# HYDROGEOLOGICAL ASSESSMENT AND TERRAIN ANALYSIS, CORKERY COMMUNITY CENTRE, 3447 OLD ALMONTE ROAD, OTTAWA, ON

Project No.: CCO-21-3339-01

Prepared for:

Nupur Chakravorty, OAA, LEED AP BD+C, B.Arch. Senior Project Manager City of Ottawa

Prepared by:

McIntosh Perry Consulting Engineers Ltd. 115 Walgreen Road Carp, Ontario K0A 1L0

Original: March 9, 2022

Revision 1: August 2, 2022 Revision 2: April 25, 2023 Revision 3: June 9, 2023

Revision 4: July 5, 2023

McIntosh Perry ('MP') was retained by the City of Ottawa ('the Client') to conduct a Scoped Hydrogeological Assessment and Terrain Analysis in support the City of Ottawa Site Plan Approval (SPA) process for the construction of an addition to the Corkery Community Centre, located at 3447 Old Almonte Road, Ottawa, Ontario (collectively referred to as 'the Site').

This report has been prepared using data collected from an existing water supply well at Community Centre at 3447 Old Almonte Road, Ottawa, ON (Test Well 1) by Mcintosh Perry staff on February 3, 2022. An additional well at the Ottawa Fire Station 84 (Test Well 2) located immediately west of the Site (3449 Old Almonte Road) was tested for water quality, as per the City of Ottawa guidance. Hydrogeological data from these wells are considered representative of the Site.

Ground surface at the Site is relatively flat, with a large portion of the site having a very gentle slope towards the east. Site elevation ranges from approximately 156 - 160 metres above sea level (m asl). Surface drainage is interpreted to reflect surface topography and is likely controlled via permeable areas and ditches along the roadway. Based on public mapping, the site represents a triple divide point between three local subwatersheds, with a larger portion of site draining to the south and east towards Huntley Creek (Carp River), and the remaining portions to the north and east to Corkery Creek (Carp River), and to the east towards Cody Creek (Mississippi River). Given this, shallow groundwater flow direction in the vicinity of the Site is difficult to infer.

Test Well 1 was pumped for a duration of six (6) hours and was sampled twice during this time. The pumping rate during the 6-hour pumping test (approximately 32 L/min) is considered sufficient to supply the proposed development. Therefore the current well may be used to service the existing building and the proposed expansion, and a new well is not required to be drilled from a hydrogeological perspective. It is recommended that this well be protected during construction.

Water quality results indicate that the bedrock aquifer provides good quality water, which may be considered suitable for human consumption. All water from Test Well 1 and Test Well 2 meets all applicable health-related standards and guidelines at the present time. Some treatment may be desired for aesthetic reasons.

On-site overburden in the area of the subject site is listed by the Ontario Geological Survey (OGS) as bedrock-drift complex in a Paleozoic terrain, and fine-textured glaciomarine deposits, which typically indicates shallow overburden. This assertion is supported by MECP WWIS records, which indicate an average depth to bedrock of approximately 2.2 m below ground surface (bgs) for listed wells within 500 m of the Site.

The Site appears to be capable of supporting the proposed from a hydrogeological perspective.

The existing on-site sewage system components appear to be constructed in conformance with applicable stipulations as per applicable Ontario Regulations and sufficiently sized to accommodate the expanded community centre.

The result of the impact assessment related to the on-site sewage systems indicate that the proposed community centre expansion will not be associated with unacceptable off-site impacts.

# **1.0 INTRODUCTION**

McIntosh Perry ('MP') was retained by the City of Ottawa ('the Client') to conduct a Hydrogeological Assessment and Terrain Analysis in support of the City of Ottawa Site Plan Approval (SPA) process for the construction of an addition to the Corkery Community Centre, located at 3447 Old Almonte Road, Ottawa, Ontario (collectively referred to as 'the Site').

Based on pre-consultation with City of Ottawa personnel, the scope of the hydrogeological investigation is to confirm whether an existing well at the Site (which currently serves the Corkery Community Centre) has sufficient capacity to serve the proposed addition as well as the existing community centre, and to confirm groundwater quality in the existing well. The scope of the septic assessment is to demonstrate that the Corkery Community Centre's existing on-site sewage system does not and will not adversely impact the existing on-site well water supply or existing water supply wells on surrounding properties as per section 5.2.5 of the City's Hydrogeological and Terrain Analysis Guidelines (March 2021).

The Site location is shown on Figure 1 - Site Location, and an outline of the Site showing the neighbouring properties is presented on Figure 2 - Site Layout.

This report has been prepared using data collected from an existing water supply well located on-Site by Mcintosh Perry staff on February 3, 2022.

This Hydrogeological Evaluation addresses the following:

- Well Record search and evaluation;
- Background hydrogeological evaluation;
- Oversight of a minimum 6-hour pumping test on-Site;
- Water level and flow monitoring, field water quality analyses;
- Sampling and analysis includes 3 samples analyzed for the 'Subdivision Supply Suite' of parameters (2 samples at Community Centre on-site (3447 Old Almonte Road), 1 sample at Ottawa Fire Station 84 located immediately west of the Site (3449 Old Almonte Road); and
- Data Evaluation and Report.

## 1.1 Consultation

The City of Ottawa and McIntosh Perry conducted a pre-application consultation with the City of Ottawa on November 18, 2021. The City of Ottawa provided information of what would be required for this Hydrogeological Report and Terrain Analysis.

# 2.0 BACKGROUND

## 2.1 Site Setting

The Site is located in the Carp area of the consolidated City of Ottawa, within the geographical township of Huntley (Figure 1). The site is zoned as Rural Institutional Sub-Zone 3 (RI3) as per the City of Ottawa Zoning By-Law Number 2008-250 sections 223 and 224.

At the present time, the Site is occupied by the Corkery Community Centre. At the time of investigation, on-Site conditions consisted primarily of one building, an outdoor skating rink, a play structure, and three soccer fields. Based on a review of aerial photographs (GeoOttawa), it appears that the Site was developed between 1991 and 1999. *It should be noted that Ontario Parcel data available on public provincial online mapping as well as the City of Ottawa's GeoOttawa GIS online mapping service suggest that the property parcel containing the Corkery Community Centre also encompasses Ottawa Fire Station 84 even though both facilities have separate entrances on Old Almonte Road as well as individual civic addresses. McIntosh Perry's scope of work for this assignment did not include legal surveying to establish property parcel boundaries and as such, this report accounts for both possibilities.* 

## 2.2 Neighbouring Properties and Land Uses

The Site is bounded by rural residential land to the north, east, south and west, with Old Almonte Road to the south, undeveloped forested land to the east/south, and the Ottawa Fire Station 84 to the west.

The Site has frontage to Old Almonte Road. While MECP Water Well Information System (WWIS) records for the area do not provide the detailed locations of most wells, all developments within the area are assumed to be privately serviced with wells and on-site sewage systems.

Figure 3 – MECP Wells Record Summary, presents the MECP Well Tag numbers and approximate well locations, where available, for wells within approximately 500 m of the Site.

## 2.3 Hydrology

Topography was reviewed on the Atlas of Canada–Toporama website. Site elevation ranges from approximately 156 - 160 metres above sea level (m asl) and is a local high point. Ground surface at the Site is relatively flat, with a large portion of the site having a very gentle slope towards the east.

Surface drainage is interpreted to reflect surface topography and is likely controlled via permeable areas and ditches along the roadway. Based on the Ministry of Natural Resources and Forestry (MNRF)'s GIS Ontario Flow Assessment Tool, the site represents a triple divide point between three local subwatersheds, with a larger portion of site draining to the south and east towards Huntley Creek (Carp River), and the remaining portions to the north and east to Corkery Creek (Carp River), and to the east towards Cody Creek (Mississippi River). Given this, shallow groundwater flow direction in the vicinity of the Site is difficult to infer.

The closest large permanent water bodies are the Mississippi River and Carp River, both located approximately 10 km from the site to the southwest and northeast of the Site, respectively, at their closest points. On regional scale, surface water is likely to flow both to the Mississippi River and Carp River given its location at the headwaters of three local sub-watersheds and on the divide of two Quaternary Watersheds (i.e., Mississippi River to the west and Carp River to the east).

## 2.4 Geology and Hydrogeology

On-site overburden at the Site is identified by the Ontario Geological Survey (OGS) as a contact between coarse-textured glaciomarine deposits consisting of sand, gravel, minor silt and clay, and Paleozoic bedrock. According to notes provided by during the pre-application consultation meeting, there are suspected thin soils in the area. This assertion is supported by MECP WWIS records, which indicate an average depth to bedrock of approximately 2.2 m below ground surface (bgs) for listed wells within 500 m of the Site. Refer to Section 5.0 for a more detailed discussion regarding surficial geology. On-site bedrock is generally characterized as limestone, dolostone, shale, arkose, and sandstone from the Ottawa and Simcoe Groups, and the Shadow Lake Formation (OGS 2020), which is supported by well records that list the bedrock as either "sandstone" or "limestone," which is commonly interchanged for dolostone in the absence of detailed inspection (MECP 2020).

Based on available information, shallow groundwater flow direction is difficult to infer as the site is located at a triple divide point for three local sub watersheds, each flowing is different directions.

## 2.4.1 Recharge and Discharge Areas

Based on a review of topographic data, geological maps, and Site visits, a larger portion of the central and south-eastern portion of the property slopes slightly downwards to the east, towards an unnamed creek which is tributary of Huntley Creek, while the northern limits drain north towards Corkery Creek and the south-western corner drains west towards Cody Creek. Shallow groundwater and surface water flows are therefore expected to vary depending the exact location of the site. Overall, the majority of the Site appears to be well drained.

No bedrock outcrops were observed at the Site, but it is important to consider that the ground was snow covered at the time of the visit.

Due to shallow bedrock in the area, the Site is therefore considered to be a hydrogeologically sensitive area. It should be noted that no unacceptable aquifer impacts have been observed by the current level of development and exact discharge locations of the on-site sewage systems servicing the Community Hall and Fire Station, therefore, it is reasonable to expect that a marginal increase in sewage effluent discharge to the Community Centre's sewage system will not disrupt the existing flow subsurface flow patterns on-site.

## 2.4.2 Potential Sources of Contamination

A windshield survey of the surrounding area was conducted in combination with a site walkthrough and review of maps and zoning information. The Site is located in a predominantly rural residential area. This does not appear to pose any significant source of contamination to the proposed development. No obvious potentially contaminating activities (e.g., fuel outlets, improperly maintained bulk fuel storage, salt storage, manure piles, livestock yards, etc.) were observed in the vicinity of the Site at the time of inspection. However, it was noted in discussions with the City of Ottawa that a retail fuel outlet may have been historically present in the vicinity of the Site, either at the community centre property itself or the adjacent fire hall. A review of aerial photographs from the City of Ottawa's online mapping tool did not identify any evidence of a retail fuel outlet based on 1976 and 1999 aerial photos.

The Site and surrounding properties are not connected to municipal services. As such, there are likely private on-site sewage systems at all nearby residences.

Based on the well construction details outlined in the well record for TW1 (see Well Record 1530802 in Appendix D), the water bearing zone is 222 ft below ground surface. Based on this depth, and the fact that the existing sewage system scheduled to remain unchanged in the location where it has been operating and discharging sewage effluent relative to two on-site wells (TW1 and TW2) that are scheduled to remain as part of the proposed facility expansion at a site and that is currently operating at steady-state with respect to the expected and acceptable anthropogenic impacts to the aquifer from the level of development currently present on and around the site that have been present for over a decade, it is our opinion that the marginal increase in sewage effluent from the proposed facility expansion will not cause undue impacts to the aquifer supply. Additionally, TW1 was constructed with extended casing of 44 ft which would greatly reduce any potential surface impacts.

## 2.4.3 Water Well Record Review

The MECP's WWIS database indicated 61 water wells that are located within 500 m of the Site boundary. 56 of these wells are listed for domestic purposes. The remaining wells are assumed abandoned. The MECP WWIS records are shown on Figure 3, and data are summarized in Appendix D.

All wells were completed in bedrock at final depths ranging from 19.2 - 17.6 m below ground surface (bgs). The average depth to bedrock was reported to be 2.15 m bgs. Driller-reported static groundwater levels ranged from 0.9 - 35.1 m bgs.

Driller-reported well yields ranged from 9.0 - 136.4 L/min, generally at or above the recommended minimum rate of 13.7 L/min for residential occupancies.

## **3.0 METHODOLOGY – HYDROGEOLOGICAL ASSESSMENT**

McIntosh Perry conducted a hydrogeological investigation at the Site to assess the feasibility of servicing the proposed development. The work generally followed the guidance of MECP Procedure D-5-5: Technical Guideline for Private Wells: Water Supply Assessment and the City of Ottawa's Hydrogeological Guidelines.

McIntosh Perry tested the existing community/institutional drilled water supply well located at 3447 Old Almonte Road (Test Well 1, TW1), which is believed to be representative of the hydrogeological conditions across the entire Site.

The MECP water well record for TW1 (1530802) indicates that the total depth of the well is 72.5 m, with the pump set at 45.72 m. The well is reportedly completed in limestone with red-green shale and sandstone, with water found at 67.7 m and a static water level of 25 m at the time of drilling. The record for TW1 is provided in Appendix D. During the pumping test, TW1 was observed to be in good condition, with at least 0.6 m of stickup as required by O.Reg. 903.

The pumping test at TW1 used the existing installed plumbing equipment. It is important to note that for the entire duration of the test, the pump cycled on and off, filling the pressure tank, which resulted in oscillating water levels.

A six-hour pumping test was conducted at TW1 by McIntosh Perry staff on February 3, 2022. During the entire duration of the test, the well was effectively taken offline and used solely for purposes of the pumping test. Water was pumped directly from the test well using the existing domestic water well pump, via a hose attached to an outdoor tap. The water discharge was directed away from the building and was allowed to flow overland across the Site. Discharging the water onto potentially thin soils did not appear to affect flow or drawdown during the pumping test.

During the testing period, water levels in the well were measured using an electronic water level tape. Water quality (pH, temperature, conductivity, turbidity, and total dissolved solids) was also monitored and recorded in the field during the test using calibrated instruments (Horiba U-52). Groundwater chemistry had stabilized prior to collecting samples of the well water.

It should be noted that the samples collected at the Site were directly from the outdoor untreated tap. Two samples (TW1-1 and TW1-2) were collected for laboratory analysis, one within the first hour of the pump test (TW1-1) and the second one within the final hour (TW1-2). An additional sample ('TW2') was collected at from another drilled well servicing an adjacent facility at 3449 Old Almonte Road, Ottawa, ON (Ottawa Fire Station 84). Refer to Appendix D for TW2's Well Record (Well Record 1520285). These samples were analyzed for the full suite of parameters list in the City of Ottawa's Guidelines for Hydrogeological Studies. Water samples were also analyzed for benzene, toluene, ethylbenzene, and xylenes (BTEX) and petroleum hydrocarbons, fractions 1 through 4 (PHC F1-F4), due to the close proximity to the fire station, and anecdotal evidence of a retail fuel outlet in the vicinity.

It is important to note that a water sample was not obtained from an additional residential dwelling in an inferred downgradient direction.

Whenever samples were collected from TW1, confirmation of zero chlorine residual was measured using disposable test strips. All groundwater samples were collected unfiltered and unchlorinated, directly into clean bottles supplied by the analytical laboratories (Paracel Laboratories Ltd., Ottawa, ON). The samples were kept on ice and shipped directly to Paracel under strict chain of custody procedures. All of the samples were received by the laboratory within 24 hours of collection.

Paracel is fully accredited by the Standards Council of Canada/Canadian Association for Laboratory Accreditation (SCC/CALA) and has accreditation for Ontario Safe Drinking Water Act (OSDWA) testing.

During the pumping test, water level monitoring consisted of manual readings with an electronic water level tape. Drawdown was measured in the pumped well and measurements were made until at least 95% recovery were achieved, or 24 hours had passed (whichever came first). A data logger could not be used due to the risk of damaging down-hole equipment (pump and associated wiring).

Drawdown and recovery data from the pumping tests were plotted and analyzed using the Cooper-Jacob solution. The hydraulic conductivity (K, m/s) and transmissivity (T, m<sup>2</sup>/d) and long-term yield (Farvolden and Moell Method) of the aquifer were estimated. Storativity cannot be assessed properly without the use of an additional observation well, which was not available at the time of the test.

# 4.0 **RESULTS**

A drawdown curve and tabular data from the pumping tests at the Site is available in Appendix A. A summary of groundwater quality data and the official Laboratory Certificates of Analysis are available in Tables 1 and 2 and Appendix B, respectively.

## 4.1 Static Conditions

Prior to the initiation of pumping, water levels were measured in the well. The static groundwater level was recorded at 32.35 m below top of casing (btoc) at the time of the pumping test (t=0). Assigning an arbitrary site benchmark of 100.00 m (local) to the top of the casing, the static water elevation in the well was 67.65 m above datum (ad). According to the MECP Well Record for TW1 (1530802), the pump was set at a depth of 45.72 m, corresponding to an available drawdown of 13.37 m.

Standing water or evidence of groundwater discharge was not observed at the test well location at the time of the pumping test.

## 4.2 **Pumping Test – TW1**

A pumping test was conducted at TW1 (3447 Old Almonte Road) under the supervision of McIntosh Perry on February 3, 2022. Water was pumped directly from the test well using the existing domestic water well pump, and one hose attached to the outdoor tap. The water discharge was directed away from the building and was allowed to flow overland across the Site. At the time of the pumping test, the weather was approximately -6°C and cloudy.

All water level measurement data are presented in Appendix A. Due to the existing installed plumbing, water levels were seen to oscillate throughout the entire duration of the test.

At 9:40 AM, the outdoor tap was turned on and the flow rate adjusted to approximately 32 L/min from the hose. This pumping rate was maintained with minimal variation for the duration of the test (361 minutes total).

The groundwater level ranged between 32.21 – 32.752 m btoc, with a maximum drawdown of 0.402 m observed. Following pump shutoff (361 minutes), drawdown was recorded at 0.02 m within 33.33 minutes (32.37 btoc, 67.63 m ad), representing approximately 95% recovery.

## 4.2.1 Well Yield

The pumping test undertaken by McIntosh Perry provides a reasonable indication of the yield of the Test Well. During this test, approximately 11,372 L of water was pumped from the well; this volume exceeds the daily demand for water for a typical 4-BR home (2,250 L) as specified in the Guideline Procedure D-5-5 Private Wells: Water Supply Assessment. Since the well will not be used for residential purposes, it was also established that the volume pumped exceeded the expected water demand of

3,600 L/day which has been established for this assessment based the calculated total daily design sanitary sewage flows for the site.

## 4.2.2 Transmissivity

The transmissivity for TW1 was calculated following the Cooper-Jacob method. The calculations for Transmissivity are presented in Appendix C. Transmissivity was calculated using the following equation:

$$T = \frac{2.3 \ Q}{4 \ \pi \Delta s}$$

Where:

- T is the transmissivity (m<sup>2</sup>/day)
- Q is the pumping rate during the pumping test (L/min); and,
- $\Delta s$  is the differential for residual drawdown for one log cycle (m)

Using drawdown and recovery data, respective transmissivities of  $301 \text{ m}^2/\text{d}$  and  $3375 \text{ m}^2/\text{d}$ ay were calculated using the Cooper-Jacob method. The transmissivity of  $301 \text{ m}^2/\text{d}$ ay calculated from the drawdown was used in the calculations as it is the more conservative value. It is noted that recovery data are likely more representative of aquifer conditions, as drawdown data were complicated by the cycling of TW1's pressure tank.

Assuming an aquifer thickness of 59.74 m (corresponding to the interval between the bottom of the casing and the bottom of the well), the screened formation of TW1 was calculated to have a hydraulic conductivity ranging from  $5.8 \times 10^{-5} - 6.5 \times 10^{-4}$  m/s.

Storativity (S) could not be calculated as no observation wells were available for measurement at the time of the pumping test.

A summary of the well and hydrogeological properties determined during the testing work at the Site are presented in Appendix A. The calculations for Transmissivity are presented in Appendix C.

## 4.2.3 Long Term Yield

The theoretical long-term safe yield was calculated using both the Farvolden and Moell methods. Drawdown data were used, as they are likely more representative of aquifer conditions (see above Section 4.2.2).

### **Farvolden Equation**

The long-term yield (Q<sub>20</sub>) was calculated using the following Farvolden equation:

$$Q_{20} = 0.68 T Ha S_f$$

Where:

- Q<sub>20</sub> is the twenty-year safe yield;
- T is the transmissivity;
- Ha is the available water column height (above the pump); and
- S<sub>f</sub> is a safety factor (0.7).

Based on the Farvolden Method, calculations indicate that a twenty-year safe yield is in the order of 1332 L/min. This means that TW1 could theoretically sustain continuous pumping for 20 years at this rate, which is improbable as with normal water use; the pump will cycle on and off on a much shorter time scale, allowing the well to recharge.

#### **Moell Method**

The Moell Method was also used to calculate the theoretical long-term safe yield for the pumping well. The long-term yield  $(Q_{20})$  was calculated using the following Moell equation:

$$(Q_{20}) = (Q Ha Sf) / (s100 + 5 \Delta s)$$

Where:

- Q<sub>20</sub> is the twenty-year safe yield (m<sup>3</sup>/day);
- Ha is the available water column height (m);
- S<sub>f</sub> is a safety factor (0.7);
- s100 is the drawdown at 100 minutes (semi-log long-term graph);
- Δs is the change in hydraulic head over one log cycle (drawdown vs. log time, see Appendix D); and
- Q is the pumping rate during the pumping test (L/min.

Using the Moell Method, calculations indicate that a twenty-year safe yield for the well is in the order of 763 L/min.

Accordingly, McIntosh Perry is of the opinion that the aquifer is capable of supplying water at a flow rate which greater than the minimum flow rate of 30 L/min, which assumes that the entire daily water demand of 3,600 occurs for a period of 120 minutes per day.

The calculations for the Farvolden and Moell method are presented in Appendix C.

## 4.2.4 Water Quality

Laboratory Certificates of Analysis for on-site groundwater testing are presented in Appendix B. A summary of field and laboratory results from the TW1 is presented in Tables 1 and 2. Samples were taken twice during the six-hour pumping test of TW1 on February 2, 2022. Samples were taken directly from the outdoor untreated tap into laboratory supplied containers. The pre-test and post-test samples at TW1 were labelled '-1' and '-2', respectively. A sample was also taken from an untreated bathroom tap at the Fire Station (TW2, 3449 Old Almonte Road), located immediately west of the Site.

The results of the analytical testing were compared to the Ontario Drinking Water Standards, Objectives, and Guidelines (ODWSOG). Based on the analytical results from February 3, 2022 the following was noted:

- Hardness concentration (as CaCO<sub>3</sub>) for TW1-1 (380 mg/L) and TW1-2 (377 mg/L) is considered to be **very hard** in relation to operational guidelines (OG) of 80-100 mg/L;
- OWDS aesthetic objectives (AO) guideline for iron (0.3 mg/L) was exceeded in sample TW1-1 (0.5 mg/l);
- Organic Nitrogen's operation guideline (OG) (0.15 mg/L) was exceeded in both TW1-1 (0.17 mg/L) and TW1-2 (0.18 mg/L) samples;
- The health warning limit for sodium (20 mg/L) was exceeded in samples TW1-1, TW1-2, and TW2.

Analytical testing indicates that the water quality of TW1 is suitable for potable purposes.

## 4.2.5 Water Treatment

The groundwater quality at the Site, as indicated by analytical data from supply well TW1, is suitable for human consumption.

The hardness in TW1 is considered to be very hard. Water softening is recommended, specifically the use of potassium salts (i.e., KCI) is recommended. With the use of sodium-based water softeners, it is important to note that sodium concentrations will be elevated; currently the sodium concentration of 27.3 mg/L exceeds the 20 mg/L benchmark concentration for individuals on a sodium restricted diet. Therefore, a potassium salt softener (KCI) is recommended to avoid elevated levels of sodium above that reported in Table 1. It should be noted that a review of the manufacturer's technical data sheet provided by the City of Ottawa for the specific UV disinfection unit employed as part of the facility's drinking water system (Hallett model 500 PN, NSF/ANSI 55 Class A) did confirm that the hardness

concentration from the supply well (380 mg/L) is within the operating range of that specific UV disinfection unit, which lists a maximum operating Hardness concentration of 850 mg/L.

The Langelier Saturation Index (LSI) and Ryznar Stability Index (RSI) were calculated for TW1 (Appendix G). These results indicate that there is limited potential for scale to form on pipes, and that any calcium carbonate formation is not likely to form a protective corrosion inhibitor film (LSI=0.96, RSI=6.30).

Iron exceeds the aesthetic objective (AO) and may cause the staining of plumbing fixtures. Iron is readily treated through water softeners or manganese greensand filters. Similar to above with respect to the Hardness parameter, a review of the manufacturer's technical data sheet provided by the City of Ottawa for the specific UV disinfection unit employed as part of the facility's drinking water system (Hallett model 500 PN, NSF/ANSI 55 Class A) did confirm that the iron concentration from the supply well (0.3 mg/L) is within the operating range of that specific UV disinfection unit, which lists a maximum operating iron concentration of 3 mg/L.

Organic nitrogen exceeds the operation guideline and is associated with odor and taste when chlorine disinfection is used. In this case, the exceedance is marginal and will not lead to odor or taste issues since it was confirmed that the facility does not employ chlorination was part of the on-site drinking water system, but instead employs UV disinfection.

It should be noted that it is expected that this facility's drinking water system would be regulated under Ontario's Small Drinking Water Regulation 319/08 (O.Reg. 319/08) as it would likely be considered a small municipal non-residential drinking water system (even though it might not be capable of supplying water at a rate of more than 2.9 L/s) since it is understood to serve a "public facility" as defined in the regulation. Small drinking water systems that are regulated under O.Reg. 319/08 are assessed by Public Health inspectors (PHI). Although not currently employed as part of the facility's drinking water system, should future PHI directives with respect to treatment requirements include the requirement to provide chloring disinfection, the organic nitrogen operational guideline exceedance should be reviewed and discussed by both the PHI and the system's operator to ensure it does not interfere with chlorination or result in taste or/and odour problems. Similarly, should a change in UV disinfection unit be required in the future, the hardness and iron operational guideline exceedances should be reviewed and discussed by both the PHI and the system's operator to ensure they don't exceed the manufacturer's specific operating range for specific UV disinfection unit being proposed for use as part of the drinking water system on-site.

#### 4.2.5.1 Well Protection During Construction

As the existing water supply well (TW1) is to be retained to service the expanded development, it is recommended that measures be taken to protect the well during construction. The well should be clearly marked to prevent accidental collisions by construction equipment. Consideration could be given to using a section of large-diameter concrete pipe around the well to protect it. Following construction, ground surface must be graded for positive drainage away from the well per the requirements of O.Reg. 903.

## 5.0 TERRAIN ANALYSIS

## 5.1 **Preamble**

EXP completed a Geotechnical Investigation in 2021 where four boreholes (BH-01 through BH-04) and three test pits (TP-03, TP-02, and TP-04) were advanced in the area of the proposed addition to the Corkery Community Centre (EXP, 2021). Additionally, as a part of this Hydrogeological Assessment and Terrain Analysis, McIntosh Perry advanced one test pit on December 22, 2021 (MP-TP1-2021), within the contact area of the existing sewage system. See Figure 7 for locations of test pits/boreholes and Appendix E for borehole logs and associated grain-size distribution curves.

The test pits and boreholes mentioned above all detail the depth of overburden and depth to bedrock. Various soil samples were collected for soil characterization.

## 5.2 General Site Evaluation

#### 5.2.1 Overburden Depth

Where boreholes were advanced to refusal, overburden across the site was found to be relatively shallow (< 2.1 m), having an average overburden thickness of 1.7 m (EXP, 2021).

The test pit advanced by McIntosh Perry staff on December 22, 2021 was advanced to a depth of 0.85 m (refusal was not reached).

## 5.2.2 Overburden Characterization

The soil and groundwater conditions from the test pits and boreholes advanced by EXP and discussed in the Geotechnical Investigation report (EXP, 2021), with the borehole logs, test pits logs and Soil Particle Size Distribution Analysis included in Appendix E, along with the test pit log for the test pit advanced by McIntosh Perry staff as part of the Sewage System assessment on December 22, 2021.

The logs indicate the subsurface conditions at the specific test pit locations only. Boundaries between zones on the logs are often not discrete but transitional and have been interpreted. Subsurface conditions described have various degrees of precision based on the frequency of test pits, uniformity of subsurface conditions and number of samples collected. Where conditions at locations other than at the test pit locations are reported, these are inferred and may vary from the conditions at the test pits.

The soil descriptions in this report are based on tactile observations by McIntosh Perry staff as well as Grain Size Distribution curves provided in the EXP Geotechnical Investigation report (EXP, 2021).

## 5.2.2.1 Topsoil

A layer of topsoil was encountered in all of the test pit and borehole locations; the topsoil had a varying thickness between 0.075 m and 0.25 m (EXP, 2021), and 0.10 m in the test pit advanced by McIntosh Perry staff.

## 5.2.2.2 Silty Sand with Gravel (SM)

A layer of silty sand with gravel was encountered below the topsoil/granular fill layer in all test pits and boreholes with the exception of test pit MP-TP1-2021; the layer had a varying thickness between 0.4m and 1.5 m.

## 5.2.2.3 Sandy Gravel with Silt, Cobbles and Boulders (GM)

A layer of sandy gravel with silt, cobble and boulders was encountered below the silty sand with gravel layer in BH-01, BH-03, and TP-01 and below the silt gravel with sand layer in MP-TP1-2021; the layer had a varying thickness between 0.6 m and 1.3 m.

#### 5.2.2.4 Silty Gravel with Sand, Cobbles and Boulders (GM)

A layer of silty gravel with sand, cobbles, and boulders was encountered either below the topsoil or below silty sand and gravel in BH-02 and MP-TP1-2021; the layer had a varying thickness between 0.1 m and 0.3 m.

#### 5.2.2.5 Silty Sand to Sandy Silt with Gravel (SM-ML)

A layer of silt sand to sandy silt was encountered below the silty sand and gravel and immediately above the refusal depth in BH-04; the layer had a thickness of 0.6 m.

## 5.2.3 Soil Classification for Private Sanitary Servicing

Comparison of the soil classification for the Unified Soil Classification as provided in the Ministry of Municipal Affairs and Housing (MMAH) Supplementary Standard SB-6: Time and Soil Descriptions, reveals that the two main soils assessed on-site falls within either the following:

- GM: Silty Gravels, gravel-sand-silt mixtures
  - According to Table 2 of SB-6, the GM group of soils has a coefficient of permeability (K) of 10<sup>-2</sup> to 10<sup>-4</sup> with a percolation time (T) between 4-12 min/cm. Due to the permeable to medium permeability nature of the soil type, it is deemed acceptable as native receiving soil for Class 4 sewage systems.
- SM: Silty sands, sand-silt mixtures
  - According to Table 2 of SB-6, the SM group of soils has a coefficient of permeability (K) of 10<sup>-3</sup> to 10<sup>-5</sup> with a percolation time (T) of 8 to 20 min/cm. This soil type has a medium to low permeability and is deemed acceptable as native receiving soil for Class 4 sewage systems.

## McINTOSH PERRY

## 5.2.4 Bedrock

As previously discussed in Section 2.4, on-site bedrock is generally characterized as limestone, dolostone, shale, arkose, and sandstone from the Ottawa and Simcoe Groups, and the Shadow Lake Formation (OGS 2020), which is supported by the geotechnical borehole BH-03 (EXP), in addition to MECP drinking well records that list the bedrock as either "sandstone" or "limestone," which is commonly interchanged for dolostone in the absence of detailed inspection (OGS 2020).

## 5.2.5 Groundwater

Groundwater was only encountered in the shallow overburden in EXP TP-03 (1.6 m bog) and was encountered in the shallow bedrock in the piezometer installed in the BH-03 (2.6 m bog).

## 5.3 **Contaminant Attenuation**

## 5.3.1 Three-Step Assessment Process

As part of the consent development application process, the City of Ottawa requires that a water quality impact risk assessment be completed as per MECP requirements. The MECP Procedure D-5-4 (Technical Guideline for Individual On-site Sewage Systems: Water Quality Impact Risk Assessment) outlines the following steps to be completed as part of a septic impact assessment:

- Step 1 Lot Size Consideration
- Step 2 System Isolation Consideration
- Step 3 Contaminant Attenuation Considerations

The following outlines the results of the sewage system impact assessment as undertaken by McIntosh Perry.

## 5.3.1.1 Step 1 - Lot Size Consideration

For the purpose of this investigation, McIntosh Perry considered the land parcels upon which the Corkery Community Centre exists (2.60 hectares) and the neighbouring lot with the sports fields (1.16 hectares) as the site, which together combine to be 3.76 hectares. The site appears to have two separate civic addresses (3447 and 3449 Old Almonte Road). Please see Figure 2 for layout of the two adjacent parcels that are considered to form the subject site.

As part of the terrain assessment for this site, McIntosh Perry established an equivalent total daily sewage flow loading rate to the 1,000 L/day/ha of domestic waste, similarly than what is used for residential developments. As the subject site is approximately 3.76 ha and assuming the equivalent of domestic strength waste will be generated for the existing fire hall and proposed expanded community centre, a total daily sewage flow loading rate of 3,760 L/day was calculated based on spatial area to adequately permit development of the Site.

The existing fire hall's sewage system is calculated as having a capacity of approximate 1,200 L/day based on a review of the available information in sewage system permit Certificate of Completion No. 09-509 (Appendix G), with McIntosh Perry cursory field observations supporting the information contained in the Certificate of Completion. Additionally, the proposed expanded community centre will be associated with a daily sewage system flow of 3,600 L/day, for a total site-wide daily sewage flow of 4,800 L/day. Accordingly, McIntosh Perry considered that this total daily sewage flow was not insufficient for the scale of proposed development on the subject site, a therefore a review of Step 2 -System Isolation Consideration was undertaken.

## 5.3.1.2 Step 2 - System Isolation Consideration

As previously outlined, the existing lot is considered too small for lot size consideration; therefore, McIntosh Perry assessed whether System Isolation Considerations were applicable. If it can be demonstrated that the sewage system effluent is hydrogeologically isolated from the existing or potential drinking water supply aquifer, then the risk to groundwater is considered to be low. The system isolation argument applies to lands that extend up to 500 metres from the Site.

Based on a review of available geological information and mapping, in conjunction with site observations made during the Terrain Analysis and background information review, overburden depth on-site is shallow (< 2.1m). The Site is therefore determined not to be hydrogeologically isolated and, as such, the consideration for system isolation of sewage system effluent from the groundwater supply aquifer is not applicable to this site.

## 5.3.1.3 Step 3 – Contaminant Attenuation Considerations

Since neither lot size nor system isolation considerations apply to the proposed project, a predictive nitrate-nitrogen attenuation assessment was undertaken to determine if sufficient attenuation of nitrate-nitrogen could be achieved on the subject site.

The Thorthwaite Water Balance method, in conjunction with local climatic data available from Environment Canada for Ottawa's MacDonald-Cartier International Airport YOW (Site Climate ID: 6106000), was used to estimate the net potential infiltration for the subject site.

As previously discussed, for the purpose of the calculations, both 3447 and 3449 Old Almonte Road properties combined were used for contaminant attenuation considerations as both are owned by the City of Ottawa.

As indicated previously, the information contained in the 2009 sewage system Certificate of Completion No. 09-505 (Appendix G) obtained via a file search with the Ottawa Sewage System Office for the property at 3449 Old Almonte Road, which services the Fire Station, suggest it was designed for a total daily sewage flow of 1,200 L/day. In coordination with the City of Ottawa's project team for the Community Centre expansion project, it was established that a total daily sewage flow of 3,600 L/day would be appropriate for the Community Centre after the expansion based on occupancy for the

facility equivalent to 450 people in an assembly hall with no food service, 180 people in public parks with access to toilets only, or 100 people in an assembly hall with food service provided. Combining the total daily sewage flow for both the fire hall and the expanded Community Centre, a site-wide sewage flow of 4,800 L/day was carried forward for this assessment.

The nitrate concentration at the site boundaries was calculated using the following information (refer to Appendix A for more information):

- A water surplus (Ws) value of 333.88 mm/yr was calculated based on 1981-2010 Climate Normal data for Ottawa's MacDonald-Cartier International Airport (YOW) (Site Climate ID: 6106000);
- An infiltration factor (I<sub>f</sub>) of **0.600** was calculated as per Table 2 of MECP's document titled "MOEE Hydrogeological Technical Requirements for Land Development Applications," dated April 1995. The factors used to calculate the Infiltration Factor (If) and the associated rationale for selection are presented below:
  - A topographic factor of 0.20 was used as the land can be considered relatively flat or 'rolling land'.
  - A soil factor of 0.30 was used due to the silty sand with gravel and silty gravel with sand encountered in the overburden throughout the site (EXP, 2021).
  - A cover factor of 0.10 was used for Cultivated Land (0.1) as the majority of the site is expected to remain as cultivated land/mowed grass.
- Available infiltration (I) was calculated by multiplying the water surplus (Ws) by the infiltration factor (If). This yielded an infiltration value of **0.200 m/yr**.
- The infiltration area (A) was determined to be 3.2218 ha (32,217.82 m<sup>2</sup>) or 85.7% of the site, once adjustments were made for the approximately 5,364 m<sup>2</sup> of hard-surfaced areas present on-site (i.e., parking/driving surfaces, roofs, and play structure).
- The dilution water (D<sub>w</sub>) available was calculated as 6454.06 m<sup>3</sup>/yr (17,682.35 L/day) by multiplying the infiltration area (A) with the available infiltration (I).
- Based on the samples collected from both Test Well 1 (3447 Old Almonte Road) and Test Well 2 (3449 Old Almonte Road), a background nitrate concentration (C<sub>b</sub>) of 1.4 mg/L was used. Note that this background nitrate concentration is expected to be conservative as it would already incorporate any of the existing steady-state anthropogenic impacts that the fire hall and existing portions of the community centre may have on the nitrate concentrations in the local groundwater supply since both of these facilities have been in operation for extended periods of time (i.e. over 20 years or approximately since ~1999) during which they would have been discharging sewage effluent to site's subsurface via Class 4 sewage systems.
- The site-wide sewage system daily flow (Q<sub>e</sub>) was set at 4,800 L/day, at a concentration ((C<sub>e</sub>) of 40 mg/L since the effluent is generally expected to be from domestic origins based on the type of facility being serviced.

Based on the above-noted information, the average nitrate concentration at the downgradient property boundary ( $C_w$ ) would of be 9.94 mg/L, which is below the maximum boundary nitrate concentration of 10 mg/L.

## 5.3.2 Other Discussions

The above-noted analysis is considered very conservative as it assumes that the full sewage system impacts of both the existing Fire Hall and existing Community Centre are not already accounted for in the background nitrate concentrations. In practice, sewage flow from the Fire Hall is not expected to change as part of this project and the additional flow associated Community Centre expansion is expected to be relatively minimal when compared to the baseline conditions at the Community Centre for the previous 20 years (i.e. since ~1999).

In addition, it has been discussed in this report that empirical water quality data from the on-site wells that the combination of the properly constructed partially-raised leaching bed and drilled wells (all of which are proposed to remain to service as part of the expansion), in conjunction with the local surficial geology and bedrock conditions, are sufficient to protect the local aquifer from unacceptable impact even though the site is considered hydrogeologically sensitive.

Calculations for the predictive nitrate attenuation are presented in Appendix F.

# 6.0 **RECOMMENDATIONS**

## 6.1 Water Supply

## Well Yield

• Well yields in the order of 32 L/min appear to be sustainable based on the pumping test data and calculations performed.

#### Water Quality and Treatment

- No maximum acceptable concentration (MAC) was exceeded in TW1. All applicable health related standards at the present time.
- If water softening is desired, the use of potassium salts (i.e., KCl) is recommended.
- It is noted that the warning level for sodium (20 mg/L) was exceeded in all samples collected as part of this investigation. As such, it is recommended that the Client notify the local Medical Officer of Health of the sodium exceeding the health-related warning limit.
- MP recommends that the Owner contact Ottawa Public Health regarding the organic nitrogen exceedance to review and discuss with the Public Health Inspector and the system's operator.
- It is expected that this facility's drinking water system is regulated under Ontario's Small Drinking Water Regulation 319/08 (O.Reg. 319/08) as a small municipal non-residential

drinking water system serving a "public facility". Should the local Public Health inspector (PHI) have issued a directive with respect to treatment requirements that include the requirement to provide disinfection, the organic nitrogen operation guideline exceedance should be reviewed and discussed by both the PHI and the system's operator to ensure it does not interfere with chlorination should it be required or already used as part of the existing drinking water system on-site.

## 6.2 Wastewater Servicing

#### Private Sewage Systems

- The capacity of the existing sewage system servicing the community centre is approximately 3,600 L/day. This was determined to be sufficient for the proposed expansion of the community centre and would translate to equivalent occupancy limits of the facility of 450 people in an assembly hall with no food service, 180 people in public parks with access to toilets only, or 100 people in an assembly hall with food service provided.
- The existing on-site sewage system components appear to be constructed in conformance with applicable stipulations as per applicable Ontario Regulations and sufficiently sized to accommodate the expanded community centre.
- The result of the impact assessment related to the on-site sewage systems indicate that the proposed community centre expansion will not cause unacceptable off-site impacts.
- Any septic systems must be constructed with all appropriate setbacks, treatment units and stipulations as per applicable Ontario Building Code requirements.
- Septic systems for the lot must be constructed down-gradient of the lot's supply well.

## Site Servicing Layout

• Proposed development on the subject site is expected to remain as is due to sufficient capacity of the existing well and sewage system servicing the community centre to accommodate the flows associated with the proposed expansion.

# 7.0 LIMITATIONS

This report has been prepared and the work referred to in this report has been undertaken by McIntosh Perry Consulting Engineers Ltd. for the applicants and the regulatory authority. It is intended for the sole and exclusive use of the applicants, their affiliated companies and partners and their respective insurers, agents, employees, advisors, and reviewers. The report may not be relied upon by any other person or entity without the express written consent (Reliance Letter) of McIntosh Perry Consulting Engineers Ltd.

Any use which a third party makes of this report, or any reliance on decisions made based on it, without a reliance letter are the responsibility of such third parties. McIntosh Perry Consulting Engineers Ltd. accept no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions based on this report.

The investigation undertaken by McIntosh Perry Consulting Engineers Ltd. with respect to this report and any conclusions or recommendations made in this report reflect McIntosh Perry Consulting Engineers Ltd. judgment based on the Site conditions observed at the time of the site inspection on the date(s) set out in this report and on information available at the time of the preparation of this report.

This report has been prepared for specific application to this Site and it is based, in part, upon visual observation of the Site, subsurface investigation at discrete locations and depths, and specific analysis of specific chemical parameters and materials during a specific time interval, all as described in this report. Unless otherwise stated, the findings cannot be extended to previous or future Site conditions, portions of the Site which were unavailable for direct investigation, subsurface locations which were not investigated directly, or chemical parameters, materials or analysis which were not addressed. Substances other than those addressed by the investigation described in this report may exist within the Site, substances addressed by the investigation may exist in areas of the Site not investigated and concentrations of substances addressed which are different than those reported may exist in areas other than the locations from which samples were taken.

If site conditions or applicable standards change or if any additional information becomes available at a future date, modifications to the findings, conclusions and recommendations in this report may be necessary.

We trust that this information is satisfactory for your present requirements. Should you have any questions or require additional information, please do not hesitate to contact the undersigned.

Respectfully submitted,

McIntosh Perry Consulting Engineers Ltd.

OTTAWA - MISSISSAUGA - HAMILTON - KINGSTON - LONDON - NIAGARA - WINDSOR - RICHMOND HILL

#### Login Qualifiers :

Container and COC sample IDs don't match - PHC, Voc bottles read: "Fire Stn", COC reads: "Fire Hall." Applies to samples: Fire Stn

Sample - Filtered and preserved by Paracel upon receipt at the laboratory - Metals 125ml subsampled from General bottle. Applies to samples: Fire Stn

#### Sample Qualifiers :

QC Qualifiers :

QM-07 : The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on other acceptable QC.

#### Sample Data Revisions

None

#### Work Order Revisions / Comments:

None

#### **Other Report Notes:**

n/a: not applicable ND: Not Detected MDL: Method Detection Limit Source Result: Data used as source for matrix and duplicate samples %REC: Percent recovery. RPD: Relative percent difference. NC: Not Calculated

#### CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.

- F1 range corrected for BTEX.

- F2 to F3 ranges corrected for appropriate PAHs where available.

- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.

- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.
- When reported, data for F4G has been processed using a silica gel cleanup.

Surrogate: Toluene-d8	0.0809		mg/L		101	50-140			

#### Login Qualifiers :

Container(s) - Labeled improperly/insufficient information - Sample time on bottles read: "AM", COC reads "10:40".

Applies to samples: TW1-1

Container(s) - Labeled improperly/insufficient information - Sample time on bottles read: "PM". COC reads: "15:10".

Applies to samples: TW1-2

#### Sample Qualifiers :

#### QC Qualifiers :

QM-07 : The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on other acceptable QC.

#### Sample Data Revisions

None

#### Work Order Revisions / Comments:

None

#### Other Report Notes:

n/a: not applicable ND: Not Detected MDL: Method Detection Limit Source Result: Data used as source for matrix and duplicate samples %REC: Percent recovery. RPD: Relative percent difference. NC: Not Calculated

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.

- F1 range corrected for BTEX.

- F2 to F3 ranges corrected for appropriate PAHs where available.

- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.

- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.

- When reported, data for F4G has been processed using a silica gel cleanup.

- 1. Sump pumps and floor drains are not to be connected to the sewage system. Connection of such fixtures to a sewage system may lead to a hydraulic failure of the said system. The above mentioned fixtures should be discharged separately to an approved Class 2 (leaching pit) sewage system.
- 2. Where laundry waste is not more than 20% of the total daily design sanitary sewage flow, it may discharge to a sewage system (Part 8, OBC, 8.1.3.1(2)).
