas is accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Bureau Veritas are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCCFP, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Bureau Veritas' profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Bureau Veritas in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Bureau Veritas liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Bureau Veritas has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Bureau Veritas, unless otherwise agreed in writing. Bureau Veritas is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by Bureau Veritas, results relate to the supplied samples tested.

Reference Method suffix “m” indicates test methods incorporate validated modifications from specific reference methods to improve performance.
* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.
(1) This test was performed by Bureau Veritas Mississauga, 6740 Campobello Rd , Mississauga, ON, L5N 2L8
(2) All CCME PHC results met required criteria unless otherwise stated in the report. The CWS PHC methods employed by Bureau Veritas conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following “Alberta Environment’s Interpretation of the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil Validation of Performance-Based Alternative Methods September 2003”. Documentation is available upon request. Modifications from Reference Method for the Canada-wide Standard for Petroleum Hydrocarbons in Soil-Tier 1 Method: F2/F3/F4 data reported using validated cold solvent extraction instead of Soxhlet extraction.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).
