1 INTRODUCTION

1.1 SCOPE

WSP Canada Group Ltd. was retained by 2705460 Ontario Inc. to conduct a stormwater management study to service the proposed redevelopment of the existing Econolodge site into a new group of residential towers.

1.2 SITE LOCATION

The existing site is located at 112 Montreal Road in Ottawa, Ontario, close to the south-west corner of the Montreal Road and Vanier Parkway intersection. The location of the proposed re-development is illustrated in **Figure 1**.

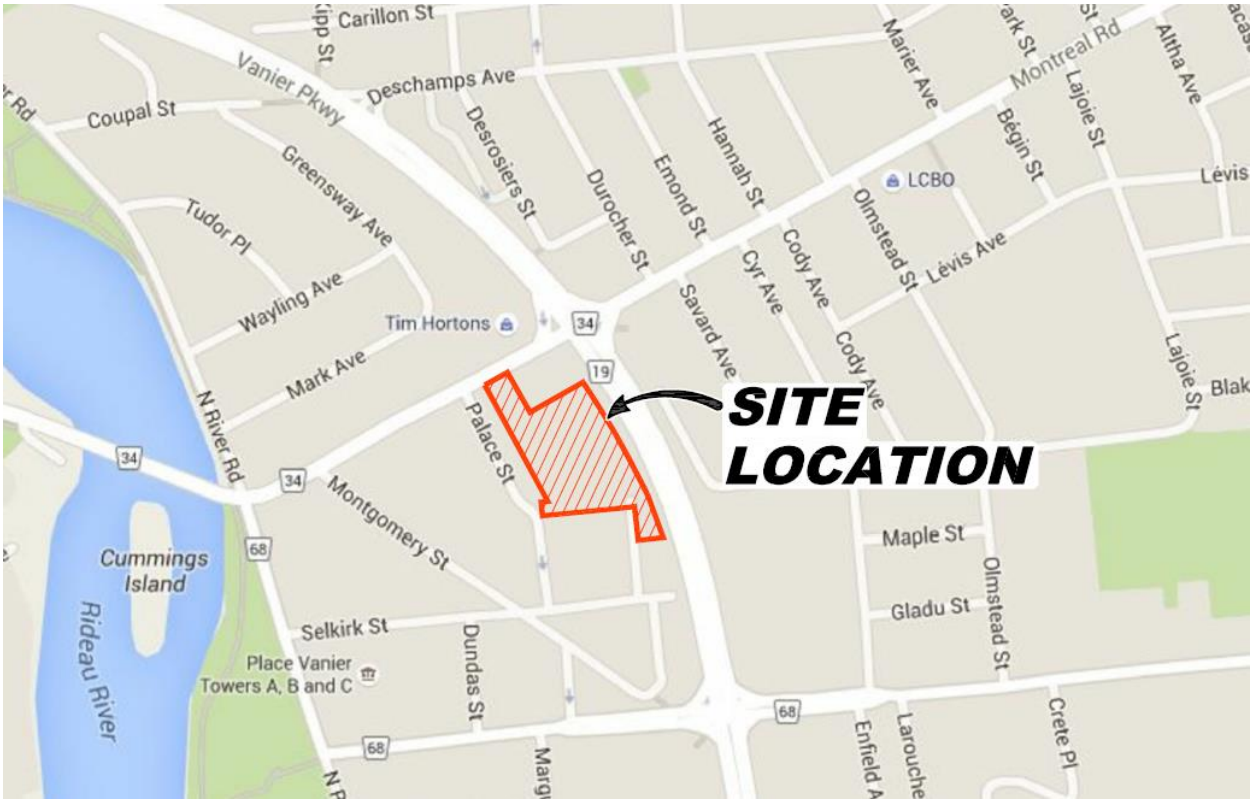

Figure 1: Site Location

1.3 STORMWATER MANAGEMENT PLAN OBJECTIVES

The objectives of the stormwater management plan are as follows:

- Determine site specific stormwater management requirements to ensure that the plan is in conformance with the City of Ottawa Sewer Design Guidelines, October 2012.
- Prepare a stormwater management report documenting the strategy along with the technical information necessary for the justification and sizing of the proposed stormwater management facilities.

1.4 DESIGN CRITERIA

The City of Ottawa (the City) was contacted to determine the stormwater management (SWM) requirements for discharge into the local City sewers for the project site. Joshua White at the City specified that flows greater than the 5-year flow generated from a runoff coefficient of 0.50 must be controlled on site up to the 100-year return period (consistent with Section 8.3.7.3 of the Ottawa Sewer Design Guidelines, October 2012).

The runoff coefficient used for design (100-year return period), was increased by 25% to comply with section 5.4.5.2.1 of the Ottawa Sewer Design Guidelines (October 2012).

As per section 8.3.7 of the Ottawa Sewer Design Guidelines "New development draining to an existing system that has no stormwater treatment facility may be subject to on-site treatment (i.e. best management practice, oil grit separators, etc.). Some existing areas within the City may be subject to a cash-in-lieu policy with respect to stormwater treatment. The designer must confirm with the City if the development area in question is subject to this policy". The City directed WSP to contact the Rideau Valley Conservation Authority (RVCA) to determine any applicable water quality criteria to be used in the design. The RVCA specified no treatment criteria for this site. A record of this conversation has been included in **Appendix A**. Similarly, the City has not specified any water quality requirements for use at this site. Therefore, none have been specifically included in the design.

In summary, the design criteria for stormwater management at the site are:

- Control the 100-year outflow from the site to the 5-year flow using a runoff coefficient of 0.50 and a T_c of 20 minutes; and
- No water quality treatment is required.

2 PRE-DEVELOPMENT CONDITIONS

2.1 GENERAL

The subject property pre-development includes an impervious at-grade parking lot, an existing group of commercial buildings (Econolodge) and a pervious landscaped area at the south-east corner of the project site. The total site area is 1.22 ha. Please refer to **Appendix B** for existing site conditions.

2.2 RAINFALL INFORMATION

The rainfall intensity is calculated in accordance with Section 5.4.2 of the Ottawa Sewer Design Guidelines (October 2012):

$$i = \left[\frac{A}{(Td + C)^B}\right]$$

Where;

- A, B, C = regression constants for each return period (defined in section 5.4.2)
- i = rainfall intensity (mm/hour)
- Td = storm duration (minutes)
- The IDF parameters/regression constants are included in **Appendix C**.

2.3 ALLOWABLE FLOW RATES

As noted in section 1.4, the City of Ottawa specified the allowable discharge rate from this site as the 5-year flow generated from a runoff coefficient of 0.50, controlled on site up to the 100-year return period.

The allowable release rate to the municipal storm sewer system from the proposed development is 119 l/sec, based on the 5-year pre-development flow rate calculated with a runoff coefficient value of 0.50.

The calculated peak flow rates for the site in the pre-development condition are summarized below in Table 2-1. Detailed calculations are contained within Appendix C.

Table 2-1: Pre-Development Peak Flow Rate Calculations (Runoff Coefficient, C = 0.50 and T_c=20 min)

RETURN PERIOD (YEARS)	RAINFALL INTENSITY (MM/HOUR)	PEAK FLOW RATE (L/SEC)	TARGET RELEASE RATE (L/SEC)
2	52.0	88.2	**119.0**
5	70.3	**119.0**	
10	82.2	139.3	
25	97.3	164.8	
50	108.5	183.8	
100	120.0	203.2	

3 POST-DEVELOPMENT CONDITIONS

3.1 GENERAL

The project proposals consist of a mixed-use development with 2 towers; a 37-storey residential tower (Tower B1), and an 8-storey mixed use building (Tower A). A multi-level basement structure is proposed over the majority of the project site area. As described further in subsequent sections of the report, a SWM cistern will be provided at the south end of the site with a connection to Montreal Road. Please refer to **Appendix D** for an illustration of the project (Storm Drainage Area Plan).

The analysis for the site and the sizing of the cistern has been completed with provisions for future development in the southeast quadrant of the site. A runoff coefficient of 0.8 has been assigned to represent the future land-use in this area (S06 and S07 on the Storm Drainage Area Plan).

The following assumptions have been used to quantify stormwater runoff for modelling/analysis purposes: 100% of proposed roof surfaces have been considered as impervious, and the top level of the rooftop area of each tower will be available for temporary surface ponding (via drainage by controlled discharge roof drains).

The entire project area will comply with the target allowable release rate.

3.2 QUANTITY CONTROL

As noted in section 2.3, the target allowable discharge rate to the municipal sewer system from the site is 119 L/sec. This is equivalent to the peak runoff rate under pre-development conditions during a 5-year design storm event with a runoff coefficient of 0.50. Compliance with the target offsite discharge rate will be achieved through use of controlled flow rooftop drains, and the provision of an underground cistern storage structure. Post-development runoff calculations have accounted for uncontrolled runoff from portions of the site that will not drain to storage features.

A cistern was identified as the preferred storage option given the substantial underground parking requirement for the site; surface storage was not considered a viable option and was not accounted for in this analysis.

The cistern is designed to receive runoff (for all events up to and including the 100-year return period), from roof surfaces and at-grade areas within the development area. The controlled and uncontrolled project areas are illustrated in **Appendix E**. The cistern will discharge to the existing municipal storm sewer system via gravity, and peak outflow rates will be controlled via a vortex flow control device (**Appendix F**).

To satisfy net target release rates for controlled and uncontrolled site areas, the recommended peak discharge rate for flow control device is 110 L/sec. If a storm event that occurs fills the cistern, the access hatch at the top of the cistern would allow water to spill to Palace Street. major system. It is noted that the return period associated with an overflow event requiring these facilities to spill would exceed 100-years.

As per the Site Servicing Plan Drawing, discharge from the cistern is proposed to the Montreal Road trunk storm sewer. This trunk storm sewer is 1050mm and it is believed that the City's flow control requirements for the site (which currently drains to this same storm sewer) are sufficient to ensure that there will be no adverse surcharging of the storm sewer.

As noted above, the top level of the rooftop area of each tower will be available for temporary surface ponding (via drainage by controlled discharge roof drains), and the remaining roof areas will drain directly to the cistern without any rooftop storage. Calculations were done based on the roof drain layouts, with four roof drains on Tower A and 6 roof drains on Tower B1. For modelling purposes, these outlets were simulated using rating curves for a *Watts Accutrol* product (in the "fully closed" position) (**Appendix F)**.

Appendix E illustrates the small portions of the project site that will drain offsite uncontrolled in post-development conditions. These uncontrolled runoff rates contribute to the total allowable release rate modelled.

A HydroCAD model of the project was constructed and utilized to include:

- storage and controlled release of stormwater from top level of rooftop areas (Towers A and B1) to the cistern;
- runoff from the remaining rooftop areas (Towers A and B1) directly to the cistern;
- controlled runoff from at-grade areas directed to the cistern; and
- uncontrolled runoff rates generated from at grade areas (S08 and S09)

The Modified Rational Method (an inherent subroutine of the HydroCAD software) has been used for the modelling exercise, and the model has informed the maximum storage volume used in the stormwater cistern based on the proposed flow. Flow rates generated from uncontrolled drainage areas within the project site and controlled flow from the cistern meet the target offsite discharge rate required (119 l/s).

The rainfall intensity and storm duration combination resulting in the largest peak flow discharged to the sewer system occurs at the critical storm duration, t_d= 10 minutes for the 100-year event (determined iteratively using HydroCAD). A summary of the model results and storage controls are listed in Table 3-1 to

Table 3-3 and the full modelling output is included in **Appendix G**.

The modelled post-development peak flow rates comply with the allowable release rate for the 100-year return period (**Table 3-1**).

Table 3-1 Post-Development Modelling Results (A)

RETURN PERIOD (YEARS)	MODELLED POST-DEV.PEAK FLOW RATE (L/SEC)[1]	ALLOWABLE RELEASE RATE (L/SEC)
5	97.8	119
100	106.0	

[1] *Includes flow rates generated from uncontrolled drainage areas within the project site and controlled flow from the cistern*

The HydroCAD analysis completed allows the performance of the SWM drainage system to be verified in all possible storm durations (based on Modified Rational method calculations) and helps identify the critical duration for different components of the system. For example, the critical storm duration for the cistern (resulting in maximum storage utilized) was found to be t_d = 32 minutes. A summary of these modelling results is provided below.

The results show that the maximum utilized storage volume in the Cistern is 309 m^3 to control the 100-year post-development runoff **(Table 3-2**).

Table 3-2 Post-Development Modelling Results (B)

RETURN PERIOD (YEARS)	MAXIMUM UTILIZED STORAGE AND ASSOCIATED PEAK FLOW (L/s)	
	(m^3)	(L/s)
100	309	97.6

[1] *Critical duration resulting in maximum storage utilized in the cistern*

Maximum rooftop storage volumes and release rates (based on the critical duration for each of the different components of the system), in addition to uncontrolled flow rates generated from uncontrolled areas are provided in **Table 3-3**.

Table 3-3 Post-Development Modelling Results (C)

RETURN PERIOD (YEARS)	ROOFTOP MAXIMUM STORAGE VOLUME & PEAK RELEASE RATE[1]				UNCONTROLLED FLOW RATE[2] (L/s)
	TOWER A		TOWER B1		
	(m^3)	(L/s)	(m^3)	(L/s)

100	16.2	1.2	26.9	1.9	15.8

[1] *Based on the critical duration resulting in maximum storage utilized on each roof surface*

[2] *Based on the critical duration resulting in the maximum flow released*

3.3 WATER QUALITY CONTROL

As per Section 1.4, no water quality treatment is required.

3.4 EROSION CONTROL

Please refer to the Erosion and Sedimentation Control plan drawing C.05 as part of the Engineering Drawing Set.

4 RIDEAU RIVER FLOOD PLAIN

The RVCA were consulted to obtain flood plain mapping for the Rideau River in the vicinity of the subject site. Please refer to mapping excerpt provided in **Appendix H**.

It is noted that the 100-year flood plain extends onto Montreal Road, to a modelled elevation of 56.52 m (cross section reference 2474). The site design has accounted for this by setting the minimum ground elevation at the project threshold to an elevation of 56.62 m (refer to Grading and Drainage Plan Drawing C.02 for details), and by specifying the use of non-return backflow preventers within the flow control device associated with the cistern.

5 CONCLUSIONS

A stormwater management plan has been prepared to support the site plan application for the 112 Montreal Road development in the City of Ottawa. The key points are summarized below.

WATER QUANTITY

Controlled runoff collected from the project site will be directed to a stormwater cistern with a minimum active storage volume of 309 m^3 to control the 100-year event. Discharge from the cistern to the municipal storm sewer will be controlled using a vortex flow control device (specified with a peak discharge rate of 98 l/sec).

For the 100-year return period, the uncontrolled runoff (A-06 and A-07) and flow control from the cistern directed to the municipal storm sewer system, will comply with the allowable 5-year release rate of 119 l/sec (calculated using a runoff coefficient of 0.50 and a T_c of 20 minutes).

WATER QUALITY

No specific water quality treatment features are required.

This report demonstrates that the proposed SWM strategy will address stormwater management related impacts from this project and meet the requirements of the City of Ottawa.

CALL FROM: Bryan Orendorff
REPRESENTING: MMM
CALL TO: Brandon Williams
REPRESENTING: RVCA

REGARDING: SWM requirements for proposed 112 Montreal Road Development

DISCUSSION: MMM contacted the RVCA to determine if they had any SWM requirements for the proposed site. The City had previously directed MMM to take this action. Brandon replied that the RVCA did not anticipate any involvement was required on their part for this site from a floodplain perspective (the site is outside the floodplain) and that they typically would not comment on a site application until it was circulated to them by the City. He indicated that the RVCA in this case could rely on the City to ensure that all appropriate requirements were being met.

ACTION: No actions required.

C PRE-DEVELOPMENT CALCULATIONS

	Stormwater Management Calculations	Project: 112 Montreal Road	No.: 19M-01935-00	
	Pre-Dev Release Rates	By: JW Checked: MH	Date: 5/7/2021	Page: 1

Step 1: Determine Pre-development Flow using Rational Formula

* Runoff Coefficient, C in accordance with City of Ottawa Sewer Design Guidelines (section 8.3.7.3)

Runoff Coefficient, C = 0.5 -

Rainfall intensity calculated in accordance with City of Ottawa Sewer Design Guidelines (section 5.4.2):

$$i = \left[\frac{A}{(Td + C)^B}\right]$$

Where: A, B, C = regression constants for each return period (defined in section 5.4.2)
i = rainfall intensity (mm/hour)
Td = storm duration (minutes) 180 minutes

Time of Concentration = 20 minutes
Catchment Area = 1.22 ha

Return Period	2	5	10	25	50	100
a =	733.0	998.1	1,174.2	1,402.9	1,569.6	1,735.7
b =	0.810	0.814	0.816	0.819	0.820	0.820
c =	6.199	6.053	6.014	6.018	6.014	6.014
$Intensity_{peak}$ (mm/hr) =	52.0	70.3	82.2	97.3	108.5	120.0
Q_{peak} (L/s) =	88.2	119.0	139.3	164.8	183.8	203.2
Q_{peak} (m^3/s) =	0.088	0.119	0.139	0.165	0.184	0.203

Return Period = 5 year
Q = 119.0 L/s Pre-development flow rate

Conclusion:

The 5-year pre-development flow rate for a 20 minute Tc governs the 100-year maximum post-development release rate and is 120.5 L/s.

Flush-Flo™	0.671	97.653
Kick-Flo®	1.418	82.712
Mean Flow		82.694

Hydro-Brake® Optimum Flow Control including:

- **5 mm** grade 304L stainless steel
- Integral stainless steel pivoting by-pass door allowing clear line of sight through to outlet, c/w stainless steel operating rope
- Beed blasted finish to maximise corrosion resistance
- Stainless steel fixings
- Rubber gasket to seal outlet

BBA APPROVAL INSPECTION TESTING CERTIFICATION CERTIFICATE 08/4596

WRc Approved PT/329/0412

IMPORTANT: LIMIT OF HYDRO INTERNATIONAL SUPPLY
THE DEVICE WILL BE HANDED TO SUIT SITE CONDITIONS
FOR SITE SPECIFIC DETAILS AND MINIMUM CHAMBER SIZE REFER TO HYDRO INTERNATIONAL
ALL CIVIL AND INSTALLATION WORK BY OTHERS
* WHERE SUPPLIED
HYDRO-BRAKE® FLOW CONTROL & HYDRO-BRAKE® OPTIMUM FLOW CONTROL ARE REGISTERED TRADEMARKS FOR FLOW CONTROLS DESIGNED AND MANUFACTURED EXCLUSIVELY BY HYDRO INTERNATIONAL

THIS DESIGN LAYOUT IS FOR ILLUSTRATIVE PURPOSES ONLY. NOT TO SCALE.

DESIGN ADVICE

The head/flow characteristics of this SHE-0379-9800-2000-9800 Hydro-Brake® Optimum Flow Control are unique. Dynamic hydraulic modelling evaluates the full head/flow characteristic curve.
The use of any other flow control will invalidate any design based on this data and could constitute a flood risk.

F-2 WATTS ACUTROL ROOF DRAIN

WATTS®	Adjustable Accutrol Weir Tag: _____	Adjustable Flow Control for Roof Drains

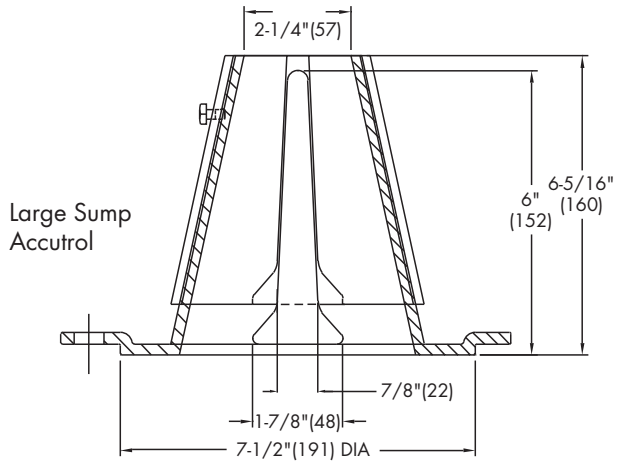
ADJUSTABLE ACCUTROL (for Large Sump Roof Drains only)

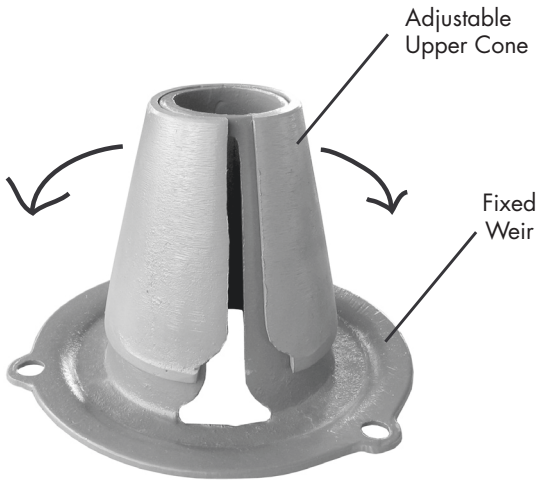
For more flexibility in controlling flow with heads deeper than 2", Watts Drainage offers the Adjustable Accutrol. The Adjustable Accutrol Weir is designed with a single parabolic opening that can be covered to restrict flow above 2" of head to less than 5 gpm per inch, up to 6" of head. To adjust the flow rate for depths over 2" of head, set the slot in the adjustable upper cone according to the flow rate required. Refer to Table 1 below.
Note: Flow rates are directly proportional to the amount of weir opening that is exposed.

EXAMPLE:

For example, if the adjustable upper cone is set to cover 1/2 of the weir opening, flow rates above 2"of head will be restricted to 2-1/2 gpm per inch of head.

Therefore, at 3"of head, the flow rate through the Accutrol Weir that has 1/2 the slot exposed will be:
[5 gpm (per inch of head) x 2 inches of head] + 2-1/2 gpm (for the third inch of head) = 12-1/2 gpm.





1/2 Weir Opening Exposed Shown Above

TABLE 1. Adjustable Accutrol Flow Rate Settings

Weir Opening Exposed	1"	2"	3"	4"	5"	6"
	Flow Rate (gallons per minute)					
Fully Exposed	5	10	15	20	25	30
