1.0 INTRODUCTION

Novatech has been retained by Lépine Corporation to prepare a Servicing and Stormwater Management Report for the proposed residential development located at 240-270 Lamarche Avenue & 3784 Innes Road within the City of Ottawa. The proposed site is denoted as Block 1 on the plan of subdivision 4M-1629 and is part of a larger development which includes the construction of a proposed public right-of-way. The proposed roadway will be named Croissant Francoise and the detailed design of the proposed roadway will be detailed within a separate report. The purpose of this report is to support the site plan application for the subject development on Block 1. **Figure 1** Key Plan shows the site location. A copy of the legal plan is included for reference.

2.0 EXISTING CONDITIONS

The total Block 1 site area is approximately 1.8 hectares. The property was previously part of the Innes Road Golfland Driving range and is currently vacant. The site is bound by the future Croissant Francoise to the north, Lamarche Avenue to the east, residential buildings to the south, and residential buildings fronting Page Road to the west. The site is generally flat and slopes towards the southwest corner of the site. Due to the recent construction of Lamarche Avenue the current site grades are +/- 1.0m below the new roadway. **Figure 2** shows the existing site conditions.

The subject site was denoted as block 150 within the Orleans Village Development. The subdivision was designed by David Schaeffer Engineering Ltd. (DSEL) and design information is provided in the following reports:

- 'Design Brief for Cavian (Orleans Village) Limited, 3490 Innes Road' prepared By DSEL dated November 2018 – Ver 3 (Reference as DSEL Report).
- 'Assessment of Adequacy of Public Services for Lepine Corporation, 3490 Innes Road' Prepared by DSEL dated May 2019 – Rev 1 (Referenced as DSEL Assessment)

3.0 PROPOSED DEVELOPMENT

The proposed development Block 1 will include +/- 1.6 ha of residential area, and +/- 0.2ha of parkland. It is proposed to develop the residential site with three (3) apartment buildings connected by an underground parking structure. Pavilion A will be six (6) storeys in height with a footprint of 2022m^2 and 105 units. Pavilion B will be seven (7) storeys in height with a footprint of 1966m^2 and 81 units. Pavilion C will be seven (7) storeys in height with a footprint of 1851m^2 and 97 residential units and 252m^2 of commercial space. **Figure 3** shows the proposed development.

Access to the site will be provided from two (2) entrances from the future Croissant Francoise which connects to the existing Lamarche Avenue. It should be noted that this report should be read in conjunction with the following engineering drawings:

- If buildings are founded directly over a clay deposit, a permissible grade raise restriction will be required. A preliminary permissible grade raise restriction of 2 m is recommended for the south portion of the site.
- It should be noted that bedrock was encountered between 5.6 to 7 m below existing grade within the subject property.
- To reduce long-term lowering of the groundwater level at this site clay seals should be provided along the sewer trenches.
- During construction, groundwater volumes pumped could be between 50,000 to 400,000 L/day and it would be required to register on the Environmental Activity and Sector Registry (EASR). However, the project is expected to be phased, so each building constructed one at a time. As the phasing of the underground foundation works is planned in stages the groundwater volumes to be pumped are expected to be maintained under the 50,000L/day threshold.

5.0 WATER SERVICING

The subject property is within the City of Ottawa 2E pressure zone. There is an existing 300mm diameter watermain within the Lamarche Avenue right-of-way that was installed as part of the Orleans Village Development. The proposed Croissant Francoise public right-of-way includes a 200mm watermain which will connect to the existing Lamarche Avenue watermain in two (2) locations creating a looped system for redundancy purposes. Hydrants are also proposed on Croissant Francoise to provide fire protection for the developments. During the construction of Lamarche Avenue a 150mm diameter watermain stub was installed near the south-east property line to provide a potential future service connection for the development lands.

The proposed development will be serviced by two (2) 150mm diameter watermains that will connect to the proposed 200mm diameter watermain in Croissant Francoise. As per the City of Ottawa Technical Bulletin ISDTB-2014-02, the water services will be separated by an isolation valve in the right-of-way as the average day domestic demands are greater than 50 cubic meters of water per day. The proposed buildings are to be sprinklered and equipped with a Siamese connection located near the front entrance of each building and are to be within 45m of a fire hydrant. Refer to the General Plan of Services drawing (121214-GPB1) for servicing details.

Water demand calculations have been calculated using criteria from Section 4 of the City of Ottawa Water Distribution Guidelines and the Ontario Building Code. The required fire demand was calculated using the Fire Underwriters Survey (FUS) Guidelines. The water demand and fire flow calculations are provided in **Appendix A** for reference. A summary of the water demand and fire flows are provided in **Table 5.1**.

Table 5.1: Domestic Water Demand Summary

Building	Population	Commercial Area (m^2)	Ave. Daily Demand (L/s)	Max. Daily Demand (L/s)	Peak Hour Demand (L/s)	Fire Flow (L/s)
Pavilion A	159	N/A	0.59	1.47	3.22	117
Pavilion B	141	N/A	0.46	1.14	2.51	100
Pavilion C	164	252	0.55	1.36	2.45	100
Park Land	32		0.01	0.02	0.04	
Total Domestic Demands	**496**	**252**	**1.60**	**3.99**	**8.23**	

The DSEL Report provided domestic demand and fire flow allocations for the proposed development lands. In the Orleans Village development, Block 150 was assumed to be a residential development with an equivalent population of 1044 people. The allotted domestic demands and fireflows for the development area (Block 150) are summarized in **Table 5.2**.

Table 5.2 Allowable Block 150 Water Demand (DSEL Report)

Area	Ave. Daily Demand (L/s)	Max. Daily Demand (L/s)	Peak Hour Demand (L/s)	Fire Flow (L/s)
Block 150	3.38	8.44	18.57	217

Therefore, based on the information in the preceding tables the proposed development water demands are less than the demands allotted from DSEL Report. Therefore, it can be concluded that the existing watermain system can provide adequate flow and pressures for the fire flows and domestic demands. Refer to **Appendix A** for DSEL Report excerpts, proposed domestic water demand and fire flow calculations.

6.0 SANITARY SERVICING

There is an existing 250mm diameter sanitary sewer within Lamarche Avenue which was constructed as part of the Orleans Village Development. An existing 200mm diameter sanitary stub is provided from the Lamarche Avenue sanitary sewer and is located near the south-east property line. The future Croissant Francoise public right-of-way will include a 250mm diameter sanitary sewer which will connect to the existing Lamarche Avenue sanitary sewer system.

Pavilion A and B of the proposed development will be serviced with a 200mm private sewer with a connection to the proposed sanitary sewer in the Croissant Francoise. Pavilion C will be serviced directly to the existing sanitary sewer in Lamarche Avenue by the existing 200mm stub in the south east property corner. The proposed park will be serviced by a 200mm service with a connection to the proposed sewer in Croissant Francoise. Refer to the General Plan of Services drawing (121214-GPB1) for servicing details.

Sanitary flows for the proposed development were calculated using criteria from Section 4 of the City of Ottawa Sewer Design Guidelines and the Ontario Building Code as follows:

- Residential Average Flow = 280 L/capita/day
- 1 Bed apartment = 1.4 Person/unit
- 2 Bed apartment = 2.1 Person/unit
- 3 Bed apartment = 3.1 Person/unit
- Single unit = 3.4 Person/unit
- Commercial flow = 75 L/9.3m^3/day
- Parkland = 1 unit/ hectare
- Residential Peaking Factor = Harmon Equation (max peaking factor = 4.0)
- Commercial Peaking Factor = 1.0
- Peak Extraneous Flows (Infiltration) = 0.33L/s/ha

The peak sanitary flow including infiltration for the Block 1 development was calculated to be 6.26 L/s with 4.18 L/s for Pavilion A and B, 2.02 L/s for Pavilion C, and 0.06L/s for the proposed parkland. Detailed sanitary flow calculations are provided in **Appendix B** for reference.

As noted previously, the Orleans Village Development detailed design was completed by DSEL. The Subdivision design assumed that block 150 was a residential development with an equivalent population 1044 people. The design flows were calculated using the following design criteria:

- Average Daily Flow = 280 L/capita/day
- Residential Peaking Factor = Harmon Equation (max peaking factor = 4.0)
- Commercial/ Institutional Peaking Factor = 1.0
- Peak Extraneous Flows (Infiltration) = 0.33L/s/ha

Based on the above criteria a theoretical peak flow of 11.56 L/s that was allotted for Block 150 is greater than the proposed theoretical peak flow of 6.26 L/s. Therefore, it is anticipated that the downstream sanitary sewer infrastructure has capacity to service the proposed Block 1 development and there is additional flow capacity for future developments. Refer to Excerpts **Appendix B** for DSEL Report excerpts, sanitary drainage area plans and design sheets.

7.0 STORM SERVICING

There is an existing 850mm and 1350mm diameter storm sewer fronting the development in Lamarche Avenue. Connected to this sewer is a 750mm diameter storm sewer and catchbasin manhole that was constructed on the Block 1 site which will be used service a portion of the development. As part of the subdivision application, it is proposed to construct Croissant Francoise which will have municipal storm sewers ranging in size from 450mm to 750mm in diameter. The proposed municipal storm sewer system will provide storm servicing for the current and future developments fronting onto Croissant Francoise.

It is proposed to service the Block 1 development by a private storm sewer system with sewers ranging in size from 250mm to 600mm in diameter. It is proposed to service the site with connections to the proposed 750mm diameter storm sewer in Croissant Francoise and the existing 750mm diameter storm sewer on site. Refer to the General Plan of Services (121214-GPB1) for more details.

The proposed storm sewers have been sized to convey the uncontrolled 5-year storm event using the Rational Method. The design criteria used in sizing the storm sewers are summarized below in **Table 7.1**.

Table 7.1: Storm Sewer Design Parameters

Parameter	Design Criteria
Local Roads	2 Year Return Period
Storm Sewer Design	Rational Method
IDF Rainfall Data	Ottawa Sewer Design Guidelines
Initial Time of Concentration (Tc)	10 min
Minimum Velocity	0.8 m/s
Maximum Velocity	3.0 m/s
Minimum Diameter	250 mm

Refer to **Appendix C** for detailed storm drainage area plans and storm sewer design sheets.

8.0 STORM DRAINAGE AND STORMWATER MANAGEMENT

The stormwater management strategy for the site is based on the established criteria from the DSEL Assessment of Adequacy of Public Services.

8.1 Existing Off-Site Storm Infrastructure – Orleans Village Development

The storm infrastructure servicing the Orleans Village development includes a stormwater management facility and storm sewers with sizes ranging from 300mm to 1800mm in diameter. The Orleans Village Development storm sewer system was designed to receive drainage from the proposed development. As previously indicated the overall Lepine development area was identified as Blocks 149 and 150 on the registered plan of subdivision. The downstream SWM Facility was designed to provide stormwater quality and quantity control for the overall Orleans Village development area prior to discharging to Mud Creek. The facility was sized to accommodate all future developments within the tributary drainage area, including the subject development lands.

8.2 Stormwater Management Criteria

8.2.1 Stormwater Quality Control

The existing SWM Facility is currently sized to provide a normal level of stormwater quality control. In the future it is proposed to upgrade the SWM facility to provide and enhanced level of stormwater quality control for 80% long-term removal of total suspended solids (TSS).

As previously indicated the Block 1 development was identified as Block 150 in the Orleans Village Development and was estimated to be 79% impervious. The proposed Block 1 development has an overall imperviousness of 74% and will therefore have no negative effects on the downstream stormwater infrastructure (sewers and pond).

8.2.2 Stormwater Quantity Control – Allowable Release Rate

The DSEL Adequacy of Public Services Report provides stormwater allowable release rates for Blocks 149, Block 150 and the external drainage areas for the residential properties fronting onto Innes Road. The allowable release rates per block are provided in **Table 8.1.**

Table 8.1 Allowable Release Rates Per Block (DSEL Report)

Block	Area (ha)	Allowable Release Rate (L/s)
Block 149	2.86	501
Block 150	2.17	406
External Area	0.11	*9.4
Total	**5.14**	**916.4**

**Note: Calculated using rational method for a 2-year storm event.*

The overall Lepine development will be required to control the release rate of stormwater from the site to 916.4 L/s . Each area in the overall Lepine development has been allocated a portion

of this total release rate. The allocated release rates are summarized below in **Table 8.2** and were calculated based on the following criteria:

- No 2-year surface ponding in the right-of-way.
- No stormwater management controls in the park blocks.
- Each development Block was allocated a portion of the remaining release rate based on its area percentage of the total Block development lands.

Table 8.2 Allowable Release Rates Per Block (Novatech Serviceability Report)

Development Area	Area (ha)	Area %	Allowable Release Rate (L/s)
ROW	0.611	N/A	147.0
Park	0.503	N/A	108.5
Sub Total	**1.114**		**255.5**
Block 1	1.535	38.2%	252.4
Block 2	0.922	22.9%	151.6
Block 3	1.563	38.9%	257.0
Sub Total	**4.020**		**660.9**
Total	**5.134**		**916.4**

Based on the information provided in **Table 8.2** the Block 1 development will be allocated 252.4 L/s to the Lamarche Avenue sewer and ultimately the downstream SWM facility. Refer to **Appendix D** for report excerpts from the DSEL Report and detailed calculations on the allowable release rate allocation.

8.3 Stormwater Management Modeling

The performance of the proposed stormwater management system was evaluated using a dual-drainage model created in PCSWMM. The PCSWMM model simulates the storage and routing of flows through the proposed storm drainage network. The results of the analysis were used to:

- Calculate the storm sewer hydraulic grade line and ponding elevations for the 2year, 5-year, and 100-year storm events.
- Determine the allowable release rates from each drainage area and size the required inlet control devices (ICD's).
- Calculate the modelled runoff from the controlled portions and uncontrolled portions of the site under post-development conditions.

The design storms used in the hydrologic analysis model include the 6-hour Chicago distribution and the 12-hour and 24-hour SCS Type II distribution for the 2-year, 5-year and 100-years storm events. IDF data was taken from the *City of Ottawa Sewer Design Guidelines* (OSDG) (October 2012). The 6-hour Chicago storm distribution was found to generate the highest peak flows and the model results from this distribution are documented in the following tables. The model schematic, system parameters and output files are provided in **Appendix D**.

8.3.1 Model Results

The following sections outline the stormwater management strategy for each area of the proposed Block 1 development, and provides post-development peak flow results from the uncontrolled and controlled flow areas. The site has been divided into the following drainage areas:

Area D-01 – D-05 : Uncontrolled Direct Runoff

Runoff from these drainage areas will sheet drain from the site uncontrolled directly to the Lamarche Avenue right-of-way (D-01), the Croissant Francoise right-of-way (D-02, D-03) and to the adjacent Park Block (D-04, D-05).

Table 8.3 summarizes the post-development direct runoff flows for the 2, 5 and 100-year event from these sub-catchment areas.

Table 8.3: Direct Runoff Flow Summary

Area A-01 (a-b) : Controlled Flows to Croissant Francoise

The parking lot area fronting the development will outlet to the 750mm diameter storm sewer system in Croissant Francoise. The post-development flow from this sub-catchment area will be attenuated using an inlet control device (ICD) installed in the outlet pipe of CBMH 101. Stormwater runoff from this sub-catchment area will be temporarily stored underground within the storm sewer system and on the paved parking lot area prior to being discharged into the Croissant Francoise storm sewer system.

Table 8.4A summarizes the post-development design flow from this sub-catchment area as well as the ICD specifications, the anticipated ponding elevations, storage volumes required and storage volume provided for the 2-year, 5-year and the 100-year design events.

Area B-01, B-02 : Controlled Building Flows to Lamarche Avenue

The building roofs and surface area above the underground parking structure will outlet to the existing 1350mm diameter storm sewer in Lamarche Avenue via the private sewer system on site. The post-development flow from these sub-catchment areas will be attenuated using ICD's installed on the outlet pipes from the underground storage tanks constructed in the underground parking garage. Stormwater runoff from this sub-catchment area will be temporarily stored underground in storage tanks prior to being discharged into the private sewer system and ultimately the Lamarche Avenue storm sewer.

Table 8.4B summarizes the post-development design flows from these sub-catchment areas as well as the ICD specifications, the anticipated ponding elevations, storage volumes required and storage volume provided for the 2-year, 5-year and the 100-year design events.

Area C-01 (a-c) : Controlled Rear Yard Flows to Lamarche Avenue

The rear yard drainage for the Block 1 development will be collected and conveyed by a swale and perforated pipe storm sewer system to the existing 1350mm diameter storm sewer in Lamarche Avenue. Post-development flows from this sub-catchment area will be attenuated using an ICD, installed in the outlet pipe of CBMH 206. Stormwater runoff from this sub-catchment area will be temporarily stored underground within the perforated pipe storm sewer system and on the surface in the grassed swale prior to being discharged into the Lamarche Avenue storm sewer system.

Table 8.4C summarizes the post-development design flow from this sub-catchment area as well as the ICD specifications, the anticipated ponding elevations, storage volumes required and storage volume provided for the 2-year, 5-year and the 100-year design events.

8.4 Major Overland Flow Route

A major overland flow route will be provided for storms greater than the 100-year storm event. Stormwater will be directed to the Croissant Francoise and Lamarche Avenue rights-of-way. The major overland system is shown on the Grading Plan (drawing 121214-GRB1).

9.0 EROSION AND SEDIMENT CONTROL

Temporary erosion and sediment control measures will be implemented on-site during construction in accordance with the Best Management Practices for Erosion and Sediment Control. This includes the following temporary measures:

- Filter socks (catchbasin inserts) will be placed in existing and proposed catchbasins and catchbasin manholes, and will remain in place until vegetation has been established and construction is completed;
- Silt fencing will be placed along the surrounding construction limits;
- Mud mats will be installed at the site entrances;
- Strawbale or rock check dams will be installed in swales and ditches;
- The contractor will be required to perform regular street sweeping and cleaning as required, to suppress dust and to provide safe and clean roadways adjacent to the construction site;

Erosion and sediment control measures should be inspected daily and after every rain event to determine maintenance, repair or replacement requirements. Sediments or granulars that enter site sewers shall be removed immediately by the contractor. These measures will be implemented prior to the commencement of construction and maintained in good order until vegetation has been established. Refer to the Erosion and Sediment Control Plan (drawing 121214-ESCZ1) for additional information.

10.0 CONCLUSIONS AND RECOMMENDATIONS

Watermain

The analysis of the existing and proposed watermain network confirms the following:

- The two (2) proposed 150mm dia. watermain services which connect to the proposed 200mm watermain system within Croissant Francoise, and ultimately the existing 300mm dia. watermain in Lamarche Avenue can service the proposed development.
- It is anticipated that there are adequate pressures in the existing watermain infrastructure to meet the required domestic demands for the development.
- It is anticipated that there is adequate flow to service the proposed fire protections system.

Sanitary Servicing

The analysis of the existing and proposed sanitary system confirms the following:

- The (2) proposed sanitary sewer in Croissant Francoise will provide service connections for the parkland and Pavilions A/ B. The existing service stub connection from the Lamarche Avenue sanitary sewer will directly service Pavilion C.
- It is anticipated there is adequate capacity within the existing sanitary infrastructure to service the proposed development based on the information provided in the existing Orleans Village Development design.

Stormwater Management

The following provides a summary of the storm sewer and stormwater management system:

- The proposed storm sewer system is to connect to the proposed 750mm diameter storm sewer in Croissant Francoise and the existing 1350mm diameter storm sewer in Lamarche Avenue.
- Storm sewers (minor system) have been designed to convey the uncontrolled 2-year peak flow using the Rational Method.
- Underground storage is be provided within the storm sewer system and underground storage tanks.

- Inlet control devices and underground storage has been designed to ensure no static ponding is achieved in the 2-year event.
- Storm flows will be attenuated through the implementation of inlet control devices.
- Parking lots have been graded to ensure that static ponding depths do not exceed 0.30m.
- As per existing conditions a major overland flow route is provided to Lamarche Avenue.
- Quality control of stormwater will be provided in the downstream SWM facility.

Erosion and Sediment control

- Erosion and sediment control measures (i.e. filter fabric, catchbasin inserts, silt fences, etc.) will be implemented prior to construction and are to remain in place until vegetation is established.

Disclaimer

The boundary condition information is based on current operation of the city water distribution system. The computer model simulation is based on the best information available at the time. The operation of the water distribution system can change on a regular basis, resulting in a variation in boundary conditions. The physical properties of watermains deteriorate over time, as such must be assumed in the absence of actual field test data. The variation in physical watermain properties can therefore alter the results of the computer model simulation. Fire Flow analysis is a reflection of available flow in the watermain; there may be additional restrictions that occur between the watermain and the hydrant that the model cannot take into account.

DEMAND EQUATION
Q = 2.78 AIR

Where : **Q = Peak flow in litres per second (L/s)**
A = Area in hectares (ha)
R = Weighted runoff coefficient (increased by 25% for 100-year)
I = Rainfall intensity in millimeters per hour (mm/hr)
Rainfall Intensity (I) is based on City of Ottawa IDF data presented in the City of Ottawa Sewer Design Guidelines (Oct. 2012)

CAPACITY EQUATION
Q full= (1/n) A R^(2/3)So^(1/2)

Where : **Q full = Capacity (L/s)**
n = Manning coefficient of roughness (0.013)
A = Flow area (m^2)
R = Wetter perimenter (m)
So = Pipe Slope/gradient

5.0 STORMWATER MANAGEMENT

5.1 Existing Stormwater Drainage

The existing site drains via sheet flow from north to south to the existing EUC Pond 1, which outlets to Mud Creek.

The subject site was contemplated in the ***Design Brief*** and construction of a storm sewer varying from 300mm to 1350mm in diameter, fronting the subject site within Avenue de Lamache is underway during the time of publication of this report.

5.2 Post-Development Stormwater Management Targets

Stormwater management for the subject property has been contemplated in the ***Design Brief*** and ***OV SWM Report***. The site is required to provide:

- Quantity controls to attenuate stormwater runoff to capture rates for Blocks 147 to 150 per ***Table 5*** for all storms up to and including the 100-year event;
- Provide an estimated storage volume of ***1780m^3*** (based on preliminary analysis of the ***OV SWM Report***), to be confirmed with detailed analysis and actual percent imperviousness during detailed design;

Table 5
Summary of Stormwater Management Targets

	Area (ha)	Capture Rate* (L/s)	Storage Required (m^3)
Block 147	2.16	405	380
Block 148	2.54	457	470
Block 149	2.86	501	545
Block 150	2.17	406	385
External Area**	0.75	73	0

Capture rates per JFSA **OV SWM Report*
*** 2-Year Capture contemplated in the storm sewer design from the **Design Brief***

- Approximately ***0.64 Ha*** and ***0.11 Ha*** of external residential properties fronting Innes Road was contemplated to drain to Blocks 147 & 148 and Blocks 149 & 150, respectively. The 2-year flow rate from the external areas is proposed to be added to the allowable release rates for Blocks 147,148, 149 and 150 described above.

5.3 Proposed Stormwater Management System

The subject property is anticipated to discharge to the future 825mm storm sewer within Avenue de Lamache. The storm sewers have been sized to convey the 2-year flow from the subject site, refer to ***Appendix D*** for stormwater drainage plans and design sheets extracted from the ***Design Brief***.

The quantity and quality control has been prescribed by the ***Design Brief*** and ***OV SWM Report.*** It is anticipated to use a combination of surface, rooftop and subsurface storage to provide the ***1780m^3*** of preliminary required storage to control the flow to a maximum of ***1842 L/s***.

5.4 Stormwater Servicing Conclusions

Stormwater management for the subject site was contemplated in the ***Design Brief*** and ***OV SWM Report***. Minor system flow is anticipated to be directed to a future 825mm storm sewer within Avenue de Lamache, the subject site was contemplated in the minor system design of the subdivision.

To accommodate the 100-year storm event, it is anticipated to use a combination of surface, rooftop and subsurface storage to provide the ***1780m^3*** of preliminary required on-site storage to control the release rate to a maximum of the 2-year storm event or a total flow of ***1842 L/s*** per the ***OV SWM Report***.

Quality control to be provided by the EUC Pond 1 in accordance with the ***Design Brief.***

The proposed stormwater design conforms to all relevant City Guidelines and Policies.
