City of Ottawa Planning, Infrastructure and Economic Development Department Planning and Infrastructure Approvals Branch 110 Laurier Avenue West, 4<sup>th</sup> Floor Ottawa ON, K1P 1J1

Attention: Ms. Laurel McCreight, MCIP, RPP

Dear Ms.:

Reference: 1200 Maritime Way - Claridge Development

Serviceability and Stormwater Management Report

Enclosed is the Serviceability and Stormwater Management Report for the proposed 1200 Maritime Way development located along the Highway 417, Kanata Avenue and Maritime Way in the City of Ottawa. This report is submitted in support of the zoning amendment/site plan control applications and outlines how the site will be serviced with public infrastructure.

Trusting this report is adequate for your purposes. Should you have any questions, or require additional information, please contact me.

Yours truly,

**NOVATECH** 

Greg MacDonald, P. Eng.

Director, Land Development and Public Sector Infrastructure

### 1.0 INTRODUCTION

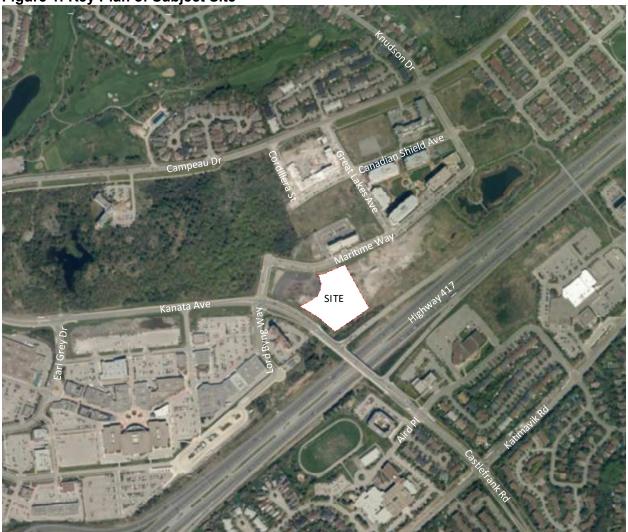

This Serviceability Study has been prepared in support of Zoning By-Law Amendment and Site Plan Control applications for the Claridge lands located at 1200 Maritime Way, as shown in **Figure 1 – Key Plan of Subject Site**. The subject site is currently occupied by a vacant land. The proposed redevelopment will include a total of 632 dwelling units and 662 parking spaces.

The subject site has an approximate area of 1.28 hectares, and is surrounded by the following:

- Maritime Way and Townplace Suites by Marriott hotel to the north;
- Highway 417 to the south;
- Vacant land to the east; and
- A retirement residence to the west.

The most recent aerial view of the subject site is provided in **Figure 1**.

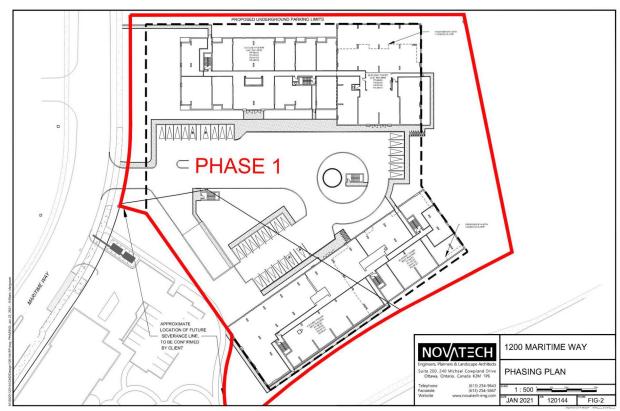

### 1.1 Proposed Development

The subject site is located within one of the Zone AM10 of the City of Ottawa. The implemented zoning for the property permits the proposed land uses. However, a Zoning By-Law Amendment is required to permit certain attributes of the proposed development, such as building height and FSI.

The proposed development will be constructed in one phase as shown in **Figure 2 – Phasing Plan** and as described below.

- Phase 1 (East/West Towers):
  - East Tower: 28-storey high-rise including 7-storey podium with 300 dwellings;
  - West Tower: 30-storey high-rise including 7-storey podium with 332 dwellings.

Figure 2 Phasing Plan

In total, the proposed development will consist of 632 apartment dwellings. The entire site will include 662 parking spaces for residents (632 inside) and visitors (30 outside) and will be accessed via full-movement driveway to Maritime Way. Phase 1 of the development is anticipated to be built out by 2028.

A copy of the Site Plan is included in **Appendix A – Site Plan**.

### 2.0 SANITARY SEWER

The development will be serviced by the existing 825mm diameter sanitary sewer on Maritime Way, as shown on the general plan of services.

The service will be a 375mm diameter sanitary sewer to Maritime Way.

The proposed development flows are based on the City of Ottawa Sewer Design Guidelines and are provided below.

### 2.1 Proposed Sanitary Flows from Development Site

Proposed sanitary flows are summarized in **Table 2.1 – Proposed Sanitary Flows** with detailed calculations below. Development statistics, e.g. apartment and townhouses are summarized in **Table 2.2 – Development Statistics**. A Phasing Plan is shown in **Figure 2 – Phasing Plan**.

**Table 2.1 Proposed Sanitary Flows** 

| Phase      | Peak Sanitary Flow (L/sec) |  |
|------------|----------------------------|--|
| East Tower | 5.52                       |  |
| West Tower | 6.02                       |  |
| Total      | 11.54                      |  |

**Table 2.2 Development Statistics** 

| Building<br>Component | Area<br>(ha) | 1 Bdr<br>(x1.4) | 2 Bdr<br>(x2.1) | Total |
|-----------------------|--------------|-----------------|-----------------|-------|
| East Tower            |              |                 |                 |       |
| Tower (incl. Podium)  | -            | 177             | 123             | 300   |
| Total                 | +/- 0.64     | 177             | 123             | 300   |
| West Tower            |              |                 |                 |       |
| Tower (incl. Podium)  | -            | 204             | 128             | 332   |
| Total                 | +/- 0.64     | 204             | 128             | 332   |
| Grand Total           | 1.28         | 381             | 251             | 632   |

### **Sanitary Flows East Tower**

Area = 1.28 ha

Tower (incl. Podium): 247.8 + 258.3 = 507 people

Sanitary flows are calculated below using the City's new Sewer Design Criteria.

Population = 507 people Peak Factor = 1 +  $14/(4 + (P/1000)^{1/2}) \times 0.80 = 3.23$  (using entire population of 1,062) Area = 1.23 ha

Q Phases 1 = 
$$\frac{(507)(280)}{86,400}$$
(3.23) +  $(0.64)(0.33)$  = 5.52 L/sec

Therefore, the total peak sanitary flow for **East Tower is 5.52 L/sec.** 

### **Sanitary Flows West Tower**

Area = 1.28 ha

Tower (incl. Podium): 285.6 + 268.8 = 555 people

Sanitary flows are calculated below using the City's new Sewer Design Criteria.

```
Population = 555 people
Peak Factor = 1 + 14/(4 + (P/1000)^{1/2}) \times 0.80 = 3.23 (using entire population of 1,062)
Area = 0.52 ha
Q_{Phases 2} = (555)(280)(3.23) + (0.64)(0.33) = 6.02 \text{ L/sec}
```

Therefore, the total peak sanitary flow for West Tower is 6.02 L/sec.

Furthermore, the total peak sanitary flow for all Phase 1 is 11.54 L/sec.

The development of the adjacent site at 1250 Maritime Way (Timberwalk Retirement Home) accounted for flows of 3.86 L/s from the future development at 1200 Maritime Way. Because of an increase in flows over and above the flows allocated to the site (e.g. 2.84 L/s per the Robinson Consultants letter dated March 27, 1996) an analysis of the downstream sewer system was completed by J.L. Richards allowing for the additional flows of 4.35 L/sec (e.g. 7.19 L/s development flows for 1250 Maritime Way and future 1200 Maritime Way – 2.84 L/s allocated flows). Both the Robinson letter and the JLR analysis is included in **Appendix B – Sanitary Sewer Design Downstream Capacity**.

The calculated flow for the current proposed development at 1200 Maritime Way is 11.54 L/sec. This flow was input into the same spreadsheet analysis used for 1250 Maritime Way to assess the impact on the downstream sewer. To provide a comparison to the initial assessment completed by JLR, the same flow parameters were used, as follows:

- Per capita flow 350 L/cap/day
- Harmon Factor = 1.0
- Infiltration = o.28 L/sec/ha
- Commercial/Retail = 50,000 L/ha/day

The resulting analysis shows an increase in peak sanitary flow in the truck sewer of 6.48 L/sec, explained as follows:

| 490.60 L/s | Peak Sanitary Flow in Trunk Sewer including proposed 1200 Maritime Way |
|------------|--|
| 480.26 L/s | Peak Sanitary Flow in Trunk Sewer under current conditions             |
| 10.34 L/s  | Difference   |
| 3.86 L/s   | Less portion of 1200 Maritime Way included in original analysis        |
| 6.48 L/s   | Additional Sanitary Flows to be Added to System                        |

The total additional flows of 6.48 L/sec represents 1.35 % of the total flow. Given the available capacity in the trunk sewer the impacts are negligible. Further, to be consistent with the original analysis completed for 1250 Maritime Way, the previous sanitary flow parameters were used.

Using current standards, e.g. 280 L/cap/day and Harmon 0.80 would further reduce the flows going into the sanitary sewer.

#### 3.0 STORM SEWER AND STORMWATER MANAGEMENT

As part of this development, stormwater will be controlled on-site and discharged via a 375mm dia. service that will connect to the existing 1650mm dia. storm sewer on Maritime Way as shown on the General Plan of Services.

The site is fairly flat overall and the majority of storm runoff from the site is self-contained with some being conveyed overland towards the neighboring properties.

### 3.1 Storm Water Management Criteria

Stormwater management (SWM) design criteria for the proposed development were established by the City of Ottawa Sewer Design Guidelines (October 2012); Kanata Town Centre, Central Business District, Stormwater Management Report (J.L. Richards, January 1999) and Servicing Brief (Revised) – Kanata Town Centre Central Business District Subdivision, Technical Memorandum (J.L. Richards, June 13, 2012). The SWM design criteria are as follows:

- Control post-development peak flows up-to and including the 100-year storm event to the allowable release rate. Provide on-site water quantity control for all flow in excess of the allowable release rate. The allowable release rate is to be determined by applying the following parameters to the site area:
  - A runoff coefficient of 0.8
  - A time of concentration of 20 minutes
  - A 5-year intensity using the City of Ottawa Intensity-Duration-Frequency (IDF) curves
- Minimize the impact on the downstream receiving watercourses by minimizing the potential erosion and volume of sediment entering the watercourses both on a temporary basis (during construction) and on a permanent basis.
- Provide guidelines to ensure that site preparation and construction is in accordance with the current Best Management Practices for Erosion and Sediment Control.

### 3.2 Hydrologic and Hydraulic Modelling

The allowable release rate for the 1.28 ha site was determined to be 199.99 L/s based on the SWM criteria provided by the City of Ottawa.

The rational method was used to estimate post-development peak flows (quantity control targets) and determine approximate storage requirements for the site. The storage requirements for the site were determined for each tower of the development.

The post-development drainage areas were delineated based on the proposed development grading. Refer to **Drawing 120144-GR** for the proposed site grading and **Drawing 120144-SWM** for the drainage areas. The storage requirements are based on meeting the allowable release rate generated for the site.

The site will be graded such that flows in excess of the 100-year storm event will be conveyed overland to Maritime Way.

### Design Storms

The design storms are based on City of Ottawa design storms. Design storms were used for the 5 and 100-year return periods (i.e. storm events).

### **Model Parameters**

Post-development catchments were modelled based on the proposed site plan and grading as shown on **Drawing 120144-SWM**. All the sub-catchments are assumed to be 100% impervious with exception to the grassed areas not over underground parking (A-1, part A-2, A-3, part A-4, part A-5 and part A-6) which are 0% impervious. The building roofs were assumed to have no depression storage.

A summary of the allowable release rate, post-development parameters and output for the 5 and 100-year storm events are provided in **Appendix C – Stormwater Management Calculations**.

### 3.3 Water Quantity Control

On-site stormwater management will be implemented to control post-development stormwater discharge to the allowable release rate of 199.99 L/s and will be achieved using internal stormwater tanks that will be pumped to the storm sewers on Maritime Way.

Runoff from the grassed areas (Sub-catchments A-1, A-2, A-3, A-4, A-5 and A-6) will be uncontrolled and will drain towards to Maritime Way. The total uncontrolled flows from the site in the 100-year event will be 87.81 L/s which requires the remaining areas of the site to be controlled to 112.18 L/s in order to meet the allowable release rate.

The remaining 112.18 L/s of allowable release rate was divided between the development phases using area-weighting as shown in **Table 3.1**.

Table 3.1 Controlled Release Rates

| Phase                         | Drainage Area (ha) | Allowable Release Rate (L/s) |
|-------------------------------|--------------------|------------------------------|
| East Tower (incl. CB1/2)      | 0.54               | 70.44                        |
| West Tower (incl. CB3/4 & TD) | 0.32               | 41.74                        |
| Total                         | 0.86               | 112.18                       |

The runoff from each tower and corresponding CBs or TD will be collected into at least one tank located within the development. The site was modeled so that the pump rate for each phase was equal to the allowable release rate for that phase. East and West towers will be pumped to the Maritime Way storm sewer. The tanks will have an emergency overflow that will connect to the ground surface. The required storage in the 100-eyar event for each phase is summarized in **Table 3.2**.

Table 3.2 Required Tank Storage for the 100-year Storm

| Phase      | Required Storage Volume (m³) |  |  |
|------------|------------------------------|--|--|
| East Tower | 131.56                       |  |  |
| West Tower | 77.96                        |  |  |
| Total      | 209.52                       |  |  |

The storage provided allows for the proposed development to meet the allowable release rate of 199.99 L/s. The total release rates from the site during the 100-year storm event are provided in **Table 3.3**.

Table 3.3 Overall Site Release Rate for the 100-year Storm

| Phase                         | Drainage Area (ha) | Allowable Release Rate (L/s) |
|-------------------------------|--------------------|------------------------------|
| East Tower (incl. CB1/2)      | 0.54               | 70.44                        |
| West Tower (incl. CB3/4 & TD) | 0.32               | 41.74                        |
| Uncontrolled                  | 0.42               | 87.81                        |
| Total                         | 1.28               | 199.99                       |

### 3.4 Water Quality Control

Runoff from the roofs, podiums, and uncontrolled grassed areas would be considered clean and will not require treatment. Additionally, the storage tanks will allow for some settling of particulates in the stored runoff from the remaining site areas. Additional water quality treatment will not be required. Erosion and sediment control measures will be implemented during all phases of construction and inspected regularly.

Cisterns from the East Tower and West Tower will discharge to the existing storm sewer on Maritime Way.

Also, there will be water quality control provided by the downstream SWM facility which has been designed to provide quantity and quality control for the proposed development (as per the Stormwater Management Study prepared by JL Richards.

The site will be graded such that flows in excess of the 100-year storm event will be conveyed overland to Maritime Way.

#### 4.0 WATERMAIN

### 4.1 Domestic Water Demand

The proposed development will be serviced by the 200mm dia. watermain on Maritime Way as shown on the General Plan of Services. Shutoff valves will be provided at property lines as per City of Ottawa Specifications. The water meters will be in the basement level mechanical rooms of the buildings. Similarly, remote receptacles will be located at the surface near the entrances to the buildings on the exterior.

The services will be two (2) 200mm diameter water services to Maritime Way, with a valve in between both of them.

Estimated domestic water demands for the development are provided below with a detailed breakdown per phase:

#### **Watermain Flows East Tower**

Average Day Demand = 2.05 L/sec

Maximum Day Demand (x2.5) = 5.13 L/sec

Peak Hour Demand (x2.2) = 11.28 L/sec

### **Watermain Flows West Tower**

Average Day Demand = 2.25 L/sec

Maximum Day Demand (x2.5) = 5.63 L/sec

Peak Hour Demand (x2.2) = 12.38 L/sec

#### 4.2 Fire Demand

An estimate of the water required to meet firefighting demands is described below.

Section 4.2.11 of the City of Ottawa Water Design Guidelines reads:

"When calculating the fire flow requirements and affected pipe sizing, designers shall use the method developed by the Fire Underwriters Survey", and

"The requirements for levels of fire protection on private property are covered in Section 7.2.11 of the Ontario Building Code."

The Fire Underwriters Survey is used to assess the performance of the water distribution system on a "City Block" basis rather than an individual building basis. The Ontario Building Code governs the assessment of fire demand for individual buildings.

Section 7.2.11.1 of the Ontario Building Code states that the design, construction, installation and testing of fire service mains and water service pipe combined with fire service mains shall be in conformance with NFPA 24.

NFPA 24 is the standard for the "Installation of Private Fire Service Mains and their Appurtenances". Chapter 13 of NFPA 24 discusses sizing the private service fire mains for fire

protection systems which shall be approved by the authority having jurisdiction, considering the following factors:

- Construction and Occupancy of the Building
- Fire Flow and Pressure of the Water Required
- Adequacy of the Water Supply

It is expected that any future building on the site will be sprinklered per Section 3.2.2.45 of the OBC. Section 3.2.5.7 of the OBC requires that an adequate water supply for fire fighting be provided to each building, and references Appendix A of the OBC. Sentence 3 of Section A 3.2.5.7 of the OBC (Appendix A) states that NFPA 13 be used for determining both sprinkler and hose stream demands for a sprinklered building.

The design of the sprinkler system is completed by a Fire Protection Engineer, or typically computed by the sprinkler contractor and approved by the Fire Protection Engineer. This process involves detailed hydraulic calculations based on building layout, pipe runs, head losses, fire pump requirements, etc. At this stage in the planning and site design process, these details are not available. Therefore, this report will confirm the maximum anticipated sprinkler and hose stream demands as per NFPA 13.

Section 11.2.3 of the NFPA 13, "Water Demand Requirements – Hydraulic Calculations Methods" was used to estimate the sprinkler and hose stream demands. Figure 11.2.3.1.1 – Area/Density Curves confirms the sprinkler demand, assuming Ordinary 1 construction. Table 11.2.3.1.2 confirms the hose stream allowance and water supply demand requirements, assuming ordinary hazard construction.

For Ordinary 1 type construction, design is based on a density of 0.15 gpm (US), and a maximum area of sprinkler operation limited to 1500 ft<sup>2</sup> (139 m<sup>2</sup>). As per NFPA 13 Figure 11.2.3.1.1, the maximum anticipated sprinkler demand is 225 gpm (US). As per NFPA 13 Table 11.2.3.1.2, the maximum total combined inside and outside hose demand is 250 gpm (US) with a duration of 60-90 minutes.

Based on the calculations above, the total estimated sprinkler and hose demand for the development is 475 gpm (US). However, because the development has not been finalized to-date, it is recommended to add a 50% contingency. Therefore, a sprinkler demand of 713 gpm (US), 2700L/min, should be anticipated at this stage. Refer to **Appendix E – Fire Demand Calculations.** 

Boundary conditions are requested from the City of Ottawa using a fire demand calculated using the **Fire Underwriters Insurance** procedure. This method is used by municipalities to assess their systems on a more global basis and results in a more conservative fire demand for individual sites, as compared to Building Code calculations. The estimated fire demand using FUS for each of the phases is provided in **Table 4.1 – Calculated Fire Demand.** Detailed calculations are included in **Appendix D – Fire Demand.** 

**Table 4.1 Calculated Fire Demand** 

| Phase      | Fire Demand (L/min) |  |
|------------|---------------------|--|
| East Tower | 6000                |  |
| West Tower | 5000                |  |

### 5.0 CONCLUSIONS

Based on the foregoing, report conclusions are:

- Adequate sanitary sewer capacity is available on Maritime Way and in the downstream system to the trunk sewer.
- On site stormwater management will be implemented to control post-development flows to that
  value calculated using a tc of 20 minutes, run-off coefficient of 0.80 and 5-year storm. This will
  be implemented through construction of cisterns in the underground parking structure as
  summarized below. Uncontrolled flow from grass areas will drain overland to Maritime Way.

| Phase      | Cistern Volume (m³) | Discharge (L/s) | Street Sewer |
|------------|---------------------|-----------------|--------------|
| East Tower | 131.56              | 70.44           | Maritime Way |
| West Tower | 77.96               | 41.74           | Maritime Way |
| 1          | Uncontrolled        | 87.81           | Maritime Way |
| Total      | 209.52              | 199.99          |              |

Adequate water services are available on Maritime Way for domestic demand. It is expected
that adequate water supply is available for firefighting which will be confirmed once boundary
conditions are received from the City. Calculated fire demand ranged from 5000 L/min to
6,000 L/min. The buildings will be equipped with fire pumps and sprinklers.

Re: Kanata Town Centre Central Business District

Master Design Sheet Update - Sanitary Peak Flows Block 4, Block 5 and Block west of Block 9 (Zone 122)

We understand that the City is requesting an update to the Master Sanitary Sewer Design Sheet for the Kanata Town Centre Central Business District (KTC-CBD) from JL Richards such to incorporate the proposed peak flow revision from Block 4, Block 5, and the parcel west of Block 9 (previously Robinson'96 - Zone 122). Refer to attached JLR Sanitary Drainage Plan and Robinson Consultants Figure 7.1 for locations of Block 4, Block 5 and Zone 122.

We understand that the City will ultimately decide (as the owner of the existing sewers within the KTC-CBD and downstream system) whether the proposed peak flow increase is acceptable and that if accepted, it will not require a reduction of the allowable peak flows for the remaining future development in the KTC-CBD.

As requested, we have incorporated the proposed sanitary peak flow increase associated with your following developments:

#### a) Proposed Block 4 - Residential development

The proposed development will result in a theoretical increase in peak flow from 3.88 L/s to 4.71 L/s at MH 513 where the Block 4 development outlets to Maritime Way. This represents a theoretical peak flow increase of 0.83 L/s from the anticipated 2012 land use (i.e., hotel use, based on 270 L/pers/day).

### b) Proposed Block 5 - Residential development

The proposed development will result in a theoretical increase in peak flow from 3.52 L/s to 5.13 L/s at MH 511 where the Block 5 development outlets to Maritime Way. This represents a theoretical peak flow increase of 1.61 L/s from the anticipated 2012 land use (i.e., hotel use, based on 270 L/pers/day).

### c) <u>Proposed parcel west of Block 9 (previously identified in the 1996 Robinson KTC Sanitary Design as Zone 122) – Retirement Home – Claridge Homes</u>

The proposed development will result in a theoretical increase in peak flow from 2.84 L/s to 7.19 L/s at MH 7A where Claridge Homes development outlets to Maritime Way. This represents a theoretical peak flow increase of 3.57 L/s from the anticipated 2012 land use (i.e., Commercial use based on 2787m2 office space and Infiltration based 1.5ha). Theoretical flows for Zone 122 were taken from Robinson Consultants Sanitary Trunk Information from Table 4.7 and Figure 7.1, see attached copies.

At the most downstream MH at the intersection of Teron Rd and Campeau Dr (MH Ex. 2) shown on the attached Sanitary Sewer Design Sheet for the Kanata Village Green subdivision (prepared in 1998 by JLR), the proposed 3 developments would result in a theoretical increase in peak flow from 475.94 L/s to 480.24 L/s which corresponds to a 4.3 L/s (0.9%) peak flow increase.

Based on the available theoretical residual capacities noted in the attached updated Master Sanitary Sewer Design Sheet, the existing sanitary sewer system from the intersection of Rock Mountain Gate and Maritime Way to the intersection of Campeau Dr and Teron Rd has the capacity to accommodate the additional theoretical peak flows of Block 4, Block 5 and Zone 122. Downstream of the Campeau Drive intersection, JLR does not have on record design sheets for the City's existing downstream sanitary sewer system.

Page 2 of 2

Should you have any questions or require anything further, please do not hesitate to call.

Subject: RE: Kanata Town Centre - Sanitary Flows

Hi Lucie,

The sanitary info for the block 4 and 5 developments are as follows:

### 1088 Maritime Way (Block 4)

San service connection between SANMH 512-513
San Drainage Area = 1.121 ha
No. Units = 144
Population = 271

### 1136 Maritime Way (Block 5)

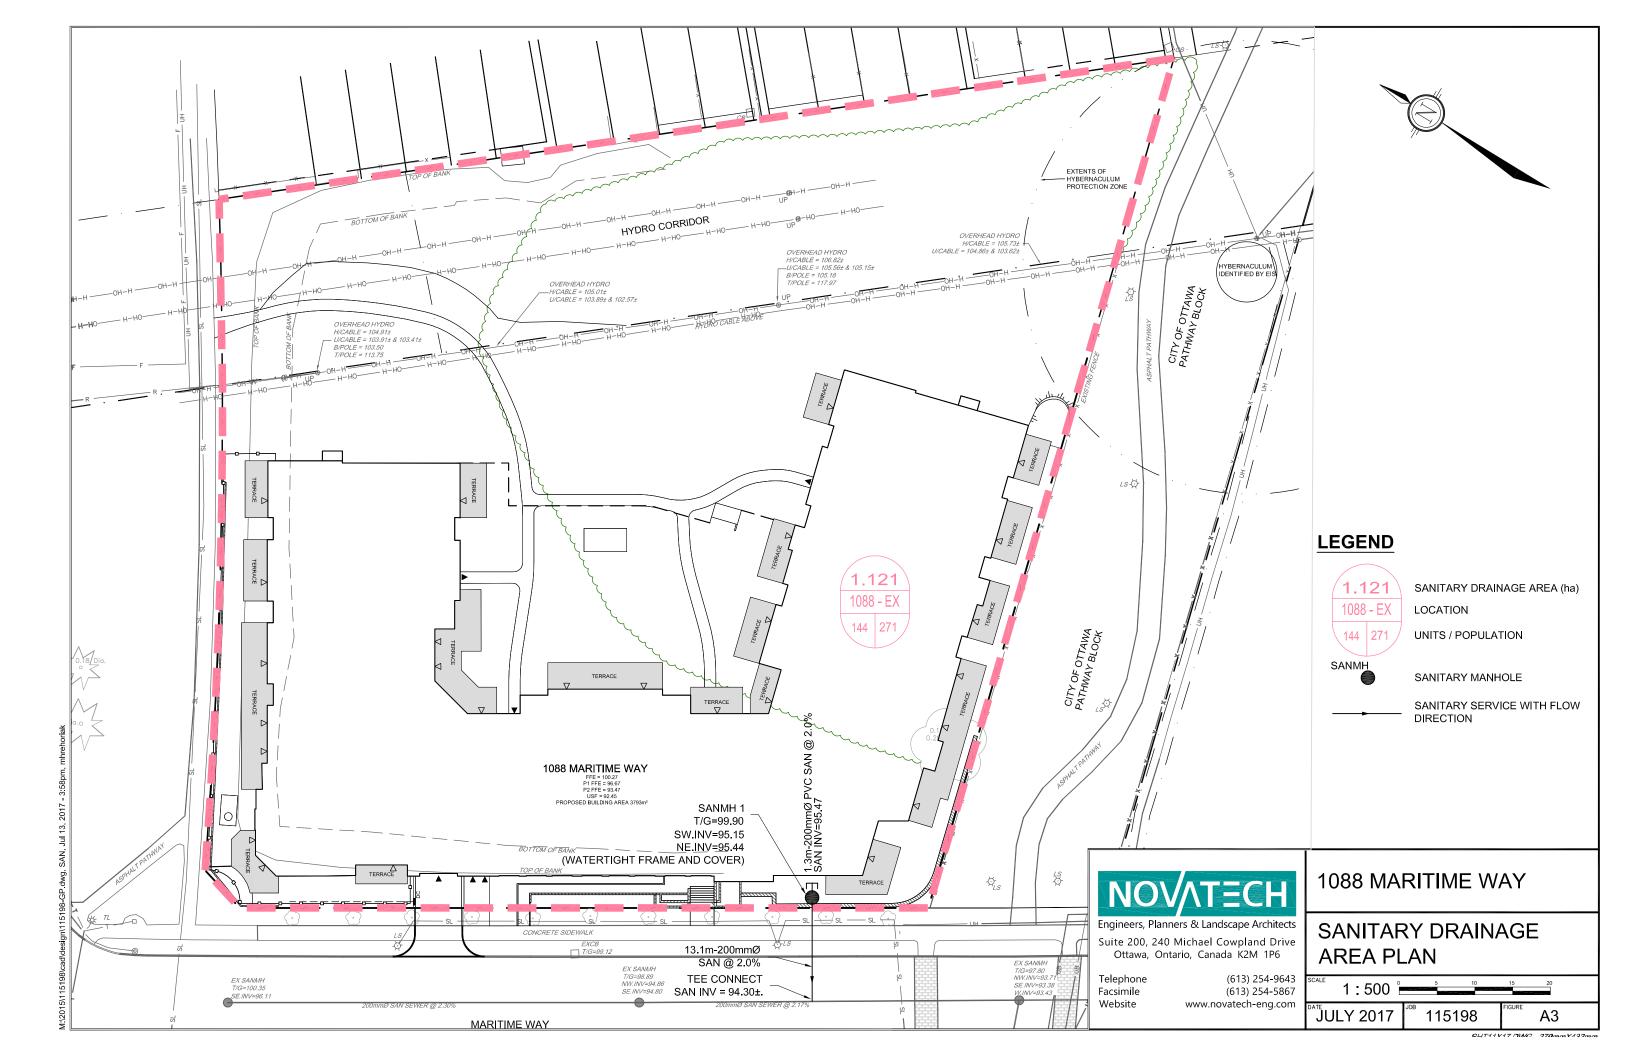

San service connection between SANMH 510-511
San Drainage Area = 0.915 ha
No. Units = 154
Population = 301

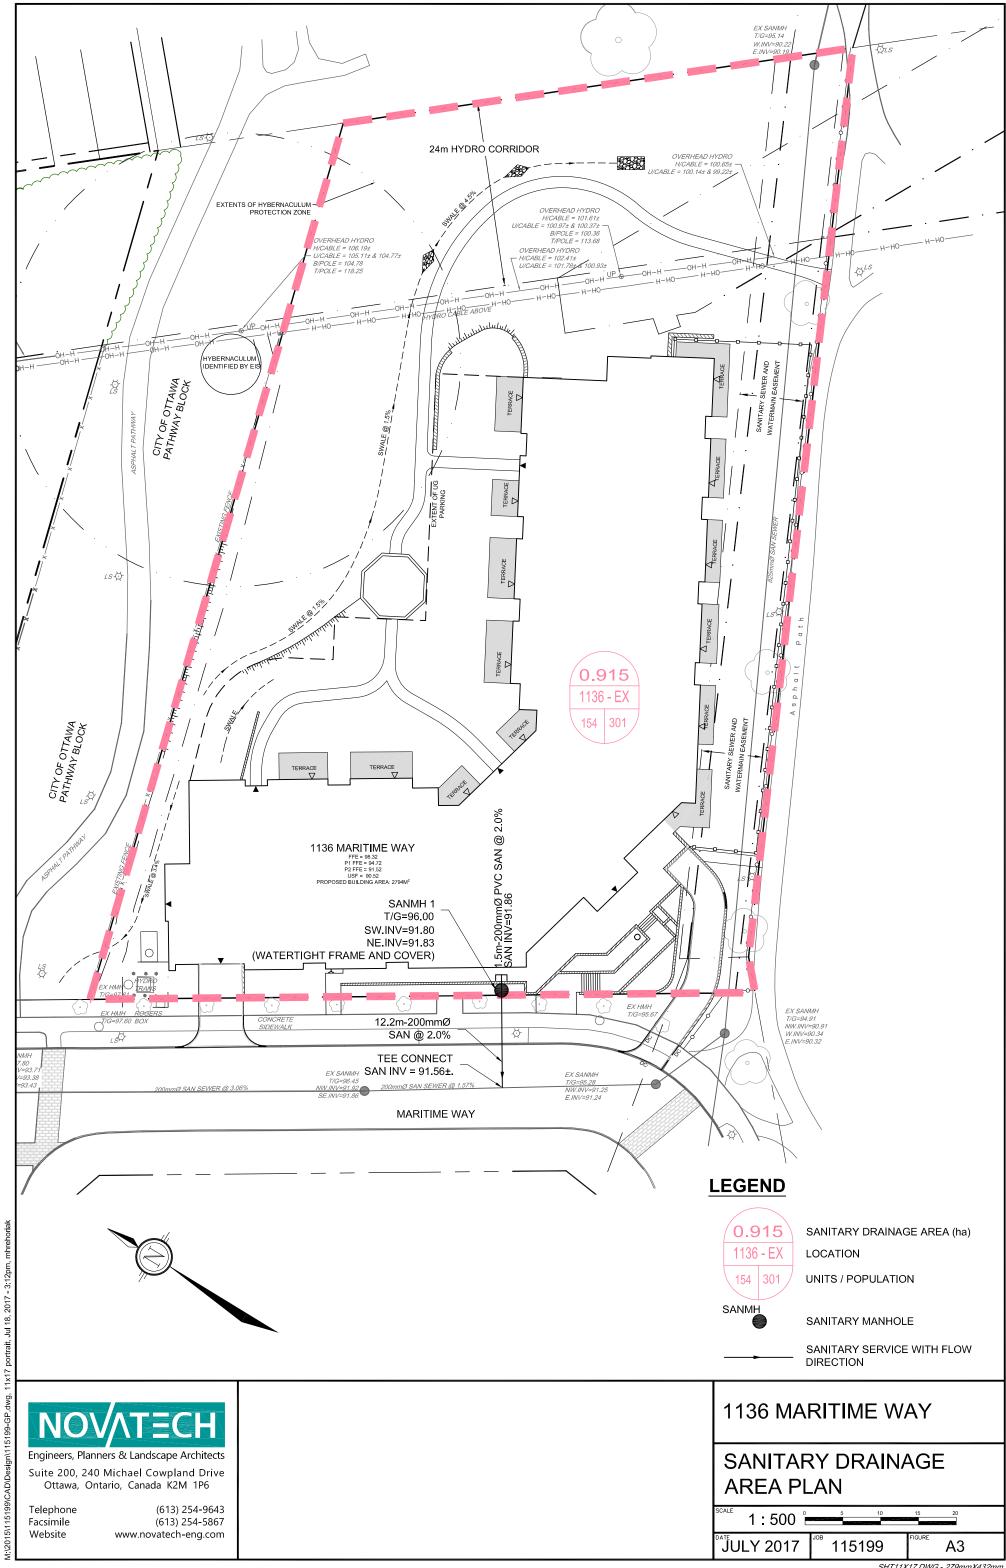

Regards,

Matthew Hrehoriak, B.Eng., EIT

Design Parameters: Residential

350 L/cap/day 450 L/bed/day 5 L/m<sup>2</sup> per day

Peaking Factor: Institutional 1.5

People/Unit: Residential Harmon Equation (max 4, min 2) 1.10 Assisted Care

Commercial 1.5 Other 1.5 1.40 1 Bedroom 2.10 2 Bedroom 1.00 Studio

Staff 275 L/cap/day 650 L/day per station Beauty Salon Laundy
Dining
Infiltration 1200 L/day per machine 115 L/seat/day 0.28 L/s/ha

Institutional

Commercial

Notes:
1. The harmon peaking factor calculated for section 507 to 7A is 3.5 per JLR Design Sheet dated October 12th, 2016
2. Residential flows were used for senior apartments (350 L/cap/day, Harmon Peaking Factor)
3. Institutional flow used for assisted care units (450 L/bed/day, Peaking Factor = 1.5)
4. Future building assumed to be a 10 storey building comprised of 110 2 bedroom units

Objet: Unit Counts - Timberwalk (Maritime Way)

Pascal,

Can you please send us over either the calculated dwelling units (I see you have the dwelling units on drawing A050 however we need to know 1 bedroom, 2 bedroom, etc.) or floor plans for each of the floors for the retirement home?

Thanks,

Matthew Linton, CAD Technologist

**Subject:** RE: 1250 Maritime Way - Sanitary

Follow Up Flag: Follow up Flag Status: Completed

Hi Matthew.

Sorry for the dealy ... it's crazy here.

Here is my response to item #1.

There are commercial washers-dryers in the basement ...

- 2 gas heater tumble dryers 75 lbs
- 1 high-performance washer extractor 65 lbs
- 1 cabinet hardmount washer extractor 20 lbs

... and residential type washer-dryer (one of each) on floors 4 to 7

Mike can you please take care of items #2 & #3.

Best regards,

Design Parameters:

Peaking Factor:

350 L/cap/day Residential Institutional 450 L/bed/day 5 L/m<sup>2</sup> per day Commercial Staff

Residential Harmon Equation (max 4, min 2) Institutional Commercial 1.5 Other 1.5

People/Unit: 1.10 Assisted Care 1.40 1 Bedroom 2.10 2 Bedroom 1.00 Studio

275 L/cap/day 650 L/day per station Beauty Salon 1200 L/day per machine Laundy Dining Infiltration 115 L/seat/day 0.28 L/s/ha

Notes:
1. The harmon peaking factor calculated for section 507 to 7A is 3.5 per JLR Design Sheet dated October 12th, 2016
2. Residential flows were used for senior apartments (350 L/cap/day, Harmon Peaking Factor)
3. Institutional flow used for assisted care units (450 L/bed/day, Peaking Factor = 1.5)
4. Future building assumed to be a 10 storey building comprised of 110 2 bedroom units

- 1) As per Kanata Town Centre Sanitary Trunk Sewer Study revised March 27, 1996 by Robinson Consultants Inc.
- 2) Park or open space area.
- 3) Equivalent population base on 208 rooms and 20 staff members.
- 4) Allowance for an ultimate flow of 188 l/s to provide flexibility in future development as per Kanata Town Centre Sanitary Trunk Study.
- 5) Additional flow associated with hotel amendities including swimming pool with bathrooms and laudry as per design calculations for Block 1 provided by WSP (October 2016).
- 6) Additional flow associated with overall amenities including beauty salon, staff, dining and laundry as per design calculations for 1250 Maritime Way (Timberwalk Retirement Home) provided by Novatech (July 31, 2017).

3.4

7) JLR Spreadsheet up-dated to include development flows from 1200 Maritime Way. Reference Appendix A of Serviceability Report for 1250 Maritime Way attached in Appendix of 1200 Maritime Way Serviceability Report (Novatech January 28, 2021)..

## Design Parameters:

1) Q(e) = 0.28 L/sec/ha 2) Q(p) = (PxqxM/86,400)3) Q(d) = Q(p) + Q(e)

2.7 1.4 1BDR; 2.1 2 BDR.

Definitions:

P = Population

q = Average per capita flow = 350 L/person/day

M = Residential Peaking Factor (Harmon Formula from section 4.4.1 of the City Sewer Design Guidelines):

 $M = 1+[14/(4+Pop/1000)]^1/2^1 - (Maximum of 4.0)$ 

N = Commercial Peak Factor 1.5

Q(d) = Design Flow (L/sec)

Q(p) = Population Flow (L/sec)

Q(r) = Commercial Flow (L/sec)

Q(e) = Extraneous Flow (L/sec)

Note: In all cases, there is only one notch in the Zurn roof drain and and flows through each drain is further reduced with and adjustable weir. See Zurn roof drains

sheet and adjustable weir specification for more details on the reduction of flow.
