6659 Franktown Road
Ottawa (Richmond), Ontario
K0A 2Z0

Attention: **Jeremy Hanna**

Subject: **Scoped Hydrogeological Assessment and Terrain Analysis**
Proposed Re-Zoning and Site Plan
6659 Franktown Road, Ottawa (Richmond), Ontario

INTRODUCTION

Further to your request, Paterson Group (Paterson) has conducted a Scoped Hydrogeological Assessment and Terrain Analysis in support of a Re-zoning Application and Site Plan Control Application for the proposed Zoning By-law Amendment and retroactive Site Plan approval of the property at 6659 Franktown Road in Ottawa (Richmond), Ontario. Please refer to the Key Plan (attached) for the approximate site location. The subject site refers to the parcel at 6659 Franktown Road. This report is a scoped assessment based on discussion with the City reviewer and uses available information for a lot severance application using the existing well at the subject site. The severance application was approved with the Gemtec Report No. 101638.001 “Hydrogeological Investigation & Terrain Analysis”, dated Aug 11, 2022 (City Application numbers D08-01-21/B-00171 & D08-01-21/B-00172).

The purpose of this work has been to re-affirm the quality of the water supply aquifer underlying the site in accordance with the Ontario Ministry of Environment, Conservation and Parks (MECP) Procedure D-5-5 and septic impact assessment to support the Re-zoning and Site Plan Application for the subject site.

The Subject Site consists of a 40.2 hectares (ha) lot and is currently occupied by a residence and home-based business for water well drilling with associated private infrastructure located at the southeast end of the property. The majority of the property is undeveloped. The ground surface at the subject site is generally flat with a slight slope from northwest to southeast towards Franktown Road.

The general groundwater flow is anticipated to be towards the southeast with localized flow variations expected.

The Subject Site is situated in a rural area which is serviced by private water supplies and private on-site septic fields. The site is bordered to the northwest by treed areas, to the northeast by residential properties followed by agricultural lands, to the southwest by residential properties and undeveloped lands, and to the southeast by Franktown Road followed by a commercial property and undeveloped lands.

The south end of the subject site and surrounding lots are zoned as RU for Rural Countryside Zone which allows for home-based businesses, while the treed area in the northwest portion of the lot is zoned as EP3 for Environmental Protection Zone Type 3. The area directly southeast of the subject site is zoned as RI for Rural Institution.

Description of Subject Site

The subject site is approximately 40.22 ha in size and is currently occupied by a two-storey residential dwelling and home-based business for well drilling. The Site Plan application is to retroactively provide site plan approval for the existing development. There are no changes to the existing use or to water usage anticipated as part of this Site Plan application. Please refer to Figure-1 Key Plan and Site Plan Drawing P1, dated July 11, 2022 by FOTENN, attached, for the subject site location and layout.

The subject site is currently serviced by two onsite sewage systems and private drilled wells. The existing site usage requires limited water capacity and the proposed site usage is being maintained within the historical site use. Therefore, there is no change in the private service capacity for this application. The existing residence has a sewage system capacity of 1,725 L/day per the approved OSSO Certificate of Compliance. A new sewage system is proposed for the home-based business to comply with Part 8 – Ontario Building Code (OBC). A septic flow calculation was completed by Paterson and resulted in a total daily water demand calculation of 2,700 L/day from a combined 1,725 L/day from the residential building and 975 L/day from the business. Please refer to Paterson Sewage System design PH4979-1 and PH4979-2, attached, for full details.

As part of this study, the water supply well was inspected and confirmed to be O.Reg.903 compliant.

Karst Mapping

Available Karst mapping (OGS GRS005) was reviewed as part of this assessment. The available mapping does not indicate the presence of any inferred or potential karstic features. Furthermore, no indication of karstic features were observed during the site visits completed by Paterson personnel.

Mississippi-Rideau Source Protection Plan

The Mississippi-Rideau Source Protection Plan (MPSPP) provides guidance as to which policies apply to a given property, municipality or specific activity and if there are specific designations that apply to the area. The subject site has been designated three of the four groundwater related vulnerable areas identified within the Clean Water Act (2006), specifically; as a Wellhead Protection Area (WHPA), a Significant Groundwater Recharge Area (SGRA), Highly Vulnerable Aquifer (HVA). The four vulnerable areas consist of Significant Groundwater Recharge Area (SGRA), Highly Vulnerable Aquifer (HVA), Intake Protection Zone (IPZ) and Wellhead Protection Area (WHPA).

The subject site has been designated as a WHPA-B, SGRA, and HVA. The WHPA-B is scored a value of 6. This rating prohibits the storage of Dense Non-aqueous Phase Liquids (DNAPLs) and a Risk Management Plan is required for the storage of Liquid Fuels, which Air Rock has completed with the Risk Management Official with the City of Ottawa. There are no current outstanding comments related to Source Water Protection. The existing site usage pre-dates the municipal supply wells constructed for the Fox Run development and surrounding area with associated extensive modeling and approvals.

HYDROGEOLOGICAL ASSESSMENT

The purpose of this work has been to determine the suitability of the water supply aquifer underlying the site to support the Site Plan Application to maintain the existing usage of the aquifer. Specifically, the intent of this report is to review the availability of a safe and reliable water supply having sufficient quantity and quality to continue providing potable water for the proposed redevelopment. The area is known to have access to bedrock aquifers with good quality and quantity as evidenced by the municipal wells in the area and historical test results by others.

Fieldwork Program

Geotechnical Program

A geotechnical investigation was carried out May 5, 2022 by others on adjacent properties in support of two lot severances, and consisted of a total of five test pits excavated to a maximum depth of 4.5 m below ground surface (bgs). The test pits were distributed in a manner to provide general coverage of the associated lot severances, taking into account underground utilities and site features.

Paterson completed a sewage system design for the existing home-based business. Paterson drawings PH4979-1 and PH4979-2 are attached and denote soils information in the southeast portion of the site with three hand auger holes.

Well Testing

As a means to demonstrate the adequacy of the aquifer underlying the subject lands, with respect to water quality and quantity, the existing drilled well (TW22-1 as referenced by others), hereafter referred to as TW22-1, on the subject site was tested. TW22-1 has a Water Well Record (WWR) Well ID of A079370. TW22-1 has a 150 mm diameter steel casing that extends to 7.9 m below ground surface (bgs) with a 0.60 m stick up. The well itself extends to a depth of 73.5 m bgs. Based on available geological mapping, the drift thickness at TW22-1 varies from 3 to 15 m. According to the Water Well Record (WWR) for the drilled well, the overburden generally consists of sand to a depth of 6.1 m, where limestone bedrock was encountered. Refer to the report by others for the approximate location of TW22-1.

As a means to evaluate the water supply aquifer intercepted by the well, the well was subjected to a 6-hour constant rate pumping test in support of the severance application. The pumping test was conducted on March 14, 2022 by others. The pumping test was carried out at a pumping rate of 104 L/min for a duration of 6 hours. Water level and flow rate measurements were taken at regular intervals throughout the pumping test. The pumping test withdrew a total volume of approximately 37,440 L. The volume of the test significantly exceeds the required daily sewage system flows for the residence and home-based business (1,725 L/day for the residence and 975 L/day for the business). This is approximately 13.9 times the theoretical daily flows.

Recovery data was collected from the well following the completion of the pumping by others. The well was noted to have fully recovered within 5 minutes after the end of pumping.

Groundwater samples were collected by others in accordance with MECP Procedure D-5-5 and City of Ottawa HTAG in support of the previously approved severance application.

Paterson returned to site on December 10, 2024 to obtain an additional water sample from the same water spigot sampled January 20, 2022. The spigot was sanitized and purged for 15 minutes before sampling. Field measurements including pH, total dissolved solids, conductivity, turbidity, apparent colour, and temperature were measured prior to sampling until stabilized. The water sample was submitted for comprehensive testing of bacteriological, chemical, and physical water quality parameters consistent with the standard “Subdivision Supply” suite of parameters and trace metals. The sample was placed immediately into a cooler with ice and transported directly to Eurofins Environmental Laboratory in Ottawa. A Phase II ESA investigation was completed by others and noted that no regulatory exceedances were found in the groundwater (exp Report – Phase Two Environmental Site Assessment – Project OTT-00243705-B0 dated August 11, 2023)

Well Inspection

A visual inspection of TW22-1 was performed by others and confirmed that the well is in good condition and met O.Reg. 903 minimum casing requirements. The existing well was considered to be technically representative of future supply wells and the severance application was approved by the City. Paterson agrees with the assessment and considers the well to meet requirements for this application.

Aquifer Analysis

Water Quantity

Drawdown data was measured using an electronic water level tape and an electronic datalogger unit.

Table 1: SUMMARY OF WATER SUPPLY AQUIFER CHARACTERISTICS OF TW22-1 by OTHERS

AQUIFER PARAMETER	RESULT OF ANALYSIS
Pumping Rate (L/min)	104
Pre-test Static Water Level (m)	2.6
Post-test Static Water Level (m)	2.8
Available Drawdown (m)	70.9
% Drawdown During Pump Test (%)	0.3
Specific Capacity (L/min/m drawdown)	520

The pumping test results show that TW22-1 has a high yield to support the water demands that significantly exceeds the existing and historical use. Overall maximum drawdown at a constant pumping rate for a period of 6 hours was approximately 0.2 m (0.3% of the available drawdown). It should be noted that full recovery was achieved within 5 minutes after the end of pumping.

The total volume of water pumped during the 6-hour pumping event was approximately 37,440 L. This is approximately 13.8 times the maximum total daily design volume of water required (2,700 L/day) to support the existing development. In addition to water use for domestic usage, water is also used to fill trucks for use while drilling. This amounts to approximately 20,000 L per day. This results in a total approximate daily usage of 22,700 L/d. The total pumped in the 6-hour pumping test was approximately 1.7 times the anticipated maximum daily water demand. It should be noted that pumping this amount resulted in a drawdown of 3% which recovered within 5 minutes.

The suitability of the aquifer to supply the Re-Zoning and Site Plan Application for the existing site usage was assessed using a scoped methodology provided in discussion with the City of Ottawa and based on the Hydrogeological and Terrain Analysis Guidelines (HTAG).

Based on the information summarized in Table 1, it is readily apparent that the water supply well has intercepted an adequately strong water supply aquifer which has sufficient quantity to continue to service the existing usage and has adequately serviced the site for an extended period of time.

Given the analyses presented and summarized above, it is our opinion that there is an adequate supply of water to support the proposed redevelopment as well as the neighbouring lots. Available water well records (WWR) of the neighboring properties on the MECP Well Record mapping website indicated that the wells were screened in limestone and sandstone. Surrounding WWR's are attached to this report.

Water Quality

Field Data

Turbidity, electrical conductivity, total dissolved solids (TDS), pH, apparent color and temperature were measured at the wellhead during the pumping test by others and by Paterson for the subsequent quality sampling. No chlorine residual was detected in the discharge water prior to the collection of the water samples as reported by others and for the Paterson sample.

Laboratory Data

A sample was taken from an outdoor spigot of the residential dwelling on January 20, 2022 by others. The Subdivision Package suite of parameters and heavy metals laboratory water quality obtained from the pumping test by others on March 14, 2022 from TW22-1 is appended to the report.

Paterson visited site on December 10, 2024 to obtained an additional sample to confirm water quality. The sample was taken after sanitizing the spigot and running the tap for 15 minutes. The laboratory results can be found below in Tables 2a and 2b. The laboratory results indicate that the water quality is consistent between the 2022 and 2024 sampling events.

TABLE 2a: GROUNDWATER MICROBIOLOGY & GENERAL GEOCHEMISTRY				
PARAMETER	UNITS	ODWS		TW1
		LIMIT	TYPE	TW22-1 12/10/2024
MICROBIOLOGICAL				
Escherichia Coli (E.Coli)	ct/100mL	0	MAC	0

1. ODWS identifies the following types of parameters:
   MAC = Maximum Acceptable Concentration
   IMAC = Interim Maximum Acceptable Concentration
   AO = Aesthetic Objective
   OG = Operational Guideline
2. Shaded Concentration Indicates an Exceedance of the ODWS Objective

The bacteriological test results (Certificate of Analysis – Report No. 2205352; and 2212093) indicated that the test samples by others were non-detect (0 ct/100 mL) for

E.Coli and Total Coliforms. These values are consistent with Paterson's analysis with non-detect values found for the December 10, 2024 sample event.

The water quality of the subject water supply well meets all the Ontario Drinking Water Standards maximum acceptable concentrations (MAC) and has values consistent with the historical sampling by others. This shows that the available quality, which was approved by the City for the previous severance application, is consistent over an extended period of time. Furthermore, the water meets all of the Aesthetic Objectives (AO) and Operational Guidelines (OG) with the exception of the following.

- ❑ Hardness (as $CaCO_3$)
- ❑ Colour
- ❑ Turbidity

Exceedances of the above parameters are not uncommon for the water supply in the subject aquifer. Each of these groundwater parameters are discussed in detail below.

Hardness as $CaCO_3$

Hardness, expressed as calcium carbonate, is an operation guideline and does not appear in the ODWS. Rather, it appears in the Technical Support Documents for Ontario Drinking Water Standards, Objectives and Guidelines as a parameter with an operational guideline at 100 mg/L. At the measured concentration of 282 mg/L, the water is considered to be very hard, however, it is below the reasonable treatable limit of 500 mg/L specified in Table 3 of the MOECC guidance document Procedure D-5-5 (1996). The hardness concentration can be treated using conventional softening technologies, if desired by the owner. This value is consistent with the sample results by others.

Colour

Colour may occur in drinking water for several reasons. It may be due to organic substances from the decay of vegetation, or the presence of metals such as iron, manganese, and copper, which are abundant in nature. The provincial aesthetic objective for colour in drinking water is 5 True Colour Units (TCU). The federal (Health Canada) guideline aesthetic objective limit for colour is 15 TCU (Guidelines for Canadian Drinking Water Quality, Health Canada June 2019). Procedure D-5-5 gives a maximum concentration considered reasonably treatable for colour as 7 TCU.

During the field pumping test by others, apparent colour was measured in the groundwater to be <5 TCU. Whereas true colour and apparent colour from laboratory measurements was 2 and <2 TCU and 8 and 10 TCU, respectively. Furthermore, Paterson's sample in the field measured apparent colour of 0 TCU, while the laboratory reading was 9 TCU. The apparent colour in the lab is above the guideline, while the field parameters are within the appropriate range of <5 TCU. The elevated colour levels detected in the lab sample is attributed to the precipitation of minerals out of the groundwater, such as calcium-based hardness and iron. The apparent colour values are consistent with the previously measured values by others for the approved severance

application. As the field measurements are below the aesthetic objective, colour is considered to meet the appropriate objectives and will not require treatment.

Turbidity

Turbidity, which is generally an aesthetic parameter, was detected in the laboratory test samples at values of 0.9, 0.3, and 1.1 NTU in the January 2022, March 2022, and December 2024 samplings, respectively. Field testing of the samples detected values of 0.88 NTU in the December 2024 field tests. It is expected that ongoing use of the well would further reduce turbidity values as evidenced by the turbidity result of 0.3 NTU after 6 hours of pumping by others.

The ODWS maximum acceptable concentration for turbidity in drinking water entering the distribution system is 1 NTU. The Aesthetic Objective for turbidity in drinking water reaching the consumer is 5 NTU. The field test parameters are below the 5 NTU objective. Furthermore, total coliforms and E.Coli were non-detect (0 ct/100 mL) in all of the samples. Therefore, treatment for turbidity is not required.

Sodium

Sodium (Na), an aesthetic parameter, was detected in the laboratory test sample at concentrations of 31.6, 33.8 and 32 mg/L, which does not exceed the ODWS aesthetic objective of 200 mg/L. Although sodium is not toxic and no maximum acceptable concentration has been set, concentrations above 20 mg/L require that the Medical Officer of Health be notified of the water quality results, so that this information may be passed on to local physicians for use in treatment of those requiring a sodium-restricted diet. This recommendation was noted in the severance application by others. As such, the Medical Officer of Health should be aware of the sodium values in the area.

TERRAIN ANALYSIS

The purpose of this study is to determine the site's attenuation capacity for the existing usage and the suitability for private on-site wastewater systems. Specifically, the intent of this report is to assess the existing design details for private septic servicing.

Surficial Geology

A geotechnical investigation by others on May 5, 2022, where five test pits were extended in a manner to provide general coverage of the adjacent lots, with specific consideration to the lot severances occurring at 6695 and 6707 Franktown Road were excavated to a maximum depth of 4 m bgs. The general overburden was observed to be a layer of topsoil to a maximum depth of 1.17 m, except in TP22-4 where the top layer consists of a clay-based fill material. The topsoil/fill layer was followed by clay in TP22-1 to a depth of 2.7 m, and silty sand in the other test pits, to a maximum depth of 1.6 m. The silty sand or clay layer was further underlain by sandy silt with variable amounts of clay, to the depth of the test pits. TP22-3 had an additional silty sand layer underneath the sandy silt. The results of the geotechnical program are generally consistent with available geological mapping provided by the Ontario Geological Survey (OGS MRD128) and with the available historical surrounding Water Well Records (WWR). Further details can be found in the GEMTEC Hydrogeological Investigation and Terrain Analysis Report (File No. 1016638.001), dated August 11, 2022.

Available bedrock geological mapping provided by the Ontario Geological Survey (MRD 219) indicates that the bedrock underlying the subject site consists of sandstone, limestone and shale of the Rockcliffe Formation. Available overburden thickness mapping shows a drift thickness of 3 to 15 m across the subject site. The onsite well (TW22-1) indicates there is 6.1 m of overburden encountered.

Hydrogeological Sensitivity of the Site

The subject site currently consists of a residential dwelling and home-based business with associated infrastructure and private servicing. The subject site is serviced by a private potable well and septic system. The site is bordered to the northwest by treed areas, to the northeast by residential properties followed by agricultural lands, to the southwest by residential properties and undeveloped lands, and to the southeast by Franktown Road followed by an institutional property and undeveloped lands. The adjacent properties are serviced by private wells and septic systems.

According to the geotechnical investigation by others, onsite water well record and available geological mapping, the overburden thickness was observed to be greater than 2 m. As the proposed site does not have bedrock within 2 m of the ground surface, the site is not considered hydrogeologically sensitive.

Lot Development Plan

The Site Plan for the existing development was produced by FOTENN Designs and is attached (Drawing P1, dated July 11, 2022). The area shown on the site plan is only the developed portion of the site and does not display the northern portion of the subject site. The full site area is used for the Nitrate Impact Assessment.

Sewage System Volumes

The existing residence has an approved sewage system design with a capacity of 1,725 L/day per the Certificate of Compliance (attached). The home-based business has an existing sewage system that is undersized for the theoretical Part 8 – Ontario Building Code (OBC) calculations. Paterson has completed a design (PH4979-1 and PH4979-2) for a replacement sewage system. The maximum TDDSSF for the additional sewage system was calculated based on Ontario Building Code (OBC) section 8.2.1.3 and is outlined below:

- Office Area; the maximum of either;
  - 3 employee shifts per day x 75 L/day = 225 L/day; or
  - 87.3 m^2 x 75L/day per 9.3 m^2 = 675 L/day
- Warehouse / Mechanic area
  - 2 loading bay doors x 150 L/day per loading bay door = 300 L/day
- Total = 675 L/day + 300 L/day = 975 L/day

The maximum TDDSSF for the office and warehouse is 975 L/day. The TDDSSF for the subject site was determined to be 2,700 L/day. An approved Ottawa Septic System Office (OSSO) permit will be submitted with the Site Plan Application.

Predictive Nitrate Impact Assessment

In order to demonstrate that private services would adequately support the proposed Site Plan application, a Predictive Nitrate Impact Assessment (NIA) for the subject site was completed due to the residential and home-based business. If the Lot Size assessment was completed, the subject site significantly exceeds the average lot size requirement of 1.0 ha. The values shown in the Predictive NIA attached to this report are summarized below.

- Site area — 40.23 ha
- Impervious area (%) — 1 %
- Daily sewage flow — 2.70 m^3/d
- Concentration of nitrate in effluent — 40 mg/L
  (Value based on typical effluent concentration)
- Surplus Water — 292 mm/yr
  (The surplus water value was estimated based on Environment Canada Climate Office values with a soil type comprised of a fine sandy loam (Urban lawns / Shallow Rooted

Crops) and anthropogenic sources.)

- ❑ Combined infiltration factor based on: 0.65
  - Topography infiltration factor 0.20
  - Soil texture infiltration factor 0.30
  - Cover infiltration factor 0.15

The topography infiltration factor of 0.20 is based upon a generally rolling land with an average slope between 2.8 to 3.8 m/km. The soil texture infiltration factor was based upon a mix between “open sandy loam” with a value of 0.4 and “medium combinations of clay and loam” with a value of 0.3 which is a reasonable generalization based upon the site investigations and available geological mapping. The “cover infiltration factor” was calculated at 0.15 based upon a mix of cultivated land type cover and treed areas.

The calculation for a conventional septic system results in a predicted nitrate concentration of **0.52 mg/L** nitrate for the subject site, using a value of 40 mg/L nitrate concentration within the effluent. This value was based upon a daily sewage flow of 2,700 L/day. It is expected that the actual usage is much lower.

Based on the results of the predictive NIA, it is our opinion that the property can adequately support the proposed Site Plan application without having an adverse impact on the underlying bedrock aquifer, using a conventional sewage system. The updated septic system design for the home-based business will be submitted to the OSSO at the time of the Site Plan application. Due to the costs associated with the application and the 1 year permit duration that begins upon permit approval, it is recommended to delay the submittal.

CONCLUSIONS

Based on the information contained within the body of this report the following conclusions can be drawn:

1. The water supply aquifer intercepted by the existing well is considered to be adequate to support the water quantity demands for the existing development.

2. The well construction is considered to meet O.Reg 903 requirements based on visual inspection by Paterson and previous review by others.

3. The preferred water supply intercepted by TW22-1 contains a water supply that is potable, and contains only elevated concentrations of hardness, colour, and turbidity. Colour and turbidity were below limits in field testing. The noted parameters can be treated with current readily available water conditioning equipment if desired by the owner.

4. A residential grade water softener is recommended to facilitate the reduction of the hardness concentration. If a water softener is in use for the existing residence, the owner should be made aware that additional sodium will be added to the water to reduce hardness. If desired, a point-of-use reverse osmosis system can be also used to provide a drinking tap source.

5. The sodium concentration was measured to be above the 20 mg/L reporting limit and, as such, the Medical Officer of Health for the City of Ottawa should be informed to assist area physicians in the treatment of local residents on sodium reduced diets.

6. The site is not considered hydrogeologically sensitive due to the available overburden in excess of 2 m.

7. The predicted nitrate concentrations at the property boundary is calculated to be well below the required 10 mg/L threshold when a conventional sewage system is used.

8. Paterson completed a sewage system design to support the site plan application. The sewage system application will be completed at the time of the Site Plan application due to the costs and permit expiry timeline. Due to the available space on site, there will be no issues receiving an approval for the designed system.

9. The results of the Hydrogeological Assessment and Terrain Analysis have provided satisfactory evidence that the subject site can support the proposed redevelopment with respect to water quality, quantity and sewage system impact assessment.

We trust that the current submission satisfies your immediate requirements.

Best Regards,

Paterson Group Inc.

WATER WELL RECORD

County or District Carleton Township, Village, Town or City Goulbourn.

Con. 3 Lot 20 Date completed 15th (day) August (month) 1964. (year)

[redacted] ress Richmond Ont.

Casing and Screen Record	
Inside diameter of casing	6 ¼"
Total length of casing	10'
Type of screen	
Length of screen	
Depth to top of screen	
Diameter of finished hole	6"

Pumping Test	
Static level	4'
Test-pumping rate	10 G.P.M.
Pumping level	28'
Duration of test pumping	30 min
Water clear or cloudy at end of test	clear
Recommended pumping rate	5' G.P.M.
with pump setting of	52 feet below ground surface

Well Log / **Water Record**

Overburden and Bedrock Record	From ft.	To ft.	Depth(s) at which water(s) found	Kind of water (fresh, salty, sulphur)
clay loam	0	8		
sandstone rock	8	65	60'	fresh

For what purpose(s) is the water to be used? NEW house.

Is well on upland, in valley, or on hillside? upland

☐ Excess Soil, Table: _____ Type: _____

The sample results from this submission will form part of a formal Record of Site Condition (RSC) under O.Reg. 153/04
☐ Yes ☐ No

The optimal temperature conditions during transport should be less than 10°C. Sample(s) cannot be frozen, unless otherwise indicated or agreed upon with the Laboratory. Note that this COC is not to be used for drinking water samples. The COC must be complete upon submission of the samples, there will be a $25 surcharge if required information is missing (required fields are shaded in grey).

PROPOSED SEWAGE SYSTEM REPLACEMENT FOR AN EXISTING OFFICE
6659 FRANKTOWN ROAD
OTTAWA (RICHMOND), ONTARIO

Drawing:

SEWAGE SYSTEM LAYOUT PLAN

Scale:	Drawn by:
1:400	HV
Date:	Checked by:
11/2024	MK

Drawing No.:

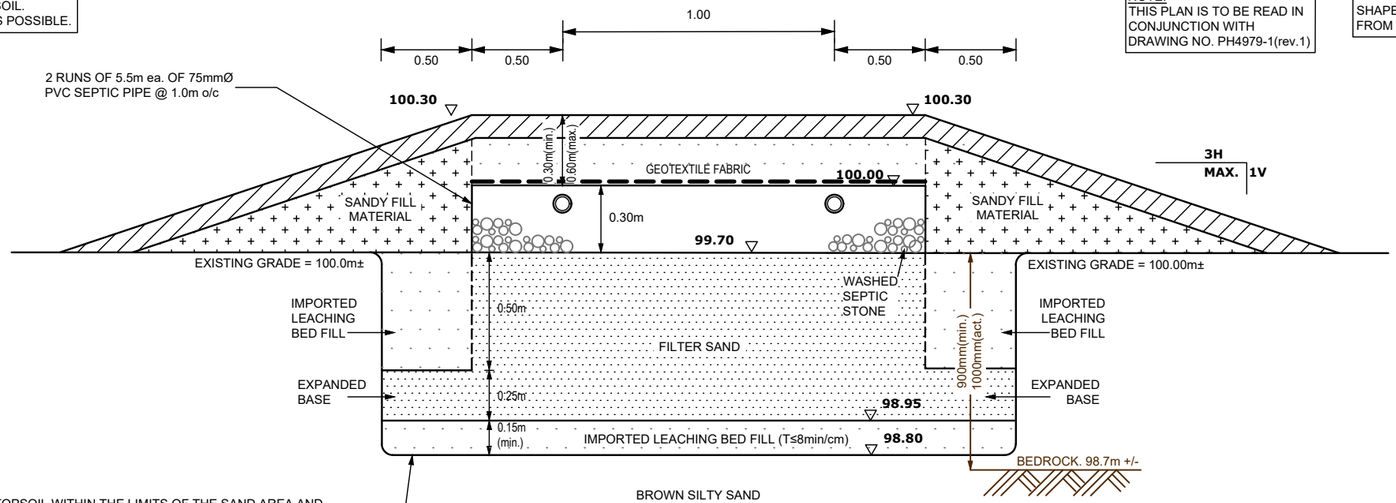
PH4979-1(rev.1)

p:\autocad drawings\hydrogeology\ph49xx\ph4979 - air rock drilling - 6659 franktown road, richmond\ph4979-1(rev.1).dwg

COVER MATERIAL TO CONSIST OF LEACHING BED FILL FOLLOWED BY APPROX. 0.10m OF SANDY TOPSOIL. LEACHING BED TO BE VEGETATED AS SOON AS POSSIBLE.

NOTE:
THIS PLAN IS TO BE READ IN CONJUNCTION WITH DRAWING NO. PH4979-1(rev.1)

FINAL GRADING SHALL BE SUITABLY SHAPED TO DIRECT SURFACE WATER AWAY FROM THE PROPOSED SEWAGE SYSTEM.



REMOVE ALL TOPSOIL WITHIN THE LIMITS OF THE SAND AREA AND SUBEXCAVATE TO AT LEAST ELEV. 98.80m. RE-ESTABLISH THE SPECIFIED CONTACT LEVEL USING ADDITIONAL LEACHING BED SAND FILL, WHERE REQUIRED.

PROFILE

N.T.S.

NOTES:

1) ESTIMATE OF DAILY SEWAGE FLOW (Q)

THE PROPOSED SEWAGE SYSTEM HAS BEEN DESIGNED TO SUPPORT COMMERCIAL USAGE CONSISTING OF OFFICE, AND WAREHOUSE. THE DAILY DESIGN SEWAGE FLOW RATE IS CALCULATED IN ACCORDANCE WITH O.B.C. TABLE 8.2.1.3.B.

OFFICE SPACE:

- (83.7 m squared / 9.3 x 75L/day = 675 L/DAY

WAREHOUSE:

- 150L/DAY x LOADING BAY DOORS = 2 X 150 = 300 L/DAY

TOTAL:

ESTIMATED SEWAGE FLOW = 975 L/DAY

2) SOIL CONDITIONS

SOILS INFORMATION GATHERED BY PATERSON GROUP INC. ON OCTOBER 1, 2024

TH 1, ELEV. 100.01m		TH 2, ELEV. 99.94m		TH 3, ELEV. 100.17m	
0-0.32	TOPSOIL with ORG.	0-0.25	TOPSOIL WITH ORG.	0-0.36	TOPSOIL WITH ORG.
0.32-1.33	BROWN SILTY SAND	0.25-1.32	BROWN SILTY SAND	0.36-1.40	BROWN SILTY SAND
-TH DRY UPON COMPLETION		- TH DRY UPON COMPLETION		- TH DRY UPON COMPLETION	

3) SEPTIC TANK

- PUMP AND INSPECT EXISTING SEPTIC TANK FOR RE-USE.
- MINIMUM WORKING CAPACITY OF PRETREATMENT TANK = 3Q OR 3,600L (min.) WHICHEVER IS GREATER = 3(975) = 2,925L, USE 3,600L (min.)
- AN OBC APPROVED EFFLUENT FILTER (I.E. POLYLOK PL-250 EFFLUENT FILTER, OR EQUIVALENT) SHALL BE INSTALLED ON THE OUTLET PIPE IN THE PRETREATMENT TANK IF ONE IS NOT PRESENT.
- THE ACCESS LIDS TO THE TANK OPENINGS SHALL BE EXTENDED TO THE GROUND SURFACE. INSTALL RISERS AND COVERS TO SUIT.
- RISER ASSEMBLY SHALL BE EQUIPPED WITH SAFETY DEVICES AS PER CSA B66-21.

4) PUMP CHAMBER

- INSTALL A 300L MIN. PUMP CHAMBER IN SERIES AND DOWNSTREAM FROM THE SEPTIC TANK.
- AN ON-DEMAND EFFLUENT PUMP (I.E. MYERS ME3F, OR SIMILAR) AND A HIGH WATER ALARM SHALL BE INSTALLED IN THE PUMP CHAMBER.
- THE OPERATIONAL FLOAT TETHER LENGTH SHALL BE SET SO THAT PUMP DUTY CYCLE DISCHARGES NO MORE THAN 92L / DOSE (75% OF PIPE VOLUME).
- A 3mmØ DRAIN HOLE SHALL BE INSTALLED IN THE UNDERSIDE OF THE FORCEMAIN IN THE PUMP CHAMBER NEAR THE WALL CONNECTION.
- RISERS WITH A COVER SHALL BE INSTALLED OVER THE PUMP CHAMBER TO PROVIDE ACCESS FROM THE GROUND SURFACE.
- DISCHARGE PIPING FOR PUMP SHALL BE CONFIGURED SUCH THAT THE PUMP IS EASILY SERVICED FROM THE GROUND SURFACE.

5) DISTRIBUTION BOX / FORCEMAIN

- A 32mmØ (NOMINAL) PVC SCH 40 FORCEMAIN SHALL BE USED TO CARRY THE EFFLUENT FROM THE PUMP CHAMBER TO A 3.0m SECTION OF 100mm PVC PIPE WITH AN ELBOW @2%(min.) SLOPE TO THE HEADER PIPE WITHIN THE LEACHING BED IN ORDER TO REDUCE THE SPEED OF THE PUMPED EFFLUENT UPON ENTERING THE BED.
- THE FORCE MAIN SHALL BE INSTALLED TO GRAVITY DRAIN TO THE PUMP CHAMBER.
- THE FORCE MAIN SHALL BE OVERLAIN WITH 50mm T x 600mm C/W RIGID INSULATION.

6) FILTER BED SIZE CRITERIA

- FILTER AREA REQUIRED = Q/75 = 975/75 = 13.0m²
- FILTER AREA PROVIDED = 2.0m x 6.5 = 13.0m²
- USE 2 RUNS OF 5.5m EACH @ 1.0 m o/c
- EXPANDED BASE REQUIRED = 975(15)/850 = 17.2m²
- TOTAL BASE AREA PROVIDED = 3.0m x 7.5m = 22.5m²

7) FILTER BED CONSTRUCTION GUIDELINES

- REMOVE ALL TOPSOIL WITHIN THE LIMITS OF THE SAND AREA AND SUBEXCAVATE TO AT LEAST ELEVATION 98.80m, WHICHEVER IS GREATER.
- A MINIMUM THICKNESS OF 0.15m OF LEACHING BED SAND FILL, HAVING A PERCOLATION RATE OF NOT GREATER THAN 8 min/cm, SHALL BE INSTALLED BELOW OVER THE EXPANDED BASE AREA.
- LEACHING BED SAND FILL SHALL CONSIST OF UNIFORM SAND WITH GRADING LIMITS SIMILAR TO 100% PASSING 13.2mm SIEVE, LESS THAN 5% PASSING 0.075mm SIEVE AND HAVING A PERCOLATION RATE OF 6 TO 8 min/cm.
- THE FILTER SAND SHALL CONFORM TO THE REQUIREMENTS OF PART 8 OF THE OBC.
- THE DISTRIBUTION PIPES (2 RUNS OF 5.5m EACH) SHALL CONSIST OF 75mmØ PERFORATED PVC SEPTIC PIPE WHICH SHALL BE EMBEDDED IN A CONTINUOUS 300mm THICK LAYER OF WASHED SEPTIC STONE.
- THE INVERT LEVEL OF THE DISTRIBUTION PIPES SHALL BE SET AT ELEVATION 99.88m AT THE HEADER AND ELEVATION 99.85m AT THE FOOTER.
- THE ENDS OF EACH RUN SHALL BE INTERCONNECTED WITH A SOLID PVC FOOTER PIPE.
- THE CLEAR STONE LAYER SHOULD BE COVERED WITH A NON-WOVEN GEOTEXTILE FABRIC.
- THE SURFACE OF THE BED SHOULD BE COVERED WITH PERMEABLE SAND FOLLOWED BY APPROXIMATELY 100mm OF SANDY TOPSOIL. THE BED AREA SHOULD BE VEGETATED.
- THE TOTAL THICKNESS OF THE COVER OVER THE CLEAR STONE SHOULD BE WITHIN A RANGE OF 0.3m TO 0.6m.
- THE SIDES OF THE BED SHOULD BE SLOPED IN THE RANGE OF 3H:1V OR SHALLOWER.

8) MINIMUM CLEARANCE DISTANCE FROM LEACHING BED

- 3.2m FROM ANY PROPERTY LINE
- 5.2m FROM ANY STRUCTURE
- 15.2m FROM ANY DRILLED WELL:
- 30.0m FROM ANY DUG OR SANDPOINT WELL.
- 5.0m FROM ANY POOL (UNLESS OTHERWISE APPROVED)
- 5.0m FROM ANY TREE (UNLESS OTHERWISE APPROVED)

9) MINIMUM CLEARANCE DISTANCE FROM TANK(S)

- 1.5m FROM ANY STRUCTURE
- 15.0m FROM ANY DRILLED WELL
- 3.0m FROM ANY PROPERTY LINE

10) GENERAL

- SNOW STORAGE SHALL NOT BE LOCATED OVER PROPOSED SEWAGE SYSTEM.
- THE SEWAGE SYSTEM HAS NOT BEEN DESIGNED TO SUPPORT TRAFFIC LOADING.
- THE BACKFILLING OF THE SEWAGE SYSTEM SHOULD MINIMIZE THE RISK OF OVER COMPACTION WITH THE USE RUBBER TRACKED EQUIPMENT AND BY AVOIDING THE CREATION OF ANY CONSTRUCTION ROUTES OR PATHWAYS OVER THE SYSTEM.
- ANY EXISTING IRRIGATION / SPRINKLER SYSTEM TO BE RELOCATED AWAY FROM PROPOSED LEACHING BED.
- CONTRACTOR SHALL BE QUALIFIED AND REGISTERED UNDER PART 8 OF THE ONTARIO BUILDING CODE.
- ALL WORK SHALL BE CARRIED OUT IN ACCORDANCE WITH THE LATEST BY-LAWS, CODES, AND REGULATIONS.
- CONTRACTOR SHALL REVIEW DRAWINGS IN DETAIL AND SHALL INFORM THIS FIRM (PATERSON GROUP INC.) OF ANY ERRORS AND/OR OMISSIONS ON DESIGN DRAWINGS IMMEDIATELY.
- CONTRACTOR SHALL BE RESPONSIBLE TO LOCATE AND PROTECT ALL EXISTING UNDERGROUND SERVICES.
- CONTRACTOR SHALL VISIT THE SITE AND REVIEW ALL DOCUMENTATION TO BECOME FAMILIAR WITH THE SITE AND SUBSURFACE SOIL CONDITIONS TO DETERMINE SUITABLE METHODS OF CONSTRUCTION.
- THE MANUFACTURER PROVIDES A LIMITED WARRANTY OF THE SYSTEM COMPONENTS. THE OWNER OF THE SYSTEM MUST SIGN A MAINTENANCE AGREEMENT WITH THE MANUFACTURER'S REPRESENTATIVE. THE HOMEOWNER IS RESPONSIBLE FOR THE ANNUAL FEES ASSOCIATED WITH THE MAINTENANCE.
- THIS FIRM HAS PROVIDED DESIGN SERVICES ONLY FOR THE SUBJECT SEWAGE SYSTEM. THE DESIGN HAS BEEN CARRIED OUT IN ACCORDANCE WITH THE MANUFACTURER'S GUIDELINES AND OUR INTERPRETATION OF PART 8 OF THE ONTARIO BUILDING CODE.
- CONSTRUCTION INSPECTIONS DURING THE INSTALLATION OF THE SEWAGE SYSTEM MAY BE REQUIRED BY THE REGULATING AUTHORITY AND ARE STRONGLY RECOMMENDED BY THIS FIRM (PATERSON GROUP INC.) DUE TO THE POTENTIAL VARIABILITY IN BEDROCK ELEVATION AT THE SUBJECT SITE. IF THIS FIRM IS TO COMPLETE ANY CONSTRUCTION INSPECTION(S), ADDITIONAL FEES MAY BE APPLIED. CONFIRMATION OF PAYMENT WILL BE REQUIRED PRIOR TO THE INSPECTION.
- THE TEST HOLE INFORMATION PROVIDED IS INTENDED TO BE USED FOR DESIGN PURPOSES ONLY, AND SHOULD NOT BE RELIED UPON FOR CONSTRUCTION PURPOSES. IF DISCREPANCIES ARE FOUND DURING THE CONSTRUCTION PROCESS, IT IS THE CLIENT'S RESPONSIBILITY TO CONTACT THIS FIRM TO MAKE ANY NECESSARY COMMENTS OR REVISIONS. ADDITIONAL REVISIONS ARE NOT CONSIDERED PART OF THE DESIGN WORKS AND WILL BE CONSIDERED AS AN ADDITIONAL COST.

Certificate of Completion

For the use and operation of an on-site sewage disposal system in accordance with the Sewage System Permit. This Certifies that the on-site sewage system conforms to the *Ontario Building Code* and Ontario Regulation 403/97 as amended by Ontario Regulation 22/98.

Sewage System Permit Number: 01-793 **Issued to:** KEN & MICHELLE DESAULNIERS

Legal Description:

Lot 18 Concession 4 Sub. Lot _____ Registered/Reference Plan 4R-14477

Municipal Address: 6659 FRANKTOWN ROAD

in the former Township/City of GOULBOURN within the City of Ottawa

Details Pertaining to System

a) Type of System: Class IV sewage system ☒ trench ☐ filter media ☐ SBT ☐ area bed ☐ other _____

b) ☒ New ☐ Existing septic tank/holding tank with a working capacity of 3600 litres constructed of ☒ concrete ☐ fibreglass ☐ plastic

c) ☒ Trench ☐ Filter Media leaching bed of total 90 metres of 75 millimetre diameter distribution pipe laid in 6 runs at 15 metres and fed by GRAVITY (gravity, siphon, pump).

d) Shallow Buried Trench _____ metres of _____ millimetre diameter distribution pipe laid in _____ runs at _____ metres

e) Area Bed: Stone _____ m^2 Sand _____ m^2 Pipe _____ metres

f) Effluent Filter: Manufacturer: POLYLOK Model: PL-124

g) Sewage Treatment Unit(s): Manufacturer: _____ Model: _____

h) Other: _____
