1 INTRODUCTION

1.1 Scope

IBI Group has been retained by Purolator Inc. to prepare the necessary engineering plans, specifications and documents to support the development of the subject lands in accordance with the policies set out by the Planning and Development Branch of the City of Ottawa. The Design Brief is prepared in support of the overall Site Plan Application for the development. This Brief will present a detailed servicing scheme to support development of the property, and will include sections on water supply, wastewater management, minor and major stormwater management along with erosion and sediment control.

1.2 Subject Site

The subject site, located within Taggart Realty Management's Kanata West Business Park, is identified as Block 5 – Phase 5 on all approved subdivision plans.

The proposed development will be made up of a warehouse, office and retail facility in support of Purolator's parcel distribution operations. The building footprint is approximately 8,835m².

The location of the subject site is shown on **Figure 1**. The site is approximately 3.19 hectares in size and is bounded by Upper Canada Street to the south, development lands to the west, agricultural lands to the north and Palladium Drive to the east. The latest aerial photo showing the existing conditions are shown on **Figure 2**. Detailed design drawings for Upper Canada Street (to which the building services will connect) have been included in **Appendix E**.

1.3 Previous Studies

Design of this project has been undertaken in accordance with the following report:

- Design Brief, Kanata West Business Park, 333 Huntmar Drive, prepared by IBI Group, revised March 2019.
- Detail Design drawing set, Kanata West Business Park, 333 Huntmar Drive, prepared by IBI Group, latest revision dated March, 2019.

1.4 Geotechnical Considerations

The following geotechnical investigation report has been prepared by Paterson Group Inc:

Report No. PG4783-1 dated July 11, 2023 for the Purolator site;

Among other items, the reports comment on the following:

- Site grading
- Foundation design
- Pavement structure
- Infrastructure construction

- · Design for earthquakes
- Corrosion potential
- Environmental considerations
- · Limit of hazard lands

Generally, the original grade is relatively flat, sloping from north-west to south-east; however, the presence of fill piles from the subdivision construction works was noted. The subsurface profile encountered at the test hole locations consists of fill in some locations, followed by topsoil underlain by a loose to compact, silty sand to sandy silt layer. Glacial till, consisting of compact to dense grey silty sand with clay, gravel, cobbles and boulders was noted below the silty sand/sandy silt layer within the boreholes.

2 WATER DISTRIBUTION

2.1 Existing Conditions

Existing watermains in proximity to the site include a 250 mm diameter main on Palladium Drive installed in 2016 and a 200 mm main on Upper Canada Street, installed in 2020.

2.2 Design Criteria

2.2.1 Water Demands

A watermain demand calculation sheet is included in **Appendix A** and the total water demands are summarized as follows:

Average Day 1.30 l/sMaximum Day 1.94 l/sPeak Hour 3.50 l/s

The watermain demand calculation was forwarded to the city to determine the boundary conditions at the site, copy of the boundary conditions is included in **Appendix A** and summarized below.

Table 2.2.1 Boundary Conditions

	Existing Condition	Future Condition
Minimum HGL	156.5	156.5
Maximum HGL	161.3	161.3
Max Day + FireFlow (183.3 L/s)	136.1	140.1

2.2.2 System Pressures

The 2010 City of Ottawa Water Distribution Guidelines states that the preferred practice for design of a new distribution system is to have normal operating pressures range between 345 kPa (50 psi) and 552 kPa (80 psi) under maximum daily flow conditions. Other pressure criteria identified in the guidelines are as follows:

Minimum Pressure Minimum system pressure under peak hour demand conditions shall

not be less than 276 kPa (40 psi).

Fire Flow During the period of maximum day demand, the system pressure shall

not be less than 150 kPa (21 psi) during a fire flow event.

Maximum Pressure Maximum pressure at any point in the distribution system in

unoccupied areas shall not exceed 689 kPa (100 psi). In accordance with the Ontario Building/Plumbing Code the maximum pressure should not exceed 552 kPa (80 psi) in occupied areas. Pressure reduction controls may be required for buildings where it is not possible/feasible to maintain the system pressure below 552 kPa.

2.2.3 Fire Flow Rate

A calculation using the Fire Underwriting Survey (FUS) method was conducted to determine the fire flow requirement for the site. The building is considered non-combustible construction and is sprinklered. The mechanical engineer has confirmed the sprinkler system is fully supervised. Results of the analysis provides a maximum fire flow rate of 11,000 l/min or 183.3 l/s is required which is used in the hydraulic analysis. A copy of the FUS calculation is included in **Appendix A**.

2.3 Proposed Water Distribution Plan

The proposed water service for the Purolator site is shown on the Site Servicing Plan C-001 (**Appendix A**). A 150mm water service is shown connecting to the building from Upper Canada Street. Three existing fire hydrants fronting the property are expected to provide full fire flow coverage for the site. For the purposes of this report, assuming a minimal loss within the service connection the pressures within the site can be estimated as follows:

Minimum Pressure (Peak Hour) – The minimum peak hour pressure on the site can be estimated as HGL 156.50m – meter elevation (assumed to be 0.4m above finished floor elevation) 105.80m = 50.7m or 497.4 kPa which exceeds the minimum requirement of 276 kPa.

<u>Fire Flow</u> – The existing condition for Max Day plus fire flow is more restrictive than future condition, therefore the existing condition will be considered. The max day plus fire flow can be estimated as HGL 136.1 – ground floor 105.4 = 30.7m or 301.2 KPa which exceeds the minimum of 150kPa.

<u>Max HGL (High Pressure Check)</u> – The high-pressure check can be estimated as HGL 161.3 – lowest level (in this case, finished floor elevation) 105.40 = 55.9m or 548.4 KPa which is below the maximum of 552 kPa, therefore a pressure reducing valve is not required.

The above results indicate the municipal infrastructure can support the proposed development.

With 2 AA hydrants within 45m of the building the minimum number of hydrants needed to deliver the required fire flow to the structure is being provided in accordance with Technical Bulletin ISTB-2018-02 dated March 21, 2018. Furthermore, the fire dept. connection is located within 45m of a public hydrant located on Upper Canada Street, as such a private hydrant is not needed.

Table 2.3 - Hydrant Table

BUILDING ID	FIRE FLOW DEMAND (L/MIN)	FIRE HYDRANT(S) WITHIN 75M (5,700 L/MIN)	FIRE HYDRANT(S) WITHIN 150M (3,800 L/MIN)	COMBINED FIRE FLOW (L/MIN)
Purolator	11,000	2	2	19,200

3 WASTEWATER DISPOSAL

3.1 Existing Conditions

The site was designed to be serviced by the existing sanitary sewers within the Kanata West Business Park as identified in the KWBP Design Brief. A copy of the Kanata West Business Park sanitary drainage area plan and sewer design sheets have been included in **Appendix B**.

3.2 Proposed Site

As described above in section 1.1, the proposed development is to be a warehouse, office and retail facility. There are no other significant waste water generators for this site. Sanitary sewer flows are estimated using the specific City of Ottawa identified below.

3.3 Criteria

In accordance with the City of Ottawa's Sewer Design Guidelines, the following design criteria has been utilized in order to predict wastewater flows generated by the subject site and complete the sewer design;

•	Minimum Velocity	0.6 m/s
•	Maximum Velocity	3.0 m/s
•	Manning Roughness Coefficient	0.013
•	Total site area	3.19 Ha
•	Industrial	35,000 l/Ha/d
•	Infiltration Allowance	0.33 L/s/Ha
•	Minimum Sewer Slopes - 200 mm diameter	0.32%

3.4 Sanitary Sewer Design

Given the above criteria, total wastewater flow from the proposed development will be 1.94 l/s. The detailed sewer calculations and sanitary drainage area plan are included in **Appendix B**.

The sanitary sewer design sheet for the Kanata West Business Park confirms flows from the subject lands have been accounted for within the KWBP sanitary sewer design. The KWBP sanitary sewer design sheet can be found in **Appendix B**.

4 SITE STORMWATER MANAGEMENT

4.1 Existing Conditions

The existing undeveloped subject lands currently drain both westward via existing ditching towards the Pond 6 West SWM facility and south-east to an existing ditch inlet on the subject site that drains to the Pond 6 East SWM facility. Storm sewers adjacent to the site include an 825mm dia sewer within Upper Canada Street which drains eastward to the Pond 6 East SWM facility, this is the ultimate outlet for the subject lands. Additional storm sewers exist in Palladium Drive and Upper Canada Street however no new connections will be made to this infrastructure.

4.2 Design Criteria

As part of the Kanata West Business Park (KWBP) Design Brief stormwater management release rates were established for individual blocks. The subject site is identified as 155A on the Kanata West Business Park 14289-500 Storm Drainage Area plan, which is included in **Appendix C**. Table 4.1 from the approved KWBP design brief has also been included in **Appendix C** to confirm the release rate for the subject block.

Some of the key criteria include the following:

•	Design Storm	1:5 year return (Ottawa)
•	Rational Method Sewer Sizing	
•	Initial Time of Concentration	10 minutes
•	Runoff Coefficients	
	- Landscaped Areas	C = 0.20
	- Asphalt/Concrete	C = 0.90
	- Roof	C = 0.90
•	Pipe Velocities	0.80 m/s to 6.0 m/s
•	Minimum Pipe Size	250 mm diameter (200 mm CB Leads)

The stormwater design for the lands in question are subject to review by the City of Ottawa development review branch and the Mississippi Valley Conservation Authority (MVCA) prior to commencement of servicing works.

The design of the on-site stormwater management has been done in such a way as to not negatively impact the adjacent properties and no flows up to and including the 100 year storm shall encroach on adjacent lands.

4.2.1 Infiltration

The KWBP Design Brief maintained the infiltration targets established within previous studies completed for the Kanata West Area, namely the Kanata West Master Servicing Study. Relevant excerpts from the Kanata West MSS are provided within **Appendix C** for reference. The targets provided within the KWBP design brief indicated that a range of 70 - 100 mm/year of runoff be infiltrated from the western portion of the KWBP site, The Design Brief also maintained that post development infiltration rates are to be increased by 25% above these pre-development rates to compensate for areas (ie. Roadway corridors) that cannot provide infiltration.

The Purolator site is located within the western portion of the KWBP. The infiltration target has been established as 25% above the average of 70-100mm/year, for a target of 106mm/year. The subject site has limited pervious area available for infiltration. As with previously approved site plans in the KWBP, the subject site will be provided with an infiltration gallery fed by the stormwater flowing from the controlled rooftop. Please refer to the geotechnical report for confirmation of percolation rates used in calculations.

The design of the infiltration gallery is to be as per MECP requirements and the bottom of storage media will be minimum 1m above the high groundwater. The lowest bottom of media storage is 102.30m (102.90m header pipe elevation – 0.6m depth). Based on the geotechnical report the current groundwater in the area is approximately 102.64m; however, upon completion of the paving of the site it is expected that the ground water elevation will be lowered by at least 2m.

The proposed infiltration gallery has been sized to maximize infiltration potential for the site. The sizing was based on the roof drainage area, daily precipitation data (using wet year and dry year to establish overflow volume based on measured historical data). The maximum potential infiltration of the gallery was estimated using gallery size and precipitation norms for the area [920mm] and the overflow was then subtracted. Infiltration was assumed through the bottom surface area, with percolation rates established based on Geotechnical investigation of the site. The sizing of the gallery has been tailored for the proposed Purolator building roof area. The below table provides summary of the infiltration calculations for the site, further details of the infiltration galleries are provided within the Engineering Drawings 123987-001 and 123987-010. Also, detailed design calculations are provided within **Appendix C.** These calculations are discussed in-depth in Section 4.2.2 of this report. For percolation rates please refer to the geotechnical report.

Table 4.2.1 - Infiltration Gallery Calculations Summary on Annual Basis

GALLERY	TRIB AREA (M2)	ANNUAL RUNOFF VOLUME (M3)	AVERAGE OVERFLOW VOLUME (M3)	AVERAGE ANNUAL VOLUME INFILTRATED (M3)
Parking Lot	8600	7515.4	3265.0	4251.4

Where:

- Annual Runoff Volume is based on rooftop area and 95% of the annual precipitation from rooftops available as runoff (920mm annual precipitation)
- Overflow Volume is based on building specific infiltration gallery sizing

The required infiltration will be provided by an infiltration gallery fed by rooftop drains. The infiltration gallery will provide an estimated 4251m³ of infiltration on an annual basis, or 133.3mm/year for the 3.19ha site, above the required post-development rate of 106mm/year.

4.2.2 Infiltration Detailed Calculations

The Appendix C calculations have been broken down step-by-step below.

The volume of the infiltration gallery can be calculated as follows:

Volume = Width x Length x Depth x No. of Cells x Void Ratio

 $= 5m \times 42m \times 0.6m \times 1 \times 0.38$

=47.88m3

In order to establish a range of function for the proposed infiltration gallery, precipitation data for a wet year and a dry year was used. Daily precipitation data was provided by the Government of Canada Climate Normals Data for Station Ottawa CDA. The data that was provided includes rainfall amounts from April 1st through October 31st. This rainfall (in mm) was converted into an average rainfall intensity (mm/hr) by taking the amount of rain and dividing by 24 hours. The rainfall available to the infiltration gallery was then determined to be the average rainfall intensity multiplied by the roof area (8600m2) by the effective runoff percent (95%). To be conservative, the volume into the infiltration gallery was then capped at the volume of the gallery (47.88m3) and assumed any overage would outlet through the overflow pipe.

The amount of water that can infiltrate through the gallery from the bottom per day is as follows:

Infiltration = Surface Area of Infiltration Gallery x No. of Cells x Percolation Rate

 $= (5m \times 42m) \times 1 \times 0.504m/day$

= 105.84 m3/day

Therefore the maximum infiltration that the gallery can provide in one day is 105m3. Since this value is above our conservative capped volume, the calculations will only show up to 47.88m3/day of infiltration.

These calculations were applied to each "wet year" day's rainfall quantities on the roof and the infiltration gallery's overflow was tracked to be 6766 m3 and 3819 m3, respectively.

The function of the infiltration gallery during a wet year can then be determined as follows:

Runoff Percent = Overflow Volume / Precipitation Volume

= 3616 m3 / 6538 m3

= 55.30%

Therefore, during a wet year it can be expected that 55% of the water that enters the infiltration gallery will overflow without being infiltrated. The same calculations were done for a "dry year" and yielded a result of 31.57%. On average, it can be expected that 43.44% of the water that enters the infiltration gallery will overflow and not be infiltrated.

Since the data only ranges from April to October, we cannot take the wet year Precipitation Volume of 6538 m3 and Overflow Volume of 3616 m3 as the entire year's volumes. The overflow percentage must be applied to the Available Volume for an annual precipitation. The annual precipitation is 920mm as provided by the Government of Canada Climate Normals Data for Station Ottawa CDA. The Available Volume can be calculated as follows:

Available Volume = Area of Roof x (Annual Precipitation x Effective Runoff)

 $= 8600m2 \times (920mm \times 0.95 / 1000mm/m)$

= 7516.4 m3

It is then possible to determine the overflow volume for a full wet year or dry year, as shown below for a wet year:

Overflow Volume = Available Volume x Overflow Percent

= 7516.4 m3 x 55.30%

= 4156.6 m3

The infiltration volume is then the difference between the Available Volume and the Overflow Volume, or $7516.4m3 - 4156.6m3 = 3359.8 \, m3/year$. Repeating the same calculations for a dry year yields an infiltration volume of $5143.2 \, m3/year$. On average, the infiltration gallery is expected to infiltrate $4251.4 \, m3/year$, or 133.3mm/year for the 3.19ha site, which is above the target post-development rate of 106mm/year.

There will be some years with high intensity precipitation (similar to the "wet year" used in these calculations) where the target will not be reached as the intensity will flow through the gallery before it has a chance to infiltrate, however the target has been met for an average year as required.

4.3 Stormwater Management

Based on the approved Kanata West Business Park Design Brief, table 4.2, and the storm water modeling, the maximum allowable release rate for the subjected site is 525 l/s.

The site is approximately 3.19 ha and is proposed to comprise of a warehouse, office and retail facility along with asphalt parking lot and landscape areas. The post development average runoff coefficient was calculated as 0.85 in KWMSS.

The proposed development will have one outlet which will connect to the existing 825mm storm sewer within Upper Canada Street. The flows will be controlled with inlet control devices at locations identified on plan C-001 and the CB Data Table on C-010.

100 year flows from the loading dock trench drains have been included in the storm sewer design sheet.

The unrestricted portions of the site constitute 0.17 ha of softscape at the extremities of the site and 0.13 ha of hardscape areas (primarily the loading bay). Based on the proposed coefficient and Tc=10 min, the 100 yr flow from the uncontrolled area is 87.74 l/s. Based on an allowable release rate of 525 l/s for the site, the controlled portion is limited to 525 l/s - 87.74 l/s = 437.26 l/s (see detailed stormwater management calculations in **Appendix C**).

As noted above, stormwater runoff from the site is directed to the existing Upper Canada Street storm sewer system which ultimately outlets to the Pond 6 East Stormwater Management Facility.

4.4 Minor Storm Sewer Design Criteria

The minor storm sewers for this site will be sized based on standards of both the City of Ottawa and the provincial Ministry of the Environment. Some of the key criteria will include the following:

- Design Return Periods: Local and Collector Roads 1:2 yr (Ottawa)
- Sewer Sizing by Rational Method
- Runoff Coefficients: Roof C=0.90
 Asphalt Parking Lot C=0.90
 Landscaped Areas C=0.20
- Initial T of C 10 min
- Min Velocity: City Design Guidelines 0.80 m/s

The minor storm sewers for the subject site will be sized based on the rational method and the City of Ottawa 1:2 yr. event. Minor storm flow to the downstream storm sewer network will be controlled by Inlet Control Devices (ICDs) to limit flow and prevent sewer surcharging downstream.

The minor storm sewer system is illustrated on the General Plan C-001 and the Details and Notes Plan C-010. The storm sewer design sheet and related Storm Sewer Drainage Area plan C-500 are included in **Appendix C**.

Minor system discharges to the storm sewer in Upper Canada Street within the maximum 100 year restricted release rate of 525 L/s. The flow rate is based on the City requirement to limit 100 year post development flow off site base on approved parameters provided on the KWMSS Storm Sewer Design Sheet. To this end, no negative impact on the existing downstream system is anticipated.

4.5 Onsite Detention

The site was designed to limit runoff to the allowable release rate up to the 100 year storm event. Flows in excess of this release rate will be contained on-site via roof top storage, underground sewer storage, and surface ponding at inlet locations. Orifices in catchbasins will be employed to control runoff from parking, access and landscape areas. To determine the resulting storage volumes a 2 year and 100 year storm was applied, with time steps of 1 minute interval until a peak storage volume requirement was attained for the sub-area being controlled. The peak storage volume required was then met or exceeded at the ponding location. Ponding volumes were determined by the AutoCAD Civil 3D grading model. Please refer to the ponding plan 123843-C-600 for more information regarding pond volumes.

Ponding depths were limited to 300 mm for the 100 year event. In the event of less frequent storms overland flow routes toward Upper Canada Street and the Pond 6 East SWM facility have been provided that will prevent any negative impact on the buildings.

Major flow up to the 100 year storm is contained on-site and is gradually released to the minor system, major flow does not leave the site via overland flow.

The stormwater management for the site has ensured that there will be no surface ponding during the 2 year storm event.

A stormwater management summary sheet and the results of the on-site storage volume requirements are included in **Appendix C**.

A summary of the flowrate controls for each drainage area and corresponding storage details is provided in the table below.

Restricted Req Avail Drainage Tributary Area Area **Flow** Storage **Overflow** Storage MH 6/7/8 1.02 221.00 276.71 344.70 0.00 CICB₁₀A 0.06 16.00 8.32 25.30 0.00 CB1B 0.04 11.00 5.36 5.66 0.00 MH 4/3 64.50 183.31 0.00 0.52 183.68 DCICB3D 0.17 46.50 22.87 49.62 0.00 CICB2B 51.00 47.80 0.00 0.16 18.12 CICB1A 0.02 6.00 2.44 3.43 0.00 Total Surface 1.99 416.00 517.13 660.19 0.00

Total	2.85	436.00	940.78	1110.19	0.00

4.6 Quality Control

The site outlets to Kanata West Pond 6 East which was designed to provide both quantity and quality control for the subject lands. Therefore, no on-site quality control is required.

5 SEDIMENT AND EROSION CONTROL PLAN

During construction, existing stream and storm water conveyance systems can be exposed to significant sediment loadings. A number of construction techniques designed to reduce unnecessary construction sediment loadings may be used such as;

- The installation of straw bales within existing drainage features surrounding the site;
- Bulkhead barriers will be installed in the outlet pipes;
- Sediment capture filter socks will remain on open surface structures such as manholes and catchbasins until these structures are commissioned and put into use;
- Installation of silt fence, where applicable, around the perimeter of the proposed work area.

During construction of the services, any trench dewatering using pumps will be fitted with a "filter sock." Thus, any pumped groundwater will be filtered prior to release to the existing surface runoff. The contractor will inspect and maintain the filter sock as needed including sediment removal and disposal.

All catchbasins, and to a lesser degree manholes, convey surface water to sewers. Consequently, until the surrounding surface has been completed these structures will be covered to prevent sediment from entering the minor storm sewer system. Thus, these structures will be constructed with a sediment capture filer sock. These will stay in place and be maintained during construction and build-out until it is appropriate to remove them.

During construction of any development both imported and native soils are stockpiled. Mitigative measures and proper management to prevent these materials entering the sewer systems is needed.

During construction of the deeper watermains and sewers, imported granular bedding materials are temporarily stockpiled on site. These materials are however quickly used up and generally before any catchbasins are installed.

The Sediment and Erosion Control Plan C-900 is included in **Appendix D**.

6 CONCLUSION

The Servicing strategy can be summarized as follows:

- Adequate fire flow protection and domestic supply will be provided from the existing watermain located in Upper Canada Street.
- Sanitary design flows under the proposed condition can be accommodated by the existing sanitary sewers with no negative impact on downstream sewers anticipated.
- Stormwater can be attenuated on-site to meet the release rate criteria established by the
 previous study. Control will be achieved through the use of orifice controls in the
 catchbasins and manholes. Storage will be provided through underground, rooftop and
 parking lot surface ponding in larger events.
- Erosion and sediment control measures have been outlined for the construction of the development.

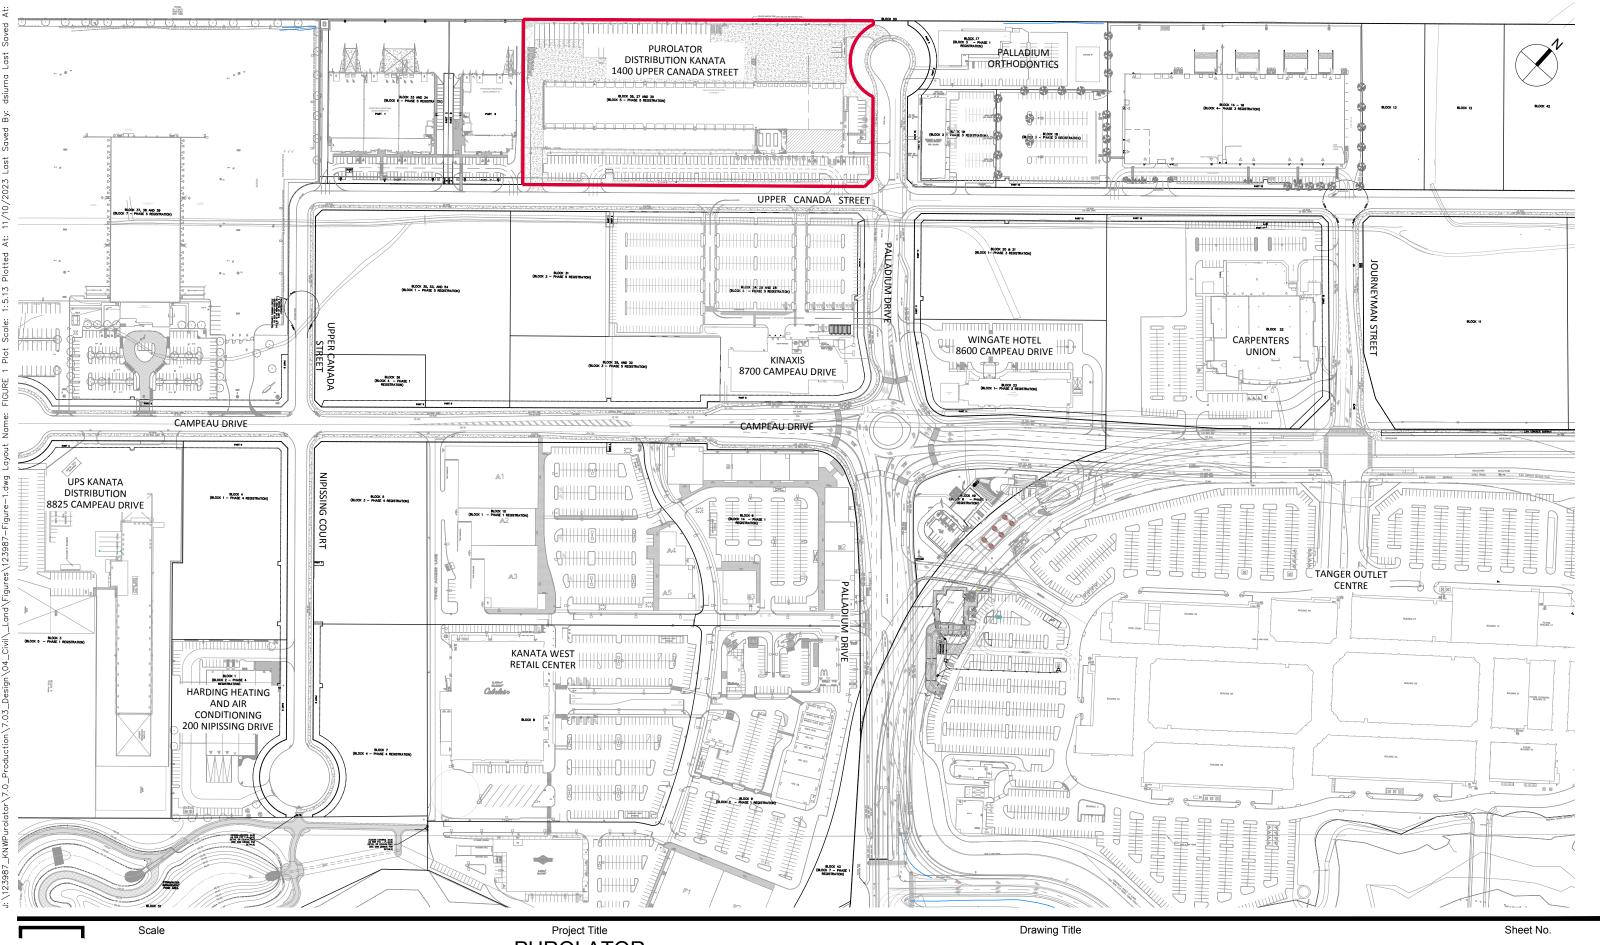

This report has illustrated that the proposed Purolator site can be serviced by the adjacent existing municipal services. All municipal infrastructure designs have been done in conformance with current City of Ottawa and MECP guidelines.

Based on the information provided within this report, the site plan prepared for the subject parcel can be serviced to meet City of Ottawa requirements.

Boundary Conditions 1440 Upper Canada Street

Provided Information

Scenario	Demand			
Scenario	L/min	L/s		
Average Daily Demand	78	1.30		
Maximum Daily Demand	116	1.94		
Peak Hour	210	3.50		
Fire Flow Demand #1 – Existing	10,998	183.30		
Fire Flow Demand #1 - Future	10.998	183.30		

Location

Future Condition: Location of future 305 mm watermain

Results

Existing Condition

Connection 1 - Upper Canada Street

Demand Scenario	Head (m)	Pressure ¹ (psi)
Maximum HGL	161.3	82.2
Peak Hour	156.5	75.4
Max Day plus Fire Flow #1	136.1	46.4

¹ Ground Elevation = 103.5

Future Condition

Connection 1 - Upper Canada Street

Demand Scenario	Head (m)	Pressure ¹ (psi)
Maximum HGL	161.3	82.2
Peak Hour	156.5	75.4
Max Day plus Fire Flow #1	140.1	52.1

¹ Ground Elevation = 103.5

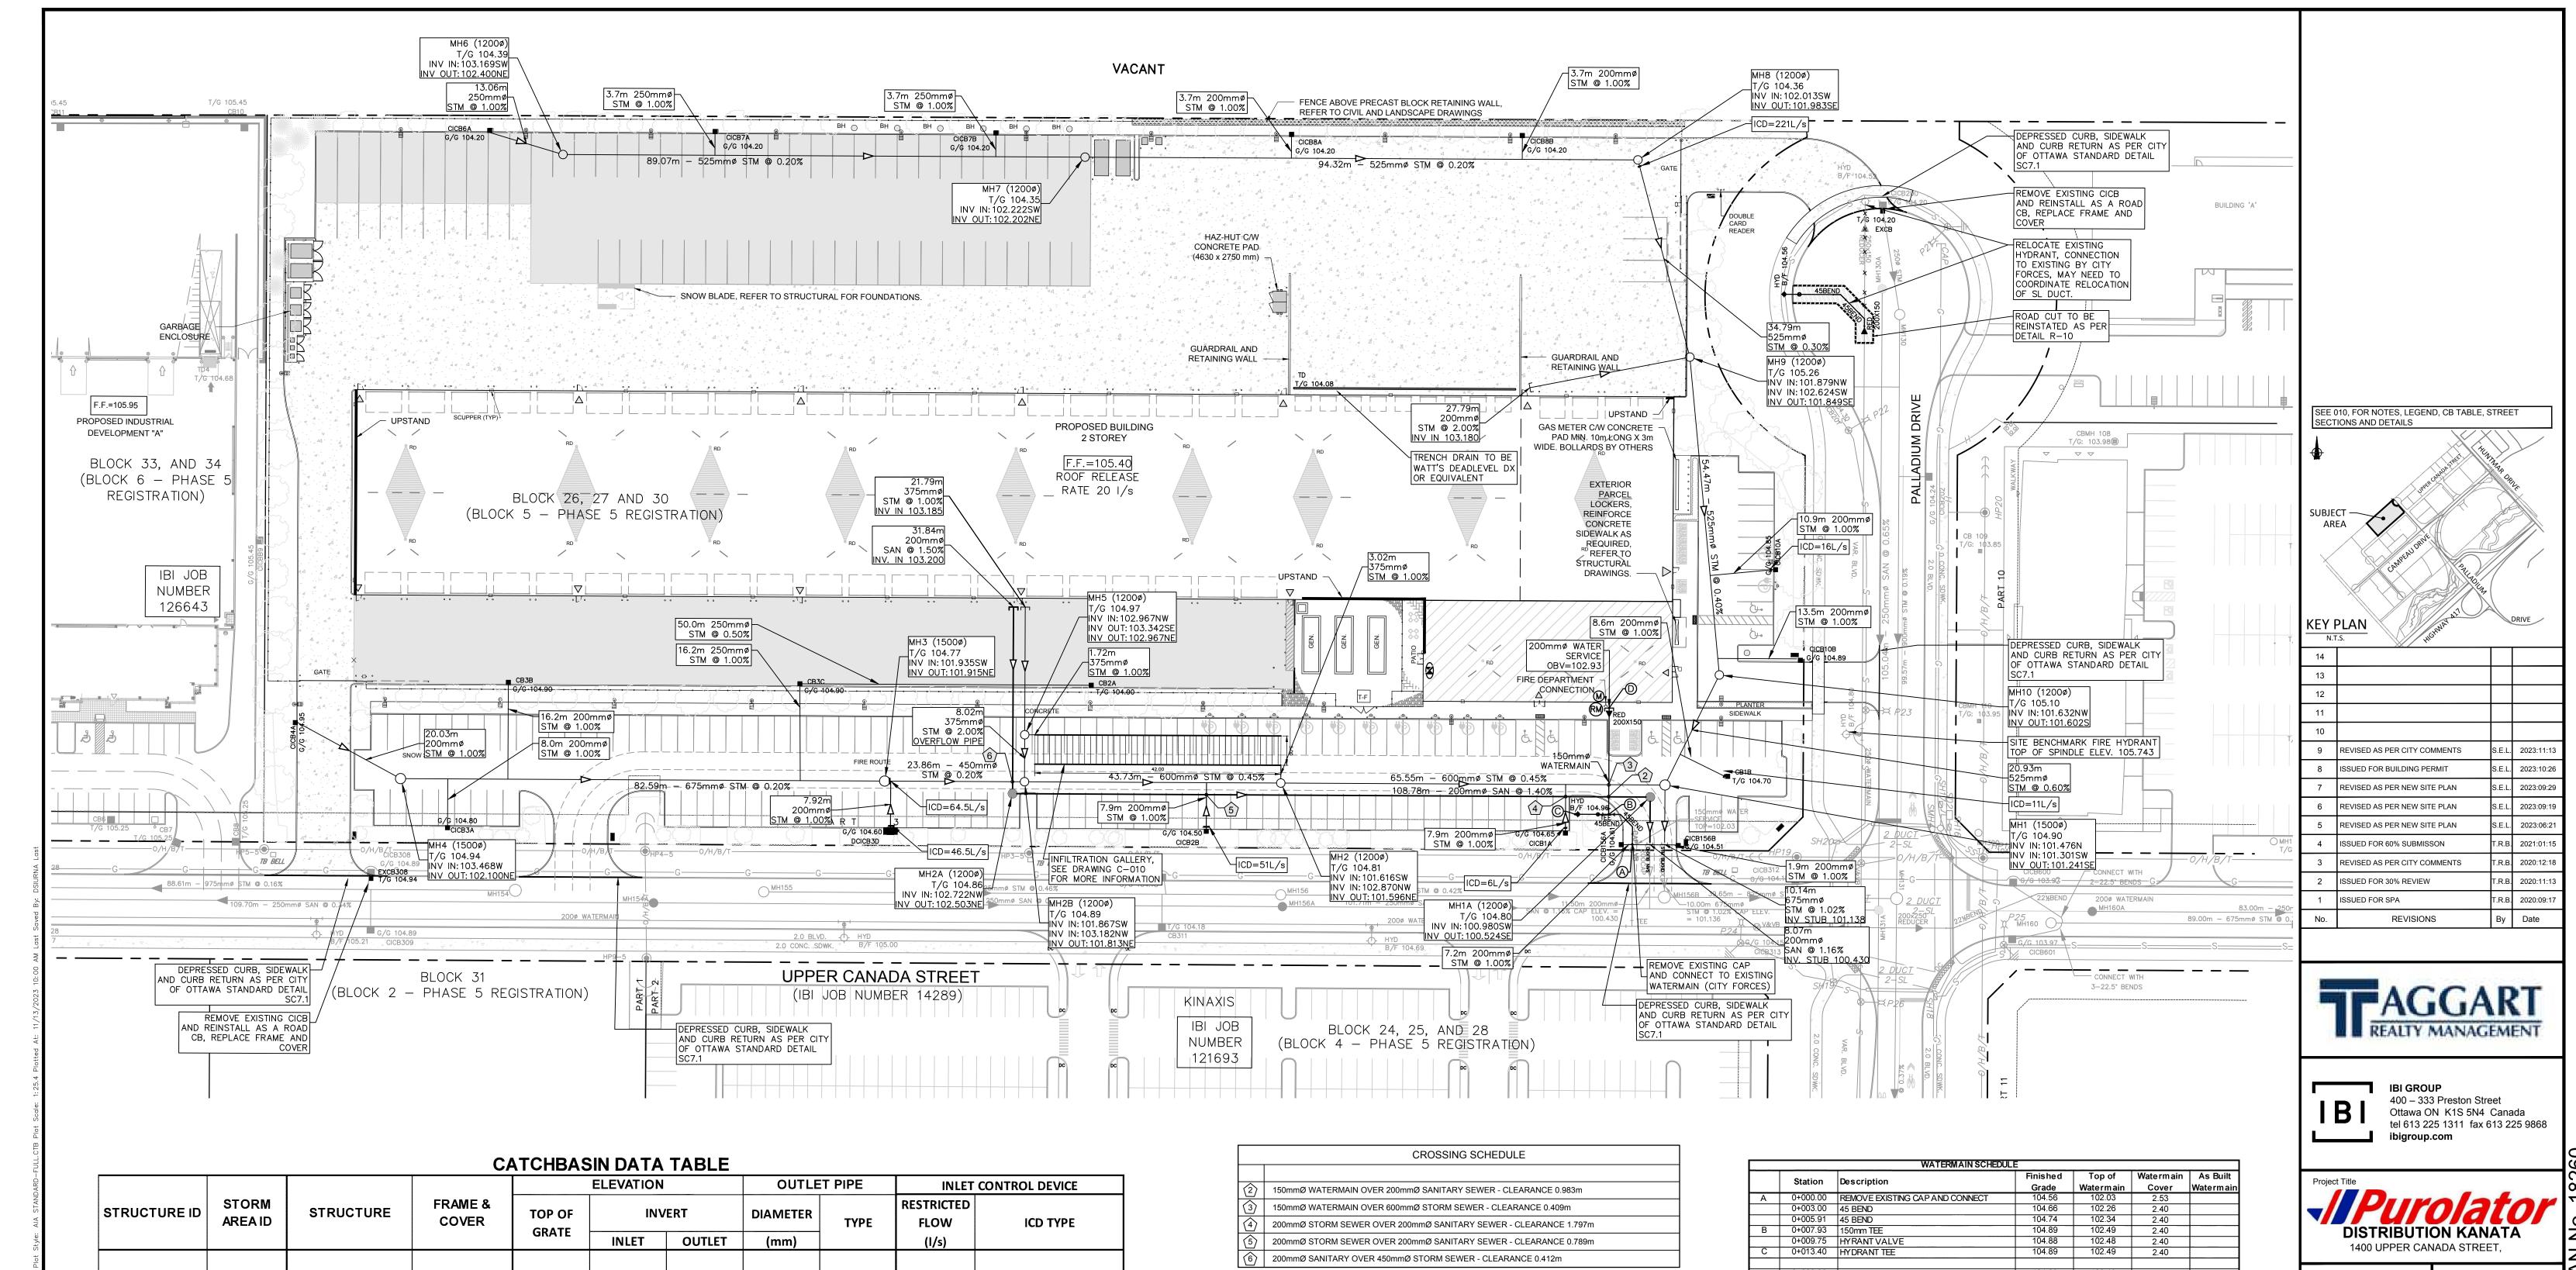

Notes

1. As per the Ontario Building Code in areas that may be occupied, the static pressure at any fixture shall not exceed 552 kPa (80 psi.) Pressure control measures to be considered are as follows, in order of preference:

- a. If possible, systems to be designed to residual pressures of 345 to 552 kPa (50 to 80 psi) in all occupied areas outside of the public right-of-way without special pressure control equipment.
- b. Pressure reducing valves to be installed immediately downstream of the isolation valve in the home/ building, located downstream of the meter so it is owner maintained.

Disclaimer

The boundary condition information is based on current operation of the city water distribution system. The computer model simulation is based on the best information available at the time. The operation of the water distribution system can change on a regular basis, resulting in a variation in boundary conditions. The physical properties of watermains deteriorate over time, as such must be assumed in the absence of actual field test data. The variation in physical watermain properties can therefore alter the results of the computer model simulation. Fire Flow analysis is a reflection of available flow in the watermain; there may be additional restrictions that occur between the watermain and the hydrant that the model cannot take into account.

DRAWING NOTES

1.1 CONTRACTOR TO VERIFY ALL DIMENSIONS PRIOR TO CONSTRUCTION.

1.2 DO NOT SCALE DRAWINGS.

1.3 CONTRACTOR TO REPORT ALL DISCOVERIES OF ERRORS, OMISSIONS OR DISCREPANCIES TO THE ARCHITECT OR DESIGN ENGINEER AS APPLICABLE.

1.4 USE ONLY THE LATEST REVISED DRAWINGS OR THOSE THAT ARE MARKED "ISSUED FOR CONSTRUCTION".

1.5 ALL CONSTRUCTION SHALL COMPLY WITH CURRENT CITY OF OTTAWA STANDARDS AND SPECIFICATIONS.

1.6 THIS DRAWING SHALL BE READ IN CONJUNCTION WITH ALL RELEVANT DRAWINGS AND SPECIFICATIONS.

1.7 FOR LEGAL SURVEY INFORMATION REFER TO REGISTERED PLAN.

1.8 REFER TO SITE PLAN BY N45 ARCHITECTURE.

1.09 CONTRACTOR TO IMPLEMENT EROSION AND SEDIMENT CONTROL MEASURES AS IDENTIFIED IN THE EROSION AND SEDIMENT CONTROL PLAN TO THE SATISFACTION OF THE CITY OF OTTAWA, PRIOR TO UNDERTAKING ANY SITE ALTERATIONS (FILLING, GRADING, REMOVAL OF VEGETATION, ETC.). DURING ALL PHASES OF THE SITE PREPARATION AND CONSTRUCTION THE MEASURES ARE TO BE MAINTAINED TO THE SATISFACTION OF THE ENGINEER AND CITY OF OTTAWA IN ACCORDANCE WITH THE BEST MANAGEMENT PRACTICES FOR EROSION AND SEDIMENT CONTROL. SHOULD ANY ADDITIONAL MEASURES BE REQUIRED TO ADDRESS FIELD CONDITIONS THEY SHALL BE INSTALLED AS DIRECTED BY THE ENGINEER OR THE CITY OF OTTAWA. SUCH ADDITIONAL MEASURES MAY INCLUDE BUT NOT BE LIMITED TO INSTALLATION OF FILTER CLOTHS ACROSS MANHOLE AND CATCHBASIN LIDS TO PREVENT SEDIMENT FROM ENTERING THE STRUCTURE AND INSTALLATION AND MAINTENANCE OF A LIGHT DUTY SILT FENCE BARRIER AS REQUIRED.

1.10 ALL IRON WORK ELEVATIONS SHOWN ARE APPROXIMATE AND ARE SUBJECT TO MINOR ADJUSTMENTS AS DETERMINED BY

1.11 ALL CONCRETE CURBS AND SIDEWALKS TO CONFORM TO O.P.S. AND CONSTRUCTED TO CITY STANDARDS. ALL ONSITE CURBS TO BE BARRIER TYPE. WITH DEPRESSIONS AS NOTED.

1.12 ALL CONCRETE SHALL BE "NORMAL PORTLAND CEMENT" IN ACCORDANCE WITH O.P.S.S. 1350 AND SHALL ACHIEVE A MINIMUM STRENGTH OF 30MPa AT 28 DAYS.

1.13 ALL CONSTRUCTION TRAFFIC TO ACCESS SITE FROM PALLADIUM DRIVE OR UPPER CANADA STREET

1.14 FOR GEOTECHNICAL REPORT SEE GEOTECHNICAL INVESTIGATION PG4783-1 REV.3 DATED JULY 11, 2023 BY PATERSON

Fable 4 - Rec Parking Area Thickness (mm)	commended Pavement Structure - Access Lanes and Heavy-Truck Material Description Wear Course - Superpave 12.5 Asphaltic Concrete

REFER LATEST GEOTECHNICAL REPORT AND STRUCTURAL DRAWINGS REGARDING RECOMMENDED RIGID PAVEMENT STRUCTURE FOR CONCRETE APRONS AND TRANSITION BETWEEN PAVEMENT STRUCTURE (ASPHALT SURFACE) AND RIGID PAVEMENT STRUCTURE (CONCRETE SURFACE)

1.15 CONTRACTOR TO PROTECT EXISTING INFRASTRUCTURE AND PROPERTY SUCH AS TREES, PARKING METERS, SIDEWALKS, CURBS, ASPHALT, AND STREET SIGNS FROM DAMAGE DURING CONSTRUCTION. CONTRACTOR TO PAY THE COST TO REINSTATE OR REPLACE ANY DAMAGED INFRASTRUCTURE OR PROPERTY TO THE SATISFACTION OF THE CITY.

1.16 THE POSITION OF POLE LINES, CONDUITS, WATERMAIN, SEWERS, AND OTHER UNDERGROUND AND ABOVEGROUND UTILITIES AND STRUCTURES ARE NOT NECESSARILY SHOWN ON THE CONTRACT DRAWINGS. AND WHERE SHOWN, THE ACCURACY OF THE POSITION OF SUCH UTILITIES AND STRUCTURES IS NOT GUARANTEED. BEFORE STARTING WORK THE CONTRACTOR SHALL INFORM ITSELF OF THE EXACT LOCATION OF ALL SUCH UTILITIES AND STRUCTURES, SHALL PROTECT ALL UTILITIES AND STRUCTURES, AND SHALL ASSUME ALL LIABILITY FOR DAMAGE TO THEM.

1.17 CONTRACTOR TO SUPPLY SUITABLE FILL MATERIAL WHERE REQUIRED TO ROUGH GRADE THE SITE. ALL IMPORTED FILL MATERIAL TO BE CERTIFIED AS ACCEPTABLE BY THE GEOTECHNICAL ENGINEER.

1.18 CONTRACTOR TO HAUL EXCESS MATERIAL OFFSITE AS NECESSARY TO GRADE SITE TO MEET THE PROPOSED GRADES. ALL EXCESS MATERIAL TO BE HAULED OFFSITE AND DISPOSED OF AT AN APPROVED DUMP SITE. SHOULD THE CONTRACTOR DISCOVER ANY HAZARDOUS MATERIAL, CONTRACTOR IS TO NOTIFY ENGINEER. ENGINEER TO DETERMINE APPROPRIATE DISPOSAL METHOD/LOCATION.

1.19 FILL MATERIAL WITHIN THE PARKING LOT AND BUILDING PAD AREAS, AND SUPPORTING BUILDING FOUNDATIONS SHALL BE COMPACTED TO 98% STANDARD MODIFIED PROCTOR DENSITY AND TO THE SATISFACTION OF THE GEOTECHNICAL ENGINEER. 1.20 ALL COMPACTION METHODS TO BE PERFORMED TO THE SATISFACTION OF THE GEOTECHNICAL ENGINEER TO INCLUDE

BUT NOT BE LIMITED TO THE THICKNESS OF LIFTS, AND COMPACTION EQUIPMENT USED. 1.21 ALL DISTURBED BOULEVARDS TO BE REINSTATED WITH SOD ON 100mm TOPSOIL.

1.22 UTILITY DUCTS TO BE INSTALLED PRIOR TO ROAD BASE CONSTRUCTION.

1.23 CLAY DIKES TO BE INSTALLED WHERE INDICATED ON THE DRAWINGS OR AS APPROVED AND DIRECTED BY THE GEOTECHNICAL ENGINEER ALL IN ACCORDANCE WITH CITY OF OTTAWA STANDARDS AND SPECIFICATIONS.

2.0 SANITARY

2.1 ALL SANITARY SEWER MAINS TO BE CSA CERTIFIED, BELL AND SPIGOT TYPE. ONLY FACTORY FITTINGS TO BE USED. SEWER TO BE INSTALLED AS PER OSPD 1005.01. SANITARY SEWER MATERIALS TO BE: 250mmØ AND SMALLER - PVC DR 35

2.2 ALL SANITARY MAINTENANCE HOLES TO BE 1.2m DIAMETER AS PER CITY OF OTTAWA STANDARDS COMPLETE WITH BENCHING, RUNGS, FRAME AND COVER, DROP PIPES AND LANDINGS WHERE NEEDED.

2.3 SANITARY MANHOLE COVERS TO BE CITY OF OTTAWA STD. S25 (MOD. OPSD. 401.020). SANITARY MANHOLE COVER TO BE CLOSED COVER TYPE, AS PER CITY STANDARD S24.

2.4 SANITARY SEWER LEAKAGE TEST AND CCTV INSPECTION SHALL BE COMPLETED AS PER CITY SPECIFICATIONS PRIOR TO INSTALLATION OF BASE COURSE ASPHALT.

2.5 ANY SANITARY SEWER WITH LESS THAN 2.0m COVER REQUIRES THERMAL INSULATION AS PER CITY OF OTTAWA STANDARD W22, OR AS APPROVED BY THE ENGINEER.

2.6 CONNECTION TO THE EXISTING SANITARY SEWER TO BE INCLUDED IN THE COST FOR SANITARY SEWER INSTALLATION. THIS INCLUDES REINSTATEMENT OF ROAD CUTS TO CITY STANDARDS.

3.1 ALL STORM SEWERS TO BE CSA CERTIFIED, BELL AND SPIGOT TYPE. ALL STORM SEWERS TO BE INSTALLED PER MANUFACTURER'S INSTRUCTIONS. ONLY FACTORY FITTINGS TO BE USED. STORM SEWER MATERIALS TO BE: 375mmØ AND SMALLER - PVC DR 35, 450mmØ AND LARGER - CONC. CL. 100-D, 825mmØ AND LARGER - CONC. CL. 65-D

3.2 ALL STORM MAINTENANCE HOLES TO BE SIZED IN ACCORDANCE WITH THE PLANS AND AS PER CITY OF OTTAWA STANDARDS COMPLETE WITH BENCHING. RUNGS. DROP PIPES AND FRAME AND COVER.

3.3 STORM MH COVERS TO BE OPEN TYPE, AS PER CITY STANDARD S24, FRAMES TO BE PER CITY OF OTTAWA STD. S25. CONTRACTOR TO INSTALL FILTER FABRIC UNDER STORM MH COVER UNTIL SODDING IS COMPLETE.

3.4 STORM MAINTENANCE HOLES TO BE OPSD, SIZE AS SPECIFIED, TAPER TOP.

3.5 ALL CATCH BASINS TO BE AS PER OPSD 705.010, FRAME & FISH TYPE GRATE AS PER CITY OF OTTAWA STD. S19.1. 3.6 ANY STORM SEWER WITH LESS THAN 2.0M COVER REQUIRES THERMAL INSULATION AS PER CITY OF OTTAWA STANDARD W22, OR AS APPROVED BY THE ENGINEER.

3.7 CONNECTION TO THE EXISTING STORM SEWER TO BE INCLUDED IN THE COST FOR STORM SEWER INSTALLATION.

3.8 CONTRACTOR TO PROVIDE IPEX-TEMPEST HF ICD'S SHOP DRAWINGS, OR EQUIVALENT, FOR ENGINEERS REVIEW PRIOR TO

4.0 WATER

4.1 ALL WATERMAINS TO BE PVC DR 18, WITH MINIMUM COVER OF 2.4M AND INSTALLED PER CITY OF OTTAWA STANDARDS. ALL DOMESTIC WATER SERVICES ARE TO BE 200MMØ.

4.2 THRUST BLOCKS TO BE INSTALLED AT ALL BENDS, TEES, AND CAPS ALL AS PER OPSD 1103.01 AND 1103.02. 4.3 CONTRACTOR TO CONDUCT PRESSURE AND LEAKAGE TESTING OF ALL WATERMAINS AND DISINFECT AND CHLORINATE ALL WATERMAINS TO THE SATISFACTION OF M.O.E. AND THE CITY OF OTTAWA.

4.4 TRACER WIRE TO BE INSTALLED ALONG THE FULL LENGTH OF WATERMAIN AND ATTACHED TO EACH MAIN STOP AS PER CITY OF OTTAWA STANDARDS.

4.5 ALL COMPONENTS OF THE WATER DISTRIBUTION SYSTEM SHALL BE CATHODICALLY PROTECTED AS PER CITY OF OTTAWA

4.6 ALL VALVES & VALVE BOXES AND CHAMBERS, HYDRANTS, AND HYDRANT VALVES AND ASSEMBLIES SHALL BE INSTALLED AS PER CITY OF OTTAWA STANDARDS.

4.7 ANY WATERMAIN WITH LESS THAN 2.4M COVER REQUIRES THERMAL INSULATION AS PER CITY OF OTTAWA STANDARD W22, OR AS APPROVED BY THE ENGINEER.

4.8 CONTRACTOR IS RESPONSIBLE FOR ACQUIRING THE WATER PERMIT FROM THE CITY OF OTTAWA AND PAYMENT OF ANY FEES ASSOCIATED WITH SECURING THE WATER PERMIT. OWNER IS RESPONSIBLE FOR REIMBURSING THE CONTRACTOR FOR THE ACTUAL COST OF ACQUIRING THE WATER PERMIT

4.9 CONNECTION TO EXISTING WATERMAIN TO BE INCLUDED IN THE COST FOR THE WATERMAIN INSTALLATION. THIS COST INCLUDES REINSTATEMENT OF ROAD CUTS TO CITY STANDARDS.

5.0 PARKING LOT AND WORK IN PUBLIC RIGHTS OF WAY

5.1 CONTRACTOR TO REINSTATE ROAD CUTS PER CITY OF OTTAWA STANDARD R-10.

5.2 THE CONTRACTOR SHALL PREPARE A TRAFFIC MANAGEMENT PLAN FOR REVIEW AND APPROVAL BY THE CITY OF OTTAWA. CONTRACTOR TO MAINTAIN TRAFFIC FLOW DURING THE ENTIRE CONSTRUCTION PERIOD. MAINTENANCE OF ROAD CUTS SHALL BE THE RESPONSIBILITY OF THE CONTRACTOR. PROVISION OF FLAGMEN. DETOURS AS NECESSARY. BARRICADES AND SIGNS TO THE FULL SATISFACTION OF THE ENGINEER AND ROAD AUTHORITY SHALL BE THE CONTRACTOR'S RESPONSIBILITY.

5.3 CONTRACTOR TO PREPARE SUBGRADE, INCLUDING PROOFROLLING, TO THE SATISFACTION OF THE GEOTECHNICAL ENGINEER PRIOR TO THE COMMENCEMENT OF PLACEMENT OF GRANULAR B MATERIAL.

5.4 FILL TO BE PLACED AND COMPACTED PER THE GEOTECHNICAL REPORT REQUIREMENTS.

5.5 CONTRACTOR TO SUPPLY, PLACE AND COMPACT GRANULAR B MATERIAL IN ACCORDANCE WITH THE RECOMMENDATIONS OF THE GEOETCHNICAL ENGINEER. CONTRACTOR TO PROVIDE ENGINEER WITH SAMPLES OF GRANULAR B MATERIAL FOR TESTING AND CERTIFICATION FROM THE GEOTECHNICAL ENGINEER THAT THE MATERIAL MEETS THE GRADATION REQUIREMENTS SPECIFIED IN THE GEOTECHNICAL REPORT.

5.6 GRANULAR A MATERIAL TO BE PLACED ONLY UPON APPROVAL BY THE GEOTECHNICAL ENGINEER OF GRANULAR B

5.7 CONTRACTOR TO SUPPLY, PLACE AND COMPACT GRANULAR A MATERIAL IN ACCORDANCE WITH THE RECOMMENDATIONS OF THE GEOETCHNICAL ENGINEER. CONTRACTOR TO PROVIDE ENGINEER WITH SAMPLES OF GRANULAR A MATERIAL FOR TESTING AND CERTIFICATION FROM THE GEOTECHNICAL ENGINEER THAT THE MATERIAL MEETS THE GRADATION REQUIREMENTS SPECIFIED IN THE GEOTECHNICAL REPORT.

5.8 ASPHALT MATERIAL TO BE PLACED ONLY UPON APPROVAL BY THE GEOTECHNICAL ENGINEER OF GRANULAR A PLACEMENT.

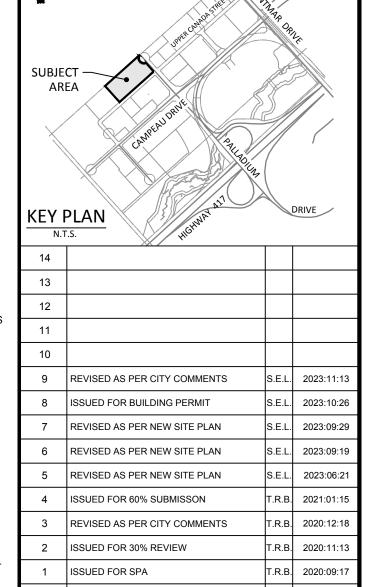

5.9 CONTRACTOR TO SUPPLY, PLACE AND COMPACT ASPHALT MATERIAL IN ACCORDANCE WITH THE RECOMMENDATIONS OF THE GEOTECHNICAL ENGINEER. CONTRACTOR TO PROVIDE ENGINEER WITH SAMPLES OF ASPHALT MATERIAL FOR TESTING AND CERTIFICATION FROM THE GEOTECHNICAL ENGINEER THAT THE MATERIAL MEETS THE REQUIREMENTS SPECIFIED IN THE

5.10 CONTRACTOR IS RESPONSIBLE FOR ESTABLISHING LINE AND GRADE IN ACCORDANCE WITH THE PLANS, AND FOR PROVIDING THE ENGINEER WITH VERIFICATION PRIOR TO PLACEMENT.

5.11 DITCHES DISTURBED DURING CULVERT INSTALLATION AND GRADING OPERATIONS ARE TO BE REINSTATED TO THEIR ORIGINAL CONDITION AND FLOWLINE GRADES. 5.12 ALL EXCESS MATERIAL TO BE HAULED OFFSITE AND DISPOSED OF AT AN APPROVED DUMP SITE. SHOULD THE

CONTRACTOR DISCOVER ANY HAZARDOUS MATERIAL, CONTRACTOR IS TO NOTIFY ENGINEER. ENGINEER TO DETERMINE APPROPRIATE DISPOSAL METHOD/LOCATION.

5.13 PAVEMENT STRUCTURE (MATERIAL TYPES AND THICKNESSES) FOR HEAVY DUTY AND LIGHT DUTY AREAS TO BE AS SPECIFIED IN THE GEOTECHNICAL REPORT AND SHOWN ON THE PLANS.

Pre-Sloped Polypropylene Trench Drain System w/Ductile Iron Frame

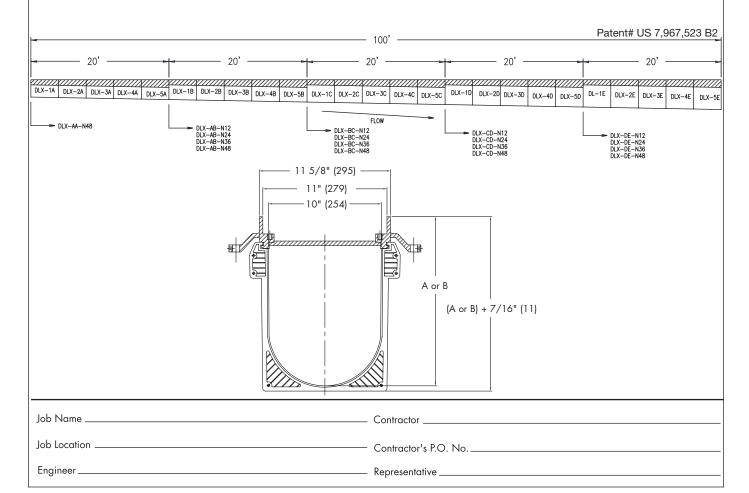

SPECIFICATION: Watts Dead Level DX Pre-Sloped Trench Drain System with 12"(305) wide x 48"(1219) long (standard) ductile iron frame, UV stabilized talc-filled polypropylene channels with 6"(152) No Hub Bottom or End outlet(s). System shall be frame-anchored, with (specify) grating to suit DIN Class (specify) load rating. System to include frame connectors, grate lockdowns, and construction covers. Installation to be performed in accordance with manufacturer's instructions and building code.

Suffix	Grate Options: Description

C. Minor system flows generated in the SWMHYMO model were exported to the XPSWMM models to determine hydraulic grade line within the sewer networks serviced by the existing Pond 6 West and Pond 6 East, as discussed in Section 4.6. The main hydrological parameters used in the rational method spreadsheet and SWMHYMO model are summarized in the following sections.

4.4.1 Design Storms and Drainage Area Parameters

The following design parameters were used in the evaluation of the stormwater management system for the subject site.

4.4.1.1 Design Storms

The following storm events were used in the design and evaluation of the site:

- 5 and 100 year 3 hour Chicago
- Sensitivity analysis: 100 year 3 hour Chicago with 20% increase in intensity

The following storm events were used in the evaluation of the existing Pond 6 West and Pond 6 East.

- 2, 5, 10, and 100 year, 12 hour SCS Type II storm event,
- Sensitivity analysis: July 1979, August 1988, and August 1996 Historical storms, as well
 as the 100 year 12 hour SCS Type II storm event with 20% increase in intensity.

4.4.1.2 Drainage Area Parameters

- Area and imperviousness Catchment areas and imperviousness values are based on the
 areas and runoff coefficients applied in the rational method spreadsheet. Runoff coefficients
 were established in the September 2012 Conceptual Site Servicing Plan and are typical of
 commercial land use. See Drawing 14289-500 for the catchment areas used in the
 SWMHYMO modeling.
- <u>Infiltration</u> Infiltration losses were selected to be consistent with the OSDG. The Horton values are as follows: $f_0 = 76.2 \text{ mm/h}$, $f_c = 13.2 \text{ mm/h}$, $k = 0.00115 \text{ s}^{-1}$.
- <u>Length Parameter</u> The length parameter (LGI) for the detailed design municipal ROW within
 the development area are based on the measured sewer trunk length. The length parameter
 (LGI) for the proposed commercial blocks within the development area are based on the
 average between the trunk sewer length and a calculated length from the SWMHYMO user
 manual. This approach is consistent with the OSDG Appendix 8 (November 2004). Applicable
 calculations are provided in **Appendix C**.
- <u>Slope</u> The ground slope was based upon the average slope for both impervious and pervious area. Generally, the slope is approximately 2% (0.02 m/m). This assumes a slope of approximately 1% for impervious or road surfaces and 3% for pervious surfaces (lot grading).
- <u>Initial Abstraction (Detention Storage)</u> Detention storage depths of 0.8 mm and 1.5 mm were
 used for impervious and pervious areas, respectively. These values are more conservative
 than the OSDG.
- Manning's Roughness Manning's roughness coefficients of 0.013 and 0.25 were used for impervious and pervious areas, respectively.

Table 4.2 summarizes the main hydrological parameters used in the SWMHYMO model. The drainage area plan is presented in Drawing 14289-500. Model output files are enclosed within **Appendix C**.

Table 4.2 Drainage Area Parameters (Model file: 100398.OUT)
