PROJECT No.: MH ref. 210292799

RE: 1354 & 1376 Carling Avenue Development – Phase 2 Site Servicing and Storm Water Management for the Future City Park

X:\PROJ/2021\210292700-1356 CARLING AVE PH2-CIVIL\12. DELIVERABLES\JUNE 18 2021 UPDATED PACKAGE\MEMO_1354 CARLING AVE SITE SERVICING DESIGN BRIEF PARK REV 1.DOCX

1. Introduction

1.1. Site Description and Proposed Development

This memo describes the site servicing and stormwater management design and calculations pertaining to the new park development to be constructed at 1354 Carling Avenue. The redevelopment of 1354 and 1376 Carling Avenue consists of multi-storey residential and commercial units. An Urban Design Review Panel (UDRP) review in 2017 found that the proposed development and the surrounding neighborhood lacked parkland and amenity spaces. The URDP recommend incorporating a larger park in a location that would be accessible from outside the site to help address these concerns. As a result, the proposed development was modified to include a park within the southwestern limits of the subject property accessible from Meath Street. The proposed park area will be separated from the main property parcel into new property parcel to be owned by the City.

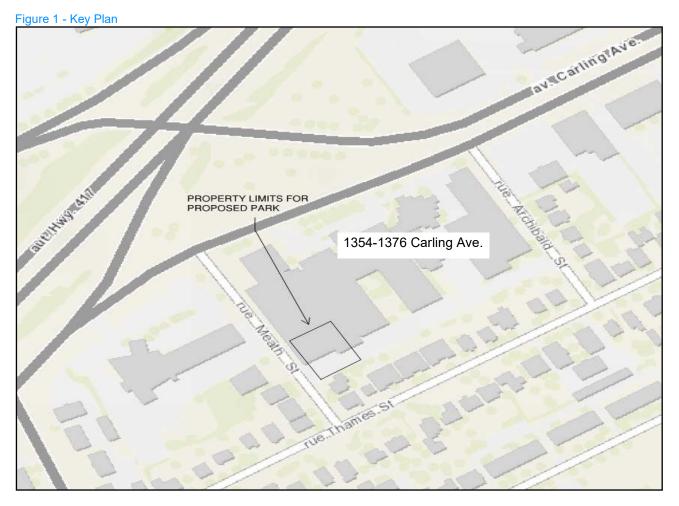

Existing infrastructure in the vicinity of the site is described in **Section 1.4** below. Design drawings for proposed site servicing, grading, and erosion control are provided in **Appendix A**.

1.2. Location Map and Plan

The location of the site is illustrated in **Figure 1**. A detailed site layout is illustrated on the drawings in **Appendix A**.

The proposed park development at 1354 Carling Ave. is entirely within the existing property parcels. The site is located within ward 16, occupied by Councillor Riley Brockington.

DATE: 6/16/2021

1.3. Consultation and Permits

The Planning Committee of the City of Ottawa amended zoning by-law regulations in anticipation for the new development for 1354 Carling Avenue. The amendment consists of zoning the proposed park location to O-1 Parks and Open Space Zone.

1.4. Available Existing Infrastructure

Sewer mapping collected from the City of Ottawa, and related documentation pertaining to the development of phase 1, indicate that the following infrastructure exists in and surrounding the subject site.

Meath Street

- 300mm diameter concrete storm sewer
- 400mm diameter PVC storm sewer
- 525mm diameter PVC storm sewer
- 300mm diameter concrete sanitary sewer
- 150mm diameter PVC watermain

Corresponding structures and services can be found in Figure 2.

Figure 2 - Existing Infrastructure

Existing infrastructure and utilities are shown in detail on Plan C801 found in Appendix A.

2. Storm Servicing and Stormwater Management

2.1. Background

The existing drainage is overland westward towards an existing catch basin located on Meath Street, at the intersection of the existing rear laneway.

The City of Ottawa's Sewer Design Guidelines require the 100-year post-development storm flow to be restricted to the 5-year pre-development runoff with an assumed pre-development coefficient no greater than 0.5.

For the proposed part development, quantity control meeting the City of Ottawa requirements is proposed to be provided through the use of on-site detention. Flow control is to be provided by an ICD and surface storage within the proposed park.

An existing trunk sewer located on Carling Ave currently receives water runoff from the existing site and will be the main sewer that collects water runoff from the new developed stormwater management system that is proposed.

2.2. Storm Servicing Strategy including Analysis of Existing Infrastructure

The stormwater management design has been completed by restricting the 100-year post-development flow to the 5-year pre-development runoff (calculated at a pre-development runoff coefficient of 0.5) to meet the capacity of downstream sewers. The 100-year flow will be detained on site. The required storage volume has been calculated using the Modified Rational Method. Storm water storage will be provided in accordance with the City of Ottawa Sewer Design Guidelines Section 8.3.11.1.

2.3. Proposed Storm Servicing

Proposed storm servicing is indicated on Drawing C801 in **Appendix A**. The proposed predevelopment and post-development catchment areas, runoff coefficients and catchment total areas are indicated on the Drainage Area Plans, also in **Appendix A**.

2.4. Stormwater Quantity Control

2.4.1. Runoff Coefficient and Peak Flows

Table 1 indicates the runoff coefficient for each catchment. The 100-year runoff coefficients include a 25% increase (to a maximum of 1.0) as required by the City of Ottawa Sewer Design Guidelines Section 5.4.5.2.1.

	Pre-Development Runoff Coefficients		
Storm Event	5-Year Storm	100-Year Storm	
Areas Description	Existing	Existing	
Site Area (in ha)	0.14	0.14	
Runoff Coefficient	0.86	1.00	

Intensity (i) is calculated using the formula:

$$i = \frac{A}{(T_d + C)^B}$$

Where A, B and C are all factors of the IDF Return Period, T_d being the time of concentration and A the drainage area (Detailed calculations provided in **Appendix B**).

Time of concentration is determined using the inlet time graph (Appendix 5D Ottawa City Sewer Design Guidelines) which results in a value of 7 minutes (a minimum of 10 minutes shall be used). With the pre and post-development runoff coefficients and rainfall intensity, the peak flows for each drainage area can be calculated using the Rational Method. The results (using actual runoff coefficients) are summarized in **Table 2**.

Table 2– Pre-Development Peak Flows

	Pre-Development Peak Flows (actual runoff coefficients)				
Return Period (Years)	Intensity, I (mm/hr) Area (ha) Runoff Coefficient, R (Note 1) Runoff Rate, Q (L/s)				
2	76.8	0.14	0.86	26.2	
5	5 104.2 0.14 0.86 35				
100	178.6	0.14	1.00	71.0	

Note 1: For 100-year event, Runoff Coefficient is increased by 25% to a maximum of 1.0.

To calculate the allowable release rate, the following criteria are applied:

Return Period

5

Maximum Runoff Coefficient 0.5

Time of Concentration10Minutes

Table 3– Allowable Release Rate

Return Period (Years)	Intensity, I (mm/hr)	Area (ha)	Runoff Coefficient, R	Runoff Rate, Q (L/s)
5	104.2	0.14	0.50	20.7

The allowable release rate for the site has been calculated to be 20.7 L/s.

The project will result in the existing area being partially covered with impervious surfaces. The postdevelopment runoff coefficients are indicated in **Table 4**:

 Table 4– Overall Post-Development Runoff Coefficients

	Overall Post-Development Runoff Coefficients		
Storm Event	5-Year Storm	100-Year Storm	
Areas Description	proposed park site	proposed park site	
Project Area (in ha)	0.14	0.14	
Weighted Runoff Coefficient	0.47	0.58	

2.4.2. Stormwater Management Concept

The subject property limits are bounded by easements and zoning regulations and as a result stormwater runoff will be maintained within the property limits of the park.

Table 5 provides a summary of the characteristics of the post-development peak flow rates.

Table 5– Post-Development Peak Flow Rates

	Post-Developmer	nt Peak Flow Rates
Storm Event	5-Year Storm	100-Year Storm
Drainage area (ha)	0.14	0.14
Runoff Coefficient	0.47	0.58
Peak Flow (L/s)	19.2	41.1

As a result, the post-development 100-year flow rate is required to be reduced by **20.4 L/s** to meet the allowable release rate of 20.7 L/s.

All stormwater within the proposed park site will be directed to a central catch basin. An ICD will be installed on the catch basin lead to control the flow to the allowable release rate. As indicated by the proposed storage calculations, the required surface storage was calculated to be 20.7 m³. Storage will be provided through surface storage above the catch basin to a maximum ponding depth of 300mm. The extents of surface ponding are indicated on drawing C802 in **Appendix A**.

Summary

Design calculations for the new storm service are provided in Appendix B.

Table 6 summarizes the proposed release rates and confirms that the total release rate does not exceed the allowable release rate.

Table 6 – Post-Development Controlled Peak Flows

	Post-Development Controlled Peak Flows (L/s)
Allowable Release Rate	20.7
Release Rate from Uncontrolled Drainage Areas	41.1
Release Rate from Controlled Drainage Areas	0
Total Release Rate	41.1

2.5. 100 Year Flood Levels and Major Flow Routing

The site is not within a 100-year floodplain. A figure of the Ottawa river floodplain overlay extracted from the City's GeoOttawa resource is included in **Appendix C**.

2.6. Grading

The proposed grading plan is shown in Drawing C802 in **Appendix A**. The development will be tied into the existing grades on Meath St, phase 2 development, and the existing easement along the southern project limits.

3. Conclusions

In conclusion the proposed development meets all required servicing constraints and associated design criteria/requirements as well as the additional City of Ottawa requirements identified in the preconsultation phase. It is recommended that this report be submitted to the City of Ottawa in support of the application for site plan approval.

Sincerely,

Morrison Hershfield Limited

James Fookes, P.Eng., C.Eng.

Senior Municipal Engineer

Dellor

Dillon O'Neil, EIT Municipal Engineer-in-Training

Subject:	RE: 1354-1376 Carling Avenue - ECA Requirement

Hi Alison,

Yes, I agree with your assumption that this project will meet the exemption set out under Ontario Regulation 525/98 section 3 once the parcels are amalgamated into one.

Regards,

Emily Diamand

Environmental Officer Ministry of the Environment and Climate Change

Ottawa District Office 2430 Don Reid Drive Ottawa, Ontario, K1H 1E1 Tel: 613-521-3450 ext 238 Fax: 613-521-5437 e-mail: emily.diamond@ontario.ca

From: Alison Gosling [mailto:AGosling@dsel.ca]
Sent: March-24-17 10:41 AM
To: Diamond, Emily (MOECC)
Cc: Robert Freel
Subject: 1354-1376 Carling Avenue - ECA Requirement

Good morning Emily,

We just wanted to touch base with you regarding a proposed development we are working on located at 1354-1376 Carling Avenue.

Currently comprised of two parcels of land, the existing 1.9ha site currently consists of two lodging buildings and is zoned Arterial Main Street and Residential Fourth Density. Please note that the parcels will be amalgamated into one parcel of land prior to construction.

The phased development proposes to construct four residential/commercial buildings with incremental demolition of the existing buildings. The full build-out will consist of approximately 2,437 m² of commercial space and 914 residential units.

It appears that the existing stormwater management system currently directs flow towards the municipal infrastructure within Meath Street and Archibald Street.

Proposed stormwater controls will use subsurface storage, and surface ponding to attenuated the release rate to City of Ottawa requirements.

As the proposed sewage works and stormwater management facility will be servicing a single parcel of land which will be owned and operated by a single entity, does not discharge to a combined sewer system, and is not proposed to be used for industrial purposes, it is assumed this falls within the exemption requirements for an Environmental Compliance Approval as per O.Reg 525/98, Section 3 (a) & Ontario Water Resources Act Section 53. 6 (c).

I hope you could comment on my assumption that this property would be exempt from requiring an ECA. Please feel free to call to discuss this further.

Thank you,

Alison Gosling, E.I.T. Project Coordinator / Junior Designer

Hello Alison,

Our records concur with the information you have provided. Given that the stormwater from this site will travel greater than 2 km before outletting to the receiver (the Ottawa River), the RVCA advises that we will not be requiring water quality controls on the stormwater management design for the redevelopment of this site. Jocelyn

Subject: 1376 Carling Ave - RVCA

Good afternoon Jocelyn,

We wanted to touch base with you regarding a mixed-use development at 1376 Carling Avenue. The development proposes residential towers and at grade commercial units.

The existing stormwater on site discharges to the Carling Avenue storm sewer. Based on the information available, the existing storm sewers servicing the site travels 3.5-3.8 km to an outlet into the Ottawa River, as shown by the figure below.

Can you provide a comment regarding quality controls that maybe required for the site?

Please feel free to call if you have any questions or you would like to discuss.

Thanks in advance,

Alison Gosling, E.I.T. Project Coordinator / Junior Designer
