## 1 Introduction

#### 1.1 Overview

EXP Services Inc. (EXP) was retained by 11061917 Canada Inc. to prepare a Site Servicing and Stormwater Management report for the proposed redevelopment of 365 Forest Street in support of Official Plan Amendment, Zoning By-Law Amendment and Site Plan Control applications.

The 0.54 hectare site is situated at the corner of Richmond Road and Forest Street as illustrated in **Figure 1-1** below. The site is within the City of Ottawa urban boundary and situated in Bay Ward. The description of the subject property is noted below:

- Part of Lots 42, 56 and 57, Registered Plan 311, in the City of Ottawa, consisting of:
- PIN 039620357 or 1420 Richmond Road.
- PIN 039620356 or 365 Forest Street.
- PIN 039620352 or 2589 Bond Street.
- PIN 039620390 & PIN 039620391, 2583 Bond Street.

The development will consist of two high-rise buildings. Tower A is a 12-storey high-rise comprised of 168 units and Tower B is 12-storey high-rise and comprised of 223 units. Below the towers, four levels of underground parking will be provided. As part of the development, a road widening will be provided to the City along Richmond Road (18.75 m from centreline), reducing the site area to 0.51 hectares.

This report will discuss the adequacy of the adjacent municipal watermain, sanitary sewers and storm sewers to provide the required water supply, convey the sewage and stormwater flows that will result from the proposed development. This report provides a design brief for submission, along with the engineering drawings, for City approval.

Figure 1-1 - Site Location

1

## 2 Existing Conditions

Within the four subject properties, there are two (2) existing buildings. The following summarizes the current land use conditions.

- 1420 Richmond Road Vacant property, but currently used as gravel parking lot.
- 365 Forest Street Automobile garage and repair shop including asphalt parking lot.
- 2589 Bond Street Automobile repair shop and asphalt parking lot.
- 2583 Bond Street Vacant property.

All four properties are zoned Arterial Mainstreet Zone (AM10).

The topography of the subject site falls in a southerly and easterly direction along Forest Street and Bond Street, with a localized roadway sag condition on Forest Street approximately ±50m south of Richmond Road.

## 3 Existing Infrastructure

The site includes two commercial buildings that will be removed during the redevelopment of the site.

From review of the sewer and watermain mapping, as-built drawings and Utility Central Registry (UCC) plans, the following summarizes the onsite and adjacent offsite infrastructure:

#### Within property

• Storm, sanitary and watermain laterals to the two buildings that will be abandoned.

On Bond Street

- 150mm watermain
- 225mm sanitary sewer
- 300mm storm sewer
- 35mm Gas / Bell / Streetlighting/ Hydro

#### **On Forest Street**

- 300mm watermain
- 250mm sanitary sewer
- 300mm storm sewer
- Hydro /Bell / Streetlighting / Hydro

#### On Richmond Road

- 300mm watermain
- 225 mm sanitary sewer
- 525mm storm sewer
- 200mm Gas / Hydro / Bell / Streetlighting

As-built drawings for Bond Street, Forest Street, and Richmond Road were obtained from the City's vault and are included in **Appendix F**.

### 1.3 Pre-Consultation / Permits / Approvals

A pre-consultation meeting was held with the City prior to design commencement. This meeting outlined the submission requirements and provided information to assist with the development proposal. A copy of pre-consultation correspondence is included in **Appendix E**.

The proposed site is located within the Rideau Valley Conservation Authority (RVCA) jurisdiction, therefore signoff from the RVCA will be required prior to Site Plan approval. The RVCA has been contacted to confirm the stormwater management quality control requirements. A copy of the correspondence with the RCVA is attached in **Appendix E**.

Generally, an Environmental Compliance Approval (ECA) would be obtained from the Ministry of Environment, Conservation and Parks (MECP), formerly the Ministry of the Environment and Climate Change (MOECC), for any onsite private Sewage Works.

The onsite Sewage Works would generally include the onsite stormwater works such as flow controls, associated stormwater detention, and treatment works. However, an Approval Exemption under Ontario Regulation 525/98 can be applied. Under Section 3 of O. Reg 525/98, Section 53 (1) and (3) do not apply to the alteration, extension, replacement or a change to a stormwater management facility that 1) is designed to service one lot or parcel of land, b) discharges into a storm sewer that is not a combined sewer, c) does not service industrial land or a structure located on industrial land, and finally d) is not located on industrial land.

Based on this exemption, if the parcels noted above are merged into one property parcel, then by completing this the Approval Exemptions under O. Reg 525/98, would be satisfied and not require an ECA. Prior to City signoff on the infrastructure design a pre-consultation meeting will be held with the local MECP, to confirm that the site will not require an ECA.

In addition, various design guidelines were referred to in preparing the current report including:

- Bulletin ISDTB-2012-4 (20 June 2012)
  - Technical Bulletin ISDTB-2014-01 (05 February 2014)
  - Technical Bulletin PIEDTB-2016-01 (September 6, 2016)
  - Technical Bulletin ISDTB-2018-01 (21 March 2018)
  - Technical Bulletin ISDTB-2018-04 (27 June 2018)
- Ottawa Design Guidelines Water Distribution, July 2010 (WDG001), including:
  - Technical Bulletin ISDTB-2014-02 (May 27, 2014)
  - Technical Bulletin ISTB-2018-02 (21 March 2018)
- Stormwater Management Planning and Design Manual, Ontario Ministry of the Environment and Climate Change, March 2003 (SMPDM).
- Design Guidelines for Drinking-Water Systems, Ontario Ministry of the Environment and Climate Change, 2008 (GDWS).
- Fire Underwriters Survey, Water Supply for Public Fire Protection (FUS), 1999.
- Ontario Building Code 2012, Ministry of Municipal Affairs and Housing.
- Stormwater Management Guidelines for the Pinecrest Creek/Westboro Area Final Report by JFSA
- Stormwater Management Design Criteria for Pinecrest Creek/Westboro Area, City of Ottawa Final May 2020

## 4 Water Servicing

#### 4.1 Existing Water Servicing

The subject site is within the City of Ottawa 1W pressure zone. The site is currently serviced by the existing 300mm watermain on Forest Street and the 150mm watermain on Bond Street. The two existing buildings are serviced by laterals that will be blanked at the main to satisfaction of the City's Sewer Operations prior to shoring and excavating of the building.

#### 4.2 Water Servicing Proposal

The proposed development will consist of two high-rise buildings. Tower A is a 12-storey high-rise comprised of 168 units and Tower B is 12 storeys and comprised of 223 units. Architectural plans and rendering of the proposed building along with building statistics are provided in **Appendix H.** 

Water supply for the site will be provided by twin 200mm watermains supplied from the existing watermain on Forest Street. The need for a twin watermain is the result of the average day water demands exceeding 50 m<sup>3</sup>/day. The watermain feeds from the underground parking level and will connect directly to the existing 300mm watermain on Forest Street and will have an isolation valve between them, consistent with City of Ottawa Water Design Guidelines.

The buildings will be protected by automatic sprinkler systems. A fire department connection (or siamese) will be located within 45 metres of an adjacent municipally owned fire hydrant. In order to achieve this, a new hydrant will be installed off the existing 300mm watermain within Forest Street. Detailed layout of the proposed water services is provided in drawing C100 of **Appendix H.** 

#### 4.3 Water Servicing Design

The water servicing requirements for the proposed building is designed in accordance with the City Design Guidelines (July 2010). The following steps indicate the basic methodology that was used in our analysis:

- Estimated water demands under average day, maximum day and peak hour conditions. As the total population estimate was greater than 500, standard residential peaking factors were used, rather than based on MECP Table 3-3 which would be necessary when the design population is less than 500 persons.
- Estimated the required fire flow (RFF) based on the Fire Underwriters Survey (FUS).
- Obtained hydraulic boundary conditions (HGL) from the City, based on the above water demands and required fire flows.
- Boundary condition data and water demands were used to estimate the pressure at the proposed building, and this was compared to the City's design criteria.

Since the average day demand exceed 50 m<sup>3</sup> per day, two watermain feeds to the building will be necessary as per Section 4.31 of the WDG001. **Table B-1** in **Appendix B** provides detailed calculations of the total water demands.

A review of the estimated watermain pressures at the building connection, based on the boundary conditions provided, was completed based on using two watermains. **Table B-5** in **Appendix B** provides a comparison of anticipated pressures at the building connection based on using a single or double watermain feed. A single watermain analysis was completed to determined if the water pressure still met the City requirement during either the maximum day plus fire flow or peak hour condition, if one of the laterals was out of service.

Based on results, the use of two 150mm watermains would result in a pressure of  $\pm$ 50.1 psi at the building, while the use of two 200mm watermains would improve the pressure to  $\pm$ 52.4 psi under maximum day plus fire flow conditions. The minimal

difference in pressure is the result of the short length of the water service lateral. In the event one of the watermains are down for service, the pressure at the building using only a single 150mm or 200mm watermain would be  $\pm$ 42.1 psi or  $\pm$ 50.3 psi respectively.

Under peak hour conditions, there is little difference using a 150mm or 200mm watermain, with anticipated pressure at the building of ±52.2 psi.

Based on the results, the installation of two 200mm watermains with a shut-off valve between them is proposed. Detailed calculations of the anticipated water pressures, based on City of Ottawa boundary conditions, is provided in **Table B-5**.

No pressure reducing measures are required as operating pressures are within 50 psi and 80 psi.

#### 4.4 Water Servicing Design Criteria

**Table 4-1** below summarizes the Design Criteria that was used to establish the water demands and the required fire flows, based on the proposed building uses. The design parameters that apply to this project and used for calculations are identified below in **Table 4-1**.

#### Table 4-1 - Summary of Water Supply Design Criteria

Design Parameter	Value	Applies
Population Density – Single-family Home	3.4 persons/unit	
Population Density – Semi-detached Home	2.7 persons/unit	
Population Density – Townhome or Terrace Flat	1.8 persons/unit	
Population Density – Bachelor Apartment	1.4 persons/unit	✓
Population Density – Bachelor + Den Apartment	1.4 persons/unit	
Population Density – One Bedroom Apartment	1.4 persons/unit	√
Population Density – One Bedroom plus Den Apartment	1.4 persons/unit	√
Population Density – Two Bedroom Apartment	2.1 persons/unit	√
Population Density – Two Bedroom plus Den Apartment	2.1 persons/unit	
Average Day Demands – Residential	350 L/person/day	√
Average Day Demands – Commercial / Institutional	28,000 L/gross ha/day	√
Average Day Demands – Light Industrial / Heavy Industrial	35,000 or 55,000 L/gross ha/day	
Maximum Day Demands – Residential	2.5 x Average Day Demands	<b>√</b>
Maximum Day Demands – Commercial / Institutional	1.5 x Average Day Demands	√
Peak Hour Demands – Residential	2.2 x Maximum Day Demands	√
Peak Hour Demands – Commercial / Institutional	1.8 x Maximum Day Demands	✓
Fire Flow Requirements Calculation	FUS	✓
Depth of Cover Required	2.4m	√
Maximum Allowable Pressure	551.6 kPa (80 psi)	√
Minimum Allowable Pressure	275.8 kPa (40 psi)	√
Minimum Allowable Pressure during fire flow conditions	137.9 kPa (20 psi)	√

#### 4.5 Estimated Water Demands

The following **Table 4-2** below summarizes the anticipated water demands for the proposed development based on following:

- Tower A having 168 units and estimated population of 264.6 persons.
- Tower B having 223 units and estimated population of 342.3 persons.

#### Table 4-2 : Water Demand Summary

Water Demand Conditions	Tower A - Water Demands (L/sec)	Tower B - Water Demands (L/sec)	Total Water Demands (L/sec)
Average Day	1.1	1.4	2.5
Max Day	2.7	3.5	6.2
Peak Hour	5.9	7.6	13.6

#### 4.6 Boundary Conditions

Hydraulic Grade Line (HGL) boundary conditions were obtained from the City for design purposes. A copy of the correspondence received from the City is provided in **Appendix E**.

The following hydraulic grade line (HGL) boundary conditions were provided:

- Minimum HGL = 108.3 m
- Maximum HGL = 115.4 m
- Max Day + Fire Flow (133L/sec) = 109.8 m
- Max Day + Fire Flow (183L/sec) = 109.2 m

#### 4.7 Fire Flow Requirements

Water for fire protection will be available utilizing the proposed fire hydrants located along the adjacent roadways: Bond Street, Forest Street, Croydon Avenue, and Richmond Road. The required fire flows for the proposed buildings were calculated based on typical values as established by the Fire Underwriters Survey 1999 (FUS).

The following equation from the Fire Underwriters document "Water Supply for Public Fire Protection", 1991, was used for calculation of the on-site supply rates required to be supplied by the hydrants:

F = 200 \* C \* V (A)

where:

F	=	Required Fire flow in Litres per minute
С	=	Coefficient related to type of Construction
А	=	Total Floor Area in square metres

The proceeding **Table 4-3** summarizes the parameters used for estimating the Required Fire Flows (RFF) based on the Fire Underwriters Survey (FUS) and the latest City of Ottawa Technical Bulletins. The RFFs were estimated in accordance with ISTB-2018-02, and based on floor areas provided by the architect, which are illustrated in **Appendix H**.

The following summarizes the parameters used for both proposed buildings.

- Type of Construction
   Non-combustible
- Occupancy
   Limited combustible
- Sprinkler Protection
   Fully Supervised Automatic Sprinkler

#### Table 4-3 - Summary of Design Parameters Used in Calculating Required Fire Flows (RFF) Using FUS

Design Parameter	Value
Coefficient Related to type of Construction C	0.80 (Towers A, Tower B)
Total Floor Area (m2)	7,175 (Tower A) 9,480 (Tower B)
Fire Flow prior to reduction (L/min)	14,908 (Tower A) 17,136 (Tower B)
Reduction Due to Occupancy Non-combustible (-25%), Limited Combustible (-15%), Combustible (0%), Free Burning (+15%), Rapid Burning (+25%)	-15% (Tower A) -15% (Tower B)
Reduction due to Sprinkler (Max 50%) Sprinkler Conforming to NFPA 13 (-30%), Standard Water Supply (-10%), Fully Supervised Sprinkler (-10%)	-50% (Tower A) -50% (Tower B)
Exposures	+25% (Tower A) +46% (Tower B)

The estimated required fire flows (RFF) based on the FUS methods is: 133 L/sec for Tower A, and 183 L/sec for Tower B.

#### 4.8 Review of Hydrant Spacing

A review of the hydrant spacing was completed to ensure compliance with Ottawa Design Guidelines – Water Distribution, July 2010 (WDG001) and Appendix I of Technical Bulletin ISTB-2018-02. To meet the fire hydrant spacing guidelines of 90m for apartments and high-density areas, an additional fire hydrant is proposed on Bond Street, approximately 25m east of Forest Street. An additional fire hydrant is proposed on Forest Avenue to be within 45m of the fire department connection on each building.

As per Section 3 of Appendix I of Technical Bulletin ISTB-2018-02, all hydrants within 150 metres were reviewed to assess the total possible available flow from these contributing hydrants. For each hydrant the distance to the proposed building was determined to arrive at the contribution of fire flow from each. All hydrants are expected to be of Class AA as per Section 5.1 of Appendix I. For each hydrant the straight-line distance, distance measured along a fire route or roadway, whether its location is accessible, and its contribution to the required fire flow was established. **Figure A-3 in Appendix A** illustrates the hydrant locations in proximity to the site.

#### Table 4-4 – Required Fire Flows

Building	Required Fire Flow (L/min)	Available Fire flow Based on Hydrant Spacing as per ISTB-2018-02 (L/min)
Tower A	8,000 (or 133 L/sec)	22,800
Tower B	11,000 (or 183 L/sec)	34,200

The total available contribution of flow from hydrants was estimated at ±22,800 L/min and ±34,200 L/min for Towers A and B, whereas the required fire flows (RFF) for each building is only 8,000 L/min and 11,000 L/min. Therefore, the available flows from hydrants exceed each building's fire flow requirements as identified in Appendix I of Technical Bulletin ISTB-2018-02. Additional information on the available flows from hydrants is provided in **Table B-4**.

## 5 Sewage Servicing

#### 5.1 Existing Sewage Conditions

The subject property is located within the Pinecrest Collector Sewershed, which then discharges to the West Nepean Collector. From the property sewage is discharged:

- Southerly on Forest Street (±45m of 250mm pipe),
- Easterly on Bond Street (130m of 225mm and 250mm pipe)
- Northerly on Croydon Avenue (±180m of 225mm pipe)
- Easterly on Richmond Road (±625m of 300mm pipe) to Pinecrest Collector
- Northerly on Transitway (±460m of 900mm pipe) to West Nepean Collector

Table 5-1 below summarizes the sewage flow from the existing properties.

#### Table 5-1 – Summary of Existing Sewage Flows

Sewage Condition	Sanitary Sewage Flow (L/sec)	
Average Day Sewage Flow	0.26	
Infiltration Flow (at 0.33 L/ha/sec)	0.18	
Peak Wet Weather Sewage Flow	0.44	

#### 5.2 Proposed Sewage Conditions

It is proposed to provide one single sanitary sewer connection from the subject property to the existing sanitary sewer on Forest Street. Each tower will have a separate building lateral which will discharge to an onsite sanitary manhole. This manhole will be installed near the property line and be used as a monitoring manhole. The sanitary sewer system was designed based on a population flow with an area-based infiltration allowance. A 250mm diameter sanitary sewer is proposed with a minimum 2% slope, having a capacity of 87.7 L/sec based on Manning's Equation under full flow conditions. Based on the OBC, the maximum permitted hydraulic load for a 250mm at 2% is 4,500 fixture units. **Table 5-2** below summarizes the design parameters used.

#### Table 5-2 – Summary of Wastewater Design Criteria / Parameters

EXP Services Inc. 365 Forest Street, Ottawa, ON OTT-00252570-A0 2022-09-15

Design Parameter	Value	Applies
Population Density – Single-family Home	3.4 persons/unit	
Population Density – Semi-detached Home	2.7 persons/unit	
Population Density – Duplex	2.3 persons/unit	
Population Density – Townhome (row)	2.7 persons/unit	
Population Density – Bachelor Apartment	1.4 persons/unit	✓
Population Density – Bachelor + Den Apartment	1.4 persons/unit	
Population Density – One Bedroom Apartment	1.4 persons/unit	✓
Population Density – One Bedroom plus Den Apartment	1.4 persons/unit	~
Population Density – Two Bedroom Apartment	2.1 persons/unit	✓
Population Density – Two Bedroom plus Den Apartment	2.1 persons/unit	
Average Daily Residential Sewage Flow	280 L/person/day	
Average Daily Commercial / Intuitional Flow	28,000 L/gross ha/day	~
Average Light / Heavy Industrial Daily Flow	35,000 / 55,000 L/gross ha/day	
Residential Peaking Factor – Harmon Formula (Min = 2.0, Max =4.0, with K=0.8)	$M = 1 + \frac{14}{4 + P^{0.5}} * k$	~
Commercial Peaking Factor	1.0	~
Institutional Peaking Factor	1.5	
Industrial Peaking Factor	As per Table 4-B (SDG002)	
Unit of Peak Extraneous Flow (Dry Weather / Wet Weather)	0.05 or 0.28 L/s/gross ha	
Unit of Peak Extraneous Flow (Total I/I)	0.33 L/s/gross ha	✓

The estimated peak sanitary flow rate from the proposed property at 365 Forest Street is **6.76 L/sec** based on City Design Guidelines. Sewage rates below include a total infiltration allowance of 0.18 L/ha/sec based on the total gross site area. Refer to **Appendix C** for detailed calculations.

Sewage Flows within the property were estimated in order to compare with developed conditons. **Table 5-3** below summarizes the approximate sewage flows generated from the existing properties, based on a commerical flow and infiltration allowance.

#### Table 5-3 – Summary of Anticipated Sewage Rates

Sewage Condition	Sanitary Sewage Flow (L/sec)
Peak Residential / Commercial Flow	6.58
Infiltration Flow	0.18
Peak Design Flow	6.76

A review of the downstream sanitary sewer capacity was completed. The minimum sewer capacity of the last sewer run on Croydon Street (with a slope of 0.36%) has a calculated full flow capacity of 27 L/sec. It is anticipated that the increase in peak sewage flows up to 6.76 L/sec can be accommodated in the downstream sanitary sewer system.

## 6 Storm Servicing & Stormwater Management

Since the subject properties are located within the Ottawa River East subwatershed, stormwater works are therefore subject to both the Rideau Valley Conservation Authority (RVCA) and City of Ottawa (COO) approval.

In November 2020, after receipt of the comments from RVCA and pre-consultation with the City of Ottawa in 2019, the City of Ottawa Council approved the "Stormwater Management Design Criteria for the Pinecrest Creek/Westboro Area" (herein referred to as the Pinecrest/Westboro Criteria). The subject site falls within the Pinecrest Study Area identified on Figure 1 of the Pinecrest/Westboro Criteria and discharges directly to the Ottawa River. After multiple calls with the City of Ottawa, it was determined that the site would be required to adhere to the quality and quantity control guidelines of the Pinecrest/Westboro Criteria as it relates to the site discharges to the Ottawa River and the requirements based on the Pinecrest/Westboro Criteria as it relates to the subject development. Email correspondence is provided in **Appendix E**.

#### 6.1 Design Criteria

The proposed stormwater system is designed in conformance with the latest version of the City of Ottawa Design Guidelines (October 2012). Section 5 "Storm and Combined Sewer Design" and Section 8 "Stormwater Management". A summary of the design criteria that relates to this design report is in the proceeding sections below.

The requirements related to stormwater quantity control were noted in the pre-consultation meeting as follows:

- Stormwater quantity control criteria control the quantity to the 5-year pre-development/existing level for all storms up to and including the 100-year storm.
- When using the modified rational method to calculate the storage requirements for the site, the underground storage should not be included in the overall available storage. The modified rational method assumes that the restricted flow rate is constant throughout the storm which, in this case, underestimates the storage requirement prior to the 1: 100-year head elevation being reached. Alternately, if you wish to include the underground storage, you may use an assumed average release rate equal to 50% of the peak allowable rate. Otherwise, disregard the underground storage as available storage or provide modeling to support the design.

The stormwater management criteria identified for Site Plan Approval of sites within Pinecrest Creek Study Area draining to the Ottawa River are provided on Table 1: SWM Design Criteria for the Pinecrest Creek / Westboro Study Area of the Pinecrest/Westboro Criteria as follows:

- Runoff Volume Reduction Minimum on-site retention of the 10 mm design storm.
- Water Quality 80% TSS removal, some of which may be achieved by on-site retention of first 10 mm of rainfall.
- Water Quantity As per the City of Ottawa Sewer Design Guideline.
- Erosion Control Not applicable.

#### 6.2 Runoff Volume Reduction

The reduction of flow from the site following development is provided through retention of the 10 mm design storm as follows:

- Amended topsoil in all landscaped areas.
- Calculation of the 10 mm storm volume based on the site proposed development.

• Capture and retention of the 10 mm storm volume in a cistern in the underground parking lot to store for use on-site irrigation and maintenance. Location and details of the cistern are provided on the Mechanical Plans in **Appendix H**.

#### 6.3 Water Quality

- An oil grit separator (OGS) structure designed to remove 80% total suspended solids will be in the underground parking lot. Refer to Mechanical Plans in **Appendix H**.
- Runoff from the at grade driveway area will be collected by area drains, conveyed to the mechanical plumbing within the underground parking garage that discharges to the OGS for treatment prior to leaving the site. Details of the Oil Grit Separator are provided in **Appendix H**.

#### 6.4 Minor System Design Criteria

- The storm sewer was sized based on the Rational Method and Manning's Equation under free flow conditions for the 2year storm using a 10-minute inlet time.
- Since a detailed site plan was available for the site, including building footprints, calculations of the average runoff coefficients for each drainage area were completed.
- Minimum sewer slopes to be based on minimum velocities for storm sewers of 0.80 m/sec.

#### 6.5 Major System Design Criteria

- The major system has been designed to accommodate on-site detention with sufficient capacity to attenuate the 100-year design storm. On-site storage is calculated based on the 100-year design storm with on-site detention storage provided on the roof and within the underground parking structure (stormwater cistern).
- On site storage is provided and calculated for up to the 100-year design storm. There is no surface ponding proposed on the ground surface.
- Overland flow routes are provided.
- The vertical distance from the spill elevation on the street and the ground elevation at the buildings is at least 15cm.
- The emergency overflow spill elevation is at least 30 cm below the lowest building opening.

#### Table 6-1 – Spillway Elevations

Building	Spillway Elevation	Lowest building opening Elevation	Lowest Ground Elevation at Building
Tower A (Richmond Road)	74.85	75.60	75.40
Tower B (Bond St./Croydon Ave.)	74.08	74.40	74.40

#### 6.6 Runoff Coefficients

Runoff coefficients used for were based on actual areas taken from CAD. Runoff coefficients for impervious surfaces (roofs, asphalt, and concrete) were taken as 0.90, whereas those for pervious surfaces (grass/landscaping) were taken as 0.20. Average runoff coefficients were calculated for subcatchments (or drainage areas) using the area-weighting routine in PCSWMM. The runoff coefficients for pre-development and post-development catchments are provided in **Appendix D**, with a summary provided in **Table 6-2** below.

#### Table 6-2 – Summary of Runoff Coefficients

Location	Area (hectares)	Pre-Development Runoff Coefficient, C <sub>AVG</sub>	Post-Development Runoff Coefficient, C <sub>AVG</sub>
Entire Site	0.5126	0.75	0.81

#### 6.7 Time of Concentration

A minimum time of concentration of 10-minutes was used for both pre-development and post-development subcatchments.

#### 6.8 Pre-Development Conditions

Under current conditions stormwater runoff from the 0.5126 hectare site is divided into two drainage areas. Stormwater runoff discharges: 1) in a northwestern direction towards Richmond Road / Forest Street and 2) in a southern direction towards Bond Street. **Figure A-1** illustrates these pre-development drainage areas. These drainage areas (or subcatchments) are derived from PCSWMM using the Watershed Delineation Tool.

#### Table 6-3 – Summary of Pre-Development Flows

Return Period Storm	Peak Flows to Richmond Road / Forest Street Storm Sewers (L/sec)	Peak Flows to Bond Street Storm Sewers (L/sec)	Total Peak Flows (L/sec)
2-year	21.7	60.9	82.6
5-year	29.5	82.6	112.1
100-year	63.1	176.9	240.0

#### 6.9 Allowable Release Rate

Rather than meeting pre-development release rates, the City of Ottawa imposes a more restrictive stormwater release rate as noted in Section 8.3.7.3 of the SDG002. The allowable discharge release rate from the site was established using the peak flows derived based on a 5-year return period storm, a maximum runoff coefficient of 0.50 and a standard time of concentration of 10 minutes.

The allowable release rate of 74.3 L/sec from the proposed site will be based on a 5-year storm event. **Table D-9** provides detailed calculations on the total allowable peak flow, and the distribution to each outfall. In summary, the allowable release rate of 74.3 L/sec is comprised of 19.9 L/sec to Forest Street and 54.4 L/sec to Bond Street.

#### Table 6-4 – Summary of Allowable Release Rates

Area (onsite)	Area (ha)	Storm = 2 Year Q <sub>2ALLOW</sub> (L/sec)	Storm = 5 Year Q <sub>5ALLOW</sub> (L/sec)
Pre-1	0.1375	14.7	19.9
Pre-2	0.3751	40.0	54.4
Totals	0.5126	54.7	74.3

#### 6.10 Proposed Stormwater System

Stormwater runoff from the proposed site will drain from a combination of controlled and uncontrolled areas. As a result of the changes onsite the overall post-development runoff coefficient will change over pre-development conditions. This increase / decrease in runoff is the result of changes due to site development (i.e. additional hard surfaces, roof areas and hard landscaping).

A storm drainage plan is illustrated on **Figure A-2**. A total five (5) subcatchments (or drainage areas) within the development site are shown on this drawing with average runoff coefficients calculated for each drainage area. As the entire site property contains an underground parking structure, the stormwater works shall consist of the following elements:

- The proposed grading for the site will generally meet the existing drainage pattern sloping from the west at Richmond Road and Forest Street southerly/easterly to Bond Street.
- Roof drainage and landscape/hard surfaces to have separate 250mm storm lateral connections to the municipal storm sewer system with the roof drainage being conveyed to Forest Street storm sewer and the remainder of the site being conveyed to Bond Street storm sewer.
- Flow-control roof drains for Towers A & B discharging to internal storm plumbing to the stormwater cistern retaining the 10 mm storm volume prior to the excess flows discharging to the municipal sewer on Forest Street.
- Runoff from surface areas will be collected by area drains and discharge to underground storage (2.0 m x 5.0 m x 6.0 m stormwater cistern) located in the underground parking structure on P2 that will detain the runoff from the site to meet allowable rates. This in turn will be conveyed by the internal storm plumbing ultimately discharging to the storm lateral outletting from Tower B to STMMH 101 at the allowable rate.
- Remaining drainage areas along frontage of Forest Street and Bond Street to flow uncontrolled overland to the right-ofway.

A summary of the proposed storm and foundation infrastructure is provided in **Table 6-5** below.

Storm Laterals	Manhole	Foundation Drainage	Catchbasins	Area Drains
Storm Outlet #1 250mm from Underground Parking Garage to existing 300mm Storm Sewer on Forest Street.	STMMH 102		CBE1 CB1	AD1 through AD13
Storm Outlet #2 250 mm from Underground Parking Garage to existing 300 mm Storm Sewer on Bond Street	STMMH 100 STMMH 101	To STMMH 101	CBE2	
			Above CBs and ADs dra in Parking Garage with existing STMMH 100 a existing storm sewer o	nd then the 300mm

#### Table 6-5 – Summary of Proposed Storm System

A summary of the post-development flows is provided in **Table 6-6** below.

Return Period Storm	Peak Flows to Richmond Road / Forest Street Storm Sewers (L/sec)	Peak Flows to Bond Street Storm Sewers (L/sec)	Total Peak Flows (L/sec)	Allowable Peak Flows (L/sec)
2-year	10.4	14.5	24.9	
5-year	14.1	19.7	33.8	74.3
100-year	28.1	41.1	69.2	
Allowable to Fores	19.9			
Allowable to Bond =				54.4

To achieve the quantity control requirements and meet the allowable discharge rates as noted in **Section 6.9**, the roof drains on both Towers will require flow-controlled weirs. Based on the roof areas, an estimate of the number of roof drains required was completed. WATTS ACCUTROL weirs were used to determine the total discharge rates from the roof areas based on the number of drains. In addition, the total cumulative prism volumes on the roofs were calculated at a maximum permitted depth of 150mm. Additional information on the estimated 100-year volumes is provided in **Section 6.11**.

It is noted that the post-development flow to Richmond Road/ Forest St (28.1 L/s) is a few litres in excess of the pre-development flow to Richmond Road / Forest St (19.9 L/s), however the overall flow from the site following development, **69.2 L/s** is less than the allowable flow of 74.3 L/s with the two systems (from Richmond and Bond St storm sewers) joining immediately downstream at Croydon Ave and Richmond Road intersection. The proposed flow from the development is 29% of the pre-development flow, which results in a significant reduction in flow to the City sewers.

#### 6.11 Flow Attenuation

Stormwater flow attenuation will be achieved by utilizing roof storage and a stormwater storage cistern in the underground parking structure. Using the allowable release rates, the Modified Rational Method was used to determine the 2-year, 5-year, and 100-year volumes that will occur for corresponding release rates.

**Table D-12, Table D-13** and **Table D-14** provide the storage volumes required on the roof and in the cistern in the underground parking structure to attenuate the controlled release rates. **Table D-11** summarizes the combined controlled and uncontrolled flows leaving the subject site. A summary of release rates, storage volume requirements, and provided storage volumes are identified in **Table 6-7** below and calculated in **Appendix D**.

Area No.	Outlet	Release Rate (L/s)		e (L/s)	Storage Required (m <sup>3</sup> ) (MRM)		Storage Provided (m <sup>3</sup> )		Control Method	
		2-yr	5-yr	100-yr	2-yr	5-yr	100-yr	Roof	Cistern	
Tower A Roof		3.6	4.8	9.2	16.8	22.6	42.6	59.9		Flow Controlled Roof Drains with Weir (Set 3- 1/4 open)
Surface - Uncontrolled	Richmond / Forest	3.6	4.9	10.4						None
Tower B Roof		3.3	4.5	8.5	20.8	27.9	52.5	69.2		Flow Controlled Roof Drains with Weir (Set 3- 1/4 open)
Surface - Controlled		11.4	15.4	33.0	8.1	11.0	38.4		59.0	Pump Rate from Cistern
Surface - Uncontrolled	Bond St	3.1	4.3	8.1						none
Totals =		24.9	33.8	69.2	45.7	61.5	133.5	129.1	59.0	

Table 6-7 – Summary of Post-Development Storage

For the building roofs flow-controlled drains are necessary. An estimate of the controlled release rate and associated 100-year storage requirements was completed for the flat roof areas. **Table 6-7** provides the estimated 5-year and 100-year storage requirements for the entire site based on the Modified Rational Method. A combined 100-year storage of 133.5 m<sup>3</sup> is required based on the allowable discharge rate of 74.3 L/s. The combination of controlled release from the roofs (6 drains on each roof with weir open 3-1/4) and cistern pump along with the uncontrolled flow result in an overall release rate of 69.2 L/s. Roof catchment areas and drains are shown on **Figure A-4** in **Appendix A**. For each tower (A & B), the penthouse roofs will drain onto the main roofs and be controlled through the controlled roof drains. **Table 6-8** below summarizes the estimated water depths on the roof during the 100-year event. Detailed calculations are provided in **Appendix D**, **Table D-15 and D-16**.

Storm	Tower A	Tower B
2-year	Not calculated	Not calculated
5-year	94-100	103-111
100-year	121-138	131-139

The roof top terraces on Level 11 of each building will have roof drains uncontrolled to allow for sufficient drainage with no ponding of water. The uncontrolled flow is accounted for as shown in **Appendix D, Table D-15 and D-16**.

Refer to Mechanical Plans in **Appendix H** for cistern details.

#### 6.12 Quality Control Measures

The site is located within the Pinecrest Creek subcatchment. As this area discharges to the Ottawa River the following summarizes the specific additional quality control requirements as per the Pinecrest / Westboro Criteria.

15

- Runoff Volume Reduction: On-site retention of 10 mm storm.
- Water Quality: 80% TSS removal.

As total suspended solids (TSS) removal efficiency of 80% is required it is proposed to provide an oil grit separator for quality control. Following discussions with the City, only the runoff from the driveway and surrounding pathways require treatment. This area is 0.1124 ha. The Mechanical Design Drawing Details and sizing calculations for the quality control structure are provided in **Appendix H**.

To provide the necessary 10mm of volume reduction, the method outlined on Page 2 of Appendix B of the "SWM Guidelines for Pinecrest Creek/Westboro Area" report by JFSA was used. Approximately **38.9** m<sup>3</sup> of the stormwater runoff from the 10 mm storm is required to be retained on site. A summary of the calculations from the methodology are shown below:

Landscaped Area Runoff Volume	= 0.085 ha * (10mm – 4.67mm) * 10 m3/ha*mm = 4.5 m³
Hard Surface Runoff Volume	= 0.1124 ha * (10mm – 1.57mm) * 10 m3/ha*mm = 9.5 m³
Roof Area Runoff Volume	= 0.2953 ha * (10mm – 1.57mm) * 10 m3/ha*mm = 24.9 m <sup>3</sup>

4.5 m<sup>3</sup> is required from the landscaped areas and will be captured and retained by amended topsoil. Runoff will be drained from the rooftop to the cistern located at the west side of Tower B and stored water will be used for irrigation and maintenance purposes. The required 10 mm storm volume for the two buildings and driveway area is +/- 34.4 m<sup>3</sup>. This volume of water will be collected from the roofs only, to allow runoff from the driveway area to be treated in the OGS located on the east side of the site. The remainder of the site, approximately 199 m<sup>2</sup>, requiring approximately 2 m<sup>3</sup> retention of 10 mm storm, is located along the perimeter of the site adjacent to Forest and Bond Street right of way. This area drains uncontrolled via surface flow to the municipal right of way. As per discussions with the City, the allowance for the uncontrolled flow from these areas is acceptable.

The potential for LID infiltration methods were reviewed but determined impractical due to the required extent of the development and underground parking garage.

## 7 Erosion & Sediment Control

During all construction activities, erosion and sedimentation shall be controlled by the following techniques:

- Filter cloth shall be installed between the frame and cover of all adjacent catch basins and catch basin manhole structures.
- Heavy duty silt fencing will be used to control runoff around the construction area. Silt fencing locations are identified on the site grading and erosion control plan.
- A mud mat will be installed at the construction entrance to help avoid mud from being transported to offsite roads.
- Visual inspection shall be completed daily on sediment control barriers and any damage repaired immediately. Care will be taken to prevent damage during construction operations.
- In some cases, barriers may be removed temporarily to accommodate the construction operations. The affected barriers will be reinstated at night when construction is completed.

- Sediment control devices will be cleaned of accumulated silt as required. The deposits will be disposed of as per the requirements of the contract.
- During the course of construction, if the engineer believes that additional prevention methods are required to control erosion and sedimentation, the contractor will install additional silt fences or other methods as required to the satisfaction of the engineer.
- Construction and maintenance requirements for erosion and sediment controls are to comply with Ontario Provincial Standard Specification (OPSS) OPSS 805 and City of Ottawa specifications.

## 8 Conclusions and Recommendations

This Functional Servicing & Stormwater Report outlines the rationale which will be used to service the proposed development. The following summarizes the servicing requirements for the site:

#### Water

- Two parallel 200mm watermains are proposed to service the residential Towers A and B, as the average day demands exceed 50 m<sup>3</sup> per day, which is mandatory as per Section 4.31 of the WDG001.
- Two new hydrants are proposed; one located on Bond Street to meet spacing requirements of 90m for apartments and high-density areas as per WDG001 and the other located on Forest Street within 45m from the proposed fire department connections.
- The Required Fire Flows (RFFs) were estimated at 8,000 L/min (133 L/sec) for Tower A, and 11,000 L/min (183 L/sec) for Tower B. The total minimum available flows for firefighting purposes, based on the contribution from hydrants, was estimated at 22,800 L/min.
- Based on hydraulic boundary conditions (HGL) provided by the City of Ottawa, a system pressure of ±52.2 psi under peak hourly demands is anticipated at the proposed building. This exceeds the City's guideline of 20 psi.
- Domestic water booster and fire pump will be provided in the mechanical room at P1 parking level.

#### <u>Sewage</u>

• Estimated peak sewage flows of **6.76 L/sec** are anticipated. This exceeds the estimated current sewage flows of **0.44 L/sec** under existing conditions. An initial review of the downstream sanitary sewer system from the site and the Pinecrest Collector indicates minimum pipe capacity of 27 L/sec for a sewer run on Croydon Ave.

#### **Stormwater**

- For the stormwater system, the allowable capture rate from the entire site was calculated based on a runoff coefficient of 0.50, time of concentration of 10 minutes for a 5-year storm event. The allowable release rate for the entire site was calculated to be **78.8 L/sec**. Runoff in excess of this will be detained onsite for up to the 100-year storm.
- Two minor surface drainage areas will flow uncontrolled to the right-of-way. The 100-year peak flows from these two areas were accounted for (ie. subtracted) from the total runoff rate to establish the allowable rate.
- In order to meet the allowable release rate, a total retention volume of ±133.5 m<sup>3</sup> is required.
- Runoff on the building roofs will be controlled using flow-controlled roof drains. For each roof-drain is equipped with WATTS ACCUTROL weirs and set at the OPEN position are proposed. Each drain having maximum discharge rate of 30 gpm at 150mm depth. A maximum discharge rate of **9.2 L/sec from Tower A** and **8.5 L/sec from Tower B** was established for the 100-year event.
- A total 100-year storage volume requirements on the roofs of Tower A and Tower B was estimated as 84.9 m<sup>3</sup> (38.6 m<sup>3</sup> and 46.3 m<sup>3</sup> respectively), based on the above release rates, using the Modified Rational Method. The volumes available on the roofs are 108.4 m<sup>3</sup> (48.3 m<sup>3</sup> and 60.1 m<sup>3</sup> respectively), therefore exceeding the required volumes.

- Runoff from the surface areas above the parking structure will be collected and detained in an underground stormwater chamber (cistern) located in the parking structure. The allowable discharge rate of 16.5 L/sec (50% of 33 L/s) from the cistern will be met using an equal pump rate. The volume necessary to detain the 100-year event, is 59.0 m<sup>3</sup>, based on using 50% of the allowable release rate as required by the City of Ottawa. The stormwater tank (cistern 2) will be sized to hold a minimum volume of approximately 59.0 m<sup>3</sup>.
- Retention of the 10 mm storm is capture within the site through amended topsoil in the landscaped areas and a cistern located in the parking garage. The **34.4** m<sup>3</sup> retained in cistern 1 will be reused on site for irrigation and maintenance.
- Quality control is provided via an oil grit separator within the underground parking garage collecting runoff from the driveway area and conveyed to cistern 2 prior to discharge to the municipal sewer. It is designed to remove 80% TSS from stormwater runoff from the driveway and surrounding area.

#### **Erosion & Sediment Control**

• Erosion and sediment control methods will be used during construction to limit erosion potential.

#### TABLE B-2

#### FIRE FLOW REQUIREMENTS BASED ON FIRE UNDERWRITERS SURVEY(FUS) 1999 FOR

TOWER A

An estimate of the Fire Flow required for a given fire area may be estimated by:

F = 220 \* C \* SQRT(A)

where: F = required fire flow in litres per minute

 $\label{eq:action} A = total floor area in m^2 (including all storeys, but excluding basements at least 50% below grade)$ C = coefficient related to the type of construction

#### TABLE B-3

#### FIRE FLOW REQUIREMENTS BASED ON FIRE UNDERWRITERS SURVEY(FUS) 1999 FOR

TOWER B

An estimate of the Fire Flow required for a given fire area may be estimated by:

F = 220 \* C \* SQRT(A)

where:

F = required fire flow in litres per minute

A = total floor area in  $m^2$  (including all storeys, but excluding basements at least 50% below grade) C = coefficient related to the type of construction

Task	Options	Multiplier			Inpu	ıt	Value Used	Fire Flow Total (L/min)

Location: Room 4103E, City Hall Date: May 28, 2pm to 3pm

Attendee	Role	Organization		
Mary Dickinson	Planner			
Santosh Kuruvilla	Project Manager (Infrastructure)	City of Ottowa		
Melanie Knight	Planner (Urban Design)	City of Ottawa		
Samantha Gatchene	Planning Assistant			
Jamie Posen	Planner	FoTenn		
Steve Heafey	Owner's Representative			
Carmine Zayoun	Owner's Representative	Heafey Group		
Shawn Vandette	Owner			
Mathieu LaPalm	Architect	LaPalm Rheault Architects		

## **Comments from Applicant**

- 1. The applicant is proposing the development two 12-storey high rise buildings at 365 Forest Street, 1420 Richmond Road, and 2583-2589 Bond Street. The buildings would be residential in nature with 333 units total. Currently, no commercial uses at grade are proposed.
- 2. Underground parking and surface vehicle parking would be provided as well as bicycle parking.
- 3. The current two access points off Richmond Road and Forest Street are proposed to be maintained.

## Planning Comments

- A Zoning By-law Amendment and an Official Plan Amendment would be required to permit the 12-storey building option, in accordance with the settlement of Official Plan Amendment 150 (OPA 150). The amendment to Section 3.6.3 maintains that up to 9-storeys is permitted on Arterial Mainstreets unless stated in a secondary plan or if the building is located at a qualifying node defined as a location that is:
  - a. within 400 metres walking distance of a Rapid Transit Station on Schedule D of this Plan; or
  - b. directly abutting an intersection of the Mainstreet with another Mainstreet or a Transit Priority Corridor on Schedule D of this Plan; or

- c. directly abutting a Major Urban Facility.
- Under OPA 150, the site is not considered a node and would require an OPA. Information regarding the settlement of OPA 150 building height and design appeals can be found in the April 24th <u>Planning Committee Report</u>.
- 3. The City is in the early stages of creating a secondary plan for the area. This process is scheduled to begin in late 2019/early 2020. City staff strongly encourage the applicant to participate in that process.
- 4. Cash-in-lieu of parkland and associated appraisal fee will be required as a condition of approval as per the <u>Parkland Dedication By-law</u>. For commercial and industrial purposes, parkland is calculated as 2% of the gross land area of the site being developed.
- 5. Building A should include a main front entrance directly from Richmond Road, or at the corner where Richmond Road and Forest Street meet. This is in accordance with the current AM10 zoning requirements. Please refer to the development standards in this zone for all other provisions including minimum glazing, minimum ceiling heights for the first storey etc.

## Urban Design Comments

- 1. Site design:
  - All vehicular access should be off of Forest and/or Bond. Preference would be for all vehicular access off of Bond. Bond Street should be treated as a 'laneway' to the site where access to underground parking and any loading or servicing can be located.
  - There are hydro lines along Forest and Bond, which requires minimum building setbacks. If the hydro lines are to be buried, the building should still be set back to allow for enough space for street trees along Forest and Bond.
  - A sidewalk should be provided along Forest to connect to the sidewalk recently built along Forest towards Carling (Dymon Storage site).
  - All parking should be located underground. This would significantly improve the immediate area, which is dominated by surface parking lots.
  - There is an opportunity at the corner of Richmond and Forest to create a plaza space either as a POPS (privately owned public spaces) or a patio space associated with a commercial use
- 2. Built form/building design:

- The building separation in the current design between Building A and B should be maintained to break up the façade along Forest.
- The long frontage along Forest needs to be designed well to ensure that there is permeability to the site and the buildings do not negatively dominate the streetscape.
- 3. Building A (12 storeys)
  - With vehicular access from Richmond removed, the building fronting onto Richmond Road can be designed as a complete perimetre corner building with design emphasis on the corner of Richmond and Forest.
  - Main pedestrian entrances should be located off of Richmond with a corner entrance/plaza space at the corner of Richmond and Forest.
  - The building should be designed with consideration for the City's <u>High Rise</u> <u>Design Guidelines</u> specifically with respect to built form (chapter 2).
  - Consider the shadowing impacts to the low-rise residential homes on the north side of Richmond Road with the shaping of Building A
- 4. Building B (12 storeys)
  - At 12 storeys, the mass of Building B dominates the site and Bond Street. A reduced building footprint and a reduced height down to 9 storeys is recommended. Please refer to Chapter 2 in the <u>High Rise Design Guidelines</u> for guidance on the appropriateness, mass and height of a bar building.
  - This building should create a transition from the newly constructed building at 2599 Carling Avenue.
  - The roof top amenity space could be realigned north/south to take better advantage of sun exposure and provide relief between the Building A and B.
  - The building should be designed with consideration for the City's <u>High Rise</u> <u>Design Guidelines</u> specifically with respect to built form (Chapter 2).
- 5. General comments:
  - This site presents an opportunity for redevelopment which can improve the existing context that is dominated by surface parking lots and oversized (high rise) bar buildings.
  - With frontage on three streets, there is an opportunity to make a significant contribution to the public realm. Please refer to the City's <u>High Rise Design</u>

<u>Guidelines</u> (chapter 3) for more direction on the design of the pedestrian realm.

## **Engineering Comments**

- 1. Stormwater quantity control criteria control the quantity to the 5-year predevelopment/existing level for all storms up to and including the 100-year storm.
- 2. When calculating the existing composite runoff coefficient (C) for the site, please provide a drawing showing the individual area and its runoff coefficient.
- 3. It appears that the subject site consists of more than one parcel. Therefore, MECP ECA is required. All parcels can be merged into one to avoid MECP ECA requirement.
- Stormwater quality control Consult with the Conservation Authority (RVCA) for their requirements. Include the correspondence with RVCA in the stormwater/site servicing report.
- 5. Show the existing storm and sanitary lateral service connections on the site servicing plan.
- 6. When using the modified rational method to calculate the storage requirements for the site, the underground storage should not be included in the overall available storage. The modified rational method assumes that the restricted flow rate is constant throughout the storm which, in this case, underestimates the storage requirement prior to the 1: 100-year head elevation being reached. Alternately, if you wish to include the underground storage, you may use an assumed average release rate equal to 50% of the peak allowable rate. Otherwise, disregard the underground storage as available storage or provide modeling to support the design.
- 7. Engineering plans are to be submitted on standard A1 size (594mm x 841mm) sheets.
- 8. Provide the following information for water main boundary conditions:
  - a. Location map with water service connection location
  - b. Average daily demand (l/s)
  - c. Maximum daily demand (l/s)
  - d. Maximum hourly demand
  - e. Fire flow demand (provide fire detailed flow calculations based on the fire underwriters survey method)
  - f. If you are proposing any exterior light fixtures, all must be included and approved as part of the site plan approval. Therefore, the lights must be clearly identified by make, model and part number. All external light

fixtures must meet the criteria for full cut-off classification as recognized by the Illuminating Engineering Society of North America (IESNA or IES), and must result in minimal light spillage onto adjacent properties (as a guideline, 0.5 fc is normally the maximum allowable spillage). In order to satisfy these criteria, the applicant must provide certification from an acceptable professional engineer. The location of all exterior fixtures, a table showing the fixture types (including make, model, part number), and the mounting heights must be included on a plan.

# Transportation Comments

- 1. Please revise your screening form to indicate that the property is located on a Spine Bicycle Network (Richmond)
- 2. Follow Traffic Impact Assessment Guidelines
  - a. Traffic Impact Assessment will be required.
  - b. Start this process asap.
  - c. Applicant advised that their application will not be deemed complete until the submission of the draft step 1-4, including the functional draft RMA package (if applicable) and/or monitoring report (if applicable).
- 3. ROW protection on Richmond between HWY 417 and Ottawa River Parkway is 37.5m even (18.75 metres from centreline of road).
- 4. Corner triangles as per OP Annex 1 Road Classification and Rights-of-Way at the following location on the final plan will be required:
  - a. Local Road to Local Road: 3 metre x 3 metres
  - b. Local Road to Arterial Road: 5 metre x 5 metres
- 5. Noise Impact Studies required for the following:
  - a. Road
  - b. Stationary (due to the proximity to neighbouring exposed mechanical equipment) and/or (if there will be any exposed mechanical equipment due to the proximity to neighbouring noise sensitive land uses)
- 6. Clear throat requirements on an arterial (Richmond) are as follows:

Apartments	Unit Count	Length (m)
	<100 units	15
	100-200 units	25
	>200 units	40

\*\*Please note that vehicular access from Richmond Road is not our desired configuration.

- 7. On site plan:
  - a. Show all details of the roads abutting the site up to and including the opposite curb; include such items as pavement markings, accesses and/or sidewalks.
  - b. Turning templates will be required for all accesses showing the largest vehicle to access the site; required for internal movements and at all access (entering and exiting and going in both directions).
  - c. Show all curb radii measurements; ensure that all curb radii are reduced as much as possible
  - d. Show lane/aisle widths.
  - e. Sidewalk and cycle tracks are to be continuous across access as per City Specification 7.1.
  - f. Grey out any area that will not be impacted by this application.

## **Requested Plans and Studies**

1. A list of required plans and studies required for a complete combined Official Plan Amendment, Zoning By-law Amendment and Site Plan Control application have been attached.

#### Process

- 1. This is a pre-consultation to determine the nature of the application and the requirements for a complete application.
  - a. For an Official Plan Amendment application, subject to Public Consultation, the application form, timeline, and fees can be found <u>here</u>.
  - b. For a Major Zoning By-law Amendment application, Manager Approval, subject to Public Consultation, the application form, timeline, and fees can be found <u>here</u>.
- This proposal will trigger a Site Plan Control application, Manager Approval, subject to Public Consultation. The proposal would fall under the 'complex' category as per the <u>Site Plan Control Subtype Threholds</u>. The application form, timeline and fees can be found <u>here</u>.
- 3. The applicant will be required to present their proposal to the Urban Design Review Panel (UDRP). The site is in a Design Priority Area and a preconsultation is recommended. The next UDRP meeting is scheduled for Friday, July 12<sup>th</sup> and the submission deadline is Friday, June 28. Information regarding the review process and timelines can be found <u>here</u>.

Please refer to the links to "<u>Guide to preparing studies and plans</u>" and <u>fees</u> for general information. Additional information is available related to <u>building permits</u>, <u>development</u> <u>charges</u>, <u>and the Accessibility Design Standards</u>. Be aware that other fees and permits may be required, outside of the development review process. You may obtain background drawings by contacting informationcentre@ottawa.ca.

These pre-con comments are valid for one year. If you submit a development application(s) after this time, you may be required to meet for another pre-consultation meeting and/or the submission requirements may change. You are as well encouraged to contact us for a follow-up meeting if the plan/concept will be further refined.

Please contact me at <u>mary.dickinson@ottawa.ca</u> or at 613-580-2424 extension 13923 if you have any questions.

Sincerely,

Mary Dickinson MCIP RPP Planner II Development Review - West

## **Jennifer Diaz**

From: Sent: To: Cc: Subject: Attachments: Kuruvilla, Santhosh <Santhosh.Kuruvilla@ottawa.ca> Wednesday, June 2, 2021 1:56 PM Bruce Thomas; Jennifer Diaz Jason Fitzpatrick RE: Request for Boundary Conditions - 365 Forest Street 365 Forest May 2021 - 2nd Submission.pdf

# Hi Bruce,

The following are boundary conditions, HGL, for hydraulic analysis at 365 Forest (zone 1W) assumed to be connected to the 305 mm on Forest Street (see attached PDF for location).

Minimum HGL = 108.3 m Maximum HGL = 115.4 m MaxDay + FireFlow (133L/s) = 109.8 m MaxDay + FireFlow (183L/s) = 109.2 m

These are for current conditions and are based on computer model simulation.

Disclaimer: The boundary condition information is based on current operation of the city water distribution system. The computer model simulation is based on the best information available at the time. The operation of the water distribution system can change on a regular basis, resulting in a variation in boundary conditions. The physical properties of watermains deteriorate over time, as such must be assumed in the absence of actual field test data. The variation in physical watermain properties can therefore alter the results of the computer model simulation.

## Thanks,

## Santhosh

Hi Santhosh,

A double feed is proposed from the location on Forest with a valve in between the two proposed connections.

Hi Jennifer,

We noticed that the previous boundary conditions that you requested for this site required two connections. Now there is only being requested but the demands require 2 connections (see section 4.3 of the Ottawa Water Distribution Design Guideline).

Please update your map showing both connection points and send us a copy.

Thanks,

#### Santhosh

Hi Santhosh,

Please see the attached requested information and summary of the water demand below: Average Day: 2.5 L/sec Max Day: 6.2 L/sec Peak Hour: 13.6 L/sec Fire flow (RFF): Tower A: 133 L/sec, Tower B: 183 L/sec (based on FUS method) Max Day + FF: 189.2 L/sec.

Please advise if you require anything else.

Thank you

## Hi Jennifer,

Please provide the following information for water boundary condition request.

- Provide the following information for water main boundary conditions:
  - 1. Location map with water service connection location(s).
  - 2. Average daily demand (I/s).
  - 3. Maximum daily demand (I/s).
  - 4. Maximum hourly demand (l/s).
  - 5. Fire flow demand (provide detailed fire flow calculations based on Fire Underwriters survey (FUS) Water Supply for Public Fire Protection). Exposure separation distances shall be defined on a figure to support the FUS calculation and required fire flow (RFF).

6. Hydrant capacity shall be assessed to demonstrate the RFF can be achieved. Please identify which hydrants are being considered to meet the RFF on a fire hydrant coverage plan as part of the boundary conditions request.

Please ensure all information listed above must be provided in the same email.

Thanks,

#### Santhosh

#### Good evening,

Further to our request there have been minor changes to the design of the proposed development at the subject address. We have since completed additional calculations and estimate the following demands and flow requirements:

Average Day: 2.5 L/sec Max Day: 6.2 L/sec Peak Hour: 13.6 L/sec Fire flow (RFF): Tower A: 133 L/sec, Tower B: 183 L/sec (based on FUS method) Max Day + FF: 189.2 L/sec.

Please provide the updated hydraulic boundary conditions based on our estimated values.

Thank you!

#### Jennifer Diaz, P.Eng.

Subject: RE: Request for Boundary Conditions - 365 Forest Street

#### Hi Jason,

Here is the boundary conditions for the subject application. Please see attached for the connection locations.

The following are boundary conditions, HGL, for hydraulic analysis at 365 Forest (zone 1W) assumed to be connected to the 305mm on Forest and 305mm on Richmond (see attached PDF for location). Minimum HGL = 108.5m, same at both connections Maximum HGL = 115.7m, same at both connections

MaxDay + FireFlow (150L/s) = 107.0m, Forest connection

MaxDay + FireFlow (150L/s) = 109.0m, Richmond connection

These are for current conditions and are based on computer model simulation.

Disclaimer: The boundary condition information is based on current operation of the city water distribution system. The computer model simulation is based on the best information available at the time. The operation of the water distribution system can change on a regular basis, resulting in a variation in boundary conditions. The physical properties of watermains deteriorate over time, as such must be assumed in the absence of actual field test data. The variation in physical watermain properties can therefore alter the results of the computer model simulation.

Hi Mary,

We are working with the Heafey Group on a site plan application for 365 Forest Street, and would appreciate if you could arrange for IAD/water Resources to provide hydraulic boundary conditions that we will need for the watermain design. I have attached a sketch of the site and the approximate boundary condition locations. We are requesting boundary conditions at locations at this time to evaluate the best connection location within the right of way.

The following is a summary of the demands and the required fire flows (RFF) we have estimated. We would appreciate the hydraulic boundary conditions based on our estimated water demands and required fire flows as noted below:

Average Day: 2.4 L/sec Max Day: 6.0 L/sec Peak Hour: 13.2 L/sec Fire flow (RFF): Tower A: 100 L/sec, Tower B: 150 L/sec (worst case). (based on FUS method) Max Day + FF: 156.0 L/sec.

In the event you require confirmation of the above demands and the RFF, I've attached the design tables for reference.

Regards,

sexh

Hi Ghislaine,

Hope you had a great Thanksgiving weekend. Thanks for your response below.

Yes, we wish to exclude the uncontrolled drainage areas from the 10mm retention requirement, as it is would be very difficult collect the runoff.

For the larger events we would be ok with over controlling the release rate from other areas of the site, to account for the uncontrolled areas.

**RESPONSE:** Yes, for this project (given the outlet of the STM sewers system to Ottawa River), the small area of uncontrolled drainage may be excluded from meeting the 10 mm retention.

Please let us know when you discuss with your colleagues.

Thanks,

Bruce

Hi Bruce (and Jennifer),

Re the uncontrolled drainage areas: is your question whether these areas be excluded from the 10 mm retention requirement **OR** are you asking if they can be excluded from the 10 mm retention requirement **AND** if runoff from these areas not contribute towards allowable release rate?

Once I hear back from you then I will reach out to my colleagues.

Thanks. Ghislaine

Hi Ghislaine,

Thank you for meeting with us to provide guidance on the requirements provided within the "Stormwater Management Guidelines for the Pinecrest/Westboro Area Final Report" as they relate to the planned development at 365 Forest Street.

As per our discussion, we request further clarification on the following:

1. The referenced SWM guidelines states that the 10 mm design storm is to be retained. Please confirm whether it would be acceptable to provide measures for excess retention in one area to account for areas with uncontrolled flow. i.e. capture +/- first 20mm on the roof. Is it possible to have a very restrictive release rate for the site/portion of the site that would drain the 10mm storm over a longer time frame of say a few days?

**RESPONSE:** Yes, for this project (given the outlet of the STM sewers system to Ottawa River) we will accept the provision for excess retention in one area to account for areas with uncontrolled flow. Similar to the Feedmill Creek retention criteria, please account for initial abstraction contributing towards the retention target.

2. Our current design for quantity control allows for overcontrol of the runoff from the roof area to account for small uncontrolled areas adjacent to the City right of way (Forest St and Bond St). Due to limitations on grading, location, size and existing conditions, would the City be agreeable to these areas remaining uncontrolled? i.e. not retaining the 10 mm storm at these locations?

**RESPONSE:** Please see October 12, 2021 clarification and City response.

3. Could you provide City contacts in the Buildings Department for our team to discuss the City's preferred/acceptable methods for reuse of the captured stormwater (watering, maintenance/cleaning, reuse as greywater, etc.).

**RESPONSE:** For this project (given the outlet of the STM sewers system to Ottawa River), please identify as many opportunities to retain the first 10 mm onsite (where it makes sense). Unfortunately, the City does not have guidelines specific to water re-use systems (especially within the building). If infiltrating does not make sense (i.e subsurface infiltration LID on top of the parking garage), then please consider simple surface type LID that provide opportunities for evapotranspiration (designed to not cause nuisances like mosquito breeding grounds) or re-use systems that make sense for the site (i.e. water re-use for landscape irrigation). If 10 mm cannot be achieved on the entire site (excluding the small uncontrolled areas) then justify why not.

4. During pre-consultation with the City and Conservation Authority for this project, it was noted that quality control for the site was not required. The above noted guidelines require 80% TSS removal. There is limited area on site for vehicle use (lane and turning circle). Please verify quality control requirements.

**RESPONSE**: Please provide enhanced quality control (to treat runoff from surfaces with vehicular traffic). The sizing of the unit may be based on the area draining to the unit. If Rooftop runoff is not directed to the OGS then the Rooftop area can be excluded from the sizing of the OGS unit. If landscape runoff is not directed to the OGS unit then the OGS unit does not need to be sized including landscape area.

Thank you, we look forward to your reply.

Regards,

WATTS®	Adjustable Accutrol Weir Tag:	Adjustable Flow Control for Roof Drains
--------	----------------------------------	--

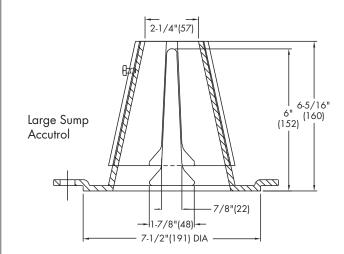

#### ADJUSTABLE ACCUTROL (for Large Sump Roof Drains only)

For more flexibility in controlling flow with heads deeper than 2", Watts Drainage offers the Adjustable Accutrol. The Adjustable Accutrol Weir is designed with a single parabolic opening that can be covered to restrict flow above 2" of head to less than 5 gpm per inch, up to 6" of head. To adjust the flow rate for depths over 2" of head, set the slot in the adjustable upper cone according to the flow rate required. Refer to Table 1 below. Note: Flow rates are directly proportional to the amount of weir opening that is exposed.

#### EXAMPLE:

For example, if the adjustable upper cone is set to cover 1/2 of the weir opening, flow rates above 2"of head will be restricted to 2-1/2 gpm per inch of head.

Therefore, at 3" of head, the flow rate through the Accutrol Weir that has 1/2 the slot exposed will be: [5 gpm (per inch of head) x 2 inches of head] + 2-1/2 gpm (for the third inch of head) = 12-1/2 gpm.

Mair Opening	1"	2"	3"	4"	5"	6"

Appendix G – Checklist

GEN	ERAL CONTENT	RESPONSE
	Executive Summary (for larger reports only).	Not included
$\boxtimes$	Date and revision number of the report.	Date of report provided
$\boxtimes$	Location map and plan showing municipal address, boundary, and layout of proposed development.	Page 1 and Appendix G
	Development statistics, land use, density, adherence to zoning and official plan, and reference to applicable subwatershed and watershed plans that provide context to which individual developments must adhere.	Section 2 of report
$\boxtimes$	Summary of Pre-consultation Meetings with City and other approval agencies.	In Appendix E
	Reference and confirm conformance to higher level studies and reports (Master Servicing Studies, Environmental Assessments, Community Design Plans), or in the case where it is not in conformance, the proponent must provide justification and develop a defendable design criteria.	No Master Servicing Studies.
$\boxtimes$	Statement of objectives and servicing criteria.	Section 1 of report
$\boxtimes$	Identification of existing and proposed infrastructure available in the immediate area.	Section 2 & 3 of report
	Identification of Environmentally Significant Areas, watercourses and Municipal Drains potentially impacted by the proposed development (Reference can be made to the Natural Heritage Studies, if available).	Not applicable
	Concept level master grading plan to confirm existing and proposed grades in the development. This is required to confirm the feasibility of proposed stormwater management and drainage, soil removal and fill constraints, and potential impacts to neighbouring properties. This is also required to confirm that the proposed grading will not impede existing major system flow paths.	Not applicable
	Identification of potential impacts of proposed piped services on private services (such as wells and septic fields on adjacent lands) and mitigation required to address potential impacts.	Not applicable
	Proposed phasing of the development, if applicable.	Not applicable
	Reference to geotechnical studies and recommendations concerning servicing.	Not applicable
	All preliminary and formal site plan submissions should have the following information: Metric scale North arrow (including construction North) Key plan	Functional Report, Civil and Architectural Plans provided all this information.
	name and contact information of applicant and property owner	
	Property limits including bearings and dimensions Existing and proposed structures and parking areas	
	Easements, road widening and rights-of-way	
	Adjacent street names	
DEVE	LOPMENT SERVICING REPORT: WATER	RESPONSE
	Confirm consistency with Master Servicing Study, if available Availability of public infrastructure to service proposed development Identification of system constraints	Not applicable
$\boxtimes$	Identify boundary conditions	Section 4.6
$\boxtimes$	Confirmation of adequate domestic supply and pressure	Section 4.3
	Confirmation of adequate fire flow protection and confirmation that fire flow is calculated as per the Fire Underwriter's Survey. Output should show available fire flow at locations throughout the development.	Section 4.7
$\boxtimes$	Provide a check of high pressures. If pressure is found to be high, an assessment is required to confirm the application of pressure reducing valves.	Section 4.6 & Table B-5 Appendix B
	Definition of phasing constraints. Hydraulic modeling is required to confirm servicing for all defined phases of the project including the ultimate design	Not applicable
$\boxtimes$	Address reliability requirements such as appropriate location of shut-off valves Check on the necessity of a pressure zone boundary modification.	Section 4.3
	Reference to water supply analysis to show that major infrastructure is capable of delivering sufficient water for the proposed land use. This includes data that shows that the expected demands under average day, peak hour and fire flow conditions provide water within the required pressure range	Section 4.5 & Table B-1 Appendix B
	Description of the proposed water distribution network, including locations of proposed connections to the existing system, provisions for necessary looping, and appurtenances (valves, pressure reducing valves, valve chambers, and fire hydrants) including special metering provisions.	Section 4.2

	Description of off-site required feeder mains, booster pumping stations, and other water infrastructure that will be ultimately required to service proposed development, including financing, interim facilities, and timing of implementation.	Not applicable
$\boxtimes$	Confirmation that water demands are calculated based on the City of Ottawa Design Guidelines.	Table B-1 Appendix B
	Provision of a model schematic showing the boundary conditions locations, streets, parcels, and building locations for reference.	Not applicable
DEVE	LOPMENT SERVICING REPORT: WASTEWATER	RESPONSE
$\boxtimes$	Summary of proposed design criteria (Note: Wet-weather flow criteria should not deviate from the City of Ottawa Sewer Design Guidelines. Monitored flow data from relatively new infrastructure cannot be used to justify capacity requirements for proposed infrastructure).	Section 5.1
	Confirm consistency with Master Servicing Study and/or justifications for deviations.	Not applicable
	Consideration of local conditions that may contribute to extraneous flows that are higher than the recommended flows in the guidelines. This includes groundwater and soil conditions, and age and condition of sewers.	Section 5.2
$\square$	Description of existing sanitary sewer available for discharge of wastewater from proposed development.	Section 5.2
	Verify available capacity in downstream sanitary sewer and/or identification of upgrades necessary to service the proposed development. (Reference can be made to previously completed Master Servicing Study if applicable)	Not applicable
$\boxtimes$	Calculations related to dry-weather and wet-weather flow rates from the development in standard MOE sanitary sewer design table (Appendix 'C') format.	Table C-6 in Appendix C
$\boxtimes$	Description of proposed sewer network including sewers, pumping stations, and forcemains.	Section 5.2
	Discussion of previously identified environmental constraints and impact on servicing (environmental constraints are related to limitations imposed on the development in order to preserve the physical condition of watercourses, vegetation, soil cover, as well as protecting against water quantity and quality).	Not applicable
	Pumping stations: impacts of proposed development on existing pumping stations or requirements for new pumping station to service development.	Not applicable
_		
	Forcemain capacity in terms of operational redundancy, surge pressure and maximum flow velocity.	Not applicable

#### THIRD-PARTY TESTING AND VERIFICATION

► Stormceptor® EF and Stormceptor® EFO are the latest evolutions in the Stormceptor® oil-grit separator (OGS) technology series, and are designed to remove a wide variety of pollutants from stormwater and snowmelt runoff. These technologies have been third-party tested in accordance with the Canadian ETV Procedure for Laboratory Testing of Oil-Grit Separators and performance has been third-party verified in accordance with the ISO 14034 Environmental Technology Verification (ETV) protocol.

#### PERFORMANCE

► Stormceptor® EF and EFO remove stormwater pollutants through gravity separation and floatation, and feature a patentpending design that generates positive removal of total suspended solids (TSS) throughout each storm event, including highintensity storms. Captured pollutants include sediment, free oils, and sediment-bound pollutants such as nutrients, heavy metals, and petroleum hydrocarbons. Stormceptor is sized to remove a high level of TSS from the frequent rainfall events that contribute the vast majority of annual runoff volume and pollutant load. The technology incorporates an internal bypass to convey excessive stormwater flows from high-intensity storms through the device without resuspension and washout (scour) of previously captured pollutants. Proper routine maintenance ensures high pollutant removal performance and protection of downstream waterwavs.

#### PARTICLE SIZE DISTRIBUTION (PSD)

► The **Canadian ETV PSD** shown in the table below was used, or in part, for this sizing. This is the identical PSD that is referenced in the Canadian ETV **Procedure for Laboratory Testing of Oil-Grit Separators** for both sediment removal testing and scour testing. The Canadian ETV PSD contains a wide range of particle sizes in the sand and silt fractions, and is considered reasonably representative of the particle size fractions found in typical urban stormwater runoff.

Particle	Percent Less	Particle Size	Percent

### SCOUR PREVENTION AND ONLINE CONFIGURATION

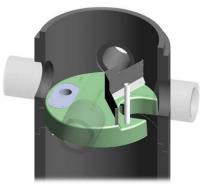

► Stormceptor® EF and EFO feature an internal bypass and superior scour prevention technology that have been demonstrated in third-party testing according to the scour testing provisions of the Canadian ETV Procedure for Laboratory Testing of Oil-Grit Separators, and the exceptional scour test performance has been third-party verified in accordance with the ISO 14034 ETV protocol. As a result, Stormceptor EF and EFO are approved for online installation, eliminating the need for costly additional bypass structures, piping, and installation expense.

#### **DESIGN FLEXIBILITY**

► Stormceptor<sup>®</sup> EF and EFO offers design flexibility in one simplified platform, accepting stormwater flow from a single inlet pipe or multiple inlet pipes, and/or surface runoff through an inlet grate. The device can also serve as a junction structure, accommodate a 90-degree inlet-to-outlet bend angle, and can be modified to ensure performance in submerged conditions.

#### **OIL CAPTURE AND RETENTION**

► While Stormceptor® EF will capture and retain oil from dry weather spills and low intensity runoff, **Stormceptor® EFO** has demonstrated superior oil capture and greater than 99% oil retention in third-party testing according to the light liquid reentrainment testing provisions of the Canadian ETV **Procedure for Laboratory Testing of Oil-Grit Separators**. Stormceptor EFO is recommended for sites where oil capture and retention is a requirement.

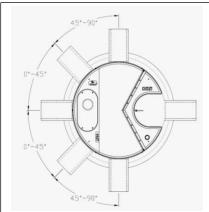

#### **INLET-TO-OUTLET DROP**

Elevation differential between inlet and outlet pipe inverts is dictated by the angle at which the inlet pipe(s) enters the unit.

 $0^{\circ}$  - 45° : The inlet pipe is 1-inch (25mm) higher than the outlet pipe.

45° - 90° : The inlet pipe is 2-inches (50mm) higher than the outlet pipe.

#### HEAD LOSS

The head loss through Stormceptor EF is similar to that of a 60-degree bend structure. The applicable K value for calculating minor losses through the unit is 1.1. For submerged conditions the applicable K value is 3.0.

-					Pollutant Capacity

#### STANDARD STORMCEPTOR EF/EFO DRAWINGS

For standard details, please visit http://www.imbriumsystems.com/stormwater-treatment-solutions/stormceptor-ef STANDARD STORMCEPTOR EF/EFO SPECIFICATION

For specifications, please visit http://www.imbriumsystems.com/stormwater-treatment-solutions/stormceptor-ef

#### STANDARD PERFORMANCE SPECIFICATION FOR "OIL GRIT SEPARATOR" (OGS) STORMWATER QUALITY TREATMENT DEVICE

#### PART 1 – GENERAL

#### 1.1 WORK INCLUDED

This section specifies requirements for selecting, sizing, and designing an underground Oil Grit Separator (OGS) device for stormwater quality treatment, with third-party testing results and a Statement of Verification in accordance with ISO 14034 Environmental Management – Environmental Technology Verification (ETV).

#### 1.2 REFERENCE STANDARDS & PROCEDURES

ISO 14034:2016 Environmental management – Environmental technology verification (ETV)

Canadian Environmental Technology Verification (ETV) Program's **Procedure for Laboratory Testing of Oil-Grit Separators** 

#### 1.3 SUBMITTALS

1.3.1 All submittals, including sizing reports & shop drawings, shall be submitted upon request with each order to the contractor then forwarded to the Engineer of Record for review and acceptance. Shop drawings shall detail all OGS components, elevations, and sequence of construction.

1.3.2 Alternative devices shall have features identical to or greater than the specified device, including: treatment chamber diameter, treatment chamber wet volume, sediment storage volume, and oil storage volume.

1.3.3 Unless directed otherwise by the Engineer of Record, OGS stormwater quality treatment product substitutions or alternatives submitted within ten days prior to project bid shall not be accepted. All alternatives or substitutions submitted shall be signed and sealed by a local registered Professional Engineer, based on the exact same criteria detailed in Section 3, in entirety, subject to review and approval by the Engineer of Record.

#### PART 2 – PRODUCTS

#### 2.1 OGS POLLUTANT STORAGE

The OGS device shall include a sump for sediment storage, and a protected volume for the capture and storage of petroleum hydrocarbons and buoyant gross pollutants. The minimum sediment & petroleum hydrocarbon storage capacity shall be as follows:

2.1.1 4 ft (1219 mm) Diameter OGS Units:
6 ft (1829 mm) Diameter OGS Units:
8 ft (2438 mm) Diameter OGS Units:
10 ft (3048 mm) Diameter OGS Units:
12 ft (3657 mm) Diameter OGS Units:

 $\begin{array}{l} 1.19 \ m^3 \ sediment \ / \ 265 \ L \ oil \\ 3.48 \ m^3 \ sediment \ / \ 609 \ L \ oil \\ 8.78 \ m^3 \ sediment \ / \ 1,071 \ L \ oil \\ 17.78 \ m^3 \ sediment \ / \ 1,673 \ L \ oil \\ 31.23 \ m^3 \ sediment \ / \ 2,476 \ L \ oil \\ \end{array}$ 

#### PART 3 – PERFORMANCE & DESIGN

3.1 GENERAL

The OGS stormwater quality treatment device shall be verified in accordance with ISO 14034:2016 Environmental management – Environmental technology verification (ETV). The OGS stormwater quality treatment device shall

remove oil, sediment and gross pollutants from stormwater runoff during frequent wet weather events, and retain these pollutants during less frequent high flow wet weather events below the insert within the OGS for later removal during maintenance. The Manufacturer shall have at least ten (10) years of local experience, history and success in engineering design, manufacturing and production and supply of OGS stormwater quality treatment device systems, acceptable to the Engineer of Record.

#### 3.2 SIZING METHODOLOGY

The OGS device shall be engineered, designed and sized to provide stormwater quality treatment based on treating a minimum of 90 percent of the average annual runoff volume and a minimum removal of an annual average 60% of the sediment (TSS) load based on the Particle Size Distribution (PSD) specified in the sizing report for the specified device. Sizing shall be determined using historical rainfall data and a sediment removal performance curve derived from the actual third-party verified laboratory testing data. The OGS device shall also have sufficient annual sediment storage capacity as specified and calculated in Section 2.1.

#### 3.3 CANADIAN ETV or ISO 14034 ETV VERIFICATION OF SCOUR TESTING

The OGS device shall have Canadian ETV or ISO 14034 ETV Verification of third-party scour testing conducted in accordance with the Canadian ETV Program's **Procedure for Laboratory Testing of Oil-Grit Separators.** 

3.3.1 To be acceptable for on-line installation, the OGS device must demonstrate an average scour test effluent concentration less than 10 mg/L at each surface loading rate tested, up to and including 2600 L/min/m<sup>2</sup>.

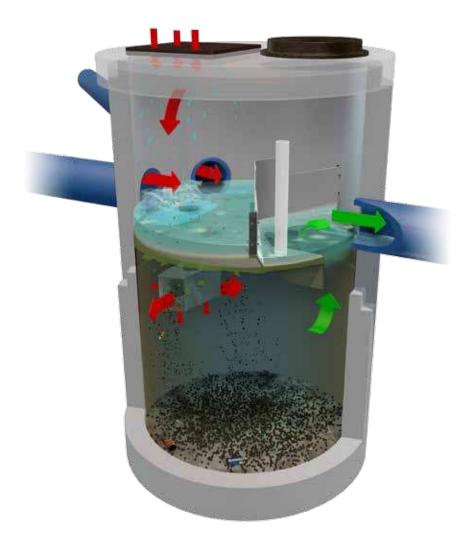

#### 3.4 LIGHT LIQUID RE-ENTRAINMENT SIMULATION TESTING

The OGS device shall have Canadian ETV or ISO 14034 ETV Verification of completed third-party Light Liquid Re-entrainment Simulation Testing in accordance with the Canadian ETV **Program's Procedure for Laboratory Testing of Oil-Grit Separators**, with results reported within the Canadian ETV or ISO 14034 ETV verification. This reentrainment testing is conducted with the device pre-loaded with low density polyethylene (LDPE) plastic beads as a surrogate for light liquids such as oil and fuel. Testing is conducted on the same OGS unit tested for sediment removal to assess whether light liquids captured after a spill are effectively retained at high flow rates.

3.4.1 For an OGS device to be an acceptable stormwater treatment device on a site where vehicular traffic occurs and the potential for an oil or fuel spill exists, the OGS device must have reported verified performance results of greater than 99% cumulative retention of LDPE plastic beads for the five specified surface loading rates (ranging 200 L/min/m2 to 2600 L/min/m2) in accordance with the Light Liquid Re-entrainment Simulation Testing within the Canadian ETV Program's **Procedure for Laboratory Testing of Oil-Grit Separators.** However, an OGS device shall not be allowed if the Light Liquid Re-entrainment Simulation Testing was performed with screening components within the OGS device that are effective at retaining the LDPE plastic beads, but would not be expected to retain light liquids such as oil and fuel.

# *Stormceptor®EF* Technical Manual

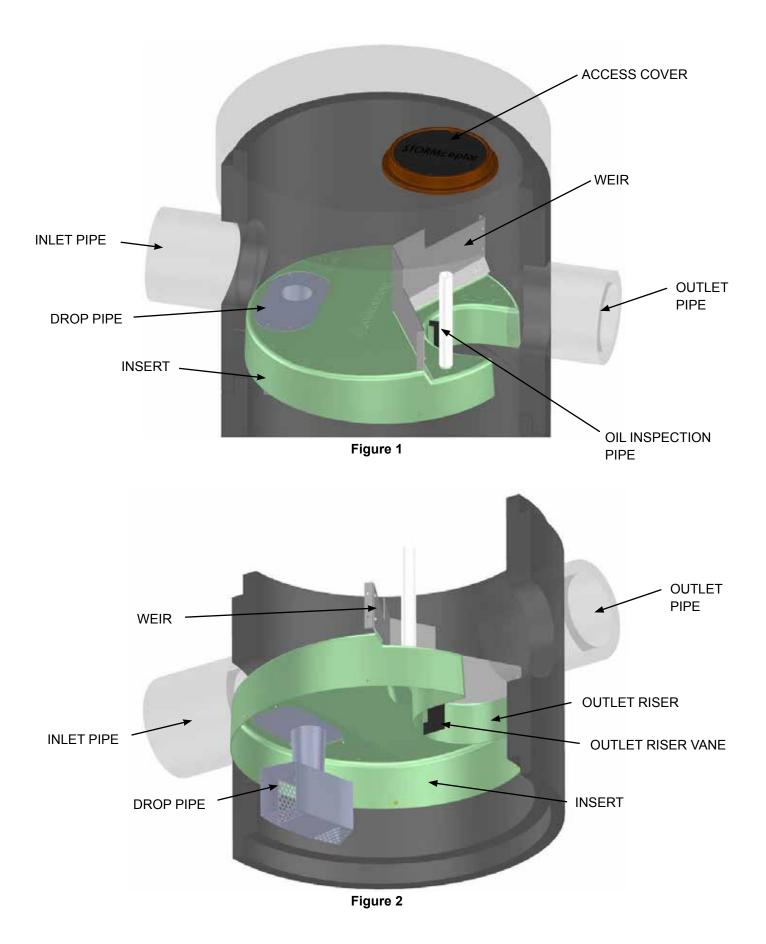

#### **OVERVIEW**

**Stormceptor**<sup>®</sup> **EF** is a continuation and evolution of the most globally recognized oil-grit separator (OGS) stormwater treatment technology - *Stormceptor*<sup>®</sup>. Also known as a hydrodynamic separator, the enhanced flow Stormceptor EF is a high performing oil-grit separator that effectively removes a wide variety of pollutants from stormwater and snowmelt runoff at higher flow rates as compared to the original Stormceptor. Stormceptor EF captures and retains sediment (TSS), free oils, gross pollutants and other pollutants that attach to particles, such as nutrients and metals. Stormceptor EF's patent-pending treatment and scour prevention technology and internal bypass ensures sediment is retained during all rainfall events..

Stormceptor EF offers design flexibility in one simplified platform, accepting stormwater flow from a single inlet pipe, multiple inlet pipes, and/or from the surface through an inlet grate. Stormceptor EF can also serve as a junction structure, accommodate a 90-degree inlet to outlet bend angle, and be modified to ensure performance in submerged conditions. With its scour prevention technology and internal bypass, Stormceptor EF can be installed online, eliminating the need for costly additional bypass structures.

#### OPERATION

- Stormwater enters the Stormceptor upper chamber through the inlet pipe(s) or a surface inlet grate. A specially
  designed insert reduces the influent velocity by creating a pond upstream of the insert's weir. Sediment particles
  immediately begin to settle. Swirling flow sweeps water, sediment, and floatables across the sloped surface of
  the insert to the inlet opening of the drop pipe, where a strong vortex draws water, sediment, oil, and debris down
  the drop pipe cone.
- Influent exits the cone into the drop pipe duct. The duct has two large rectangular outlet openings as well as perforations in the backside and floor of the duct. Influent is diffused through these various opening in multiple directions and at low velocity into the lower chamber.
- Free oils and other floatables rise up and are trapped beneath the insert, while sediment settles to the sump. Pollutants are retained for later removal during maintenance cleaning.
- Treated effluent enters the outlet riser, moves upward, and discharges to the top side of the insert downstream of the weir, where it flows out the outlet pipe.
- During intense storm events with very high influent flow rates, the pond height on the upstream side of the weir may exceed the height of the weir, and the excess flow passes over the top of the weir to the downstream side of the insert, and exits through the outlet pipe. This internal bypass feature allows for online installation, avoiding the cost of additional bypass structures. During bypass, the pond separates sediment from all incoming flows, while full treatment in the lower chamber continues at the maximum flow rate.
- Stormceptor EF's patent-pending enhanced flow and scour prevention technology ensures pollutants are captured and retained, allowing excess flows to bypass during infrequent, high intensity storms.
- Refer to components identified in Figures 1 and 2 to understand the Stormceptor EF operation.

#### FEATURES AND BENEFITS

FEATURE	BENEFITS
Patent-pending enhanced flow, TSS treatment technology	Superior, verified third-party performance
Scour prevention with an internal bypass	Validated online installation and cost savings
Third-party verified light liquid capture (oil) and retention (Stormceptor EFO)	Proven performance for fuel/oil hotspot locations
Functions as bend, junction or inlet structure	Cost savings & design flexibility
Minimal drop between inlet and outlet	Site installation ease
Large diameter outlet riser for inspection and maintenance	Easy maintenance access from grade

#### **APPLICATIONS**

Stormceptor EF is designed as an 'at source' solution for commercial and industrial sites, urban environments, and residential developments. Stormceptor EF is ideal for:

- Pretreatment of wet ponds, filters, infiltration systems, bioretention, and other Low Impact Development (LID) applications
- Commercial sites
- Manufacturing/Industrial sites
- Residential developments
- Fueling stations, convenience stores, fast food restaurants
- Roads and highways
- Airports, seaports, and military bases
- Hydrocarbon spill, high pollutant load hotspots (Stormceptor EFO)

1. Sediment Capacity is measured from the floor to the bottom of the drop pipe cone. Sediment Capacity can be increased to accommodate specific site designs and pollutant loads. Contact your local representative for assistance.

2. Hydrocarbon Storage Capacity is measured from the bottom of the outlet riser to the underside of the insert. Hydrocarbon Storage Capacity can be increased to accommodate specific site designs and pollutant loads. Contact your local representative for assistance.

EF Maximum Flow Rate into Lower Chamber is based on a maximum surface loading rate (SLR) into the lower chamber of 1135 L/min/m<sup>2</sup> (27.9 gpm/ft<sup>2</sup>). EFO Maximum Flow Rate into Lower Chamber is based on a maximum surface loading rate (SLR) into the lower chamber of 535 L/min/m<sup>2</sup> (13.1 gpm/ft<sup>2</sup>).

4. Peak Conveyance Flow Rate is limited by a maximum velocity of 1.5 m/s (5 fps).

#### **UNIT DESIGN**

#### **Sizing Methodology**

Stormceptor<sup>®</sup> EF and Stormceptor<sup>®</sup> EFO are sized using local historical rainfall data for the site of interest, specific site parameters, and a performance curve for TSS removal derived from third-party testing conducted in accordance with the Canadian Environmental Technology Verification (ETV) Program's *Procedure for Laboratory Testing of Oil-Grit Separators*. Every Stormceptor unit is designed to achieve the specified target TSS removal, however, for sites where oil/fuel capture and retention is an additional specified water quality objective Stormceptor EFO is the proper selection. The sizing methodology includes various considerations, including:

- Site parameters
- Local historical rainfall data
- Capture of the Canadian ETV particle size distribution
- · Requirements for oil/fuel capture and retention
- · Performance results from third-party testing and verification

State, provincial, and local regulatory agencies and municipalities may have specific sizing and design criteria for stormwater treatment systems such as OGS devices. To ensure proper sizing and design, contact your local Stormceptor representative for sizing and design assistance or visit www.imbriumsystems.com for more information.

#### **ONLINE APPLICATION**

Stormceptor EF's internal bypass and patent-pending scour prevention technology has demonstrated very effective retention of pollutants in third-party testing and verification following the Canadian ETV's *Procedure for Laboratory Testing of Oil-Grit Separators*. Sediment scour prevention demonstrated an effluent concentration of less than 10 mg/L for sediment particles ranging from 1 to 1,000 microns, even during peak influent flow rates associated with infrequent high intensity storm events. While Stormceptor EF will capture oil, only the Stormceptor EFO configuration has been third-party tested and verified to retain greater than 99% of captured oil.

Based on these verified performance attributes, the most efficient and widely accepted application of Stormceptor EF is an online configuration, which allows all upstream conveyance flows to enter and exit the unit. The online application eliminates the need for costly additional bypass structures, piping and installation expense.

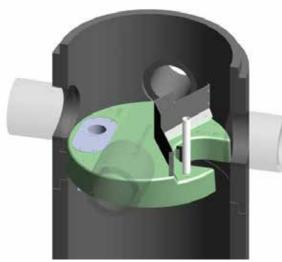

Figure 4

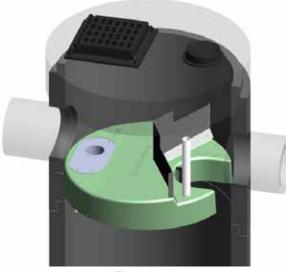

Figure 5

#### FLOW ENTRANCE OPTIONS

**Single Inlet Pipe** – A common design which includes one inlet pipe and one outlet pipe. A 90-degree (maximum) bend is also accepted with this configuration. **Example seen in Figure 3**.

MAXIMUM PIPE DIAMETER							
MODEL	INLET	OUTLET					
MODEL	(in / mm)	(in / mm)					
EF4 / EFO4	24 / 610	24 / 610					
EF6 / EFO6	36 / 915	36 / 915					
EF8 / EFO8	48 / 1220	48 / 1220					
EF10 / EFO10	72 / 1828	72 / 1828					
EF12 / EFO12	72 / 1828	72 / 1828					

*Multiple Inlet Pipes* – Allows for multiple inlet pipes of various diameters to enter the unit. **Example seen in Figure 4**.

MAXIMUM PIPE DIAMETER							
MODEL	INLET	OUTLET					
MODEL	(in / mm)	(in / mm)					
EF4 / EFO4	18 / 457	24 / 610					
EF6 / EFO6	30 / 762	36 / 915					
EF8 / EFO8	42 / 1067	48 / 1220					
EF10 / EFO10	60 / 1524	72 / 1828					
EF12 / EFO12	60 / 1524	72 / 1828					

*Inlet Grate* – Allows surface runoff to enter the unit from grade. The inlet grate option can also be used in conjunction with one inlet pipe or multiple inlet pipes. A removable flow deflector is added in the Stormceptor EF4/EFO4. **Example seen in Figure 5**.

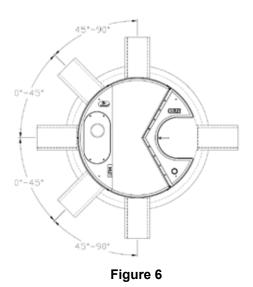

MAXIMUM PIPE DIAMETER							
MODEL	INLET	OUTLET					
MODEL	(in / mm)	(in / mm)					
EF4 / EFO4	24 / 610	24 / 610					
EF6 / EFO6	36 / 915	36 / 915					
EF8 / EFO8	48 / 1220	48 / 1220					
EF10 / EFO10	72 / 1828	72 / 1828					
EF12 / EFO12	72 / 1828	72 / 1828					

#### **INLET-TO-OUTLET DROP**

Elevation differential between the inlet and outlet pipe inverts is dictated by the angle at which the inlet pipe(s) enters the unit (**illustration seen in Figure 6**).

0° – 45°: The inlet pipe is 1-inch (25mm) higher than the outlet pipe.

45° – 90°: The inlet pipe is 2-inches (50mm) higher than the outlet pipe.

#### SUBMERGED (TAILWATER) DESIGN

Submerged or tailwater conditions are defined as standing water above the insert elevation during zero-runoff conditions. A weir height modification allows Stormceptor EF to operate under submerged conditions. The following information is necessary to properly design Stormceptor EF for the submerged condition:

- Stormceptor top of grade elevation
- Stormceptor outlet pipe invert elevation
- Standing water elevation

NOTE: The maximum weir height for Stormceptor EF is 48 inches (1200 mm). Contact your local Stormceptor representative for design assistance.

#### LIVE LOAD

Stormceptor EF is typically designed for local highway truck loading. In instances where other live loads are required, Stormceptor EF can be customized to meet the necessary structural requirements. Contact your local Stormceptor representative for design assistance.

#### SHALLOW COVER

Stormceptor EF is typically designed with a minimum depth of burial to the outlet invert based on the diameter of the inlet and outlet pipes. A common minimum burial depth to the outlet invert is 48 inches (1.2 meters). In instances where there may be site constraints to the depth of burial contact your local Stormceptor representative for design assistance.

#### **HEAD LOSS**

The head loss through Stormceptor EF is similar to that of a 60-degree bend structure. The applicable K value for calculating minor losses through the unit is 1.1. For submerged conditions the applicable K value is 3.0.

#### **ABOVE-GROUND INSTALLATIONS**

Stormceptor EF can be designed as a free-standing above-ground unit, constructed of fiberglass as illustrated in **Figure 7**. These customized units are lightweight and can be installed within a building footprint, providing structural support and installation advantages. Contact your local Stormceptor representative for design assistance.

#### PERFORMANCE VERIFICATION TESTING

Stormceptor EF has been third-party performance tested according to the Canadian Environmental Technical Verification (ETV) Procedure for *Laboratory Testing of Oil-Grit Separators*, and has received ISO 14034 Environmental Management – Environmental Technology Verification (ETV).

For more information, please visit www.imbriumsystems.com or contact your local Stormceptor representative.

## Figure 7

#### INSTALLATION

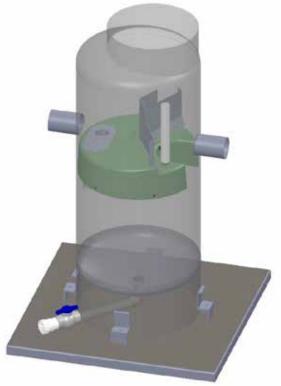

For installation details, please visit www.imbriumsystems.com and refer to the Stormceptor EF Installation Guideline or contact your local Stormceptor representative.

#### **INSPECTION AND MAINTENANCE**

As with any stormwater treatment device, periodic inspection and maintenance of Stormceptor EF is required for long-term performance.

Inspection and maintenance is performed from grade without entering the unit. Sediment depth inspections are performed through the outlet riser, and oil presence can be determined through the oil inspection pipe. Oil presence and sediment depth are determined by inserting a Sludge Judge<sup>®</sup> or measuring stick to quantify the pollutant depths. Visual inspections of the insert can be performed to ensure there is no damage or blockages. A beneficial feature of Stormceptor EF in comparison to many other treatment practices is that once it is maintained, Stormceptor EF is functionally restored to its original condition.

When maintenance is required, a standard vacuum truck is used to remove the pollutants (sediment and floatables) from the lower chamber of the unit through the outlet riser. When an appreciable amount of oil or other hydrocarbons is present, these floatable pollutants can be removed by hydrovac from the water surface. Should an oil/fuel spill occur, or presence of oil/fuel be identified within the unit, it should be cleaned immediately by a licensed liquid waste hauler.

RECOMMENDED SEDIMENT DEPTHS FOR MAINTENANCE SERVICE*				
MODEL	Sediment Depth			
MODEL	(in/mm)			
EF4 / EFO4	8 / 203			
EF6 / EFO6	12 /305			
EF8 / EFO8	24 / 610			
EF10 / EFO10	24 / 610			
EF12 / EF012	24 / 610			

\* Based on a minimum distance of 40 inches (1,016 mm) from bottom of outlet riser to top of sediment bed.

The frequency of inspection and maintenance may need to be adjusted based on site conditions to ensure the unit is operating and performing as intended. Maintenance costs will vary based on the size of the unit, site conditions, local requirements, location, and transportation distance(s).

For more details on inspection and maintenance refer to the Stormceptor EF Owner's Manual at www.imbriumsystems.com.

#### HYDROCARBON CAPTURE AND RETENTION

#### Stormceptor EFO

Stormceptor is often installed on high-traffic pollutant hotspots where hydrocarbon spill potential exists.

The technology platform of Stormceptor EFO is the same as Stormceptor EF, however the maximum surface loading rate into the lower chamber is restricted to a lower value with Stormceptor EFO, thereby ensuring excellent oil retention. Third-party testing in accordance with the Light Liquid Re-entrainment testing provisions within the Canadian ETV protocol *Procedure for Laboratory Testing of Oil-Grit Separators* demonstrated greater than 99% oil retention. Stormceptor EFO is engineered to capture and retain free floating oil/chemical/fuel spills, not emulsified hydrocarbons.

#### **Oil Sheen**

When oil is present in stormwater runoff, a sheen may be noticeable at the Stormceptor outlet. An oil rainbow or sheen can be noticeable at very low oil concentrations (< 10 mg/L). Despite the appearance of a sheen, Stormceptor EFO may still be functioning as intended.

#### Disposal

Maintenance providers are to follow all federal, state/ provincial, and local requirements for disposal of hydrocarbons.

#### **Oil Level Alarm**

As an added safeguard, an oil level alarm is available as an optional feature for Stormceptor EFO. This is an electronic monitoring system designed to trigger a visual and audible alarm when a preset level of oil is captured INI in the lower chamber. The oil level alarm is installed as illustrated in **Figure 8**. Optional Oil Alarm

OIL ALARM PROBE INSTALLED ON DOWNSTREAM SIDE OF WEIR

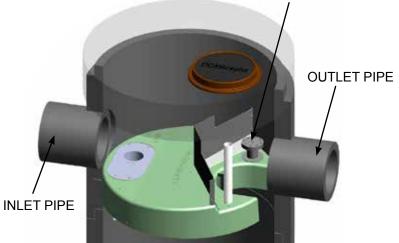

Figure 8

#### ADDITIONAL POLLUTANT STORAGE CAPACITY

Stormceptor EF/EFO can be easily modified to increase sediment storage capacity by extending the depth of the lower chamber. Stormceptor EFO can be modified to increase hydrocarbon storage capacity by extending the outlet riser, thereby providing the storage volumes depicted in the table below.

STORMCEPTOR EFO STORAGE VOLUME							
Stormceptor EFO Model	Standard Hydrocarbon Storage Capacity <sup>1</sup>	Extended Hydrocarbon Storage Capacity <sup>1,2</sup>					
	(L / gal)	(L / gal)					
EFO4	265 / 70	395 / 105					
EFO6	610 / 160	1615 / 425					
EFO8	1070 / 280	4340 / 1145					
EFO10	1670 / 440	NA					
EFO12	2475 / 655	NA					

1. Hydrocarbon Storage Capacity is measured from the bottom of the outlet riser to the underside of the insert.

 Distance from bottom of the extended outlet riser to top of the sediment maintenance depth is 914 mm (36 in). NA –Not available in these model sizes

Additional hydrocarbon storage capacity can be added with a draw off tank.

Contact your local Stormceptor representative for additional information and design assistance.

#### HEALTH AND SAFETY

For all aspects of installation and inspection/maintenance, OSHA and appropriate local regulations should be followed to ensure safe practice.
