1.0 INTRODUCTION

This Site Servicing and Stormwater Management Brief has been prepared in support of a zoning amendment and site plan control application for the construction of a 28 – story apartment building attached to the existing hotel expansion constructed in 2016. The building will contain 224 apartment units, ground floor amenities, an extension of the existing ball room and a roof top restaurant. Two levels of underground parking will provide 110 parking spaces. The existing parking structure will provide another 288 spaces on the two lower levels. Refer to **Figure 1 – Brookstreet Apartments** for an overview.

Figure 1 Brookstreet Apartments

The stormwater management for the site will continue in the current pattern with little impact from the additional building. The storm flows will be conveyed in the existing storm sewer to the existing stormwater management pond. The existing stormwater pond has surplus capacity for this development.

The sanitary service for the expansion will be provided by connecting to an existing 250mm sanitary service in the vicinity of the hotel building. The existing sanitary service only services the underground parking facility and the recently constructed expansion and has excess capacity to service the proposed apartment building.

The apartment building will connect to the existing municipal water service on Terry Fox Drive. Dual water services will be provided.

Servicing and Grading Plans for the development are included in **Appendix A.**

2.0 GEOTECHNICAL INVESTIGATION

A subsurface investigation was carried out at the site by Paterson Group. The results of that investigation are provided in the report entitled "Geotechnical Investigation, Proposed Brookstreet Development, Report No. PG5673-1, June 10, 2021". The principal findings of the geotechnical investigations are as follows:

- A surficial layer of pavement structure and/or topsoil and surficial fill of thickness from 0.3m to 0.6m.
- A silty sand and silty clay layer of thickness up to 2 metres was encountered below the pavement structure/topsoil in all boreholes.
- A glacial till layer at depths of 1.5m to 2.5m below existing ground surface
- The boreholes were terminated in bedrock at depths of about 1.5m to 2.5m below ground surface.

3.0 STORMWATER MANAGEMENT

The stormwater management strategy for the Kanata Research Park is described in the Kanata Research Park Stormwater Management Report (April, 2000) for the 188 ha site. In brief, there are four SWM ponds (Pond 1, Pond 2, Pond 3, and the Duck Pond) which were used to control post-development peak flows to pre-development levels up to the 100-year storm as well as to provide water quality control. The Brookstreet Apartment lands are part of Area 1 in that SWM plan and drain to Pond 1. Area 1 is 19.85 ha in size with an imperviousness of 80%. Pond 1 has a 100-year required storage volume of 5210 m^3 and a maximum allowable 100-year release rate of 1.514m^3/s.

The proposed building footprint is approximately 1300 m^2 most of which is situated over existing impervious areas. The additional impervious areas because of hard landscaping are approximately 1500 m^2. In the 100-year rainfall event, this additional impervious area is projected to create 144 m^3 of additional runoff resulting in an increase in pond depth of 9.6 mm. Refer to **Appendix B** for calculations.

The increase in volume represents a 2.7 % increase in the required volume of the pond and less than a 10mm increase in the total water level in the pond. These increases are negligble and will not affect the function of Pond 1 and are within the modelling error tolerance for the SWM facility. Moreover, while Pond 1 only requires 5210 m^3 of storage, according to the MOE Certificate of Approval the total available storage capacity of the constructed pond is 28,920 m^3. The pond has been oversized and has substantial additional storage capacity to accommodate development in the area.

The expansion is proposed to drain via roof drains and an internal drainage system to the storm sewer which runs along the west side of the existing parking structure. This storm sewer is a 900mm pipe set at a slope of 0.32% and drains directly to the Pond 1 forebay. Due to the extent of the proposed parking structure this storm sewer will be relocated around the parking structure to the SWMF as shown on drawing 120202-GP2. A storm sewer design sheet and storm drainage area plans are included in **Appendix B.**

4.0 SANITARY SEWER SYSTEM

The proposed Apartment Building will be serviced by connecting to an existing 250mm sanitary service that currently services the existing parking garage and the recent expansion to the hotel. The existing 250mm sanitary sewer outlets to the main 250mm sanitary sewer to the west of the hotel which in turn outlets to the 750mm dia. March Trunk Sewer on the Marshes Golf Course lands. The March Trunk Sewer was designed to accommodate flow from the tributary drainage areas shown on the Sanitary Drainage Area Plan (98066-SAN) in **Appendix C.**

As part of previous investigations, the capacity of the existing sanitary sewer system on Kanata Research Park Lands has been documented within the report Sanitary and Storm Trunk Sewer Design Brief Kanata Research Park Lands by Novatech dated November 12, 2014. Contained in the report are the tributary sanitary flows from the Brookstreet Hotel as well as the underground parking structure. A Sanitary Sewer Design Sheet and Drainage Area Plan from this report are contained in **Appendix C,** as well as flows from the recent expansion .

The City of Ottawa design criteria were used to calculate the theoretical sanitary flows for the proposed Apartment Building.

Apartment Building

- Per capita flow 280 L/cap/day
- Peak Factor = $1 + 14/(4 + P^{1/2}) \times 0.80 = 3.10$; Commercial Peak Factor 1.5
- 0.33 L/sec/ha extraneous flows
- Restaurant 30L/seat/day; Typical Floor Space/Seat: 1.25m^2/seat
- Design Population: 361 m^2 / 1.25m^2/seat = 288 seats

Table 3.1 identifies the theoretical sanitary flows from the Apartment Building.

Table 3.1 Theoretical Sanitary Flows based on the Design Population

Component	Floor Area (m^2)	Floor Area per Seat	Design Population	Flow per Seat (L/seat/day)	Average Flow (L/s)	Peaking Factor	Peak Flow (L/s)
Commercial	361	1.25m^2/seat	288 seats	30	**0.10**	**1.5**	**0.15**
Component	**Units**	**Pop/Unit**	**Population**	**Per Capita Flow**	**Average Flow**	**Peak Factor**	**Peak Flow**
1 Bdr	162	1.4	227	280 L/day	0.74		
2 Bdr	93	2.1	195	280 L/day	0.56		
3 Bdr	1	3.1	3	280 L/day	0.11		
	224		**425**		**1.41**	**3.40**	**4.79**
Extraneous Flow = 0.53 ha x 0.33 L/sec/ha = 0.17 L/sec							**0.17**
Total Flow = 5.11 L/sec							

In the Sanitary and Storm Trunk Sewer Design Brief Kanata Research Park Lands by Novatech dated November 12, 2014, the existing underground parking area tributary to the sanitary sewer system had no peak population flow and a peak design flow of 0.36 L/s that included extraneous flows. The recent expansion added a population flow of 0.45 L/s. The new apartment building will add a peak design flow of 5.11L/sec. From the 2014 report, the total peak design flow in the sanitary sewer downstream of the proposed hotel expansion connection was 13.91 L/s, and amended to include the recent expansion to 14.36 L/sec. With the increase in population flow from the proposed apartment building, the peak design flow is now 19.47 L/s (14.36 + 5.11). The capacity in the 250 mm diameter sewer to convey these flows to the City's trunk sewer is 44.74 L/sec. See Sanitary Sewer Design Sheet in **Appendix C**.

5.0 WATER SUPPLY

The proposed Apartment Building will be connected to the existing municipal water service within Terry Fox Drive. The existing 150 mm diameter watermain that services the Monmouth Building will be extended to the parking garage of the proposed apartment building. A second 150 mm diameter water service will be constructed from Terry Fox Drive to the parking structure. A valve will be placed on the Terry Fox main between the two watermain services.

The theoretical water demands for the proposed apartment building were calculated using City of Ottawa Design Criteria as follows:

Residential
- Average Day Demand = Design Population x 350 L/cap/day
- Maximum Day Demand = 2.5 x Average Day Demand
- Peak Hour Demand = 2.2 x Maximum Day Demand

Commercial (Restaurant)
- Average Day Demand = 5 L/m^2/day
- Maximum Day Demand = 1.5 x Average Day Demand
- Peak Hour Demand = 1.8 x Maximum Day Demand

Table 4.1 Theoretical Average Water Demand Brookstreet Apartments

Site Component	**Floor Area (m^2)**		**Population (m2)**		**Average Flow (L/s)**
Commercial	361		5 L/m2/day		0.02
Site Component	**Units**	**Pop/Unit**	**Population**	**Per Capita Flow**	**Average Flow (L/s)**
Residential	224	1.9	425	350 L/day	1.73
Based on the above, water demands are summarized as follows: **Average Day** = **1.75 L/sec** **Maximum Day** = (0.02 x 1.5) + (1.73 x 2.5) = **4.35 L/sec** **Peak Hour** = (0.02 x 1.5 x 1.8) + (1.73 x 2.5 x 2.2) = **9.57 L/sec**					

Fire Underwriters Survey (FUS) was used to provide water demands to the City to obtain the boundary conditions in the existing water mains on Terry Fox Drive. A fire demand of 6,000 L/min was calculated which is included in **Appendix D.**

6.0 EROSION AND SEDIMENT CONTROL

Temporary erosion and sediment control measures will be implemented during construction in accordance with the "Guidelines on Erosion and Sediment Control for Urban Construction Sites" (Government of Ontario, May 1987). These measures include:

- Placement of filter socks or bags under all catch basins and maintenance holes;
- Silt fences around the area under construction placed as per OPSS 577 and OPSD 219.110;
- Light duty straw bale check dam per OPSD 219.180;
- Application of topsoil and sod to disturbed areas

The proposed erosion and sediment control measures will be implemented prior to construction and will remain in place during construction until vegetation is established. There will be regular inspection and maintenance of the sediment control measures.

GENERAL NOTES:

1. COORDINATE AND SCHEDULE ALL WORK WITH OTHER TRADES AND CONTRACTORS.
2. DETERMINE THE EXACT LOCATION, SIZE, MATERIAL AND ELEVATION OF ALL EXISTING UTILITIES PRIOR TO COMMENCING CONSTRUCTION. PROTECT AND ASSUME RESPONSIBILITY FOR ALL EXISTING UTILITIES WHETHER OR NOT SHOWN ON THIS DRAWING.
3. OBTAIN ALL NECESSARY PERMITS AND APPROVALS FROM THE CITY OF OTTAWA BEFORE COMMENCING CONSTRUCTION.
4. BEFORE COMMENCING CONSTRUCTION OBTAIN AND PROVIDE PROOF OF COMPREHENSIVE, ALL RISK AND OPERATIONAL LIABILITY INSURANCE FOR $5,000,000.00. INSURANCE POLICY TO NAME OWNERS, ENGINEERS AND ARCHITECTS AS CO-INSURED. (amount of liability insurance to be verified on a project by project basis)
5. RESTORE ALL DISTURBED AREAS ON-SITE AND OFF-SITE, INCLUDING TRENCHES AND SURFACES ON PUBLIC ROAD ALLOWANCES TO EXISTING CONDITIONS OR BETTER TO THE SATISFACTION OF THE CITY OF OTTAWA AND ENGINEER.
6. REMOVE FROM SITE ALL EXCESS EXCAVATED MATERIAL, ORGANIC MATERIAL AND DEBRIS UNLESS OTHERWISE INSTRUCTED BY ENGINEER. EXCAVATE AND REMOVE FROM SITE ANY CONTAMINATED MATERIAL. ALL CONTAMINATED MATERIAL SHALL BE DISPOSED OF AT A LICENSED LANDFILL FACILITY.
7. ALL ELEVATIONS ARE GEODETIC.
8. REFER TO GEOTECHNICAL REPORT (No. PG5673-1 DATED JUNE 10, 2021 BY PATTERSON GROUP) FOR SUBSURFACE CONDITIONS, CONSTRUCTION RECOMMENDATIONS, AND GEOTECHNICAL INSPECTION REQUIREMENTS. THE GEOTECHNICAL CONSULTANT IS TO REVIEW ON-SITE CONDITIONS AFTER EXCAVATION PRIOR TO PLACEMENT OF THE GRANULAR MATERIAL.
9. REFER TO ARCHITECT'S AND LANDSCAPE ARCHITECT'S DRAWINGS FOR BUILDING AND HARDSURFACE AREAS AND DIMENSIONS.

Calculation Summary

Project: 120202

Brookstreet Apartment Building

Additional Volume:

1600m^2 additional impervious area $V = CAd$

$$V = (0.9) \times (1330m^2) \times (100mm\ rainfall)$$

$$V = 144\ m^3$$

Pond Impacts:

$$Volume\ Increase\ = \frac{Added\ Volume}{Existing\ Volume}$$

$$= \frac{144m^3}{5210m^3}$$

= 0.027

Depth Increase, $d = \frac{Added\ Volume}{Surface\ Area}$

$$d = \frac{144m^3}{15{,}000m^2}$$

d = 9.6 mm

5. FLEXIBLE CONNECTIONS ARE REQUIRED FOR CONNECTING PIPES TO MANHOLES (FOR EXAMPLE KOR-N-SEAL, PSX: POSITIVE SEAL AND DURASEAL). THE CONCRETE CRADLE FOR THE PIPE CAN BE ELIMINATED.
6. THE OWNER SHALL REQUIRE THAT THE SITE SERVICING CONTRACTOR PERFORM FIELD TESTS FOR QUALITY CONTROL OF ALL SANITARY SEWERS. LEAKAGE TESTING SHALL BE COMPLETED IN ACCORDANCE WITH OPSS 410.07.16, 410.07.16.04 AND 407.07.24. DYE TESTING IS TO BE COMPLETED ON ALL SANITARY SERVICES TO CONFIRM PROPER CONNECTION TO THE SANITARY SEWER MAIN. THE FIELD TESTS SHALL BE PERFORMED IN THE PRESENCE OF A CERTIFIED PROFESSIONAL ENGINEER WHO SHALL SUBMIT A CERTIFIED COPY OF THE TEST RESULTS.
7. STORM MANHOLES AND CBMHS ARE TO HAVE 300mm SUMPS UNLESS OTHERWISE INDICATED.
8. CONTRACTOR TO TELEVISE (CCTV) ALL PROPOSED SEWERS, 200mmØ OR GREATER PRIOR TO BASE COURSE ASPHALT. UPON COMPLETION OF CONTRACT, THE CONTRACTOR IS RESPONSIBLE TO FLUSH AND CLEAN ALL SEWERS & APPURTENANCES.

NOTE:
THE POSITION OF ALL POLE LINES, CONDUITS, WATERMAINS, SEWERS AND OTHER UNDERGROUND AND OVERGROUND UTILITIES AND STRUCTURES IS NOT NECESSARILY SHOWN ON THE CONTRACT DRAWINGS, AND WHERE SHOWN, THE ACCURACY OF THE POSITION OF SUCH UTILITIES AND STRUCTURES IS NOT GUARANTEED. BEFORE STARTING WORK, DETERMINE THE EXACT LOCATION OF ALL SUCH UTILITIES AND STRUCTURES AND ASSUME ALL LIABILITY FOR DAMAGE TO THEM.

3. Daily Sewage Flow from Office Towers = 75 L/person/day (Appendix 4-A, Ottawa Sewer Design Guidelines)
4. Commercial Peaking Factor = 1.5 (Figure 4.3 Ottawa Sewer Design Guidelines)
5. Refer to Sanitary Drainage Area Plan (114060-SAN, C200) for details of drainage areas
6. Refer to the 'Sanitary and Storm Sewer Design Brief' for a breakdown of Daily Sewage Flow components and applicable peaking factors from the Brookstreet Hotel

* Denotes sewers applicable to this MOE ECA appplication. All other sewers shown on this design sheet are private sewers tributary to the sanitary trunk sewer under application for MOE approval and/or have MOE approval under an existing C of A.
** An existing C of A covers the sanitary stub from SAN MH B north approx. 16.1m to the existing cap. The 10.7m of proposed sewer from the cap to SAN MH 3 is applicable to the new MOE ECA application.
† Total peak sanitary flow from hotel site = 8.33 L/s, including Extraneous Flows (Also refer to Note 6 above for further details)

If considered gross floor area, then enter 1 floor/storey. If Fire wall, then reduce footprint accordingly.

Un-Protected **8** = number of floors above first 2, up to max of 10 floors total

Protected **2** = number of additional immediately adjoining floors to be considered, up to 2

Do vertical openings have minimum 1 hour rating between floors? Confirm this with the architect.
