## **EXECUTIVE SUMMARY**

### **Assessment**

A Phase II ESA was conducted for the property addressed 829 Carling Avenue, in the Ottawa, Ontario. The purpose of the Phase II ESA was to address potentially contaminating activities (PCAs) that were identified during the Phase I ESA and considered to result in areas of potential environmental concern (APECs) on the Phase II ESA Property.

The subsurface investigation consisted of six (6) boreholes, of which three (3) were instrumented with groundwater monitoring wells. The general soil profile encountered during the field program consisted of fill material consisting of silty sand and crushed stone, followed by another fill layer consisting of silty sand with demolition debris (concrete and brick fragments), crushed stone, and some gravel and organics, overlying shallow limestone bedrock.

Four (4) soil samples, including a duplicate sample, were submitted for laboratory analysis of benzene, toluene, ethylbenzene and xylenes (BTEX), petroleum hydrocarbons (PHCs, Fractions F<sub>1</sub>-F<sub>4</sub>), Polycyclic Aromatic Hydrocarbons (PAHs), and metals (including hydride forming compounds: arsenic (As), Antimony (Sb), Selenium (Se)), mercury (Hg) and hexavalent chromium (CrVI). No BTEX/PHC concentrations were identified in any of the soil samples analysed. Concentrations of several PAH parameters and metal parameters were identified above the selected MECP Table 7 Standards in soil sample BH1-AU1/SS3.

Groundwater samples from monitoring wells MW-1, MW-2, BH1-21, BH2-21 and BH3-21 were collected during the interim of April 18 to April 28, 2021. No free product or petroleum hydrocarbon sheen was noted on the purge water during the groundwater sampling event.

Groundwater samples were analyzed for BTEX, PHCs and/or VOCs. A concentration of benzene was identified at BH1-21, in excess of the selected MECP Table 7 Standards. The groundwater from this well is indicate that the well has not stabilized. Additional groundwater analysis is recommended to confirm the true groundwater quality. All other groundwater results comply with the MECP Table 7 Standards.

### **Recommendations**

It is our understanding that the Phase II ESA Property will be redeveloped with a 60-storey residential building with ground-floor commercial space and underground parking.

Due to the change in land use to a more sensitive land use (commercial parking lot to residential), a record of site condition (RSC) will be required as per O.Reg 154/03.

### Soils

Fill material on the northeastern corner of the Phase II ESA Property contained PAH concentrations in excess of the Table 7 Standards. Soil/fill in excess of the MECP Standards, will need to be removed and disposed of at an approved waste disposal facility.

Subsequent to demolition and prior to construction, a test pit program to assess the soil for off-site disposal purposes and at the same time delineate the PAH exceedances identified is recommended.

In accordance with the new Excess Soil Reg.406/19, additional testing of the soil will be required prior to off-site disposal at a receiving site.

### Groundwater

It is expected that the small concentrations of benzene present in the groundwater in BH1-21 above MECP Table 7 Standards is a result of the groundwater monitoring well not properly developed and should be retested when it stabilizes.

### Monitoring Wells

If the monitoring wells installed on the subject site are not going to be used in the future, or will be destroyed during site redevelopment, they should be abandoned according to Ontario Regulation 903. The wells will be registered with the MECP under this regulation.

## 1.0 INTRODUCTION

At the request of Claridge Homes, Paterson Group (Paterson) conducted a Phase II Environmental Site Assessment at 829 Carling Avenue (the Phase II ESA Property), in the City of Ottawa, Ontario. The purpose of this Phase II ESA has been to address areas of potential environmental concern (APECs) identified during the Phase I ESA conducted by Paterson in April of 2021.

### 1.1 Site Description

Address:	829 Carling Avenue, Ottawa, Ontario
Legal Description:	Part of Lots 1554, 1554, 1556 and 1557 of Plan 38, in the City of Ottawa.
Location:	The site is located on the northwest corner of the Preston Street and Carling Avenue intersection, in the City of Ottawa, Ontario. Refer to Figure 1 - Key Plan in the Figures section following the text.
PINs:	04102-0029
Latitude and Longitude:	45° 23' 52.02" N, 75° 42' 29.22" W

#### Site Description:

Configuration:	Irregular
Area:	1,579 m <sup>2</sup> (approximately)
Zoning:	AM – Main Artillery Zone.

### 1.2 Property Ownership

Paterson was engaged to conduct this Phase I-ESA by Mr. Vincent Denomme of Claridge Homes. The head office is located at 210 Gladstone Avenue, Ottawa, Ontario. Mr. Denomme can be reached by telephone at (613)-233-6030.

### 1.3 Current and Proposed Future Uses

The Phase II ESA Property is currently occupied by a slab-on-grade commercial building and an asphaltic concrete paved parking lot situated on the eastern and western portions of the Phase II ESA Property, respectively.

It is our understanding that the Phase II ESA Property will be redeveloped with a 60-storey mixed-use high-rise building with 6 levels of underground parking. Due to the change in land use to a more sensitive land use (commercial to residential), a record of site condition (RSC) will be required as per O.Reg 154/03.

## **1.4 Applicable Site Condition Standard**

The site condition standards for the property were obtained from Table 7 of the document entitled "Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act", prepared by the Ontario Ministry of Environment, Conservation and Parks (MECP), April 2011. The MECP selected Table 7 Standards are based on the following considerations:

- Coarse-grained soil conditions
- Generic site conditions for shallow soils
- Non-potable groundwater conditions
- Residential land use

Section 35 of O.Reg. 153/04 does apply to the Phase II ESA Property in that the property does not rely upon potable groundwater.

Section 41 of O.Reg. 153/04 does not apply to the Phase II ESA Property, as the property is not within 30m of an environmentally sensitive area.

Section 43.1 of O.Reg. 153/04 does apply to the Phase II ESA Property in that the property is a Shallow Soil property.

The intended use of the Phase II ESA Property is residential; therefore, the Residential Standards have been selected for the purpose of this Phase II ESA.

## **2.0 BACKGROUND INFORMATION**

### **2.1 Physical Setting**

The Phase II ESA Property is situated in a mixed-used urban area, located on the northwest corner of Preston Street and Carling Avenue.

The Phase II ESA Property is occupied by a 2-storey, slab-on-grade commercial building with a more recent addition constructed circa early 1960s, which occupies the eastern portion of the site with an associated asphaltic concrete paved parking lot on the western portion of the Phase I ESA Property. Site

drainage consists primarily of sheetflow to catch basins located on site and overflows to the adjacent streets.

The site is relatively flat and at the grade of the adjacent streets, while the regional topography slopes downwards in a northerly direction.

## 2.2 Past Investigations

- ❑ *“Phase I Environmental Site Assessment, 829 Carling Avenue, Ottawa, Ontario, (CIBC Transit #406),”* prepared by Pinchin, dated March 2, 2016.

The Phase I ESA did not identify any potential environmental concerns on the subject site, however a former retail fuel outlet and garage located on the adjacent property to the west was considered to have the potential to impact the subject site. A Phase II ESA was recommended.

- ❑ *“Phase II Environmental Site Assessment, 829 Carling Avenue, Ottawa, Ontario, (CIBC Transit #406),”* prepared by Pinchin, dated May 27, 2016.

The subsurface program consisted of drilling three (3) boreholes along the western portion of the site, all of which were completed as groundwater monitoring wells. Soil and groundwater samples were collected and analyzed for BTEX, PHCs and VOCs. All soil samples were in compliance with the selected MECP Table 7 Commercial Standards. Groundwater samples obtained from the monitoring wells identified benzene concentration in excess of the selected MECP standards. Based on the results of the Phase II ESA, Pinchin recommended further investigation to delineate, remediate and/or manage the groundwater impacts.

Paterson completed a Phase I ESA in April of 2021 for the subject property. Based on the findings of the Phase I ESA, three (3) potentially contaminating activities (PCAs) were determined to result in areas of potential environmental concern (APECs) on the Phase II ESA Property:

- ❑ APEC 1: Resulting from fill material of unknown quality, associated with the redevelopment of the site in the 1960s (PCA 30).
- ❑ APEC 2: Resulting from the use of road salt for de-icing purpose on the asphaltic paved concrete parking lot and walkways (PCA Other).
- ❑ APEC 3: Resulting from the presence of former retail fuel outlet and current automotive repair garage at 845 Carling Avenue (PCA 28, PCA 52).

Although not identified as a specific PCA in Table 2 of the O.Reg. 153/04, the application of deicing salts for vehicular and pedestrian safety is also considered to represent an APEC (APEC 2) on the Phase I ESA Property.

Based on the findings of the Phase I ESA, it is considered likely that road salt was applied to the surface of the walkways and paved access lane on the Phase I ESA Property for the safety of vehicular and pedestrian traffic under conditions of ice and/or snow.

According to Section 49.1 of O.Reg. 153/04, if an applicable site condition standard is exceeded at a property solely because of the following reason, the applicable site condition standard is deemed not to be exceeded for the purpose of Part XV.1 of the Act: “The qualified person has determined, based on a phase one environmental site assessment or a phase two environmental site assessment, that a substance has been applied to surfaces for the safety of vehicular or pedestrian traffic under conditions of snow or ice or both.”

In accordance with Section 49.1 of O.Reg. 153/04, any EC and SAR concentrations on the Phase I ESA Property that may exceed the MECP Table 7 Standards for a residential/institutional land use are deemed not to be exceeded for the purpose of Part XV.1 of the Act.

The rationale for identifying the above APECs is based on a review of fire insurance plans, aerial photographs, previous reports, field observations, and personal interviews. A Phase II ESA was recommended to address the aforementioned APECs.

## **3.0 SCOPE OF INVESTIGATION**

### **3.1 Overview of Site Investigation**

The subsurface investigation was conducted on April 20 and April 21, 2021. The field program consisted of drilling six (6) boreholes to address the APECs identified on the Phase II ESA Property. Three (3) the boreholes (BH1-21 through BH3-21) were cored into the bedrock and completed with monitoring well installations. Boreholes were drilled to a maximum depth of 23.49 m below the ground surface (mbgs).

### **3.2 Media Investigated**

During the subsurface investigation, soil samples and groundwater samples were obtained and submitted for laboratory analysis. The rationale for sampling and

analyzing the soil and groundwater is based on the Contaminants of Potential Concern (CPCs) identified in the Phase I ESA.

Contaminants of potential concern on the Phase II ESA Property include benzene, toluene, ethylbenzene, and xylenes (BTEX), petroleum hydrocarbons (PHCs, F1-F4), volatile organic compounds (VOCs), polycyclic aromatic hydrocarbons (PAHs), and metals; including arsenic, antimony, selenium, mercury (Hg) and hexavalent chromium (CrVI). These CPCs may be present in the soil and/or groundwater beneath the Phase II ESA Property.

### **3.3 Phase I Conceptual Site Model**

According to the Geological Survey of Canada website, the bedrock in the area of the Phase I Property is reported to consist of interbedded shale and limestone of the Verulam Formation. The surficial geology in the area of the site consists of plain till with a drift thickness ranging from 1 to 3 m.

The groundwater beneath the Phase I ESA Property is anticipated to flow in an easterly direction.

#### **Fill Placement**

Based on the historical use of the Phase I ESA Property, fill material of an unknown quality is potentially present on-site. It is expected that that fill material is associated with the former buildings on-site, which were demolished prior to the 1965.

#### **Existing Buildings and Structures**

A 2-storey, slab-on-grade commercial building constructed circa early 1960s with an addition added on the north end of the building in 1991, occupies the eastern portion of the Phase I ESA Property. The building exterior is finished in brick with a flat tar and gravel style roof. The building is heated and cooled by a natural gas fired HVAC roof mounted unit with electrical baseboard heaters for secondary heating.

#### **Subsurface Structures and Utilities**

The Phase I ESA Property is situated in a municipally serviced area. Underground utilities, both public and private are present on the Phase I ESA Property.

### **Areas of Natural Significance**

No areas of natural significance were identified in the Phase I ESA Study Area.

### **Water Bodies**

Dow's Lake is located approximately 175 m southeast of the Phase I ESA Property. No other natural bodies were identified in the Phase I ESA Study Area.

### **Drinking Water Wells and Monitoring Wells**

There are no known potable water wells on the Phase I ESA Property, nor are they expected to be present as the subject land is situated in a municipally serviced area.

Three (3) groundwater monitoring wells drilled by Pinchin were identified along the western portion of the Phase I ESA Property.

### **Neighbouring Land Use**

Neighbouring land use in the Phase I Study Area consists of both residential and commercial (offices, cafes, and retailers) properties.

### **Potentially Contaminating Activities and Areas of Potential Environmental Concern**

As per Section 7.1 of the Phase I-ESA, three (3) PCAs were considered to result in APECs on the Phase I ESA Property, which are summarized in Table 1, along with their respective location and contaminants of potential concern (CPCs).

<b>Table 1: Potentially Contaminating Activities and Areas of Potential Environmental Concern</b>					
<b>Area of Potential Environmental Concern</b>	<b>Location of Area of Potential Environmental Concern</b>	<b>Potentially Contaminating Activity</b>	<b>Location of PCA (on-site or off-site)</b>	<b>Contaminants of Potential Concern</b>	<b>Media Potentially Impacted (Groundwater, Soil, and/or Sediment)</b>
APEC 1: Resulting from fill material of unknown quality	Western portion of the Phase I ESA Property.	PCA 30 – Importation of Fill Material of Unknown Quality	On-site	PAHs Metals Hg, CrVI	Soil
APEC 2: Resulting from the use of road salt	Western portion of the Phase I ESA Property.	PCA Other – the application of road salt on paved areas for the safety of vehicular or pedestrian traffic under conditions of snow or ice	On-site	Electrical conductivity and Sodium adsorption ratio	Soil
APEC 3: Resulting from the former retail fuel outlet and current automotive repair garage at 845 Carling Avenue.	Western corner of the Phase I ESA Property	PCA 28 – Gasoline and Associated Products Storage in Fixed Tanks  PCA 52 – Storage, maintenance, fuelling and repair of equipment, vehicles, and material used to maintain transportation systems	Off-site	VOCs PHCs (F <sub>1</sub> -F <sub>4</sub> )	Soil Groundwater

Based on the findings of this assessment, it is understood that a substance has been applied to surfaces of the Phase I ESA Property for the safety of vehicular or pedestrian traffic under conditions of snow or ice or both.

In accordance with Section 49.1 of O.Reg. 153/04, any EC and SAR concentrations on the RSC Property that exceed the applicable MECP standards for a residential/institutional land use are deemed not to be exceeded for the purpose of Part XV.1 of the Act.

This exemption is being relied on for APEC 2. The remaining off-site PCAs were not considered to represent APECs on the Phase I ESA Property based on their separation distances and/or orientations relative to the subject property.

### **Contaminants of Potential Concern**

Contaminants of potential concern on the Phase II ESA Property include, Petroleum Hydrocarbons (PHCs, F1-F4), Polycyclic Aromatic Hydrocarbons (PAHs), Volatile Organic Compounds (VOCs) and Metals; including arsenic, antimony, selenium, mercury (Hg) and hexavalent chromium (CrVI).

### **Assessment of Uncertainty and/or Absence of Information**

The information available for review as part of the preparation of the Phase I-ESA is considered to be sufficient to conclude that there are PCAs that have resulted in APECs on the Phase I ESA Property.

A variety of independent sources were consulted as part of this assessment, and as such, the conclusions of this report are not affected by uncertainty which may be present with respect to the individual sources.

## **3.4 Deviations from Sampling and Analysis Plan**

There were no deviations from the Sampling and Analysis Plan which is included in Appendix 1 of this report.

## **3.5 Impediments**

No physical impediments were encountered during the Phase II ESA field program aside from utilities and building structures. Paterson resampled the existing groundwater monitoring wells (MW-1, MW-2 and MW-3) during the April 16, 2021 sampling event, however, no groundwater sample could be retrieved from MW-3, as the monitoring well was dry when checked several times during the program.

## **4.0 INVESTIGATION METHOD**

### **4.1 Subsurface Investigation**

The subsurface investigation was conducted April 20 through April 22, 2021, and consisted of drilling six (6) boreholes (BH1-21 through BH6-21) across the Phase II ESA Property, three (3) of which were completed with groundwater monitoring

well installations. The boreholes were drilled to a maximum depth of 23.49m below ground surface (bgs) to intercept groundwater.

The boreholes were drilled using a low clearance track mounted drill rig operated by George Downing Estate Drilling of Hawkesbury, Ontario, under full-time supervision of Paterson personnel. The borehole locations are indicated on the attached Drawing PE4247-3 - Test Hole Location Plan.

## **4.2 Soil Sampling**

A total of 15 soil samples and 44 rock core samples were obtained from the boreholes by means of grab sampling from auger flights, split spoon sampling, and rock coring using diamond drilling bits. Split spoon samples were taken at approximate 0.76 m intervals.

The depths at which grab samples, split spoon samples, and rock core samples were obtained from the boreholes are shown as “**AU**”, “**SS**” and “**RC**” on the Soil Profile and Test Data Sheets.

The borehole profiles generally consist of an asphaltic concrete paved structure overlying a gravelled layer, followed by fill material consisting of silty sand with some silty clay, with crushed stones, and traces of gravel and topsoil, underlain by limestone bedrock. Boreholes BH1-21 through BH3-21 were terminated in bedrock at depths ranging from 22.61 to 23.93 m below the ground surface (mbgs).

## **4.3 Field Screening Measurements**

Soil samples recovered at the time of sampling were placed immediately into airtight plastic bags with nominal headspace. All lumps of soil inside the bags were broken by hand, and the soil was allowed to come to room temperature prior to conducting the vapour survey. Allowing the samples to stabilize to room temperature ensures consistency of readings between samples.

To measure the soil vapours, the analyser probe is inserted into the nominal headspace above the soil sample. A photo ionization detector (PID) was used to measure the volatile organic vapour concentrations. The sample is agitated/manipulated gently as the measurement is taken. The peak reading registered within the first 15 seconds is recorded as the vapour measurement.

The PID readings were found to range from 0 to 14.2 ppm in the soil samples obtained. These results do not indicate the potential for significant contamination

from volatile contaminants. Vapour readings are noted on the Soil Profile and Test Data Sheets in Appendix 1.

The results of the vapour survey are presented on the Soil Profile and Test Data sheets.

#### 4.4 Groundwater Monitoring Well Installation

Three (3) groundwater monitoring wells were installed on the Phase II ESA Property as part of the subsurface investigation. The monitoring wells consisted of 32 mm diameter, Schedule 40 threaded PVC risers and screens. Monitoring well construction details are listed below in Table 2 and are also presented on the Soil Profile and Test Data Sheets provided in Appendix 1.

Borehole locations and elevations were surveyed geodetically by Paterson personnel.

<b>TABLE 2. Monitoring Well Construction Details</b>						
<b>Well ID</b>	<b>Ground Surface Elevation</b>	<b>Total Depth (m BGS)</b>	<b>Screened Interval (m BGS)</b>	<b>Sand Pack (m BGS)</b>	<b>Bentonite Seal (m BGS)</b>	<b>Casing Type</b>
BH1-21	62.29	10.7+	9.29-10.79	8.53-10.79	0.18-8.53	Flushmount
BH2-21	62.37	22.86	19.83-22.86	19.51-22.86	0.18-19.51	Flushmount
BH3-21	62.67	7.62	4.62-7.62	3.35-7.62	0.18-3.35	Flushmount

#### 4.5 Field Measurement of Water Quality Parameters

Groundwater samples from the existing Pinchin 2016 groundwater monitoring wells MW1 and MW2 were collected on April 16, 2021, and on April 28, 2021 for the wells installed during the recent subsurface program. Water levels were the only field parameter measured. No other field parameters were measured at the time of sampling.

#### 4.6 Groundwater Sampling

Groundwater sampling protocols were followed using the MECP document entitled “Guidance on Sampling and Analytical Methods for Use at Contaminated Sites in Ontario”, dated May 1996. Groundwater samples were obtained from each monitoring well, using dedicated sampling equipment. Standing water was purged from each well prior to sampling. Samples were stored in coolers to reduce analyte volatilization during transportation. Details of our standard

operating procedure for groundwater sampling are provided in the Sampling and Analysis Plan in Appendix 1.

## 4.7 Analytical Testing

Based on the guidelines outlined in the Sampling and Analysis Plan appended to this report, the following soil and groundwater samples, as well as analyzed parameters are presented in Tables 3 and 4.

<b>TABLE 3: Soil Samples Submitted and Analyzed Parameters</b>										
Sample ID	Sample Depth / Stratigraphic Unit	Parameters Analyzed								Rationale
		BTEX	PHCs (F1-F4)	PAHs	VOCs	Metals	Hg	CrVI	EC/SAR	
<b>April 15, 2016 (Pinchin)</b>										
MW1-SS2	0.75-1.52m Fill	X	X		X					Assess the potential soil impact due to the former off-site retail fuel outlet and garage.
MW2-SS2	0.75-1.52m Fill	X	X		X					Assess the potential soil impact due to the former off-site retail fuel outlet and garage.
MW3-SS2	0.75-1.52m Fill	X	X		X					Assess the potential soil impact due to the former off-site retail fuel outlet and garage.
<b>April 20, 21 and 22, 2021</b>										
BH1-AU2/SS3	0.3-1.27m Fill	X		X	X	X	X	X	X	Assess the potential soil impact due to the former off-site retail fuel outlet, garage and use of road salt as well as assess the quality of the fill material.
BH3-AU1	0.08-0.60m Fill			X		X	X	X		Assess the quality of the fill material.
BH3-SS2	0.76-1.09m Fill			X		X	X	X		Assess the quality of the fill material.
BH4-SS3	0.76-1.37m Fill	X	X	X		X	X	X		Assess the potential soil impact due to the former off-site retail fuel outlet and garage as well as assess the quality of the fill material.
DUP	0.3-1.27m Fill	X			X					Duplicate soil sample (BH1-AU2/SS3) for QA/QC purposes.

<b>TABLE 4: Groundwater Samples Submitted and Analyzed Parameters</b>					
Sample ID	Screened Interval	Parameters Analyzed			Rationale
		BTEX	PHCs (F1-F4)	VOCs	
<b>April 18, 2016 (Pinchin)</b>					
MW-1	2.6-4.53m	X	X	X	Assess potential groundwater impacts from the former off-site retail fuel outlet and garage.
MW-2	3.1-6.1m	X	X	X	Assess potential groundwater impacts from the former off-site retail fuel outlet and garage.
<b>April 13, 2021</b>					
MW-1-GW1	2.6-4.53m	X	X	X	Assess potential groundwater impacts from the former off-site retail fuel outlet and garage.
MW-2-GW1	3.1-6.1m	X	X	X	Assess potential groundwater impacts from the former off-site retail fuel outlet and garage.
<b>April 28, 2021</b>					
BH1-GW1	9.29-10.79m	X	X	X	Assess potential groundwater impacts from the former off-site retail fuel outlet and garage.
BH3-GW1	4.62-7.62m	X	X	X	Assess potential groundwater impacts from the former off-site retail fuel outlet and garage.
DUP	4.62-7.62m	X		X	Duplicate groundwater sample (BH3-GW1) for QA/QC purposes.

Parcel Laboratories (Parcel), of Ottawa, Ontario, performed the laboratory analysis on the samples submitted for analytical testing. Parcel is a member of the Standards Council of Canada/Canadian Association for Laboratory Accreditation (SCC/CALA). Parcel is accredited and certified by SCC/CALA for specific tests registered with the association.

#### 4.8 Residue Management

All soil cuttings, purge water and fluids from equipment cleaning were retained on-site.

#### 4.9 Elevation Surveying

Boreholes were surveyed at geodetic elevations by Paterson personnel.

## 4.10 Quality Assurance and Quality Control Measures

A summary of quality assurance and quality control (QA/QC) measures, including sampling containers, preservation, labelling, handling, and custody, equipment cleaning procedures, and field quality control measurements is provided in the Sampling and Analysis Plan in Appendix 1.

## 5.0 REVIEW AND EVALUATION

### 5.1 Geology

Site soils consist of an asphaltic concrete structure over sand with crushed stones, underlain by fill material consisting of silty sand with demolition debris (brick and concrete fragments), traces of crushed stone and organics, underlain by silty clay, overlying glacial till (silty clay with sand and gravel) and shale bedrock. The boreholes were terminated at a maximum depth of 23.93mbgs.

Groundwater was encountered within the bedrock at depths ranging from approximately 2.1 to 23.24 mbgs.

Site geology details are provided in the Soil Profile and Test Data Sheets provided in Appendix 1.

### 5.2 Groundwater Elevations, Flow Direction, and Hydraulic Gradient

Groundwater levels were measured during the groundwater sampling event on April 28, 2021, using an electronic water level meter. Groundwater levels are summarized below in Table 5.

<b>Borehole Location</b>	<b>Ground Surface Elevation (m)</b>	<b>Water Level Depth (m below grade)</b>	<b>Water Level Elevation (m ASL)</b>	<b>Date of Measurement</b>
MW1	62.32	1.51	60.81	April 28, 2021
MW2	62.12	1.16	60.96	April 28, 2021
MW3	62.69	Dry	--	April 28, 2021
BH1-21	62.29	10.35	51.94	April 28, 2021
BH2-21	62.37	23.24	39.13	April 28, 2021
BH3-21	62.67	3.59	59.08	April 28, 2021

Based on the shallow wells, groundwater elevations measured during the sampling events, groundwater contour mapping was completed. Groundwater contours are shown on Drawing PE4247-3. Based on the contour mapping,

groundwater flow at the subject site is in a northerly direction. A horizontal hydraulic gradient of approximately 0.15 m/m was calculated.

### 5.3 Fine-Coarse Soil Texture

Grain-size analysis was not completed for the Phase II ESA Property. As such, the more stringent, coarse-grained soil standards were used.

### 5.4 Soil: Field Screening

Field screening of the soil samples collected during drilling resulted in vapour readings ranging from 0 to 14.2 ppm. The field screening results of each individual soil sample are provided on the Soil Profile and Test Data Sheets appended to this report.

### 5.5 Soil Quality

Three (3) soil samples including a duplicate sample were submitted for BTEX, PHCs (F1-F4), PAHs, VOCs, and/or metals including mercury and hexavalent chromium as well as EC/SAR analysis. The results of the 2016 Pinchin and the recent analytical tests results are presented below in Tables 6 through 10. The laboratory certificate of analysis is provided in Appendix 1.

<b>TABLE 6: Analytical Test Results – Soil BTEX and PHCs F<sub>1</sub>-F<sub>4</sub></b>					
Parameter	MDL (µg/g)	Soil Samples (µg/g) April 15, 2016			MECP Table 7 Residential Standards (µg/g)
		MW-1-SS2	MW-2-SS2	MW-3-SS2

The soil pH and sodium absorption ratio (SAR) are in compliance with the selected MECP standards. The electrical conductivity (EC) is in excess of the MECP Table 7 Residential Standards. It should be noted that although the use of road salt was identified as an APEC, an exception has been made under the Section 49.1 of O.Reg. 153/04.

The analytical results for BTEX, PHCs, PAHs, VOCs and metals including pH and EC/SAR tested in soil are shown on Drawings PE4247-4, PE4247-5 and PE4247-6 - Analytical Testing Plans.

The maximum concentrations of analyzed parameters in the soil at the site are summarized below in Table 11.

<b>TABLE 11: Maximum Concentrations – Soil</b>

Note: ▪ <b><u>Bold and underlined</u></b> – Parameter exceeds the selected MECP standards			

No other parameters were identified above the laboratory method detection limits.

## 5.6 Groundwater Quality

Groundwater samples from monitoring wells installed in BH1-21 and BH3-21 including a duplicate sample from BH3-21 were submitted for laboratory analysis of BTEX and PHC (fractions, F1-F4) and/or VOC analyses. The groundwater samples were obtained from the screened intervals noted in Table 2. The results of the analytical testing are presented in Tables 12 and 13. The laboratory certificates of analysis are provided in Appendix 1.

<b>TABLE 12: Analytical Test Results – Groundwater BTEX and PHCs</b>

- NA – not analyzed for this parameter
- and Underlined** – parameter exceeds the selected MECP Standards

No detectable PHC concentrations were identified in the groundwater samples analyzed. No BTEX parameters were identified in BH3-21.

Based on the most recent groundwater sampling event, BTEX concentration in excess of the selected MECP Table 7 Standards was identified in BH1-GW1.

The analytical results for BTEX and PHCs tested in groundwater are shown on Drawing PE4247-7–Analytical Testing Plan – Groundwater.

The maximum concentrations of analyzed parameters in the groundwater at the site are summarized below in Table 14.

Parameter	Maximum Concentration (µg/g)	Borehole	Screened Interval (m BGS)
Benzene	2.6	BH1-GW1	9.85-12.85m
Bromodichloromethane	0.9		
Chloroform	16.5		
Toluene	6.4		
Xylenes	0.6		

Remaining parameters analysed were not identified above the laboratory method detection limits.

## 5.7 Quality Assurance and Quality Control Results

All samples submitted as part of the April 2021 sampling events were handled in accordance with the Analytical Protocol with respect to preservation method, storage requirement, and container type. As per Subsection 47(3) of O.Reg. 153/04, as amended, under the Environmental Protection Act, a Certificate of Analysis has been received for each sample submitted for analysis and all Certificates of Analysis are appended to this report.

A duplicate soil sample and groundwater sample (DUP) were obtained from BH1-AU2/SS3 and BH3-GW1 and analyzed for BTEX and VOCs. Test results for the duplicate soil sample were non detect above the laboratory limits. Test results for the duplicate groundwater sample and RPD calculations are provided below in Table 15.

Parameter	BH3-GW1	DUP	RPD (%)	QA/QC Results
Chloroform	0.5	0.6	18.18	Within the acceptable range

The remainder of the test results for the duplicate water sample were non-detect above the laboratory detection limit.

Based on the analytical laboratory results, it is our opinion that the overall quality of the field data collected during this Phase II-ESA is sufficient to meet the overall objectives of this assessment.

## 5.8 Phase II Conceptual Site Model

The following section has been prepared in accordance with the requirements of O.Reg. 153/04, as amended by the Environmental Protection Act. Conclusions and recommendations are discussed in a subsequent section.

### Site Description

#### Potentially Contaminating Activity and Areas of Potential Environmental Concern

As presented in Table 1 in Section 3.3 of this report on- and off-site PCAs are considered to results in the following three APECs on the Phase II ESA Property:

- APEC 1: Resulting from fill material of unknown quality, associated with the redevelopment of the site in the 1960s (PCA 30).
- APEC 2: Resulting from the use of road salt for de-icing purpose on the asphaltic paved concrete parking lot and walkways (PCA Other).
- APEC 3: Resulting from the presence of former retail fuel outlet and current automotive repair garage at 845 Carling Avenue (PCA 28, PCA 52).

#### Contaminants of Potential Concern

Based on the APECs identified on the Phase II ESA Property, the contaminants of potential concern (CPCs) present in soil and/or groundwater include:

- Benzene, toluene, ethylbenzene, and xylenes (BTEX);
- Petroleum hydrocarbons (PHCs, Fractions F<sub>1</sub>-F<sub>4</sub>);
- Polycyclic aromatic compounds (PAHs);
- Metals, Hg and CrVI; and
- Volatile organic compounds (VOCs).

#### Subsurface Structures and Utilities

The Phase II ESA Property is situated in a municipally serviced area. Underground utility services on the Phase II ESA Property include natural gas, electricity, municipal water and sewer services. These services enter the Phase II ESA Property from Carling Avenue and Preston Street.

Based on the findings of the Phase II ESA, underground utilities are not expected to affect contaminant distribution and transport.

## **Physical Setting**

### **Site Stratigraphy**

The site stratigraphy, from ground surface to the deepest aquifer or aquitard investigated, is illustrated on Drawings PE4247-4A, 4B, 5A, 5B, 6A, 6B, 7A and 7B. The stratigraphy consists of:

- An asphaltic concrete structure of approximately 0.05 to 0.08 m thick, which overlies a fill material consisting of silty sand with crushed stone. This fill was encountered in BH1-21, BH3-21 and BH6-21 extending to depths of 0.76 to 0.91 mbgs. Groundwater was not encountered in this layer.
- Fill material consisting of silty sand or silty clay with crushed stone and traces of gravel and topsoil and traces of demolition debris. Fill material was encountered in all of the boreholes and extended to depths of approximately 1.09 to 1.22 mbgs. Groundwater was not encountered in this layer.
- Limestone bedrock was encountered in boreholes BH1-21, BH2-21 and BH3-21 and terminated at a maximum depth of 23.93 mbgs. Practical refusal to augering was encountered at BH4-21, BH5-21 and BH6-21 at depths ranging from 0.91 to 1.45 mbgs. Groundwater was encountered in this layer at BH1-21, BH2-21 and BH3-21.

### **Hydrogeological Characteristics**

Groundwater at the Phase II ESA Property was encountered in the bedrock. During the most recent groundwater monitoring event, groundwater flow was measured in a northerly direction, with a hydraulic gradient of 0.15 m/m. Groundwater contours are shown on Drawing PE4247-3 – Test Hole Location Plan.

### **Approximate Depth to Bedrock**

Bedrock was encountered during the drilling program at depths ranging from approximately 0.91 to 1.45 mbgs.

### **Approximate Depth to Water Table**

The depth to the water table at the subject site varies between approximately 2.1 to 23.24 m below existing grade.

### **Sections 35, 41 and 43.1 of the Regulation**

Non-potable groundwater conditions, as defined in Section 35 of O.Reg. 153/04, were selected as the Phase II ESA Property is situated in a municipally serviced area and residential land use standards were selected based on the proposed development.

Section 41 of the O.Reg. 153/04 does not apply to the Phase II ESA Property, as there are no areas of natural significance or bodies of water located on or within 30 m of the Phase II ESA Property. The Phase II ESA Property is not considered to be environmentally sensitive.

Section 43.1 of O.Reg. 153/04 does apply to the Phase II ESA Property as bedrock is located less than 2 m below ground surface and thus, the site is defined as a shallow soil property.

### **Fill Placement**

Two fill material layers were encountered during the subsurface program. The first layer consisted of silty sand with crushed stone, and traces of clay, which extended to depths of approximately 0.76 to 0.91 mbgs. The second layer consisted of silty sand with gravel, traces of topsoil and demolition debris, which extended to depths ranging from 1.09 to 1.22 mbgs.

### **Existing Buildings and Structures**

A 2-storey, slab-on-grade commercial building constructed circa early 1960s occupies the eastern portion of the Phase II ESA Property. The building exterior is finished in brick with a flat tar and gravel style roof. The building is heated and cooled by a natural gas fired HVAC roof mounted unit with electrical baseboard heaters for secondary heating.

No other buildings or above-grade structures are present on the Phase II ESA Property.

### **Proposed Buildings and Other Structures**

The proposed site development for the Phase II ESA Property will include a 60-storey residential building with ground floor commercial space and 6 levels of underground parking.

## **Areas of Natural Significance**

No areas of natural significance were identified in the Phase I ESA Study Area.

## **Water Bodies**

Dow's Lake is located approximately 175 m southeast of the Phase II ESA Property. No other natural bodies were identified in the Phase I ESA Study Area.

## **Environmental Condition**

### **Areas Where Contaminants are Present**

Based on the analytical results for soil and groundwater, contaminants are present in the fill material on the western portion of the Phase II ESA Property, and in the groundwater below the western portion of the Phase II ESA Property.

### **Types of Contaminants**

Based on the PCAs identified at the Phase II ESA Property, the Contaminants of Concern (COCs) identified in the soil at the Phase II ESA Property included lead (Pb) and mercury (Hg) and several PAH parameters.

The COCs identified in the groundwater at the Phase II ESA Property include Benzene. Chloroform was also identified in the groundwater in excess of the selected standards, however, the presence of chloroform at the time of the testing is a result of the municipal water used for bedrock coring. It is expected that the chloroform concentration will dissipate in the near future.

### **Contaminated Media**

Based on the findings of the Phase II ESA, the concentration of lead, mercury, and several PAH parameters at BH1-21 exceed MECP Table 7 Standards for soil.

The analyzed groundwater sample for BH1-21 exceeded MECP Table 7 Standard for benzene.

### **What Is Known About Areas Where Contaminants Are Present**

The impacted soil identified in BH1-21 is considered to have originated on-site from former residential buildings during site redevelopment in approximately the early 1960s.

It is suspected that the small concentrations of benzene present in the groundwater in BH1-21 above MECP Table 7 Standards is a result of the groundwater monitoring well not properly developed and should be retested when it stabilizes.

### **Distribution and Migration of Contaminants**

A layer of impacted fill material was identified in the western portion of subject site. This layer was observed to be approximately 1.2 metres thick. Based on the observations made during the field program, in conjunction with analytical test results, it is expected that the majority of the fill material is impacted with metals and/or PAHs.

The groundwater results from BH1 are not considered to be representative of the groundwater beneath the Phase II ESA Property given the presence of the chloroform.

### **Discharge of Contaminants**

The metals and PAH impacted fill material identified in the western portion of the subject site is considered to be the result of site redevelopment, or from the importation of fill material of a poor quality.

It is suspected that the small concentrations of benzene present in the groundwater in BH1-21 above MECP Table 7 Standards is a result of the groundwater monitoring well not properly developed and should be retested when it stabilizes.

### **Climatic and Meteorological Conditions**

In general, climatic and meteorological conditions have the potential to affect contaminant distribution. Two (2) ways by which climatic and meteorological conditions may affect contaminant distribution include the downward leaching of contaminants by means of the infiltration of precipitation, and the migration of contaminants via groundwater levels and/or flow, which may fluctuate seasonally.

Based on the analytical results contaminant distribution is not considered to have occurred on the Phase II ESA Property.

### **Potential for Vapour Intrusion**

Based on the findings of the Phase II ESA and lack of building structures below the ground surface, there is no potential for vapour intrusion on the Phase II ESA Property.

## 6.0 CONCLUSIONS

### Assessment

A Phase II ESA was conducted for the property addressed 829 Carling Avenue, in the Ottawa, Ontario. The purpose of the Phase II ESA was to address potentially contaminating activities (PCAs) that were identified during the Phase I ESA and considered to result in areas of potential environmental concern (APECs) on the Phase II ESA Property.

The subsurface investigation consisted of six (6) boreholes, of which three (3) were instrumented with groundwater monitoring wells. The general soil profile encountered during the field program consisted of fill material consisting of silty sand and crushed stone, followed by another fill layer consisting of silty sand with demolition debris (concrete and brick fragments), crushed stone, and some gravel and organics, overlying shallow limestone bedrock.

Four (4) soil samples, including a duplicate sample, were submitted for laboratory analysis of benzene, toluene, ethylbenzene and xylenes (BTEX), petroleum hydrocarbons (PHCs, Fractions F<sub>1</sub>-F<sub>4</sub>), Polycyclic Aromatic Hydrocarbons (PAHs), and metals (including hydride forming compounds: arsenic (As), Antimony (Sb), Selenium (Se)), mercury (Hg) and hexavalent chromium (CrVI). No BTEX/PHC concentrations were identified in any of the soil samples analysed. Concentrations of several PAH parameters and metal parameters were identified above the selected MECP Table 7 Standards in soil sample BH1-AU1/SS3.

Groundwater samples from monitoring wells MW-1, MW-2, BH1-21, BH2-21 and BH3-21 were collected during the interim of April 18 to April 28, 2021. No free product or petroleum hydrocarbon sheen was noted on the purge water during the groundwater sampling event.

Groundwater samples were analyzed for BTEX, PHCs and/or VOCs. A concentration of benzene was identified at BH1-21, in excess of the selected MECP Table 7 Standards. The groundwater from this well is indicate that the well has not stabilized. Additional groundwater analysis is recommended to confirm the true groundwater quality. All other groundwater results comply with the MECP Table 7 Standards.

## **Recommendations**

It is our understanding that the Phase II ESA Property will be redeveloped with a 60-storey residential building with ground-floor commercial space and underground parking. Due to the change in land use to a more sensitive land use (commercial parking lot to residential), a record of site condition (RSC) will be required as per O.Reg 154/03.

### Soils

Fill material on the northeastern corner of the Phase II ESA Property contained PAH concentrations in excess of the Table 7 Standards. Soil/fill in excess of the MECP Standards, will need to be removed and disposed of at an approved waste disposal facility.

Subsequent to demolition and prior to construction, a test pit program to assess the soil for off-site disposal purposes and at the same time delineate the PAH exceedances identified is recommended.

In accordance with the new Excess Soil Reg.406/19, additional testing of the soil will be required prior to off-site disposal at a receiving site.

### Groundwater

It is expected that the small concentrations of benzene present in the groundwater in BH1-21 above MECP Table 7 Standards is a result of the groundwater monitoring well not properly developed and should be retested when it stabilizes.

### Monitoring Wells

If the monitoring wells installed on the subject site are not going to be used in the future, or will be destroyed during site redevelopment, they should be abandoned according to Ontario Regulation 903. The wells will be registered with the MECP under this regulation.

## 7.0 STATEMENT OF LIMITATIONS

This Phase II - Environmental Site Assessment report has been prepared under the supervision of a Qualified Person, in general accordance with O.Reg. 153/04, as amended, and meets the requirements of CSA Z769-00. The conclusions presented herein are based on information gathered from a limited sampling and testing program. The test results represent conditions at specific test locations at the time of the field program.

The client should be aware that any information pertaining to soils and all test hole logs are furnished as a matter of general information only and test hole descriptions or logs are not to be interpreted as descriptive of conditions at locations other than those of the test holes themselves.

Should any conditions be encountered at the subject site and/or historical information that differ from our findings, we request that we be notified immediately in order to allow for a reassessment.

This report was prepared for the sole use of Claridge Homes. Notification from Claridge Homes and Paterson Group will be required to release this report to any other party.

## 1.0 SAMPLING PROGRAM

Paterson Group Inc. (Paterson) was commissioned by Vincent Denomme of Claridge Homes to conduct a Phase II Environmental Site Assessment (ESA) for the Phase II ESA Property, addressed 829 Carling Avenue, Ottawa, Ontario.

The Phase II ESA was carried out to address the APECs identified in the Paterson Phase I ESA. The following subsurface investigation program was developed to identify and delineate potential environmental concerns.

<b>Borehole</b>	<b>Location &amp; Rationale</b>	<b>Proposed Depth &amp; Rationale</b>
BH1-21	Assess soil and/or groundwater conditions on and beneath the Phase I Property due to APECs 1, 2 and 3.	Boreholes to be advanced to approximately 10.8 mbgs to intercept water table to install groundwater monitoring well.
BH2-21	Assess soil and groundwater conditions on and beneath the Phase I Property due to APECs 1, 2 and 3.	Boreholes to be advanced to approximately 23 mbgs to install a deep groundwater monitoring well.
BH3-21	Assess soil and groundwater conditions on and beneath the Phase I Property due to APECs 1 and 2.	Boreholes to be advanced to approximately 7.6 mbgs to intercept water table to install groundwater monitoring well.
BH4-21	Assess soil conditions on the Phase I Property due to APECs 1, 2 and 3.	Boreholes to be advanced to approximately 1.4 mbgs.
BH5-21	Assess soil conditions on the Phase I Property due to APECs 1, 2 and 3.	Boreholes to be advanced to approximately 1.5 mbgs.
BH5-21	Assess soil conditions on the Phase I Property due to APECs 1, 2 and 3.	Boreholes to be advanced to approximately 0.9 mbgs.

At each borehole, split-spoon samples of overburden soils will be obtained at 0.76 m (2'6") intervals until groundwater was intercepted. All soil samples will be retained, and samples will be selected for submission following a preliminary screening analysis.

Following borehole drilling, monitoring wells will be installed in selected boreholes (as above) for the measurement of water levels and the collection of groundwater samples. Borehole locations are shown on the Test Hole Location Plan appended to the main report.

## 2.0 ANALYTICAL TESTING PROGRAM

The analytical testing program for soil at the subject site is based on the following general considerations:

- At least one sample from each borehole should be submitted, in order to delineate the horizontal extent of contamination across the site.
- At least one sample from each stratigraphic unit should be submitted, in order to delineate the vertical extent of contamination at the site.
- In boreholes where there is visual or olfactory evidence of contamination, or where organic vapour meter or photoionization detector readings indicate the presence of contamination, the 'worst-case' sample from each borehole should be submitted for comparison with MECP's site condition standards.
- In boreholes with evidence of contamination as described above, a sample should be submitted from the stratigraphic unit below the 'worst-case' sample to determine whether the contaminant(s) have migrated downward.
- Parameters analyzed should be consistent with the Contaminants of Potential Concern identified in the Phase I ESA.

The analytical testing program for groundwater at the subject site is based on the following general considerations:

- Groundwater monitoring wells should be installed in all boreholes with visual or olfactory evidence of soil contamination, in stratigraphic units where soil contamination was encountered, where those stratigraphic units are at or below the water table (i.e. a water sample can be obtained).
- Groundwater monitoring well screens should straddle the water table at sites where the contaminants of concern are suspected to be LNAPLs.
- At least one groundwater monitoring well should be installed in a stratigraphic unit below the suspected contamination, where said stratigraphic unit is water-bearing.
- Parameters analyzed should be consistent with the Contaminants of Concern identified in the Phase I ESA and with the contaminants identified in the soil samples.

## 3.0 STANDARD OPERATING PROCEDURES

### 3.1 Environmental Drilling Procedure

#### Purpose

The purpose of environmental boreholes is to identify and/or delineate contamination within the soil and/or to install groundwater monitoring wells in order to identify contamination within the groundwater.

#### Equipment

The following is a list of equipment that is in addition to regular drilling equipment stated in the geotechnical drilling SOP:

- glass soil sample jars
- two buckets
- cleaning brush (toilet brush works well)
- dish detergent
- methyl hydrate
- water (if not available on site - water jugs available in trailer)
- latex or nitrile gloves (depending on suspected contaminant)
- RKI Eagle organic vapour meter or MiniRae photoionization detector (depending on contamination suspected)

#### Determining Borehole Locations

If conditions on site are not as suspected, and planned borehole locations cannot be drilled, **call the office to discuss**. Alternative borehole locations will be determined in conversation with the field technician and supervising engineer.

After drilling is completed a plan with the borehole locations must be provided. Distances should be measured using a measuring tape or wheel rather than paced off. Elevations were surveyed at geodetic elevations by Paterson personnel.

#### Drilling Procedure

The actual drilling procedure for environmental boreholes is the same as geotechnical boreholes (see SOP for drilling and sampling) with a few exceptions as follows:

- Continuous split spoon samples (every 0.6 m or 2') or semi-continuous (every 0.76 m or 2'6") are required.

- Make sure samples are well sealed in plastic bags with no holes prior to screening and are kept cool but unfrozen.
- If sampling for VOCs, BTEX, or PHCs F1, a soil core from each soil sample which may be analyzed must be taken and placed in the laboratory-provided methanol vial.
- Note all and any odours or discolouration of samples.
- Split spoon samplers must be washed between samples.
- If obvious contamination is encountered, continue sampling until vertical extent of contamination is delineated.
- As a general rule, environmental boreholes should be deep enough to intercept the groundwater table (unless this is impossible/impractical - call project manager to discuss).
- If at all possible, soil samples should be submitted to a preliminary screening procedure on site, either using a RKI Eagle, PID, etc. depending on type of suspected contamination.

### **Spoon Washing Procedure**

All sampling equipment (spilt spoons, etc.) must be washed between samples in order to prevent cross contamination of soil samples.

- Obtain two buckets of water (preferably hot if available)
- Add a small amount of dish soap to one bucket
- Scrub spoons with brush in soapy water, inside and out, including tip
- Rinse in clean water
- Apply a small amount of methyl hydrate to the inside of the spoon. (A spray bottle or water bottle with a small hole in the cap works well)
- Allow to dry (takes seconds)
- Rinse with distilled water, a spray bottle works well.

The methyl hydrate eliminates any soap residue that may be on the spoon, and is especially important when dealing with suspected VOCs.

### **Screening Procedure**

The RKI Eagle is used to screen most soil samples, particularly where petroleum hydrocarbon contamination is suspected. The MiniRae is used when VOCs are suspected, however it also can be useful for detecting petroleum. These tools are for screening purposes only and cannot be used in place of laboratory testing. Vapour results obtained from the RKI Eagle and the PID are relative and must be interpreted.

Screening equipment should be calibrated on an approximately monthly basis, more frequently if heavily used.

- Samples should be brought to room temperature; this is specifically important in colder weather. Soil must not be frozen.
- Turn instrument on and allow to come to zero - calibrate if necessary
- If using RKI Eagle, ensure instrument is in methane elimination mode unless otherwise directed.
- Ensure measurement units are ppm (parts per million) initially. RKI Eagle will automatically switch to %LEL (lower explosive limit) if higher concentrations are encountered.
- Break up large lumps of soil in the sample bag, taking care not to puncture bag.
- Insert probe into soil bag, creating a seal with your hand around the opening.
- Gently manipulate soil in bag while observing instrument readings.
- Record the highest value obtained in the first 15 to 25 seconds
- Make sure to indicate scale (ppm or LEL); also note which instrument was used (RKI Eagle 1 or 2, or MiniRae).
- Jar samples and refrigerate as per Sampling and Analysis Plan.

## 3.2 Monitoring Well Installation Procedure

### Equipment

- 5' x 2" [1.52 m x 50 mm] threaded sections of Schedule 40 PVC slotted well screen (5' x 1 ¼" [1.52 m x 32 mm] if installing in cored hole in bedrock)
- 5' x 2" [1.52 m x 50 mm] threaded sections of Schedule 40 PVC riser pipe (5' x 1 ¼" [1.52 m x 32 mm] if installing in cored hole in bedrock)
- Threaded end-cap
- Slip-cap or J-plug
- Asphalt cold patch or concrete
- Silica Sand
- Bentonite chips (Holeplug)
- Steel flushmount casing

### Procedure

- Drill borehole to required depth, using drilling and sampling procedures described above.
- If borehole is deeper than required monitoring well, backfill with bentonite chips to required depth. This should only be done on wells where contamination is not suspected, in order to prevent downward migration of contamination.
- Only one monitoring well should be installed per borehole.
- Monitoring wells should not be screened across more than one stratigraphic unit to prevent potential migration of contaminants between units.
- Where LNAPLs are the suspected contaminants of concern, monitoring wells should be screened straddling the water table in order to capture any free product floating on top of the water table.
- Thread the end cap onto a section of screen. Thread second section of screen if required. Thread risers onto screen. Lower into borehole to required depth. Ensure slip-cap or J-plug is inserted to prevent backfill materials entering well.
- As drillers remove augers, backfill borehole annulus with silica sand until the level of sand is approximately 0.3 m above the top of the screen.
- Backfill with holeplug until at least 0.3 m of holeplug is present above the top of the silica sand.
- Backfill remainder of borehole with holeplug or with auger cuttings (if contamination is not suspected).
- Install flushmount casing. Seal space between flushmount and borehole annulus with concrete, cold patch, or holeplug to match surrounding ground surface.

### 3.3 Monitoring Well Sampling Procedure

#### Equipment

- Water level metre or interface probe on hydrocarbon/LNAPL sites
- Spray bottles containing water and methanol to clean water level tape or interface probe
- Peristaltic pump
- Polyethylene tubing for peristaltic pump
- Flexible tubing for peristaltic pump
- Latex or nitrile gloves (depending on suspected contaminant)
- Allen keys and/or 9/16" socket wrench to remove well caps
- Graduated bucket with volume measurements
- pH/Temperature/Conductivity combo pen
- Laboratory-supplied sample bottles

#### Sampling Procedure

- Locate well and use socket wrench or Allan key to open metal flush mount protector cap. Remove plastic well cap.
- Measure water level, with respect to existing ground surface, using water level meter or interface probe. If using interface probe on suspected NAPL site, measure the thickness of free product.
- Measure total depth of well.
- Clean water level tape or interface probe using methanol and water. Change gloves between wells.
- Calculate volume of standing water within well and record.
- Insert polyethylene tubing into well and attach to peristaltic pump. Turn on peristaltic pump and purge into graduated bucket. Purge at least three well volumes of water from the well. Measure and record field chemistry. Continue to purge, measuring field chemistry after every well volume purged, until appearance or field chemistry stabilizes.
- Note appearance of purge water, including colour, opacity (clear, cloudy, silty), sheen, presence of LNAPL, and odour. Note any other unusual features (particulate matter, effervescence (bubbling) of dissolved gas, etc.).
- Fill required sample bottles. If sampling for metals, attach 75-micron filter to discharge tube and filter metals sample. If sampling for VOCs, use low flow rate to ensure continuous stream of non-turbulent flow into sample bottles. Ensure no headspace is present in VOC vials.
- Replace well cap and flushmount casing cap.

#### **4.0 QUALITY ASSURANCE/QUALITY CONTROL (QA/QC)**

The QA/QC program for this Phase II ESA is as follows:

- All non-dedicated sampling equipment (split spoons) will be decontaminated according to the SOPs listed above.
- All groundwater sampling equipment is dedicated (polyethylene and flexible peristaltic tubing is replaced for each well).
- Where groundwater samples are to be analyzed for VOCs, one laboratory-provided trip blank will be submitted for analysis with every laboratory submission.
- Approximately one (1) field duplicate will be submitted for every ten (10) samples submitted for laboratory analysis. A minimum of one (1) field duplicate per project will be submitted. Field duplicates will be submitted for soil and groundwater samples
- Where combo pens are used to measure field chemistry, they will be calibrated on an approximately monthly basis, according to frequency of use.

## 5.0 DATA QUALITY OBJECTIVES

The purpose of setting data quality objectives (DQOs) is to ensure that the level of uncertainty in data collected during the Phase II ESA is low enough that decision-making is not affected, and that the overall objectives of the investigation are met.

The quality of data is assessed by comparing field duplicates with original samples. If the relative percent difference (RPD) between the duplicate and the sample is within 20%, the data are considered to be of sufficient quality so as not to affect decision-making. The RPD is calculated as follows:

$$RPD = \left| \frac{x_1 - x_2}{(x_1 + x_2)/2} \right| \times 100\%$$

Where  $x_1$  is the concentration of a given parameter in an original sample and  $x_2$  is the concentration of that same parameter in the field duplicate sample.

For the purpose of calculating the RPD, it is desirable to select field duplicates from samples for which parameters are present in concentrations above laboratory detection limits, i.e. samples which are expected to be contaminated. If parameters are below laboratory detection limits for selected samples or duplicates, the RPD may be calculated using a concentration equal to one half (0.5 x) the laboratory detection limit.

It is also important to consider data quality in the overall context of the project. For example, if the DQOs are not met for a given sample, yet the concentrations of contaminants in both the sample and the duplicate exceed the MOE site remediation standards by a large margin, the decision-making usefulness of the sample may not be considered to be impaired. The proximity of other samples which meet the DQOs must also be considered in developing the Phase II Conceptual Site Model; often there are enough data available to produce a reliable Phase II Conceptual Site Model even if DQOs are not met for certain individual samples.

These considerations are discussed in the body of the report.

## 6.0 PHYSICAL IMPEDIMENTS TO SAMPLING & ANALYSIS PLAN

Physical impediments to the Sampling and Analysis plan may include:

- The location of underground utilities
- Poor recovery of split-spoon soil samples
- Insufficient groundwater volume for groundwater samples
- Breakage of sampling containers following sampling or while in transit to the laboratory
- Elevated detection limits due to matrix interference (generally related to soil colour or presence of organic material)
- Elevated detection limits due to high concentrations of certain parameters, necessitating dilution of samples in laboratory
- Drill rig breakdowns
- Winter conditions
- Other site-specific impediments

Site-specific impediments to the Sampling and Analysis plan are discussed in the body of the Phase II ESA report.

# SYMBOLS AND TERMS

## SOIL DESCRIPTION

Behavioural properties, such as structure and strength, take precedence over particle gradation in describing soils. Terminology describing soil structure are as follows:

Desiccated	-	having visible signs of weathering by oxidation of clay minerals, shrinkage cracks, etc.
Fissured	-	having cracks, and hence a blocky structure.
Varved	-	composed of regular alternating layers of silt and clay.
Stratified	-	composed of alternating layers of different soil types, e.g. silt and sand or silt and clay.
Well-Graded	-	Having wide range in grain sizes and substantial amounts of all intermediate particle sizes (see Grain Size Distribution).
Uniformly-Graded	-	Predominantly of one grain size (see Grain Size Distribution).

The standard terminology to describe the relative strength of cohesionless soils is the compactness condition, usually inferred from the results of the Standard Penetration Test (SPT) 'N' value. The SPT N value is the number of blows of a 63.5 kg hammer, falling 760 mm, required to drive a 51 mm O.D. split spoon sampler 300 mm into the soil after an initial penetration of 150 mm. An SPT N value of "P" denotes that the split-spoon sampler was pushed 300 mm into the soil without the use of a falling hammer.

Compactness Condition	'N' Value	Relative Density %
Very Loose	<4	<15
Loose	4-10	15-35
Compact	10-30	35-65
Dense	30-50	65-85
Very Dense	>50	>85

The standard terminology to describe the strength of cohesive soils is the consistency, which is based on the undisturbed undrained shear strength as measured by the in situ or laboratory shear vane tests, unconfined compression tests, or occasionally by the Standard Penetration Test (SPT). Note that the typical correlations of undrained shear strength to SPT N value (tabulated below) tend to underestimate the consistency for sensitive silty clays, so Paterson reviews the applicable split spoon samples in the laboratory to provide a more representative consistency value based on tactile examination.

Consistency	Undrained Shear Strength (kPa)	'N' Value
Very Soft	<12	<2
Soft	12-25	2-4
Firm	25-50	4-8
Stiff	50-100	8-15
Very Stiff	100-200	15-30
Hard	>200	>30

## SYMBOLS AND TERMS (continued)

### SOIL DESCRIPTION (continued)

Cohesive soils can also be classified according to their “sensitivity”. The sensitivity,  $S_t$ , is the ratio between the undisturbed undrained shear strength and the remoulded undrained shear strength of the soil. The classes of sensitivity may be defined as follows:

Low Sensitivity:	$S_t < 2$
Medium Sensitivity:	$2 < S_t < 4$
Sensitive:	$4 < S_t < 8$
Extra Sensitive:	$8 < S_t < 16$
Quick Clay:	$S_t > 16$

### ROCK DESCRIPTION

The structural description of the bedrock mass is based on the Rock Quality Designation (RQD).

The RQD classification is based on a modified core recovery percentage in which all pieces of sound core over 100 mm long are counted as recovery. The smaller pieces are considered to be a result of closely-spaced discontinuities (resulting from shearing, jointing, faulting, or weathering) in the rock mass and are not counted. RQD is ideally determined from NQ or larger size core. However, it can be used on smaller core sizes, such as BQ, if the bulk of the fractures caused by drilling stresses (called “mechanical breaks”) are easily distinguishable from the normal in situ fractures.

RQD %	ROCK QUALITY
90-100	Excellent, intact, very sound
75-90	Good, massive, moderately jointed or sound
50-75	Fair, blocky and seamy, fractured
25-50	Poor, shattered and very seamy or blocky, severely fractured
0-25	Very poor, crushed, very severely fractured

### SAMPLE TYPES

SS	-	Split spoon sample (obtained in conjunction with the performing of the Standard Penetration Test (SPT))
TW	-	Thin wall tube or Shelby tube, generally recovered using a piston sampler
G	-	"Grab" sample from test pit or surface materials
AU	-	Auger sample or bulk sample
WS	-	Wash sample
RC	-	Rock core sample (Core bit size BQ, NQ, HQ, etc.). Rock core samples are obtained with the use of standard diamond drilling bits.

## SYMBOLS AND TERMS (continued)

### PLASTICITY LIMITS AND GRAIN SIZE DISTRIBUTION

WC%	-	Natural water content or water content of sample, %
LL	-	Liquid Limit, % (water content above which soil behaves as a liquid)
PL	-	Plastic Limit, % (water content above which soil behaves plastically)
PI	-	Plasticity Index, % (difference between LL and PL)
D <sub>xx</sub>	-	Grain size at which xx% of the soil, by weight, is of finer grain sizes These grain size descriptions are not used below 0.075 mm grain size
D <sub>10</sub>	-	Grain size at which 10% of the soil is finer (effective grain size)
D <sub>60</sub>	-	Grain size at which 60% of the soil is finer
C <sub>c</sub>	-	Concavity coefficient = $(D_{30})^2 / (D_{10} \times D_{60})$
C <sub>u</sub>	-	Uniformity coefficient = $D_{60} / D_{10}$

C<sub>c</sub> and C<sub>u</sub> are used to assess the grading of sands and gravels:

Well-graded gravels have:  $1 < C_c < 3$  and  $C_u > 4$

Well-graded sands have:  $1 < C_c < 3$  and  $C_u > 6$

Sands and gravels not meeting the above requirements are poorly-graded or uniformly-graded.

C<sub>c</sub> and C<sub>u</sub> are not applicable for the description of soils with more than 10% silt and clay (more than 10% finer than 0.075 mm or the #200 sieve)

### CONSOLIDATION TEST

p' <sub>o</sub>	-	Present effective overburden pressure at sample depth
p' <sub>c</sub>	-	Preconsolidation pressure of (maximum past pressure on) sample
C <sub>cr</sub>	-	Recompression index (in effect at pressures below p' <sub>c</sub> )
C <sub>c</sub>	-	Compression index (in effect at pressures above p' <sub>c</sub> )
OC Ratio		Overconsolidation ratio = $p'_c / p'_o$
Void Ratio		Initial sample void ratio = volume of voids / volume of solids
W <sub>o</sub>	-	Initial water content (at start of consolidation test)

### PERMEABILITY TEST

k	-	Coefficient of permeability or hydraulic conductivity is a measure of the ability of water to flow through the sample. The value of k is measured at a specified unit weight for (remoulded) cohesionless soil samples, because its value will vary with the unit weight or density of the sample during the test.

**Received: 2016/04/19, 11:15**

Maxxam Analytics has performed all analytical testing herein in accordance with ISO 17025 and the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. All methodologies comply with this document and are validated for use in the laboratory. The methods and techniques employed in this analysis conform to the performance criteria (detection limits, accuracy and precision) as outlined in the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act.

Maxxam Analytics is accredited for all specific parameters as required by Ontario Regulation 153/04. Maxxam Analytics is limited in liability to the actual cost of analysis unless otherwise agreed in writing. There is no other warranty expressed or implied. Samples will be retained at Maxxam Analytics for three weeks from receipt of data or as per contract.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

\* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

- (1) This test was performed by Maxxam Analytics Mississauga
- (2) No lab extraction date is given for F1BTEX & VOC samples that are field preserved with methanol. Extraction date is the date sampled unless otherwise stated.
- (3) All CCME PHC results met required criteria unless otherwise stated in the report. The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following "Alberta Environment's Interpretation of the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil Validation of Performance-Based Alternative Methods September 2003". Documentation is available upon request. Modifications from Reference Method for the Canada-wide Standard for Petroleum Hydrocarbons in Soil-Tier 1 Method: F2/F3/F4 data reported using validated cold solvent extraction instead of Soxhlet extraction.

**GENERAL COMMENTS**

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	3.0°C
-----------	-------

VOC Analysis: Due to insufficient sample volume, samples required dilution. Detection limits were adjusted accordingly.

Sample CFE303-01 : NF/NI=Non Flammable and Non Ignitable

**Results relate only to the items tested.**

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Leachate Blank: A blank matrix containing all reagents used in the leaching procedure. Used to determine any process contamination.

QC Standard: A sample of known concentration prepared by an external agency under stringent conditions. Used as an independent check of method accuracy.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spiked amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than 2x that of the native sample concentration).

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (one or both samples < 5x RDL).

**VALIDATION SIGNATURE PAGE**

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

Ewa Pranjic, M.Sc., C.Chem, Scientific Specialist

**Received: 2016/04/19, 11:15**

- (1) This test was performed by Maxxam Analytics Mississauga
- (2) No lab extraction date is given for F1BTEX & VOC samples that are field preserved with methanol. Extraction date is the date sampled unless otherwise stated.
- (3) All CCME PHC results met required criteria unless otherwise stated in the report. The EWS PHG methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following "Alberta Environment's Interpretation of the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil Validation of Performance-Based Alternative Methods September 2003". Documentation is available upon request. Modifications from Reference Method for the Canada-wide Standard for Petroleum Hydrocarbons in Soil-Tier 1 Method: F2/F3/F4 data reported using validated cold solvent extraction instead of Soxhlet extraction.

**GENERAL COMMENTS**

VOC Analysis: Due to insufficient sample volume, samples required dilution. Detection limits were adjusted accordingly.

Sample CFE303-01 : NF/Ni=Non Flammable and Non Ignitable

Results relate only to the items tested.

N/A = Not Applicable

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Leachate Blank: A blank matrix containing all reagents used in the leaching procedure. Used to determine any process contamination.

QC Standard: A sample of known concentration prepared by an external agency under stringent conditions. Used as an independent check of method accuracy.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spiked amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than 2x that of the native sample concentration).

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (one or both samples < 5x RDL).

**VALIDATION SIGNATURE PAGE**

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

Ewa Pranjic, M.Sc., C.Chem, Scientific Specialist

---

Maxxam has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per section 5.10.2 of ISO/IEC 17025:2005(E), signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

Certificate of Analysis

Report Date: 27-Apr-2021

Client: Paterson Group Consulting Engineers

Order Date: 21-Apr-2021

Client PO: 33066

Project Description: PE4247

**Qualifier Notes:**

***Login Qualifiers :***

Container and COC sample IDs don't match - Moisture taken from sample BH1-AU2/SS3.

*Applies to samples: DUP*

***QC Qualifiers :***

QM-06 : Due to noted non-homogeneity of the QC sample matrix, the spike recoveries were out side the accepted range. Batch data accepted based on other QC.

**Sample Data Revisions**

None

**Work Order Revisions / Comments:**

None

**Other Report Notes:**

n/a: not applicable

ND: Not Detected

MDL: Method Detection Limit

Source Result: Data used as source for matrix and duplicate samples

%REC: Percent recovery.

RPD: Relative percent difference.

NC: Not Calculated

Soil results are reported on a dry weight basis when the units are denoted with 'dry'.

Where %Solids is reported, moisture loss includes the loss of volatile hydrocarbons.

***CCME PHC additional information:***

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.
- When reported, data for F4G has been processed using a silica gel cleanup.

Client: Paterson Group Consulting Engineers

Order Date: 23-Apr-2021

Client PO: 33053

Project Description: PE4247

**Qualifier Notes:**

*QC Qualifiers :*

QM-05 : The spike recovery was outside acceptance limits for the matrix spike due to matrix interference.

**Sample Data Revisions**

None

**Work Order Revisions / Comments:**

None

**Other Report Notes:**

n/a: not applicable

ND: Not Detected

MDL: Method Detection Limit

Source Result: Data used as source for matrix and duplicate samples

%REC: Percent recovery.

RPD: Relative percent difference.

NC: Not Calculated

Soil results are reported on a dry weight basis when the units are denoted with 'dry'.  
Where %Solids is reported, moisture loss includes the loss of volatile hydrocarbons.

Source Result: Data used as source for matrix and duplicate samples  
%REC: Percent recovery.  
RPD: Relative percent difference.  
NC: Not Calculated

***CCME PHC additional information:***

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.
- When reported, data for F4G has been processed using a silica gel cleanup.

Trichlorofluoromethane	40.1	1.0	ug/L	ND	100	60-130			
Vinyl chloride	44.2	0.5	ug/L	ND	111	50-140			
m,p-Xylenes	90.3	0.5	ug/L	ND	113	60-130			
o-Xylene	44.0	0.5	ug/L	ND	110	60-130			
Surrogate: 4-Bromofluorobenzene	69.3		ug/L		86.6	50-140			
Surrogate: Dibromofluoromethane	79.8		ug/L		99.7	50-140			
Surrogate: Toluene-d8	71.2		ug/L		89.0	50-140			

Certificate of Analysis

Client: Paterson Group Consulting Engineers

Client PO: 30926

Report Date: 06-May-2021

Order Date: 30-Apr-2021

Project Description: PE4247

**Qualifier Notes:**

None

**Sample Data Revisions**

None

**Work Order Revisions / Comments:**

None

**Other Report Notes:**

n/a: not applicable

ND: Not Detected

MDL: Method Detection Limit

Source Result: Data used as source for matrix and duplicate samples

%REC: Percent recovery.

RPD: Relative percent difference.

NC: Not Calculated

***CCME PHC additional information:***

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.
- When reported, data for F4G has been processed using a silica gel cleanup.
