#### **Statement of Conditions**

This Report / Study (the "Work") has been prepared at the request of, and for the exclusive use of, the Owner / Client, the City of Ottawa and its affiliates (the "Intended User"). No one other than the Intended User has the right to use and rely on the Work without first obtaining the written authorization of Lithos Group Inc. and its Owner. Lithos Group Inc. expressly excludes liability to any party except the intended User for any use of, and/or reliance upon, the work.

Neither possession of the Work, nor a copy of it, carries the right of publication. All copyright in the Work is reserved to Lithos Group Inc. The Work shall not be disclosed, produced or reproduced, quoted from, or referred to, in whole or in part, or published in any manner, without the express written consent of Lithos Group Inc. and the Owner.

City of Ottawa

Functional Servicing and Stormwater Management Report

## **Executive Summary**

Lithos Group Inc. (Lithos) was retained by 276405 Ontario Inc. (the "Owner") to prepare a Functional Servicing and Stormwater Management Report in support of a Site Plan Application, for a proposed residential-use development located in the area referred to as the "Golden Triangle", at 50 The Driveway (K2P 1E2), in the City of Ottawa (the "City"). The following summarizes our conclusions:

#### **Storm Drainage**

The post-development 100-year storm flow has been designed to match the five (5)-year predevelopment storm flow. In order to achieve the target flows and meet the City's Regulations, quantity controls will be utilized and 79.00 m³ of storage tank will be required as well as 54.10 m³ will be utilized in underground chambers. The stormwater management (SWM) system will be designed to provide enhanced level (Level 1) protection as specified by the Ministry of the Environment, Conservation and Parks (MECP). Water quality control can be provided for a minimum total suspended solids (TSS) removal of 80%.

#### **Sanitary Sewers**

The proposed development will connect to the existing 300mm combined sewer on Queen Elizabeth Driveway ROW, through a 200mm diameter sanitary sewer lateral connection, with a minimum grade of 2.00% (or equivalent pipe design). The additional net discharge flow from the proposed development, is anticipated at approximately 1.80 L/s. According to the information provided by the City, the existing infrastructure has the capacity to support the additional sanitary flow, from the proposed development.

#### **Water Supply**

Water supply for the site will be from the existing 300mm diameter watermain on the Queen Elizabeth Driveway ROW. It is anticipated that a total design flow of 84.81 L/s will be required to support the proposed development. Based on the boundary conditions received from the City, it is revealed that the existing water infrastructure can support the proposed development.

#### **Site Grading**

The proposed grades will improve the existing drainage conditions to meet the City's/Regional requirements. Grades will be maintained along the property line wherever feasible. Existing drainage patterns on adjacent properties will not be altered and stormwater runoff from the subject development will not affect the adjacent properties.

## **Appendices**

Appendix A – Site Photographs

Appendix B – Background Information

Appendix C – Storm Analysis

Appendix D – Sanitary Data Analysis

Appendix E – Water Data Analysis

#### 1.0 Introduction

Lithos Group Inc. (Lithos) was retained by Main and Main (the "Owner") to prepare a Functional Servicing and Stormwater Management Report in support of a Site Plan Application for a proposed residential-use development located at 50 The Driveway in the City of Ottawa (the "City").

The purpose of this report is to provide site-specific information for the City's review with respect to infrastructure required to support the proposed development. More specifically, the report will present details on sanitary discharge, water supply and of the storm drainage pattern.

The following documents were available for our review:

- Plan and Profiles of:
  - o Waverley Street, drawing No. 3331 Sheet 11 of 20, dated January, 2003;
  - Lewis Street from Robert Street to N.C.C Driveway, drawing No. 911-P, dated June, 1978;
  - o Gilmour Street, drawing No. 012 Sheet 12 of 35, dated March 2018.
- Sewer and Water Maps of the existing combined sewer network upstream and downstream of the subject site (for reference purposes only);
- Site Plan & Statistics prepared by Hobin Architecture Inc., dated January 05, 2023;
- Topographical Survey prepared by Annis, O'Sullivan, Vollebekk Ltd., dated July 01, 2021; and,
- Geotechnical Investigation prepared by Paterson Group dated July 16, 2021.

## 2.0 Site Description

The existing site is approximately 0.296 hectares and is currently comprised of an existing building, an elevated tower and outdoor parking area. The site is located within the urban limits of the City of Ottawa (K1L 6N1), in the area referred to as the "Golden Triangle". Refer to Figures 1 and 2 following this report and site photographs in Appendix A.

## 3.0 Site Proposal

The proposed development will be a 9-storey residential-use building and it will be serviced by two (2) underground parking levels. The proposed development will be comprised of 77 residential units. The total development will include approximately 8,886.92 m<sup>2</sup> of Gross Floor Area (GFA). Please refer to **Appendix B** for site plan and building statistics.

## 4.0 Terms of Reference and Methodology

#### 4.1. Terms of Reference

The following references and technical guidelines were consulted in the present study:

- A City of Ottawa Servicing Study Guidelines, online edition,
- A City of Ottawa Sewer Design Guidelines, (2012),
- A City of Ottawa Design Guidelines Water Distribution, (2010),
- A Technical Bulletin ISTB-2018-2;
- A Ministry of Environment, Conservation and Park (MECP) Guidelines for the Design of Water Systems (2008)
- A MECP Guidelines for the Design of Sanitary Sewage Systems (2008)
- A MECP Stormwater Planning and Design Manual (2003)
- A Ontario Building Code (2010)

#### 4.2. Methodology: Stormwater Drainage and Management

This report provides a detailed Stormwater Management (SWM) review of the pre-development and post-development conditions and comments on opportunities to reduce peak flows, as per the City of Ottawa guidelines.

The stormwater management criteria for this development are based on the City of Ottawa Sewer Design Guidelines, as well as the Ministry of Environment, Conservation and Parks (MECP) 2003 Stormwater Management Planning and Design Manual (SWMPD). The following design criteria will be reviewed:

- Post-development peak flow for the 100-year storm event from the site should be controlled to the 5-year target flow. A 20-minute time of concentration and a 10 min inlet time derived from City of Ottawa IDF curves, were considered for connection to a dedicated storm sewer;
- For connection to a dedicated storm sewer, when the imperviousness of the existing property is greater than 50%, the maximum value of the runoff coefficient, "c", used in calculating the predevelopment peak runoff rate is limited to 0.40;
- A safe overland flow will be provided for all major flows in excess of the 100-year storm event.

#### 4.3. Methodology: Sanitary Discharge

The sanitary sewage discharge from the site will be determined using sanitary sewer design sheets that incorporate the land use and building statistics as supplied by the design team. The calculated values provide peak sanitary flow discharge that considers infiltration.

The estimated sanitary discharge flows from the proposed site will be calculated based on the criteria shown **Table 4-1** below. (Sections 4 and 6 of the City of Ottawa Sewer Design Guidelines).

| Design Parameter  | Value   |  |
|---|---|--|
| Residential Units (1-Bedroom)                                       | 1.4 people/unit                                     |  |
| Residential Units (2-Bedroom)                                       | 2.1 people/unit                                     |  |
| Residential Units (3-Bedroom)                                       | 3.1 people/unit                                     |  |
| Average Daily Residential Flow                                      | 280 L/person/day                                    |  |
| Residential Peak Factor   | PF = 1 + (14/(4+(P/1000) <sup>1/2</sup> )           |  |
| Commercial Floor Space  | 50000 L/ha/day                                      |  |
| Commercial Peaking Factor   | 1.5 if commercial contribution >20%, otherwis 1.0   |  |
| Infiltration and Inflow Allowance                                   | 0.28 L/s/ha   |  |
| Sanitary sewers are to be sized employing the Manning's<br>Equation | $Q = \frac{1}{n} A R^{\frac{2}{3}} S^{\frac{1}{2}}$ |  |
| Minimum Manning's 'n'   | 0.013   |  |
| Minimum Depth of Cover  | 1.5 m from crown of sewer to grade                  |  |
| Minimum Full Flowing Velocity                                       | 0.6 m/s   |  |
| Maximum Full Flowing Velocity                                       | 3.0 m/s   |  |

#### 4.4. Methodology: Water Usage

The fire flow requirements were estimated using the method prescribed by the Fire Underwriters Survey (FUS). This method is based on the floor area of the building to be protected, the type and combustibility of the structural frame and the separation distances with adjoining building units.

Section 4.3.22 of the City Design guidelines for water distribution provides guidance for determining the method for estimating Fire Demand. As indicated, the requirements for levels of fire protection on private property are covered in the Ontario Building Code. Section 7.2.11 of the OBC addresses the installation of water service pipes and fire service mains. Part 3 of the OBC outlines the requirement for Fire Protection, Occupant Safety, and Accessibility; and subsection A-3.2.5.7 provides the provisions for firefighting.

Based on trained personnel responding to the emergency and water supply being delivered through a municipal main, the required minimum provision for water supply flow rates shall not be less than 2,700L/min or greater than 9,000L/min (OBC Section A.3.2.5.7, Table 2). The City of Ottawa was contacted in June 2021 to obtain boundary conditions based on an estimated water demand.

The domestic water usage was calculated based on the City of Ottawa Guidelines – Water Distribution outlined in Table 4-2 that follows.

Table 4-2 – Water Usage

| Design Parameter   | Value   |
|--|---|
| Average Residential Day Demand   | 350 L/person/day                              |
| Maximum Residential Day Demand   | 2.5 x Average Day Demand                      |
| Maximum Residential Hour Demand  | 2.2 x Max Day Demand                          |
| Average Commercial Day Demand  | 2.5 L/m²/d                                    |
| Maximum Commercial Day Demand  | 1.5 x Average Day Demand                      |
| Maximum Commercial Hour Demand   | 1.8 x Max Day Demand                          |
| Minimum Depth of Cover   | 2.4 m from top of watermain to finished grade |
| During Peak Hour Demand desired operating pressure is within                             | 350kPa and 480KPa                             |
| Minimum pressure during normal operating conditions (average day to maximum hour demand) | 275kPa  |
| During normal operating conditions, pressure must not exceed                             | 552kPa  |
| Minimum pressure during fire flow plus maximum day demand                                | 140kPa  |

## 5.0 Stormwater Management and Drainage

#### 5.1. Existing Conditions

The existing site is currently comprised of an existing building, an elevated tower and outdoor parking space.

According to available records there is an on-site catchbasin (CB) in the parking area near the east end of the parking area. This catchbasin appears to be connected to the 1800 mm diameter combined sewer on Lewis Street.

Moreover, the existing site is primarily covered by impermeable surfaces; thus, there is no significant infiltration onsite. Although the existing run-off composite coefficient is estimated at 0.90, the City of Ottawa Guidelines require the target flow calculations to be based on a run-off coefficient of 0.4. **Table 5-1** shows the pre-development input parameters, as illustrated on the drainage area plan in **Figure DAP-1** in **Appendix C**.

**Table 5-1 – Target Input Parameters** 

| Catchment     | Drainage Area (ha) | Actual "C" | Design "C" | Tc (min.) |
|---------------|--------------------|------------|------------|-----------|
| A1- Pre       | 0.296              | 0.90       | 0.40       | 20        |
| External Area | 0.071              | 0.49       | 0.40       | 20        |

City of Ottawa

Functional Servicing and Stormwater Management Report

Peak flows calculated for the existing conditions are shown in **Table 5-2** below. Detailed calculations are in **Appendix C**.

| Table 5 2 Talget Feat Flows |                                 |          |  |  |  |
|-----------------------------|---------------------------------|----------|--|--|--|
| Catchment                   | Peak Flow Rational Method (L/s) |          |  |  |  |
|                             | 5-year                          | 100-year |  |  |  |
| A1 Pre                      | 23.1                            | 39.5     |  |  |  |
| External Area               | 5.5                             | 9.5      |  |  |  |

**Table 5-2 – Target Peak Flows** 

As shown on **Table 5-2** above, post-development flows towards the City's infrastructure will need to be controlled to the target flow of 23.1 L/s.

#### 5.2. Proposed Conditions

In order to meet the City's Stormwater Management criteria, the development flow rate is to be controlled to the five (5)-year target flow, as established in **Section 5.1**. The site will consist of the following three (3) internal and one (1) external drainage areas:

- 1. A1 Post Storm runoff from the Rooftops/Terraces/Walkways will be controlled in the underground storage tank, located into P1 level;
- A2 Post Uncontrolled storm runoff conveyed towards the adjacent right of ways;
- 3. A3 Post Area towards the catch basin will be controlled in infiltration chambers;
- 4. Ext.1 Storm Runoff from External Area that will be controlled in infiltration chambers.

The post-development drainage areas and runoff coefficients are indicated in Figure DAP-2, located in Appendix C and summarized in Table 5-3 below.

| Drainage Area  | Drainage<br>Area (ha) | Drainage Area<br>Atot (ha) | "C"   | Tc<br>(min.) |
|--|-----------------------|----------------------------|-------|--------------|
| A1 Post (rooftops/terrace/walkways controlled in tank)               | 0.226                 | 0.251                      | 1.00* | 10           |
| A2 Post (Uncontrolled Area – towards Lewis Street)                   | 0.025                 | 0.202                      | 0.61* | 10           |
| A3 Post (Area towards the catch basin controlled in chambers)        | 0.045                 | 0.116                      | 0.62* | 10           |
| External Area- (Area towards the catch basin controlled in chambers) | 0.071                 | 0.116                      | 0.61* | 10           |

Table 5-3 - Post-development Input Parameters

The external drainage area and A3 Post will be captured by catch basin #1 (CB1) which is to retain any storm runoff from its tributary area into an underground infiltration gallery and avoid discharging it into the municipal infrastructure for events up to 100 years.

<sup>\* &</sup>quot;C" value for the 100 year storm event is increased by 25%, with a maximum of 1.00, as per City's Sewer Design Guidelines.

#### **5.2.1.1 Quantity Controls**

Using the City's intensity-duration-frequency (IDF) data, modified rational method calculations were undertaken to determine the maximum storage required during each storm event. Results for the 5, and 100-year storm events are provided in **Table 5-4**. The detailed post-development quantity control calculations are provided in **Appendix C**.

| Storm<br>Event | Target<br>Controlled<br>Release Rate<br>(L/s) | Uncontrolled<br>Flow (L/s) | Required Storage Tank Volume (m³)  Total Controlled Release Rate of the Tank (L/s) |      | Total Site<br>Release Rate<br>(L/s) |
|----------------|---|----------------------------|--|------|-------------------------------------|
| 5-year         | 22.4  | 3.5                        | 35.0   | 9.6  | 13.1                                |
| 100-year       | 23.1  | 7.5                        | 79.0   | 14.4 | 21.9                                |

Table 5-4 – Post-development Quantity Control as Per City Requirements

As shown in **Table 5-4**, in order to control post-development flows to the 5-year pre-development conditions, a target flow of 23.1 L/s is to be satisfied. The required on-site storage is accommodated by the use of one (1) underground storage tank, located at P1 level. **Table 5-4**, illustrates the minimum required storage to be retained, which is 79.0 m³, for the 100-year storm event.

The stormwater flow released from the rooftops and the terraces (Drainage Area A1 Post) will be gravity driven into the underground storage tank, at P1 Level. Please refer to engineering drawing Site Servicing Plan ("SS-01", submitted separately) for details.

#### 5.2.1.2 Underground Storage Tank

An underground storage tank is proposed to meet the quantity control requirements, set forth by the City's WWFMG Guidelines. Controlled stormwater flows from the rooftops and terraces (**Drainage Area A1 Post**) will be gravity driven into the proposed underground main storage tank located at P1 level.

The proposed underground storage tank will have an active storage depth of 1.12 m above the inlet of the outlet pipe, accounting for a quantity control maximum storage of 79.0 m<sup>3</sup>, during the hundred year storm event. Stormwater from the underground storage tank will outlet through a **80mm diameter orifice plate** with a maximum release rate of 14.4 L/s and it will be gravity driven to the existing 300mm diameter combined sewer along Queen Elizabeth Driveway ROW.

The proposed storage tank will have a total footprint area of 70.0 m<sup>2</sup>. Refer to **Figure 3**, included in **Appendix C**, for the minimum tank design requirements. Additional details of the tank design will also be provided by the mechanical engineer.

In summary, a maximum control stormwater release rate from the main storage tank of 14.4 L/s, along with the uncontrolled release rate of 7.5 L/s (**Drainage Area A2 Post**), results to a post-development total release rate of 21.9 L/s, for the 100-year event.

Consequently, the proposed SWM plan retains enough runoff volume, to reduce the post-development peak flows for each storm event to the extent possible and approach the required target flow.

#### **Underground Infiltration Chambers**

Stormwater from the site and external will ultimately be driven into the underground storage chambers before being infiltrated.

The underground chambers will be located at the north east corner of the property (refer to Site Servicing Plan **SS-01**, submitted separately). The underground chambers will have a minimum storage depth of 1.32 m and an active storage component of 57.45 m³ to meet the 100 year storage requirement. In order to meet the required volume of 54.10 m³, it is proposed to use 136 blocks of Greenstorm-ST-B Chambers. Please refer to **Appendix B** for more details.

The bottom of the storage facility will be at 63.80 masl and there will be 1.00 m clearance from the existing 'high' groundwater level to the bottom of the chambers, as required by MOE. In addition, the proposed chambers will have more than 5.0 m at horizontal distance from the proposed buildings' footings according to the OBC requirements.

#### 5.2.1.3 Major Overland Flow Route and Emergency Overland Flow Route

Under existing conditions, overland flow from Queen Elizabeth Driveway enters the site and exits through the adjacent properties to the east, reaching Waverley Street. Under post-development conditions, the drainage pattern is being maintained without causing any flooding to the proposed development. All accesses to the building are above the flood limit and the maximum ponding achieved during flooding is estimated at 20 cm as per the proposed grading and the correspondence email, found in **Appendix B**.

#### **5.2.1.4 Quality Controls**

For MECP Enhanced Level protection, the removal of 80% total suspended solids (TSS) is required. Stormwater discharged from the proposed development's rooftop area is considered "clean" and will be driven into the underground storage tank. The detailed quality control calculations can be found in **Appendix C**. A summary of the site quality control is included in below.

| Drainage Area | Drainage Area<br>(ha) | % Area of<br>Controlled Site | Effective TSS<br>Removal | Additional Quality Control<br>Required |
|---------------|-----------------------|------------------------------|--------------------------|--|
| A1, A3, EXT.1 | 0.342                 | 100%                         | 80%                      | Inherent                               |
| Total         | 0.342                 | 100%                         |                          |  |

Table 5-5- Site TSS Removal

#### **5.2.1.5 Proposed Storm Connection**

The proposed development will connect to the existing 300 mm diameter combined sewer along Queen Elizabeth Driveway ROW, via a 150mm diameter storm sewer service connection, with a minimum grade of 2.00% (or equivalent pipe design). The engineering drawing SS-01 (submitted separately), indicates the stormwater service connection.

### 6.0 Combined Drainage System

#### 6.1. Existing Combined Drainage System

The existing site is currently comprised of an existing building, an elevated tower and outdoor parking space. According to available records, there are two (2) combined sewers abutting the subject property. More specifically:

- A 300mm diameter combined sewer located within the Queen Elizabeth Driveway ROW. This
  combined sewer outlets to the 1800 mm diameter combined sewer noted below.
- A 1800mm diameter trunk combined sewer located within Lewis Street ROW (flowing north).
   This combined sewer eventually discharges into the Somerset trunk sewer, which in turn outlets into the Rideau River Collector (RRC).

#### 6.2. Existing Flows

The sanitary flow generated by the proposed development at 50 The Driveway was compared to the existing flow in order to quantify the net increase in the combined sewer network abutting the subject site.

Using the design criteria outlined in **Section 4.3** and existing site information, the sanitary discharge flow from the existing property towards Lewis Street is estimated at 0.17 L/s.

#### 6.3. Proposed Flows

According to the proposed development statistics, as well as the design criteria outlined in **Section 4.3**, the new building will discharge 1.97 L/s (1.89 L/s of sanitary flow and 0.083 L/s of infiltration) into the City's Infrastructure.

The additional flow will be considered within the sanitary discharge rate; therefore, there is an increase in sanitary flow of approximately 1.80 L/s. For detailed calculations, refer to the sanitary sewer design sheet in **Appendix D**.

#### 6.4. Proposed Sanitary Connections

The proposed development will connect to the existing 300mm diameter combined sewer on Queen Elizabeth Driveway ROW through a 200 mm diameter sanitary sewer connection with horizontal and vertical bendings, at a minimum grade of 2.00% (or equivalent pipe design). According to the coordination that took place with the City of Ottawa, a lateral connection with bends is acceptable, in order to avoid a connection into the NCC property. Please refer to correspondence email included in **Appendix B** as well as to engineering drawing "SS-01" (submitted separately) for details.

#### 6.5. Conclusions

After taking into consideration all the above, we provided the required calculations to the City, in order to review how the additional flow from the proposed development will affect the municipal networks downstream. According to the information provided, the combined sewer infrastructure along Queen Elizabeth Driveway ROW has adequate capacity to accommodate the additional flows from the proposed development and, thus, they can support it. Refer to Appendix B for email correspondence with the City. For detailed calculations refer to the sanitary sewer design sheet in Appendix D.

### 7.0 Water Supply System

### 7.1. Existing System

The subject property lies within the City of Ottawa 1W pressure zone. The existing watermain system consists of a 300 mm diameter watermain on the Queen Elizabeth Driveway ROW.

#### 7.2. Proposed Water Supply Requirements

The estimated water consumption was calculated based on the occupancy rates shown on Table 4-2, according to the City's watermain design criteria.

It is anticipated that an average domestic water consumption of approximately 0.59 L/s (50,976 L/day), a maximum daily consumption of 1.48 L/s (127,872 L/day) and a peak hourly demand of 3.25 L/s (11,700L/hr) will be required.

The fire flow requirements we estimated using the method prescribed by the Fire Underwriters Survey (FUS) be undertaken to assess the minimum requirement for fire suppression. The fire flow calculations is normally conducted for the largest storey, by area, and for the two immediately adjacent storeys.

As a result, to the above-mentioned method, we have selected the total area of Level 2 and the immediately adjoining storeys, which are Levels 1 and 3.

**Table 7-1** illustrates the input parameters used for the FUS calculations. According to our calculations, a minimum fire suppression flow of approximately 83.33 L/s (1,320 USGPM) will be required. Detailed calculations can be found in **Appendix E**.

| Table 7.2. The Flow in pact didinetels |                                     |                     |                  |                     |                 |                 |      |  |
|--|-------------------------------------|---------------------|------------------|---------------------|-----------------|-----------------|------|--|
|  | Frame used                          | Combustibility      | Presence         | Separation Distance |                 |                 |      |  |
| Parameter                              | for Building                        | of Contents         | of<br>Sprinklers | North               | East            | South           | West |  |
| Value according to FUS options         | Non-<br>Combustible<br>Construction | Non-<br>Combustible | Yes              | 30.1m to<br>45m     | 10.1m<br>to 20m | 10.1m<br>to 20m | >45m |  |
| Surcharge/reduction from base flow     | 0.8                                 | 25%                 | 30%              | 5%                  | 11%             | 11%             | 0%   |  |

**Table 7-1 – Fire Flow Input Parameters** 

In summary, the required design flow is the sum of 'the minimum fire suppression flow' and 'maximum daily demand' (83.33 + 1.48 = 84.81 L/s, 1,344 USGPM).

**Table 7-2** summarizes the anticipated water demand on the City of Ottawa Guidelines – Water Distribution.

Table 7-2 - Water Demand

| Design Parameter    | Anticipated Demand (L/min) |
|---------------------|----------------------------|
| Average Day Demand  | 35.4                       |
| Max Day + Fire Flow | 88.8 + 7,000.2 = 7,089     |
| Max Hour Demand     | 195.0                      |

#### 7.3. Watermain Analysis Results

Upon completion of the detailed calculations in order to determine the anticipated domestic water consumption and the required minimum fire flow for the proposed development, the calculation results were provided to the City of Ottawa. As a result, the above noted values were used to generate the municipal watermain network boundary conditions.

**Table 7-3** below summarizes the boundary conditions provided by the City of Ottawa for the existing municipal watermain network along Lewis and Queen Elizabeth Driveway.

| Municipal Watermain Boundary<br>Condition | 152 mm on Lewis Street | 305 mm on Queen Elizabeth<br>Driveway |  |
|---|------------------------|---------------------------------------|--|
| Minimum HGL                               | 106.4                  | 106.4                                 |  |
| Maximum HGL                               | 115.3                  | 115.3                                 |  |
| Max Day + Fire Flow (250 L/s) (m)         | 91.7                   | 105.3                                 |  |

Table 7-3 – Boundary Conditions Provided by the City

**Table 7-4** below summarizes the calculated water demands for the proposed development under the various operating conditions and compares the anticipated operating pressures at the watermains to the normal operating pressures outlined in the City of Ottawa Design Guidelines. Furthermore, the pressure losses from the building's water service to the Siamese connection have been calculated, in order to define the available flow at this point.

| Watermain<br>Connection     | Design Parameter    | Anticipated Demand (L/s) | Approximate Design Operating Pressures (psi) / Relative Head (m) | Normal Municipal<br>Operating Pressures<br>(psi) |
|-----------------------------|---------------------|--------------------------|--|--|
|                             | Average Demand      | 0.59                     | 87 psi (66.3m)   | 50-70 psi  |
| Queen Elizabeth<br>Driveway | Peak Hour Demand    | 3.25                     | 54.0 psi (37.7m)   | 40-70 psi  |
| 2emay                       | Max Day + Fire Flow | 118.15                   | 52.0 psi (36.6m)   | 20 psi (min)                                     |

Table 7-4- Watermain Analysis Results – Domestic Flow

According to **Table 7-4** and the information provided by the City of Ottawa, the water pressure for the average demand and the peak hour demand, result in values that achieve the criteria of the City's Guidelines, as indicated in the **Table 8-4**.

### 7.4. Proposed Watermain Connection

The proposed development will be serviced by one (1) 150 mm diameter and one (1) 200 mm diameter waterline separated by an isolation valve. The proposed water lateral will connect to the 300mm diameter existing watermain on Queen Elizabeth Driveway ROW. Refer to engineering drawings "SS-01" (submitted separately) for details.

#### 8.0 Erosion and Sediment Control

Soil erosion occurs naturally and is a function of soil type, climate topography. The extent of erosion losses is exaggerated during construction where vegetation has been removed and the top layer of soil becomes agitated.

Prior to topsoil stripping, earthworks or underground construction, erosion and sediment controls will be implemented and will be maintained throughout construction.

Silt fence will be installed around the perimeter of the site and will be cleaned and maintained throughout construction.

Catch basins will have filter fabric installed under the grate during construction to protect from silt entering the storm sewer system.

A mud mat will be installed at the construction access in order to prevent mud tracking onto adjacent roads.

Erosion and sediment controls must be in place during construction. The following recommendations to the contractor will be included in contract documents.

- Limit extend of exposed soils at any given time.
- Re-vegetate exposed areas as soon as possible.
- Minimize the area to be cleared and grubbed.
- Protect exposed slopes with plastic or synthetic mulches.
- Install silt fence to prevent sediment from entering existing ditches.
- No refueling or cleaning of equipment near existing watercourses.
- Provide sediment traps and basins during dewatering.
- Install filter cloth between catch basins and frames.
- Plan construction at proper time to avoid flooding.

Establish material stockpiles away from watercourses, so that barriers and filters may be installed.

The contractor will, at every rainfall, complete inspections and guarantee proper performance. The inspection is to include:

- Verification that water is not following under silt barriers.
- Clean and change filter cloth at catch basins.

## 9.0 Site Grading

#### 9.1. Existing Grades

The existing site is approximately 0.296 hectares and is currently comprised of an existing building, an elevated tower and by an adjacent outdoor parking area. The site drains into the existing stormwater system inside the property and the drainage pattern is being maintained as previously existed.

City of Ottawa

Functional Servicing and Stormwater Management Report

#### 9.2. Proposed Grades

The proposed grades will improve the existing drainage conditions to meet the City's/Regional requirements. Grades will be maintained along the property line wherever feasible. Existing drainage patterns on adjacent properties will not be altered and stormwater runoff from the subject development will not affect the adjacent properties.

#### 10.0 Conclusions and Recommendations

Based on our investigation, we conclude the following:

#### **Storm Drainage**

The post-development 100-year storm flow has been designed to match the five (5)-year predevelopment storm flow. In order to achieve the target flows and meet the City's Regulations, quantity controls will be utilized and 79.00 m³ of storage tank will be required as well as 54.10 m³ will be utilized in underground chambers. The stormwater management (SWM) system will be designed to provide enhanced level (Level 1) protection as specified by the Ministry of the Environment, Conservation and Parks (MECP). Water quality control can be provided for a minimum total suspended solids (TSS) removal of 80%.

#### **Sanitary Sewers**

The proposed development will connect to the existing 300mm combined sewer on Queen Elizabeth Driveway ROW, through a 200mm diameter sanitary sewer lateral connection, with a minimum grade of 2.00% (or equivalent pipe design). The additional net discharge flow from the proposed development, is anticipated at approximately 1.80 L/s. According to the information provided by the City, the existing infrastructure has the capacity to support the additional sanitary flow, from the proposed development.

#### **Water Supply**

Water supply for the site will be from the existing 300mm diameter watermain on the Queen Elizabeth Driveway ROW. It is anticipated that a total design flow of 84.81 L/s will be required to support the proposed development. Based on the boundary conditions received from the City, it is revealed that the existing water infrastructure can support the proposed development.

#### **Site Grading**

The proposed grades will improve the existing drainage conditions to meet the City's/Regional requirements. Grades will be maintained along the property line wherever feasible. Existing drainage patterns on adjacent properties will not be altered and stormwater runoff from the subject development will not affect the adjacent properties.

### 1.0 Introduction

Paterson Group (Paterson) was commissioned by Main and Main to conduct a geotechnical investigation for the proposed development to be located at 50 The Driveway in the City of Ottawa (refer to Figure 1 - Key Plan in Appendix 2 of this report).

The objectives of the geotechnical investigation were to:

- Determine the subsoil and groundwater conditions at this site by means of boreholes.
- Provide geotechnical recommendations pertaining to the design of the proposed development including construction considerations which may affect the design.

The following report has been prepared specifically and solely for the aforementioned project which is described herein. It contains our findings and includes geotechnical recommendations pertaining to the design and construction of the subject development as they are understood at the time of writing this report.

Investigating the presence or potential presence of contamination on the subject property was not part of the scope of work of the present investigation. Therefore, the present report does not address environmental issues.

# 2.0 Proposed Development

Based on the available drawings, it is understood that the proposed development will consist of a multi-storey mixed-use structure with two levels of underground parking which will occupy the majority of the subject site. It is also understood that portions of the east and south existing building facades will be retained and integrated as part of the proposed building. However, the structure is expected to be demolished as part of the proposed development.

The proposed building will generally be surrounded by walkways and landscaped areas. It is also expected that the proposed building will be municipally serviced.

### 3.0 Method of Investigation

### 3.1 Field Investigation

### Field Program

The field program for the current geotechnical investigation was carried out during the period of June 30 through July 5, 2021. At that time three (3) boreholes and two (2) test pits were advanced to maximum depth of 20.5 m and 4.7 m below the existing ground surface, respectively. The test hole locations were distributed in a manner to provide general coverage of the subject site and taking into consideration the location of underground utilities and site features. The test hole locations are shown on Drawing PG5880-1 - Test Hole Location Plan included in Appendix 2.

The boreholes were drilled using a low-clearance drill rig operated by a two-person crew. The test pits were excavated using a rubber-tired back-hoe. All fieldwork was conducted under the full-time supervision of Paterson personnel under the direction of a senior engineer. The drilling procedure consisted of advancing each test hole to the required depths at the selected locations and sampling the overburden.

### Sampling and In Situ Testing

The soil samples were recovered from the auger flights and using a 50 mm diameter split-spoon sampler. Grab samples were collected from the test pit sidewalls and by hand-auger recovery at selected intervals. The samples were classified on site, placed in sealed plastic bags, and transported to our laboratory. The depths at which the auger, split spoon and grab samples were recovered from the boreholes are shown as SS, AU and G, respectively, on the Soil Profile and Test Data sheets in Appendix 1.

The Standard Penetration Test (SPT) was conducted in conjunction with the recovery of the split-spoon samples. The SPT results are recorded as "N" values on the Soil Profile and Test Data sheets. The "N" value is the number of blows required to drive the split-spoon sampler 300 mm into the soil after a 150 mm initial penetration using a 63.5 kg hammer falling from a height of 760 mm.

Undrained shear strength testing, using a vane apparatus, was carried out at regular intervals of depth in cohesive soils.

The overburden thickness was evaluated by a dynamic cone penetration test (DCPT) completed at BH 1-21 and BH 5-21. The DCPT consists of driving a steel drill rod, equipped with a 50 mm diameter cone at the tip, using a 63.5 kg hammer falling from a height of 760 mm. The number of blows required to drive the cone into the soil is recorded for each 300 mm increment.

The subsurface conditions observed in the boreholes were recorded in detail in the field. The soil profiles are logged on the Soil Profile and Test Data sheets in Appendix 1 of this report.

### Groundwater

Monitoring wells were installed at boreholes BH 1-21, BH 4-21, and BH 5-21. Boreholes BH 2-21, BH 3-21 and BH 5-21 were fitted with flexible standpipe piezometers to allow for groundwater level monitoring. Groundwater level observations are discussed in Section 4.3 and are presented in the Soil Profile and Test Data sheets in Appendix 1.

### **Monitoring Well Installation**

| 3.0 m of slotted 51 mm PVC screen at the base of the boreholes.                |
|--|
| 51 mm diameter PVC riser pipe from the top of the screen to the ground surface |
| No. 3 silica sand backfill within annular space around screen.                 |
| 300 mm thick bentonite hole plug directly above PVC slotted screen.            |
| Clean backfill from top of bentonite plug to the ground surface.               |

Typical monitoring well construction details are described below:

Refer to the Soil Profile and Test Data sheets in Appendix 1 for specific well construction details.

### Sample Storage

All samples will be stored in the laboratory for a period of one (1) month after issuance of this report. They will then be discarded unless we are otherwise directed.

### 3.2 Field Survey

The test hole locations were selected by Paterson to provide general coverage of the proposed development, taking into consideration the existing site features and underground utilities. The test hole locations and ground surface elevation at each test hole location were surveyed by Paterson personnel using a handheld GPS and referenced to a geodetic datum. The location of the boreholes and ground surface elevation at each test hole location are presented on Drawing PG5880-1 - Test Hole Location Plan in Appendix 2.

### 3.3 Laboratory Testing

Soil samples were recovered from the subject site and visually examined in our laboratory to review the results of the field logging. Soil samples will be stored for a period of one month after this report is completed, unless otherwise directed.

### 3.4 Analytical Testing

One (1) soil sample was submitted for analytical testing to assess the corrosion potential for exposed ferrous metals and the potential of sulphate attacks against subsurface concrete structures. The sample was submitted to determine the concentration of sulphate and chloride, the resistivity, and the pH of the samples. The results are presented in Appendix 1 and are discussed further in Section 6.7.

### 4.0 Observations

### 4.1 Surface Conditions

### **Existing Conditions**

The subject site is currently occupied by a three-storey institutional building with associated landscaped areas, parking areas and access lanes. The ground surface is relatively flat throughout the parking area. The ground surface around the eastern portion of the site slopes downwards gradually form north to south and between geodetic elevations of 68.5 to 66.0 m.

The site is bordered to the east by a paved pedestrian pathway and further by Queen Elizabeth Driveway, to the south by the Embassy of Germany and residential dwellings, to the west by townhouses and to the north by Lewis Street and further by a high-rise apartment building and the associated above-ground parking structure.

#### **Historical Conditions**

It should be noted Neville's Creek historically transected the southern portion of the subject site, which is understood to have been infilled in the late 19<sup>th</sup> century. The existing surface conditions have been completely altered since that time and are not considered representative of its previous footprint due to notable in-filling of the creek.

### 4.2 Subsurface Profile

### Overburden

Generally, the subsurface profile encountered at the test hole locations consisted of an asphalt pavement structure or topsoil underlain by a variable layer of fill. The fill was observed to generally consist of brown and/or grey silty clay or sand with varying amounts of gravel, cobbles, concrete, wood debris and organics. The fill was observed to extend to depths ranging between of 0.7 m to 6.7 m below the existing ground surface.

The fill layers were observed to be underlain by a deposit of silty clay. This deposit was generally observed to consist of a very stiff to stiff, brown silty clay crust underlain by a layer of stiff grey silty clay. It should be noted the crust layer was not encountered in the areas where the fill layer was encountered above the grey silty clay at BH 2-21 and BH 5 -21.

Practical refusal to DCPT was encountered at an approximate depth of 20.5 m and 22.1 m at the location of boreholes BH 1-21 and BH 5-21, respectively.

Reference should be made to the Soil Profile and Test Data sheets in Appendix 1 for the details of the soil profile encountered at each test hole location.

### **Bedrock**

Based on available geological mapping, the bedrock in the subject area consists of Paleozoic Shale of the Carlsbad formation, with an overburden drift thickness of 15 to 25 m depth.

### **Existing Building Foundation**

Two test pits were advanced against portions of the existing building that are anticipated to be incorporated as part of the proposed development. The foundation wall was generally observed to consist of damp-proofed concrete and backfilled against by fill containing variable amounts of clay, silt, sand, gravel and inorganic debris. The top of the footing was encountered at an elevation of 63.3 and 62.2 m at TP 1-21 and TP 2-21, respectively. The underside of footing was encountered at an elevation of 63.0 m at TP 1-21 along with a clay drainage pipe.

The underside of footing was not encountered at TP 2-21 due to a combination of groundwater ingress and loose foundation backfill sidewalls unable to remain open. The top of the footing was inferred at an elevation of 62.2 m based on auger-probes carried out prior to in-filling the test pit at that time.

Based on our review of structural drawings prepared for The Canadian Nurses Association and dated October 1986, the southwestern and southeastern building addition is understood to be founded on piles anticipated to have been driven to refusal.

### 4.3 Groundwater

Groundwater levels were measured on July 6, 2021 within the installed monitoring wells and piezometers. Also, groundwater infiltration levels were recorded within the open holes during the excavation of the test pits. The measured groundwater levels and observed depth of infiltration are presented in Table 1 below:

| Table 1 - Sum | Table 1 – Summary of Groundwater Levels |                   |   |                  |               |  |  |  |  |  |
|---------------|---|-------------------|---|------------------|---------------|--|--|--|--|--|
| Test Hole     | Groundwater<br>Measuring                | Ground<br>Surface | Measured Gr<br>Level / Gro<br>Infiltration fo | undwater         | Dated         |  |  |  |  |  |
| Number        | Medium                                  | Elevation<br>(m)  | Depth<br>(m)                                  | Elevation<br>(m) | Recorded      |  |  |  |  |  |
| BH 1-21       | Monitoring<br>Well                      | 68.36             | Dry   | Dry              | July 6, 2021  |  |  |  |  |  |
| BH 2-21       | Piezometer                              | 68.21             | 10.56   | 57.65            | July 6, 2021  |  |  |  |  |  |
| BH 3-21       | Piezometer                              | 68.69             | 4.13  | 64.56            | July 6, 2021  |  |  |  |  |  |
| BH 4-21       | Monitoring<br>Well                      | 66.10             | 4.03  | 62.57            | July 6, 2021  |  |  |  |  |  |
| BH 5-21       | Monitoring<br>Well                      | 66.18             | 3.82  | 62.36            | July 6, 2021  |  |  |  |  |  |
| BH 5-21       | Piezometer                              | 66.18             | 9.72  | 56.46            | July 6, 2021  |  |  |  |  |  |
| TP 1-21       | Sidewall<br>Infiltration                | 65.98             | Dry   | Dry              | June 30, 2021 |  |  |  |  |  |
| TP 2-21       | Sidewall<br>Infiltration                | 66.18             | 3.0   | 63.18            | June 30, 2021 |  |  |  |  |  |

**Note:** The ground surface elevation at each borehole location was surveyed using a handheld GPS using a geodetic datum.

It should be noted that long-term groundwater levels can also be estimated based on the observed colour and consistency of the recovered soil samples. Based on these observations, the long-term groundwater table can be expected at approximate depths of 3.5 to 4.5 m below ground surface. The recorded groundwater levels are noted on the applicable Soil Profile and Test Data sheet presented in Appendix 1.

However, it should be noted that groundwater levels are subject to seasonal fluctuations. Therefore, the groundwater levels could vary at the time of construction.

#### Good afternoon Eric,

Given the pseudo-2D nature of the model (i.e., where runoff is generated using standard storm subcatchments and directed to CBs at ground surface, from where uncaptured flow is then routed onto the 2D surface), 2D surface model results only reflect overland spill which ICM reports in terms of depth, direction, and velocity per mesh element.

However, below is s screenshot of the existing conditions model for the area of interest. This figure shows the general direction of flow and ponding in the area near 50 the Driveway under the 1:100-yr design event, based on ground elevations from the City's 1m DEM. The anticipated flow paths along Lewis St, the Driveway, and the parking lot of 50 the Driveway are also shown on the figure (blue arrows). Based on the DEM, overland flow from Gilmour St would flow southeast along the Driveway and southwest along Lewis St to Robert St. There is ~0.4m between the bottom of curb/edge of roadway to the high (spill) point in the parking lot area for the property in question.

#### Kind regards,

### Jasmin Sidhu P.Eng.

Water Resources Engineer

Of course. This does fall within the O'Connor model extents. We'll take a look at the modelled major system flow through this site and let you know what we find.

#### Kind regards,

Water Resources Engineer

I hope my email finds you well.

We are the civil engineers working on the second SPA submission for the property at 50 The Driveway, in the City of Ottawa.

Could you kindly confirm that there is enough capacity in the combined sewer network abutting our site, taking into consideration that the calculated wastewater flow for the subject property is 1.97 L/s (net flow 1.80 L/s)?

Thank you for your assistance.

Sincerely,

Sarra Karavasili, P.E., M.A.Sc.

### Hi Fel

I had a chat internally here and a lateral connection with bends would be acceptable due to the exceptional situation here. However, it will still need to be discussed with Operations first. This would be one pipe out of the Monitoring MH since this is in the ultimate combined sewer area. We would need some kind of deviation report.

We can chat further if you wish.

### Good Morning Guy,

Based on the proposed plans (rooftops and landscaped areas) and the fact that the stormwater from this site would ultimately be directed to combined storm sewers, no additional on-site water quality control would be required save and except best management practices. We would encourage you to explore opportunities to incorporate LID measures into the stormwater management plan.

Subject: 50 Driveway

Hi Eric,

Hope you are doing well.

We have been retained to prepare an Assessment of Adequacy of Public Services Report (Servicing Brief) for 50 Driveway, in the City of Ottawa.

As shown on the attached Location Plan, the Site (0.28 ha) is bounded by Queen Elizabeth Way and Lewis Street and is part of the combined sewer system that ultimately drains to ROPEC.

There is a large combined (1800 mm diameter) on Lewis Street and a smaller 305 mm diameter on QED. Based on our review of the existing condition, runoff from the site currently drains to both combined sewers.

Under the post-development condition (see attached), a significant portion of the site will be the 9-storey roof which accounts for 60% of the overall parcel (1700 m2 of 2800 m2).

The areas outside of the of the building envelope are either grassed or interlock. The area labelled in cyan as 127 m2 is the one that is almost all hard surface and will sheet flow to the 1800 mm combined sewer as there are no opportunities to pick it up with a sewer. The other areas I have labelled are a combination of grass and interlock. Please note that there is no above ground parking. As such, there will be a reduction in TSS given that the large existing parking surface will be removed.

Could you provide an opinion whether the project can proceed without any additional quality measures given the reduction in TSS combined to the fact that the Site is part of the combined system which ultimately drains to ROPEC. Note that we are submitting our Report mid next week, so we would be grateful if you could provide RVCA's opinion before then.

Thank you Guy

polypropylene (PP).

The Rigofill ST full block consists of two half elements to be installed on site and has a void ratio of > 96 %. The Rigofill ST half block consists of only one half element, which must be assembled with a roof slab on site. The cross-shaped inspection tunnel in the storage/infiltration unit has been designed for the use of automotive dollies. This allows for full inspection of the effective drainage surface and the entire system volume with all statically relevant bearing-type fixtures. In combination with QuadroControl ST, Rigofill ST storage/infiltration systems have been designed for professional final acceptance inspection and repeated inspection. Installation under trafficked areas (HGV 60) and at great depths is possible.

**NB!** Follow the Rigofill ST installation manual! **Rigofill ST block**

1 F= 220 C (A) $^{1/2}$ 

Where F= Fire flow in Lpm

C= construction type coefficient

= 0.8 for non combustible

A = total floor area in sq.m. excluding basements

Area Applied

Level 2= 1592.17 m<sup>2</sup> 100% Level 1= 1588.64 m<sup>2</sup> 25% Level 3= 1350.35 m<sup>2</sup> 25%

2,326.9 sq.m.

F = 8,489.91 L/min F(No.1) = 200C VA

F = 8,000 L/min F(No.1) Round to nearest 1000 l/min

2 Occupancy Reduction

15% reduction for limited-combustible occupancy

F = 6800 L/min  $F(No.2) = F(No.1) \times \text{occupancy reduction/charge(%)}$ 

3 Sprinkler Reduction

30% Reduction for NFPA Sprinkler System

F = 4760 l/min  $F(No.3) = F(No.2) \times \text{sprinkler reduction(%)}$ 

4 Separation Charge

 0% West
 >45m

 5% North
 30.1m to 45m

 11% South
 10.1m to 20m

 11% East
 10.1m to 20m

 27% Total Separation Charge

F = 1,836.00 L/min

 $F(No.4) = F(No.2) \times separation charge(%)$ 

 $\begin{array}{lll} F = & 6,596.00 \text{ L/min} & F (tot) = F(No.3) + F(No.4) \\ F = & 7,000 \text{ L/min} & F(tot) \text{ Round to nearest } 1000 \text{ l/min} \end{array}$ 

116.67 L/s = 1849 US GPM

#### **Domestic Flow Calculations**

Population= 146 Persons From Sanitary Calculations

Commercial Area (Retail) = 0.0 m<sup>2</sup> From Site Statistics

Average Day Demand (Residential) = 350.0 L/person/day

Average Day Demand (Commercial) = 2.5 L/m²/day (OBC) 1 US Gallon=3.785 L

Average Residential Water Demand= 0.59 L/s

9 US GPM 1L/s=15.852 US GPM

Average Commercial Water Demand= 0.00 L/s

0.00 US GPM

Max. Daily Residentail Demand Peaking Factor= 2.5

Max. Daily Commercial Demand Peaking Factor = 1.5

Max. Daily Demand = 1.48 L/s = 23 US GPM

or

Max. Hourly Residential Demand Peaking Factor = 2.2

Max. Hourly Commercial Demand Peaking Factor = 1.8

Max. Hourly Demand = 3.25 L/s = 52 US GPM

Max Daily Demand = 1.48 L/s

Fire Flow = 116.67 L/s

Required 'Design' Flow = 118.15 L/s 1873 US GPM Note: Required 'Design' Flow is the maximum of either:

1) Fire Flow + Maximum Daily Demand

2) Maximum Hourly Demand

**Subject:** RE: 50 The Driveway

Hi Abdul,

The following are boundary conditions, HGL, for hydraulic analysis at 50 The Driveway (zone 1W) assumed to be connected to either the 152 mm on Lewis Street OR the 305 mm on Queen Elizabeth Driveway (see attached PDF for location).

|                                      | 152 mm on Lewis | 305 mm on QED |
|--------------------------------------|-----------------|---------------|
| Minimum HGL (m)                      | 106.4           | 106.4         |
| Maximum HGL (m)                      | 115.3           | 115.3         |
| Max Day + Fire<br>Flow (250 L/s) (m) | 91.7            | 105.3         |
