1 INTRODUCTION AND SITE DESCRIPTION

LRL Associates Ltd. was retained by Landric Homes Inc. to complete a Stormwater Management Analysis and Servicing Brief for a proposed development of stacked townhomes located at 6001-6005 Renaud Rd, Orleans, Ottawa. The legal description of the property is Part of Lot 7, Concession 3, geographic Township of Gloucester**,** City of Ottawa.

Figure 1: Arial View of Proposed Development

The site at 6001-6005 Renaud Road has approximately 76.1 metres of frontage along Renaud Road (south property line), maximum side yard depth of approximately 61.0 metres. The overall lot area is approximately **0.46 ha.** The site is currently zoned DR (Development Reserve Zone) and is occupied by two detached residential dwellings (2-storey and 1.5-storey buildings). Most of the site is landscaped with some paved surfaces.

The proposed works will only take into consideration the area of site allocated to the development of the stacked townhomes and amenities. These works will be located primarily within the south portion of the lot, with the exception of a lane along the east property line (to provide site access to Ziegler). Frontage along Renaud will remain the same, at approximately 76.1m. Side yard lengths will vary; west side yard of 35.5m, east side yard of 61.0m. Rear yard lot line will be split

between the lot line abutting the future semi-detached lots at 68.5m, and abutting Ziegler street at 11.6m. The overall limits of construction area is approximately **0.29 ha**

The development proposes five (5) blocks of 3-storey stacked townhome buildings with walk-out basements, consisting of 20 units to the south of the property and 6 semi-detached houses to the north of the property. However, the 6 semi-detached house will not be considered for site plan application or within the stormwater report. The proposed development will also feature 18 surface parking spaces as well as sheltered garages to accommodate parking demands.

For the purposes of this report & design, the lots allocated to the development of future semi-detached homes will not be considered. The combined area of the future semi-detached lots is approximately 68.5m (frontage along Renaud) by 25.3m (side yard along the west property line).

This report has been prepared in consideration of the terms and conditions noted above and with the civil drawings prepared for the new development. Should there be any changes in the design features, which may relate to the stormwater considerations, LRL Associates Ltd. should be advised to review the report recommendations.

2 Existing Site and Drainage Description

The subject site measures ***0.29 ha*** and is gently sloped north from Renaud Road to Ziegler Street. Existing elevations range from 75.65m along south property line fronting Renaud St to 74.34m along north property line fronting Ziegler St.

Sewer and watermain mapping, along with as-built information collected from the City of Ottawa indicate the following existing infrastructure located within the adjacent right-of-way:

Ziegler Street:

- 200mmØ PVC DR-18 watermain
- 250mmØ PVC DR-35 sanitary sewer
- 750, 825 & 975mmØ CL 100-D concrete storm sewer

3 Scope of Work

As per applicable guidelines, the scope of work includes the following:

Stormwater management

- Calculate the allowable stormwater release rate.
- Calculate the anticipated post-development stormwater release rates.
- Demonstrate how the target quantity objectives will be achieved.

Water services

- Calculate the expected water supply demand at average and peak conditions.

- Calculate the required fire flow as per the Fire Underwriters Survey (FUS) method.
- Confirm the adequacy of water supply and pressure during peak flow and fire flow.
- Describe the proposed water distribution network and connection to the existing system.

Sanitary services

- Describe the existing sanitary sewers available to receive wastewater from the building.
- Calculate peak flow rates from the development.
- Describe the proposed sanitary sewer system.
- Review impact of increased sanitary flow on downstream sanitary sewer.

4 REGULATORY APPROVALS

An MECP Environmental Compliance Approval is not expected to be required for installation of the proposed storm and sanitary sewers within the site. A Permit to Take Water is not anticipated to be required for pumping requirements for sewer installation. The Rideau Valley Conservation Authority will need to be consulted to obtain municipal approval for site development. No other approval requirements from other regulatory agencies are anticipated.

5 WATER SUPPLY AND FIRE PROTECTION

5.1 Existing Water Supply Services and Fire Hydrant Coverage

The subject property lies within the City of Ottawa 2E water distribution network pressure zone. The subject property is located within proximity of an existing 200 mm dia. watermain along Ziegler St. There are currently several existing fire hydrants available to service the subject property. Refer to ***Appendix B*** for the location of fire hydrants.

5.2 Water Supply Servicing Design

The subject property is proposed to be serviced via a closed loop network of 150 mm diameter watermain connected to the existing 200 mm watermain within Ziegler Street. Refer to Site Servicing Plan C.401 in ***Appendix E*** for servicing layout.

Table 1 summarizes the City of Ottawa Design Guidelines design parameters employed in the preparation of the water demand estimate.

Table 1: ***City of Ottawa Design Guidelines Design Parameters***

Design Parameter	Value
Residential Townhouse	2.7 P/unit
Average Daily Demand	280 L/d/per
Minimum Depth of Cover	2.4 m from top of watermain to finished grade
Desired operating pressure range during normal operating conditions	350 kPa and 480 kPa
During normal operating conditions pressure must not drop below	275 kPa

During normal operating conditions pressure shall not exceed	552 kPa
During fire flow operating conditions pressure must not drop below	140 kPa
**Table updated to reflect technical Bulletin ISDTB-2018-02*	

The interior layout and architectural floor plans have been reviewed, and it was determined that the total proposed residential development will house twenty (20) stacked town units. Based on the City of Ottawa Design guidelines for population projection, this translates to approximately 54.0 residents. Table 2 below summarizes the proposed development as interpreted using table 4.1 of the City of Ottawa Design Guidelines.

Table 2: ***Development Residential Population Estimate***

Proposed Unit type	Persons Per Unit	Number of Units	Population
Townhouse	2.7	20	54.0
		Total Residential Population	**54.0**

The required water supply requirements for the residential units in proposed building have been calculated using the following formula:

Where:

$$Q = (q \times P \times M)$$

q = average water consumption (L/capita/day)
P = design population (capita)
M = Peak factor

Using a calculated Maximum Day Factor and Peak Hour factor of **7.5** and **11.2** respectively as per Table 3-3 in the *MOE Design Guidelines*, anticipated demands were calculated as follows:

- Average daily domestic water demand is **0.18** L/s,
- Maximum daily demand is **1.30** L/s, and
- Maximum hourly is **14.62** L/s.

Refer to ***Appendix B*** for water demand calculations.

The City of Ottawa was contacted to obtain boundary conditions associated with the estimated water demand, as indicated in the boundary request correspondence included in ***Appendix B***. Table 3 below summarizes boundary conditions for the proposed development.

Table 3: ***Summary of Anticipated Demands and Boundary Conditions***

Design Parameter	Anticipated Demand (L/min)	Boundary Conditions @ Renaud Road Head (m) / Pressure (psi)
Average Daily Demand	11	130.7 / 81.2
Max Day + Fire Flow (Block A)	78 + 16,000	115.5 / 59.5
Max Day + Fire Flow (Block B)	78 + 16,000	115.5 / 59.5
Peak Hour	877	126.7 / 75.5
**Assumed Ground elevation at connection point = 73.60 m.*		
Water demand calculation per City of Ottawa Water Design guidelines. ***See Appendix B*** *for details.*		

As indicated in Table 3, Average Daily Demand pressure exceeded the required pressure range (greater than 80 psi) stated in Table 1 as per City of Ottawa Design Guidelines. Pipe Pressure Losses were calculated to factor in the loss in pressure expected. Considering a PVC pipe (roughness coefficient C of 150) of 150mm inner diameter, at a length of 121.5m and an elevation variable of 1.64m, we could calculate a pipe pressure loss of **2.33 psi** within the network, resulting in an adjusted max pressure of **78.90 psi**, now falling within the allowable range.

Refer to ***Appendix B*** for Boundary Conditions & Pipe Pressure Loss Calculations.

The estimated fire flow for the proposed buildings was calculated in accordance with *ISTB-2018-02*. The following parameters were provided by the Architect, see ***Appendix A*** for collaborating correspondence:

- Type of construction – Wood Frame Construction;
- Occupancy type – Limited Combustibility; and
- Sprinkler Protection – Non-Sprinklered.

The estimated fire flow demand was estimated to be **16,000 L/min** for Blocks A and **16,000 L/min** for Block B. See ***Appendix B*** for details.

There are several existing fire hydrants within 300 m to the proposed buildings that are available to meet the required fire flow demands stated above. Refer to ***Appendix B*** for fire hydrant locations.

Table 4 below summarizes the approximate aggregate fire flow of the contributing hydrants within 300 m to the proposed development based on Table 18.5.4.3 of *ISTB-2018-02*.

Table 4: ***Fire Protection Summary Table***

Building	Fire Flow Demand (L/min)	Fire Hydrants(s) within 75m	Fire Hydrant(s) within 150m	Fire Hydrant(s) within 300m	Approximate Available Combined Fire Flow (L/min)
BLOCK A	16,000	2	6	-	(2 x 5678) + (6 x 3785) = 34,066
BLOCK B	16,000	2	6	-	(2 x 5678) + (6 x 3785) = 34,066

As shown in Table 4, the approximate total available fire flow from contributing hydrants is sufficient to provide adequate fire flow for the proposed buildings.

The proposed water supply design conforms to all relevant City Guidelines and Policies.

6 SANITARY SERVICE

6.1 Existing Sanitary Sewer Services

The subject property is tributary to the Forest valley trunk sewer. There is an existing 250 mm dia. sanitary sewer within Ziegler St. across from the subject site that ultimately conveys flows to the Forest Valley trunk sewer.

The subject property falls within the area contemplated in the *Gloucester East Urban Community Infrastructure Servicing Study Update (**Gloucester EUC)**,* prepared by Stantec, revision date March 2005. Refer to Drainage Plan extracted from the *Gloucester EUC* in ***Appendix C.***

The post development total wet wastewater flow was calculated to be is **0.80 L/s** as a result of proposed residential population and a small portion of infiltration. Refer to ***Appendix C*** for further information on the calculated sanitary flows.

As per the Urbantech Functional Servicing Report dated December 2020, the 250mm diameter sanitary sewer within Ziegler Street has a full capacity of 38.0 L/s. Maximum design from the current developed subdivision is expected to be 19.97 L/s. Assuming peak design flow should not exceed 85%, the current reserve capacity of the Ziegler sewer is expected to be 12.3 L/s.
The proposed Caivan residential development, directly East of the 6001/6005 Renaud site, is expected to have a peak design flow of 10.5 L/s. This would leave an allowable reserve capacity of **1.8 L/s** for the proposed residential developments at 6001/6005 Renaud Road.
Refer to ***Appendix C*** for the Caivan Functional Servicing Report referenced.

The current proposed residential developments (Block A, Block B) will require **0.80 L/s** of the sewer capacity. This would leave the sewer with a capacity of **1.00 L/s** for the future semi-detached houses (located along Ziegler Street, refer to site plan). Therefore, it is anticipated that

the existing local sanitary sewer network has sufficient capacity to accommodate the proposed development.

6.2 Sanitary Sewer Servicing Design

The proposed development will be serviced via a 150 mm dia. sanitary sewer network which will connect to the existing 250mm dia. sanitary sewer located within Ziegler Street. Refer to LRL drawing C.401 for the proposed sanitary servicing.

The parameters used to calculate the anticipated sanitary flows are; residential average population per unit of 2.7 persons for townhouse units, a residential daily demand of 280 L/p/day, a residential peaking factor of 4.0 and a total infiltration rate of 0.33 L/s/ha. Based on these parameters and the total site area of 0.29 ha, the total wet wastewater flow was calculated as **0.80 L/s**. Refer to ***Appendix C*** for the site sanitary sewer design sheet.

7 STORMWATER MANAGEMENT

7.1 Existing Stormwater Infrastructure

Stormwater runoff from the subject property is tributary to the City of Ottawa sewer system as such, approvals for the proposed development within this area are under the approval authority of the City of Ottawa.

In pre-development conditions, the stormwater runoff would flow uncontrolled overland to the towards the Renaud Road right-of-way. There is an existing 750 mm diameter storm sewer within Ziegler Street right-of-way. Refer to ***Appendix D*** for pre- and post-development watershed information.

7.2 Design Criteria

The stormwater management criteria for this development are based on the criteria stated in the ***Gloucester EUC Study****, a*s well as pre-consultation with City of Ottawa officials, the City of Ottawa Sewer Design Guidelines including City of Ottawa Stormwater Management Design Guidelines, 2012 (City standards), as well as the Ministry of the Environment's Stormwater Planning and Design Manual, 2003 (SWMP Manual).

7.2.1 Water Quality

The subject property lies within the Ottawa River East sub-watershed and is therefore subject to review by the Rideau Valley Conservation Authority (RVCA).

As per the ***Gloucester EUC Study***, the subject property falls within the tributary area of SWM Pond 3, refer to Figure 6 as well as the Drainage Plan extracted from the ***Gloucester EUC Study*** included in ***Appendix D.*** Therefore, it was determined that no further treatment is required for stormwater runoff from the proposed development. Correspondence with RVCA is included in ***Appendix A***.

7.2.2 Water Quantity

Based on ***Gloucester EUC Study***, the following stormwater management requirements were identified for the subject site:

- Meet an allowable release of 85 L/s/ha;
- Attenuate all storms up to and including the City of Ottawa 100-year storm event on site; and

The allowable release rate for the subject site was calculated to be **24.77 L/s**. Refer to ***Appendix D*** for calculations.

7.3 Method of Analysis

The Modified Rational Method has been used to calculate the runoff rate from the site to quantify the detention storage required for quantity control of the development. Refer to ***Appendix D*** for storage calculations.

7.4 Proposed Stormwater Quantity Controls

The proposed stormwater management quantity control for this development will be accomplished by utilizing an inlet control device to restrict flows to the allowable release rate. Storage required as a result of quantity control will be accomplished through a combination of surface storage and underground stormwater chambers in the parking lot.

The subject site is proposed to be serviced via a network of 300mm diameter storm sewers that outlet to the existing 750 mm diameter storm sewer within Ziegler street. The proposed site storm sewer and stormwater management system are shown on drawing C.401 and detailed calculations, including the design sheet, can be found in ***Appendix D***.

The existing site is delineated by catchments EWS-01 which currently drains uncontrolled towards the Renaud Road and Ziegler Street right-of-ways.

The site has been analyzed and post development watersheds have been allocated. Watershed WS-01 (0.058 ha), consisting of landscaping and a paved ramp, will flow uncontrolled. The runoff will be conveyed to the Ziegler Street right-of-way, as per the grading plan C301.

Overland flow within watershed WS-02 (0.233 ha) will be captured by catch basins CB02, CB03 and CB05. A Hydrovex 75VHV-1 vertical flow regulator is proposed at mh01 to restrict collected runoff to a specific release rate. Grading proposed will provide positive overland drainage to the proposed storm water collection and control systems.

Table 5 below summarizes post-development drainage areas. Calculations can be seen in ***Appendix D.***

Table 5: ***Drainage Areas***

Drainage Area Name	Area	Weighted Runoff Coefficient	100 Year Weighted Runoff Coefficient (25% increase)
WS-01 (uncontrolled)	0.058	0.50	0.63
WS-02 (controlled)	0.233	0.74	0.92

Table 6 below summarize the release rates and storage volumes required to meet the allowable release rate of **24.77 L/s** for 100-year flow rates.

Table 6: ***Stormwater Release Rate & Storage Volume Summary (100 Year)***

Catchment Area	Drainage Area (ha)	100-year Release Rate (L/s)	100-Year Required Storage (m^3)	Total Available Storage (m^3)
WS-01 (uncontrolled)	0.058	18.15	0	0
WS-02 (controlled)	0.233	6.62	118.35	128.09
TOTAL	**0.291**	**24.77**	**118.35**	**128.09**

It is estimated that **18.15 L/s** of runoff will flow uncontrolled from WS-01 towards the Ziegler Street right-of-way.

Runoff collected in WS-02 will be attenuated on site and discharged at a specific release rate of 6.62 L/s via a Hydrovex 75-VHV-1 flow control unit located at the invert of MH01, refer to ***Appendix D*** for additional info on the flow control unit. Considering a halved controlled release rate (to account for variable design head due to the combination of underground and overland storage), it can be calculated that a total **118.35 m^3** of storage will be required to attenuate flows to the allowable release rate. The project runoff exceeding the allowable release rate will be stored on-site via surface ponding at the parking lot as well as Stormtech underground chambers Model MC-3500 (or approved equivalent). Total proposed surface ponding provides approx. **16.98 m^3** and the proposed underground chambers provide **111.11 m^3** to provide a total storage of **128.09 m^3**, refer to ***Appendix D*** for additional info on Stormtech chambers. The 100-year maximum ponding depths can be found on drawing "C601 – Stormwater Management Plan" of ***Appendix E***.

8 Erosion and Sediment Control

During construction, erosion and sediment controls will be provided primarily via a sediment control fence to be erected along the perimeter of the site where runoff has the potential of leaving

the site. Inlet sediment control devices are also to be provided in any catch basin and/or manholes in and around the site that may be impacted by the site construction. Construction and maintenance requirements for erosion and sediment controls are to comply with Ontario Provincial Standard Specification OPSS 577. Refer to LRL Associates drawing C.101 for erosion and sediment control details.

9 CONCLUSION

This Stormwater Management and Servicing Report for the development proposed at 6001/6005 Renaud presents the rationale and details for the servicing requirements for the subject property.

In accordance with the report objectives, the servicing requirements for the development are summarized below:

Water Service

- The maximum required fire flow was calculated at **16,000 L/min** for Block A and **16,000 L/min** for Block B using the FUS method.
- There are at least seven (8) existing fire hydrants within 150m available to service the proposed developments. They will provide a combined fire flow of **34,066 L/min** to the site.
- The new development/expansion will be serviced with a new 150 mmΦ closed loop watermain network to be connected to the existing 200mmΦ watermain within Ziegler Street.
- Boundary conditions received from the City of Ottawa, considering pipe pressure losses, have indicate that sufficient pressure is available to service the proposed site.

Sanitary Service

- The anticipated sanitary flow from the proposed development is **0.80 L/s.**
- The proposed development will be serviced by a 150 mm diameter sanitary sewer network that connects to the existing 250 mm dia. sanitary sewer within Ziegler Street.

Stormwater Management

- The subject property is serviced by existing SWM Pond 3 as per the ***Gloucester EUC Study***. Hence additional quality control measures are not proposed.
- The storm water release rates from the proposed development will meet the pre-allocated rate of **85 L/s/ha** stated in the ***Gloucester EUC Study***. The target release rate for the site, based on the EUC, was calculated to be **24.77 L/s**. Permitted release rate from the site (considering controlled & uncontrolled catchment areas) was calculated to be **6.62 L/s**.
- Stormwater quantity control objectives will be met through on-site storm water ponding and sub-surface storage in the parking lot.

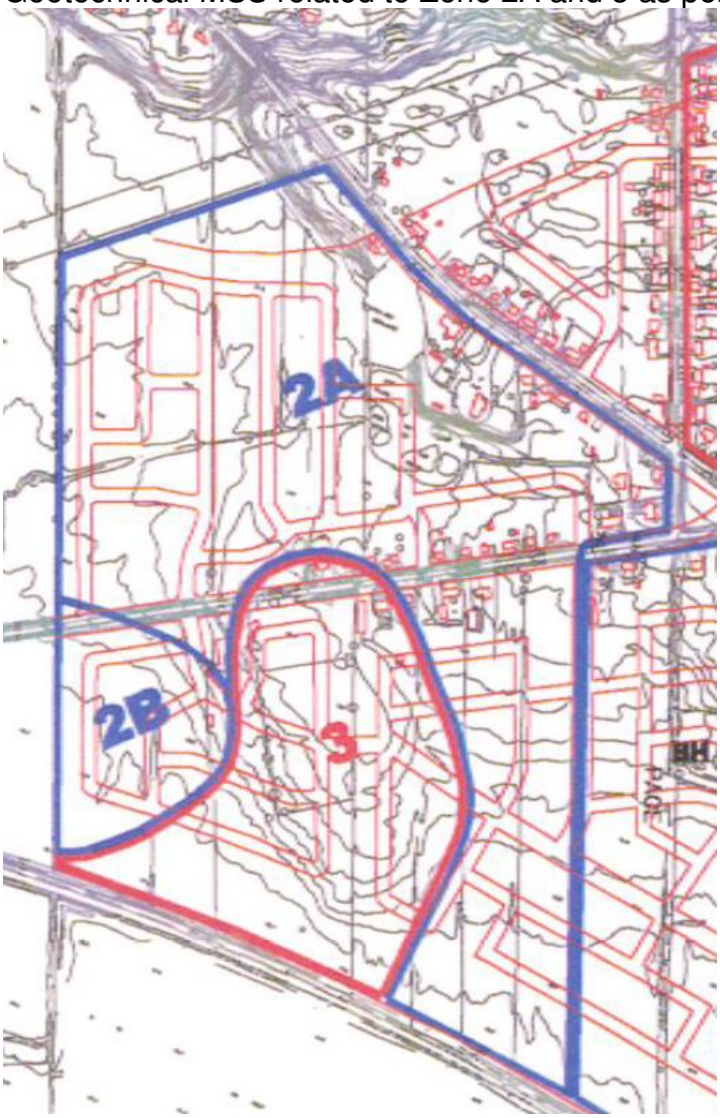
It is recommended that the Applicant contact the Trustee to discuss the terms of the agreement as a Non-Participating Owner (an owner of a land shown on the plans attached in Schedule D of the Agreement, and who is not party to this Agreement). The Trustee is Kris Kilborn at Stantec Consulting Ltd. (kris.kilborn@stantec.com).

15. Geotechnical Considerations: East Urban Community study was completed in 2004 by Golder. The study covers the EUC lands and provided findings with respect to the type of development proposed and landform (topography, and the fact that the area predominantly consists of surficial sand and silty sand over sensitive marine clay soils). These can bring some constraints along with them, specifically:

    a. grade raise restrictions
    b. slope stability (around the drainage features and the escarpment)
    c. relatively high groundwater levels.

Geotechnical MSS related to Zone 2A and 3 as per the MSS:



Zone 2

Zone 2 encompasses the area south and west of Navan Road with the exception of Zone 3 and includes the Escarpment lands. The subsurface condition typically consists of discontinuous deposits of surficial sand and silty sand typically 1.5 to 2.0m in depth overlying sensitive weathered silty clay of 2.0 to 3.0m. Surficial sand and silty sand deposits exceed 3.0m in some areas and are absent in others. The soil conditions in Zone 2 are similar to Zone 1 with varying strengths and a thinner weathered crust. The un-drained shear strength of the un-weathered silty clay is in the order of 20 to 25 kPa suggesting it is compressible. Groundwater levels are shallow, ranging in depth from the ground surface to within 1.0 to 1.5m of the ground surface.

The subsurface conditions within the escarpment are similar, with a thicker crust and deeper groundwater levels reflecting better drainage.

Due to the variability in data, making it difficult to establish grade restrictions for all of Zone 2, it was divided into two parts, Zone 2A and Zone 2B. Within Zone 2A, which includes almost all of Zone 2, a maximum grade raise restriction of 0.5m is acceptable, with no grade raise preferred. Conversely, a maximum grade raise of 2.0m is acceptable in Zone 2B.

Zone 2A is not well suited for development of higher-density structures using conventional spread footings. Even with the grade raise, conventional houses may not be feasible through all of Zone 2A, requiring wider footings or shallower foundations consistent with "high ranch" style homes.

Higher density developments on conventional spread footings are possible in Zone 2B provided grade raises are minimized to allow sufficient remaining capacity to support additional structure loads.

Zone 3

Zone 3 covers a portion of the low-lying areas south of Fourth Line Road and consists of glacial till overlain by a thick deposit of weathered silty clay. There is no practical limit to the grade raise permitted in Zone 3 but, for planning purposes, a reasonable limit of 3m was proposed. The area is well suited for mid-rise and possibly high-rise buildings on conventional spread footings.

Up to 2 storey timber frame w basements and at-grade garage (i.e. conventional suburban housing)				✓
Up to 3 storey timber frame w or w/o basements (i.e. stacked townhouses)	✓[2]			
Up to 3 storey (possibly 4 storey) timber frame w/o basements (i.e. townhouses or apartment buildings)				✓
Up to 3 storey timber frame w basements, w/o at grade garages or w garage in basement (i.e. stacked townhouses with depressed driveways)				✓
Up to 3 storey (possibly 4 storey) timber frame w concrete framed ground floor and basement level parking garages				✓
Higher density type developments		✓ (2B)	✓	

Note:
[1] Lack of good quality geotechnical information within the area and consequently guideline may be too conservative. Type of housing (conventional suburban versus "high ranch" style homes) depends on the servicing feasibility given the 0-0.5m grade raise restriction.
[2] Up to 3 storey timber framed w or w/o basements (i.e. stacked townhouses) may only be semi-feasible if supported on spread footings.

Given the grade raise and the building restrictions, please contact a geotechnical engineer to determine what possible development can occur based on the discussion in the MSS report. Further geotechnical investigation will be required to clarify the possible types of development.

Notes

1. As per the Ontario Building Code in areas that may be occupied, the static pressure at any fixture shall not exceed 552 kPa (80 psi.) Pressure control measures to be considered are as follows, in order of preference:

a. If possible, systems to be designed to residual pressures of 345 to 552 kPa (50 to 80 psi) in all occupied areas outside of the public right-of-way without special pressure control equipment.
b. Pressure reducing valves to be installed immediately downstream of the isolation valve in the home/ building, located downstream of the meter so it is owner maintained.

Disclaimer

The boundary condition information is based on current operation of the city water distribution system. The computer model simulation is based on the best information available at the time. The operation of the water distribution system can change on a regular basis, resulting in a variation in boundary conditions. The physical properties of watermains deteriorate over time, as such must be assumed in the absence of actual field test data. The variation in physical watermain properties can therefore alter the results of the computer model simulation. Fire Flow analysis is a reflection of available flow in the watermain; there may be additional restrictions that occur between the watermain and the hydrant that the model cannot take into account.

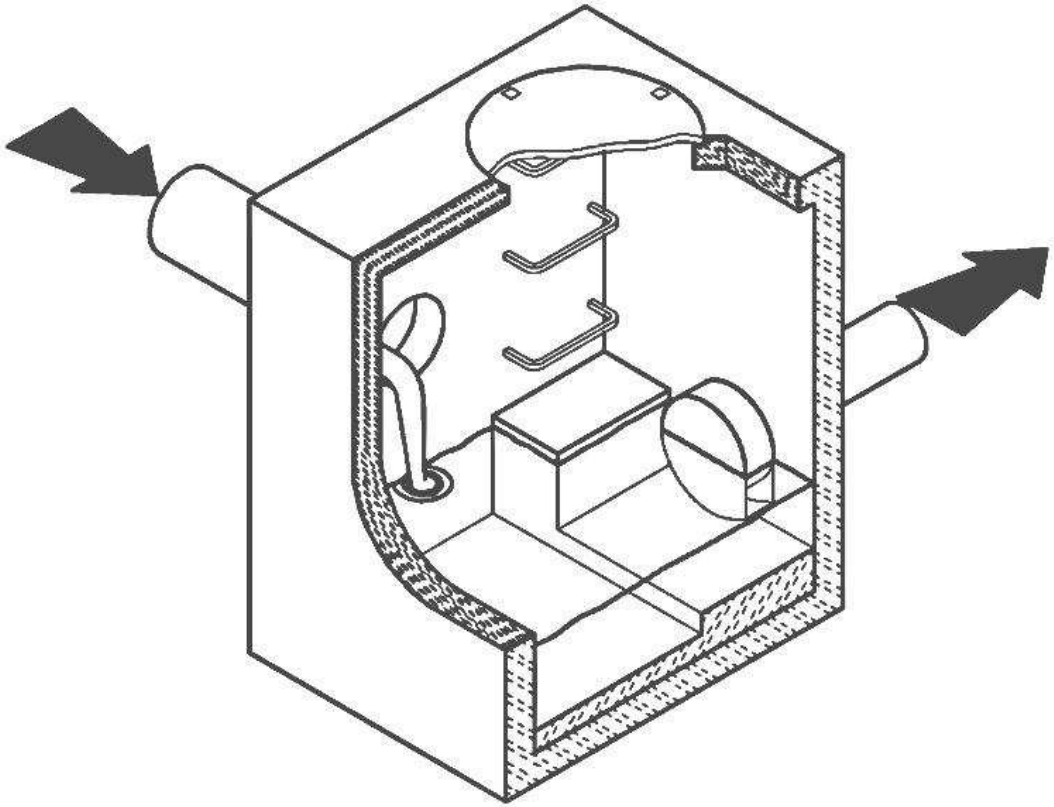
CSO/STORMWATER MANAGEMENT

HYDROVEX® VHV / SVHV
Vertical Vortex Flow Regulator



JOHN MEUNIER

HYDROVEX® VHV / SVHV VERTICAL VORTEX FLOW REGULATOR

APPLICATIONS

One of the major problems of urban wet weather flow management is the runoff generated after a heavy rainfall. During a storm, uncontrolled flows may overload the drainage system and cause flooding. Due to increased velocities, sewer pipe wear is increased dramatically and results in network deterioration. In a combined sewer system, the wastewater treatment plant may also experience significant increases in flows during storms, thereby losing its treatment efficiency.

A simple means of controlling excessive water runoff is by controlling excessive flows at their origin (manholes). **John Meunier Inc.** manufactures the **HYDROVEX® VHV / SVHV** line of vortex flow regulators to control stormwater flows in sewer networks, as well as manholes.

The vortex flow regulator design is based on the fluid mechanics principle of the forced vortex. This grants flow regulation without any moving parts, thus reducing maintenance. The operation of the regulator, depending on the upstream head and discharge, switches between orifice flow (gravity flow) and vortex flow. Although the concept is quite simple, over 12 years of research have been carried out in order to get a high performance.

The **HYDROVEX® VHV / SVHV** Vertical Vortex Flow Regulators **(refer to Figure 1)** are manufactured entirely of stainless steel, and consist of a hollow body (**1**) (in which flow control takes place) and an outlet orifice (**7**). Two rubber "O" rings (**3**) seal and retain the unit inside the outlet pipe. Two stainless steel retaining rings (**4**) are welded on the outlet sleeve to ensure that there is no shifting of the "O" rings during installation and use.

ADVANTAGES

- The **HYDROVEX® VHV / SVHV** line of flow regulators are manufactured entirely of stainless steel, making them durable and corrosion resistant.
- Having no moving parts, they require minimal maintenance.
- The geometry of the **HYDROVEX® VHV / SVHV** flow regulators allows a control equal to an orifice plate, having a cross section area 4 to 6 times smaller. This decreases the chance of blockage of the regulator, due to sediments and debris found in stormwater flows. **Figure 2** illustrates the comparison between a regulator model 100 SVHV-2 and an equivalent orifice plate. One can see that for the same height of water, the regulator controls a flow approximately four times smaller than an equivalent orifice plate.
- Installation of the **HYDROVEX® VHV / SVHV** flow regulators is quick and straightforward and is performed after all civil works are completed.
- Installation requires no special tools or equipment and may be carried out by any contractor.
- Installation may be carried out in existing structures.

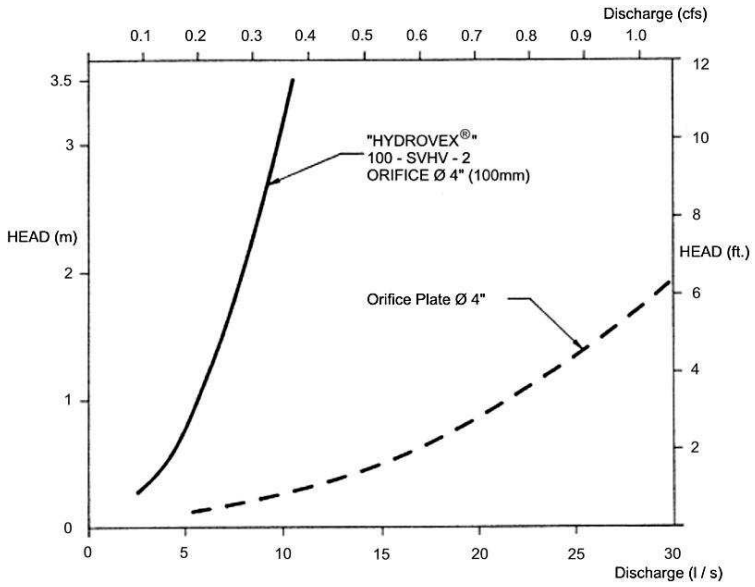

FIGURE 2: DISCHARGE CURVE SHOWING A HYDROVEX® FLOW REGULATOR VS AN ORIFICE PLATE

SELECTION

Selection of a **VHV or SVHV** regulator can be easily made using the selection charts found at the back of this brochure (see **Figure 3)**. These charts are a graphical representation of the maximum upstream water pressure (head) and the maximum discharge at the manhole outlet. The maximum design head is the difference between the maximum upstream water level and the invert of the outlet pipe. All selections should be verified by John Meunier Inc. personnel prior to fabrication.

Example:

✓ Maximum design head	2m (6.56 ft.)
✓ Maximum discharge	6 L/s (0.2 cfs)
✓ Using **Figure 3** - VHV	model required is a **75 VHV-1**

INSTALLATION REQUIREMENTS

All **HYDROVEX® VHV / SVHV** flow regulators can be installed in circular or square manholes. **Figure 4** gives the various minimum dimensions required for a given regulator. ***It is imperative to respect the minimum clearances shown to ensure easy installation and proper functioning of the regulator.***

SPECIFICATIONS

In order to specify a **HYDROVEX®** regulator, the following parameters must be defined:

- The model number (ex: 75-VHV-1)
- The diameter and type of outlet pipe (ex: 6" diam. SDR 35)
- The desired discharge (ex: 6 l/s or 0.21 CFS)
- The upstream head (ex: 2 m or 6.56 ft.) *
- The manhole diameter (ex: 36" diam.)
- The minimum clearance "H" (ex: 10 inches)
- The material type (ex: 304 s/s, 11 Ga. standard)

* ***Upstream head is defined as the difference in elevation between the maximum upstream water level and the invert of the outlet pipe where the HYDROVEX® flow regulator is to be installed.***

PLEASE NOTE THAT WHEN REQUESTING A PROPOSAL, WE SIMPLY REQUIRE THAT YOU PROVIDE US WITH THE FOLLOWING:

- ***project design flow rate***
- ***pressure head***

SECTION A **SECTION B**

INSTALLATION

The installation of a **HYDROVEX®** regulator may be undertaken once the manhole and piping is in place. Installation consists of simply fitting the regulator into the outlet pipe of the manhole. **John Meunier Inc.** recommends the use of a lubricant on the outlet pipe, in order to facilitate the insertion and orientation of the flow controller.

MAINTENANCE

HYDROVEX® regulators are manufactured in such a way as to be maintenance free; however, a periodic inspection (every 3-6 months) is suggested in order to ensure that neither the inlet nor the outlet has become blocked with debris. The manhole should undergo periodically, particularly after major storms, inspection and cleaning as established by the municipality

GUARANTY

The **HYDROVEX®** line of **VHV / SVHV** regulators are guaranteed against both design and manufacturing defects for a period of 5 years. Should a unit be defective, **John Meunier Inc.** is solely responsible for either modification or replacement of the unit.

EROSION AND SEDIMENT CONTROL NOTES

GENERAL

THE CONTRACTOR SHALL IMPLEMENT BEST MANAGEMENT PRACTICES, TO PROVIDE FOR PROTECTION OF THE AREA DRAINAGE SYSTEM AND THE RECEIVING WATERCOURSE, DURING CONSTRUCTION ACTIVITIES. THE CONTRACTOR ACKNOWLEDGES THAT FAILURE TO IMPLEMENT APPROPRIATE EROSION AND SEDIMENT CONTROL MEASURES MAY BE SUBJECT TO PENALTIES IMPOSED BY ANY APPLICABLE REGULATORY AGENCY.

THE CONTRACTOR ACKNOWLEDGES THAT SURFACE EROSION AND SEDIMENT RUNOFF RESULTING FROM THEIR CONSTRUCTION OPERATIONS HAS POTENTIAL TO CAUSE A DETRIMENTAL IMPACT TO ANY DOWNSTREAM WATERCOURSE OR SEWER, AND THAT ALL CONSTRUCTION OPERATIONS THAT MAY IMPACT UPON WATER QUALITY SHALL BE CARRIED OUT IN MANNER THAT STRICTLY MEETS THE REQUIREMENT OF ALL APPLICABLE LEGISLATION AND REGULATIONS.

AS SUCH, THE CONTRACTOR SHALL BE RESPONSIBLE FOR CARRYING OUT THEIR OPERATIONS, AND SUPPLYING AND INSTALLING ANY APPROPRIATE CONTROL MEASURES, SO AS TO PREVENT SEDIMENT LADEN RUNOFF ENTERING ANY SEWER OR WATERCOURSE WITHIN OR DOWNSTREAM OF THE WORKING AREA.

THE CONTRACTOR ACKNOWLEDGES THAT NO ONE MEASURE IS LIKELY TO BE 100% EFFECTIVELY FOR EROSION PROTECTION AND CONTROLLING SEDIMENT RUNOFF AND DISCHARGES FROM THE SITE. THEREFORE, WHERE NECESSARY THE CONTRACTOR SHALL IMPLEMENT ADDITIONAL MEASURES ARRANGED IN SUCH MANNER AS TO MITIGATE SEDIMENT RELEASE FROM THE CONSTRUCTION OPERATIONS AND ACHIEVE SPECIFIC MAXIMUM PERMITTED CRITERIA WHERE APPLICABLE. SUGGESTED ON-SITE MEASURES MAY INCLUDE, BUT SHALL NOT BE LIMITED TO, THE FOLLOWING METHODS: SEDIMENT PONDS, FILTER BAGS, PUMP FILTERS, SETTLING TANKS, SILT FENCE, STRAW BALES, FILTER CLOTHS, CATCH BASIN FILTERS, CHECK DAMS AND/OR OTHER RECOGNIZED TECHNOLOGIES AND METHOD AVAILABLE AT THE TIME OF CONSTRUCTION. ACCUMULATED SEDIMENT SHALL BE REMOVED IN SUCH A MANNER THAT PREVENTS THE DEPOSITION OF THIS MATERIAL INTO THE SEWER WATERCOURSE AND AVOIDS DAMAGE TO CONTROL MEASURES. THE SEDIMENT SHALL BE REMOVED FROM THE SITE AT THE CONTRACTOR'S EXPENSE AND MANAGED IN COMPLIANCE WITH REQUIREMENTS FRO EXCESS EARTH MATERIAL, AS SPECIFIED ELSEWHERE IN THE CONTRACT.

THE CONTRACTOR SHALL IMMEDIATELY REPORT TO THE CONTRACT ADMINISTRATOR ANY ACCIDENTAL DISCHARGES OF SEDIMENT MATERIAL INTO EITHER THE WATERCOURSE OR THE STORM SEWER SYSTEM. FAILURE TO REPORT WILL BE CONSTITUTE A BRACH OF THIS SPECIFICATION AND THE CONTRACTOR MAY ALSO BE SUBJECT TO THE PENALTIES IMPOSED BY THE APPLICABLE REGULATORY AGENCY. APPROPRIATE RESPONSE MEASURES, INCLUDING ANY REPAIRS TO EXISTING CONTROL MEASURES OR THE IMPLEMENTATION OF ADDITIONAL CONTROL MEASURES, SHALL BE CARRIED OUT BY THE CONTRACTOR WITHOUT DELAY.

NO CONTROL MEASURE MAY BE PERMANENTLY REMOVED WITHOUT PRIOR AUTHORIZATION FROM THE CONTRACT ADMINISTRATOR. ALL SEDIMENT AND EROSION CONTROL MEASURES SHALL BE REMOVED IN A MANNER THAT AVOIDS THE ENTRY OF ANY EQUIPMENT, OTHER THAN HAND-HELD EQUIPMENT, INTO ANY WATERCOURSE, AND PREVENTS THE RELEASE OF ANY SEDIMENT OR DEBRIS INTO ANY SEWER OR WATERCOURSE WITHIN OR DOWNSTREAM OF THE WORKING AREA. ALL ACCUMULATED SEDIMENT SHALL BE REMOVED FROM THE WORKING AREA AT THE CONTRACTOR'S EXPENSE AND MANAGED IN COMPLIANCE WITH THE REQUIREMENTS FOR EXCESS EARTH MATERIAL

WHERE, IN THE OPINION OF EITHER THE CONTRACT ADMINISTRATOR OR A REGULATORY AGENCY, ANY OF THE TERMS SPECIFIED HEREIN HAVE NOT BEEN COMPLIED WITH OR PERFORMED IN A SUITABLE MANNER, OR TAT ALL, THE CONTRACTOR ADMINISTRATOR OR A REGULATORY AGENCY HAS THE RIGHT TO IMMEDIATELY WITHDRAW ITS PERMISSION TO CONTINUE THE WORK BUT MAY RENEW ITS PERMISSION UPON BEING SATISFIED THAT THE DEFAULTS OR DEFICIENCIES IN THE PERFORMANCE OF THIS SPECIFICATION BY THE CONTRACTOR HAVE BEEN REMEDIED.
