EXECUTIVE SUMMARY

Assessment

A Phase II ESA was conducted for the property addressed 1166 Bank Street, in the City of Ottawa, Ontario. The purpose of the Phase II ESA was to address the potentially contaminating activities (PCAs) that were identified during the Phase I ESA and were considered to result in areas of potential environmental concern (APECs) on the Phase II Property.

The subsurface investigation for this assessment was conducted on May 3, 2022, and consisted of drilling three boreholes (BH1-22 to BH3-22) throughout the Phase II Property, all three of which were equipped with monitoring wells to allow for the collection of groundwater samples. The boreholes were advanced to depths ranging from approximately 6.10 m to 7.62 m below the existing ground surface and terminated within an overburden layer of dense brown silty sand.

It should be noted that additional subsurface information, including historical soil and groundwater testing data, was obtained from a previous Phase II ESA conducted for the Phase II Property in March 2021 by Golder Associates Ltd. and utilized as part of this assessment.

In general, the subsurface soil profile encountered at the borehole locations consists of a surficial pavement structure (asphaltic concrete and granular sub-grade fill), underlain by fill material (brown silty sand with some clay, gravel, and cobbles) over top of multiple layers of compact to dense native brown sand with varying silt and clay contents, turning grey at deeper depths in line with the long-term water table. Bedrock was not encountered in any of the boreholes during the field drilling program, however, a dynamic cone penetration test was carried out at BH2-22, which was terminated on practical refusal on inferred bedrock at a depth of approximately 9.25 m below ground surface. The groundwater beneath the Phase II Property was encountered within an overburden layer of grey silty clay at depths ranging from approximately 5.14 m to 5.83 m below ground surface.

Between Golder's 2021 and Paterson's 2022 subsurface investigations, a total of ten soil samples were submitted for laboratory analysis of VOCs, PHCs (F_1-F_4), metals, PAHs, lead, EC, SAR, and pH parameters. Based on the analytical test results, the concentration of PHCs (F_1) in Sample MW21-04-07 was in excess of the MECP Table 3 Coarse-Grained Residential Soil Standards. It should be noted that this borehole is located in the vicinity of the former underground fuel storage tank nest in the southern portion of the Phase II Property.

Some elevated levels of EC and SAR were identified within the shallow fill material in BH1-22 as well as the deeper native soils in BH3-22. It should be noted that these EC and SAR exceedances are considered to be the result of a substance which has been applied to the site surface for the safety of vehicular or pedestrian traffic under conditions of snow or ice or both, which according to Section 49.1 of O. Reg. 153/04, the standards for these parameters are considered to have been met. As a result, these exceedances are not considered to represent a contaminant issue to the Phase II Property.

Groundwater samples were recovered from monitoring wells MW21-01 to MW21-04 on April 8, 2021 as part of Golder's 2021 subsurface investigation and submitted for laboratory analysis of VOCs and PHCs (F_1-F_4). Based on the analytical test results, the concentration of chloroform in Sample MW21-02, as well as the concentrations of chloroform, 1-2-Dichloroethane, and benzene in Sample MW21-04 were in excess of the MECP Table 3 Non-Potable Groundwater Standards.

The elevated concentrations of chloroform were suspected to be the result of the use of municipal water during the drilling process, and thus was not considered to present a contaminant issue to the property. The benzene exceedance was suspected to be the result of the historical presence of the former on-site retail fuel outlet. It should be noted that this benzene exceedance was identified in the monitoring well placed within the location of the former underground fuel storage tank nest in the southern portion of the site. The presence of 1-2-Dichloroethane, which is not typical of fuel related impacts, was suspected to be related to the historical use of solvents in an auto service garage which was formerly present on the property.

As part of this current assessment, groundwater samples were recovered from BH1-22, BH2-22, BH3-22, MW21-02, and MW21-04 on May 11, 2022 and March 19, 2024 and submitted for laboratory analysis of VOCs and PHC (F_1-F_4) parameters. Based on the analytical test results, all detected parameter concentrations in the groundwater samples analyzed are in compliance with the selected MECP Table 3 Non-Potable Groundwater Standards. It should be noted that no chloroform was detected in the samples analyzed as part of the 2022 and 2024 groundwater sampling program, confirming our theory that the initial concentrations identified in the 2021 sampling program were likely the result of the use of municipal water. The benzene concentration detected in MW21-04 during the 2022 and 2024 groundwater sampling program was also significantly lower than initially identified in the 2021 sampling program. It is possible that the initially identified elevated levels of benzene could be the result of suspended sediment collected in the water samples due to improperly established wells.

Recommendations

Soil

Based on the findings of this assessment, PHC impacted soil was identified in the southern portion of the Phase II Property, in the vicinity of the former on-site underground fuel storage tank nest.

It is our understanding that the Phase II Property is to be redeveloped in the future, thus it is recommended that this contaminated soil be remediated at the time of site redevelopment. This contaminated soil will require disposal at a licensed waste disposal facility.

Prior to off-site disposal of impacted soil at a licensed waste disposal facility, a leachate analysis of a representative sample of contaminated soil must be conducted in accordance with Ontario Regulation 347/558.

It is recommended that Paterson personnel be present on-site during remediation activities to direct the excavation and segregation of impacted soil, as well as to conduct confirmatory sampling as required.

Based on the soil test results, the majority of the on-site soils comply with the MECP Table 2.1 Excess Soil Quality Standards (Ontario Regulation 406/19), for off-site disposal. Additional excess soil testing may be required prior to future site excavation activities.

Monitoring Wells

If the groundwater monitoring wells installed on-site are not going to be used in the future, or will be destroyed during future construction activities, then they must be decommissioned according to Ontario Regulation 903 (Ontario Water Resources Act), however, we recommend that the wells be maintained for future sampling purposes, at least until the excavation for the foundation has commenced. The monitoring wells will be registered with the MECP under this regulation. Further information can be provided upon request in this regard.

1.0 INTRODUCTION

At the request of Ambassador Realty Inc., Paterson Group (Paterson) conducted a Phase II – Environmental Site Assessment (Phase II ESA) the property addressed 1166 Bank Street, in the City of Ottawa, Ontario (the Phase II Property).

The purpose of this Phase II ESA has been to address the areas of potential environmental concern (APECs) identified on the Phase II Property as a result the findings of the Phase I ESA.

1.1 Site Description

Address:	1166 Bank Street, Ottawa, Ontario.
Legal Description:	Part of Lot L, Concession C (Rideau Front), Formerly the Township of Nepean, in the City of Ottawa, Ontario.
Location:	The Phase II Property is located on the northwest corner of the intersection of Bank Street and Grove Avenue, in the City of Ottawa, Ontario. Refer to Figure 1 – Key Plan, appended to this report.
Latitude and Longitude:	45° 23' 33" N, 75° 40' 57" W.
Site Description:	
Configuration:	Rectangular.
Site Area:	1,020 m^2 (approximate).
Zoning:	TM – Traditional Main Street Zone.
Current Uses:	The Phase II Property is currently occupied with a one-storey commercial retail building (*Quickie Convenience Store*).
Services:	The Phase II Property is located within a municipally serviced area.

1.2 Property Ownership

The Phase II Property is currently owned by Ambassador Realty Inc. Paterson was retained to complete this Phase II ESA by Mr. Arthur Loeb of Ambassador Realty Inc., whose offices are located at 185 Somerset Street West, Ottawa, Ontario. Mr. Loeb can be contacted via telephone at 613-233-1104.

1.3 Applicable Site Condition Standard

The site condition standards for the subject property were obtained from Table 3 of the document entitled, *"Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act"*, prepared by the Ministry of the Environment, Conservation and Parks (MECP), and dated April 15, 2011. The selected MECP standards are based on the following considerations:

- ❒ Full depth soil conditions;
- ❒ Coarse-grained soil conditions;
- ❒ Non-potable groundwater conditions;
- ❒ Residential land use.

Grain size analysis was not conducted as part of this assessment, and as such, the coarse-grained soil standards were selected as a conservative approach.

2.0 BACKGROUND INFORMATION

2.1 Physical Setting

The Phase II Property is currently occupied with a one-storey commercial retail building, located in the western portion of the property. The remainder of the site is largely paved with an asphaltic concrete parking lot, though a small, landscaped area is present within the southeastern corner of the property.

The site topography appears to slope down towards the south, in the general direction of the Rideau River, which is consistent with the greater regional topography. The Phase II Property is considered to be at grade with respect to the adjacent streets and the neighbouring properties.

Water drainage on the Phase II Property occurs primarily via surface runoff towards catch basins located in the exterior parking lot or the adjacent streets. No ponded water, stressed vegetation, surficial staining, or any other indications of potential sub-surface contamination were observed on the Phase II Property at time of the site inspection.

3.0 SCOPE OF INVESTIGATION

3.1 Overview of Site Investigations

March 2021

A subsurface investigation, carried out by Golder Associates Ltd., was conducted for the Phase II Property on March 29 and March 30, 2021. At that time, four boreholes (MW21-01 to MW21-04) were advanced throughout the property and terminated within the overburden at depths ranging from approximately 6.6 to 7.6 m below ground surface. Upon completion, all boreholes were equipped with monitoring wells to allow for the collection of groundwater samples.

May 2022

The subsurface investigation for this assessment was conducted on May 3, 2022, and consisted of drilling three boreholes (BH1-22 to BH3-22) throughout the Phase II Property, all three of which were equipped with monitoring wells to allow for the collection of groundwater samples.

The boreholes were advanced to depths ranging from approximately 6.10 m to 7.62 m below the existing ground surface and terminated within an overburden layer of dense brown silty sand. It should be noted that a dynamic cone penetration test was carried out at BH1-22, which was terminated on practical refusal on inferred bedrock at a depth of approximately 9.25 m below ground surface.

3.2 Media Investigated

During the course of this subsurface investigation, soil and groundwater samples were obtained from the Phase II Property and submitted for laboratory analysis. The rationale for sampling and analyzing these media is based on the contaminants of potential concern identified in the Phase I ESA.

The contaminants of potential concern for the soil and groundwater on the Phase II Property include the following:

- Volatile Organic Compounds (VOCs);
- Petroleum Hydrocarbons, fractions 1 – 4 (PHCs F_1-F_4);
- Polycyclic Aromatic Hydrocarbons (PAHs);
- Metals (including Mercury and Hexavalent Chromium);
- Electrical Conductivity (EC);
- Sodium Adsorption Ratio (SAR).

These CPCs have the potential to be present in the soil matrix and/or the groundwater situated beneath the Phase II Property.

3.3 Phase I ESA Conceptual Site Model

Geological and Hydrogeological Setting

Based on the available mapping information, the bedrock beneath the Phase II Property generally consists of shale of the Billings Formation, while the surficial geology consists largely of offshore marine sediments (erosional terraces) with an overburden ranging in thickness from approximately 5 m to 10 m.

Groundwater is anticipated to be encountered within the overburden and flow in a southerly direction towards the Ottawa River.

Water Bodies and Areas of Natural and Scientific Interest

No water bodies or areas of natural and scientific interest were identified within the Phase I Study Area.

The nearest named water body with respect to the Phase II Property is the Rideau River, located approximately 360 m to the south.

Drinking Water Wells

Based on the availability of municipal services, no drinking water wells are expected to be present within the Phase I Study Area.

Existing Buildings and Structures

The Phase II Property is currently occupied with a one-storey commercial retail building.

Current and Future Property Use

The Phase II Property is currently being used for commercial purposes.

It is our understanding that the Phase II Property is to be redeveloped with a six-storey mixed-use building, with one level of underground parking.

Due to the change to a more sensitive land use (commercial to residential), this will require that a record of site condition (RSC) be filed with the MECP.

Neighbouring Land Use

The surrounding lands within the Phase I Study Area consist largely of residential properties, with the exception of commercial properties and some institutional land present along Bank Street.

Potentially Contaminating Activities and Areas of Potential Environmental Concern

As per Section 7.1 of the Phase I ESA report, six potentially contaminating activities (PCAs), resulting in areas of potential environmental concern (APECs), were identified on the Phase II Property. These APECs include:

- A former auto service garage, located in the northwestern portion of the Phase II Property.
- A former underground fuel storage tank nest, located in the southern portion of the Phase II Property.
- A former fuel pump island, located in the eastern portion of the Phase II Property.
- Fill material of unknown quality, located beneath the asphaltic concrete parking lot throughout the northern, eastern, and southern portions of the Phase II Property.
- The application of road salt during snow and/or ice conditions, located beneath the asphaltic concrete parking lot throughout the northern, eastern, and southern portions of the Phase II Property.
- A former auto service garage and retail fuel outlet, located approximately 20 m to the east of the Phase II Property (1159 Bank Street).

Other off-site PCAs were identified within the Phase I Study Area but were deemed not to be of any environmental concern to the Phase II Property based on their separation distances as well as their inferred down-gradient or cross-gradient orientation with respect to anticipated groundwater flow.

Contaminants of Potential Concern

The contaminants of potential concern (CPCs) associated with the aforementioned APECs are considered to be:

- Volatile Organic Compounds (VOCs);

- ❒ Petroleum Hydrocarbons, fractions 1 – 4 (PHCs F_1-F_4);
- ❒ Polycyclic Aromatic Hydrocarbons (PAHs);
- ❒ Metals (including Mercury and Hexavalent Chromium);
- ❒ Electrical Conductivity (EC);
- ❒ Sodium Adsorption Ratio (SAR).

These CPCs have the potential to be present in the soil matrix and/or the groundwater situated beneath the Phase II Property.

Assessment of Uncertainty and/or Absence of Information

The information available for review as part of the preparation of the Phase I ESA is considered to be sufficient to conclude that there are PCAs and APECs associated with the Phase II Property.

The presence of any PCAs was confirmed by a variety of independent sources, and as such, the conclusions of this report are not affected by uncertainty which may be present with respect to the individual sources.

3.4 Deviations from the Sampling and Analysis Plan

No deviations from the Sampling and Analysis were made during the course of this Phase II ESA.

3.5 Physical Impediments

No physical impediments were encountered during the course of the field drilling program.

4.0 INVESTIGATION METHOD

4.1 Subsurface Investigation

The subsurface investigation for this assessment was conducted on May 3, 2022, and consisted of drilling three boreholes (BH1-22 to BH3-22) within the exterior parking lot of the Phase II Property.

The boreholes were advanced to depths ranging from approximately 6.10 m to 7.62 m below the existing ground surface and terminated within an overburden layer of dense brown silty sand. It should be noted that a dynamic cone penetration test was carried out at BH1-22, which was terminated on practical refusal on inferred bedrock at a depth of approximately 9.25 m below ground surface.

Upon completion, all three boreholes were instrumented with groundwater monitoring wells in order to access the groundwater table. During the field sampling program, the groundwater was measured at depths ranging from approximately 5.14 m to 5.83 m below the existing ground surface.

Under the full-time supervision of Paterson personnel, the boreholes were drilled using a low-clearance drill rig provided by George Downing Estate Drilling of Hawkesbury, Ontario. The locations of the boreholes are illustrated on "Drawing PE5590-3 – Test Hole Location Plan", appended to this report.

4.2 Soil Sampling

Soil sampling protocols were followed using the MECP document entitled, *"Guidance on Sampling and Analytical Methods for Use at Contaminated Sites in Ontario"*, dated May 1996.

The samples were recovered using a stainless-steel split spoon, while wearing protective gloves (changed after each sample), and immediately placed into plastic bags. If significant contamination was encountered, the samples were instead placed into glass jars. Sampling equipment was routinely washed in soapy water and rinsed with methylhydrate after each split spoon to prevent any cross contamination of the samples. The samples were also stored in coolers to reduce analyte volatilization during transportation.

A total of 31 soil samples were obtained from the boreholes by means of auger and split spoon sampling. The depths at which auger and split spoon samples were obtained from the boreholes are shown as "**AU**" and "**SS**", respectively, on the Soil Profile and Test Data Sheets, appended to this report.

4.3 Field Screening Measurements

All soil samples collected were subjected to a preliminary screening procedure, which included visual screening for colour and evidence of metals, as well as soil vapour screening with a Photo Ionization Detector.

The recovered soil samples were placed immediately into airtight plastic bags with nominal headspace. All lumps of soil inside the bags were broken by hand, and the soil was allowed to come to room temperature prior to conducting the vapour survey, ensuring consistency of readings between samples. To measure the soil vapours, the analyser probe was inserted into the nominal headspace above the sample. The sample was then agitated and manipulated gently by hand as the measurement was taken. The peak reading registered within the first 15 seconds was recorded as the vapour measurement. The parts per million (ppm) scale was used to measure concentrations of organic vapours.

The results of the vapour survey are presented on the Soil Profile and Test Data Sheets, appended to this report.

4.4 Groundwater Monitoring Well Installation

Three groundwater monitoring wells were installed on the Phase II Property as part of this assessment. These monitoring wells were constructed using 50 mm diameter Schedule 40 threaded PVC risers and screens. A sand pack consisting of silica sand was placed around the screen with a bentonite seal placed above to minimize cross-contamination. A summary of the monitoring well construction details are listed below in Table 1 as well as on the Soil Profile and Test Data Sheets provided in Appendix 1.

Upon completion, the groundwater monitoring wells were developed using a dedicated inertial lift pump, with a minimum of three well volumes being removed from the wells at the time of installation. The wells were developed until the appearance of the water was noted to have stabilized. In addition, the ground surface elevations of each borehole were subsequently surveyed with respect to a known geodetic elevation.

Table 1
Monitoring Well Construction Details

Well ID	Ground Surface Elevation (m ASL)	Total Depth (m BGS)	Screened Interval (m BGS)	Sand Pack (m BGS)	Bentonite Seal (m BGS)	Casing Type
BH1-22	62.80	7.62	4.62-7.62	5.79-7.62	0.31-5.79	Flushmount
BH2-22	62.88	6.10	3.10-6.10	2.74-6.10	0.31-2.74	Flushmount
BH3-22	62.33	6.86	3.86-6.86	3.35-6.86	0.31-3.35	Flushmount

4.5 Field Measurement of Water Quality Parameters

Groundwater monitoring and sampling was conducted on-site on May 11, 2022 and March 19, 2024. Following their development and stabilization during the May 2022 field sampling event, select water quality parameters were measured at each monitoring well location using a multi-reader probe device. The stabilized field parameter values are summarized below in Table 2.

Table 2
Measurement of Water Quality Parameters

Well ID	Temperature (˚C)	Conductivity (µS)	pH (Units)
BH1-22	13.6	2,258	7.29
BH2-22	16.7	>3,999	6.44
BH3-22	-	-	-
MW21-02	13.6	2,565	7.26
MW21-04	-	-	-

Due to high amounts of suspended sediment in the recovered groundwater, no water quality parameters were measured at BH3-22 and MW21-04 during the May 2022 field sampling event.

4.6 Groundwater Sampling

Groundwater sampling protocols were followed using the MECP document entitled, *"Guidance on Sampling and Analytical Methods for Use at Contaminated Sites in Ontario"*, dated May 1996.

Standing water was purged from each monitoring well prior to the recovery of the groundwater samples using dedicated sampling equipment. The samples were then stored in coolers to reduce possible analyte volatilization during their transportation. Further details of our standard operating procedure for groundwater sampling are provided in the Sampling and Analysis Plan, appended to this report.

4.7 Analytical Testing

The following soil and groundwater samples were submitted for laboratory analysis:

Table 3
Testing Parameters for Submitted Soil Samples

Sample ID	Sample Depth & Stratigraphic Unit	Parameters Analyzed									Rationale
		VOCs	PHCs (F_1-F_4)	Metals	Hg+	Cr^{VI}	PAHs	EC	SAR	pH	
BH1-22-SS3/SS4A	1.52 – 2.44 m Fill Material	X	X					X	X		To assess for potential impacts resulting from the presence of a former auto service garage and the use of road salt for de-icing purposes.
BH1-22-SS8	5.33 – 5.94 m Silty Sand	X	X							X	To assess for potential impacts resulting from the presence of a former on-site auto service garage.
BH2-22-SS4A	2.29 – 2.44 m Fill Material			X	X	X					To assess for potential impacts resulting from the presence of fill material of unknown quality.
BH2-22-SS5	3.05 – 3.66 m Silty Sand	X	X	X[1]							To assess for potential impacts resulting from the presence of a former on-site fuel pump island and a former off-site auto service garage.
BH3-22-SS3	1.52 – 2.13 m Fill Material			X	X	X	X	X	X	X	To assess for potential impacts resulting from the presence of fill material of unknown quality and the use of road salt for de-icing purposes.
BH3-22-SS6	3.81 – 4.42 m Silty Sand	X	X	X[1]							To assess for potential impacts resulting from the presence of a former on-site underground fuel storage tank nest.
DUP-1[2]	3.81 – 4.42 m Silty Sand	X									For laboratory QA/QC purposes.

1 – Lead content only
2 – Duplicate sample of BH3-22-SS6

Table 4
Testing Parameters for Submitted Groundwater Samples

Sample ID	Screened Interval & Stratigraphic Unit	Parameters Analyzed		Rationale
		VOCs	PHCs (F_1-F_4)	
MW21-02-GW2	4.82 – 7.82 m Silty Sand	X		To verify the initial results obtained during the previous 2021 Phase II ESA.
MW21-04-GW2	3.10 – 6.10 m Silty Sand	X	X	To assess for potential impacts resulting from the presence of a former on-site underground fuel storage tank nest.
BH1-22-GW1	4.62 – 7.62 m Silty Sand	X	X	To assess for potential impacts resulting from the presence of a former on-site auto service garage.
BH2-22-GW1	3.10 – 6.10 m Silty Sand	X	X	To assess for potential impacts resulting from the presence of a former on-site fuel pump island and a former off-site auto service garage.
BH3-22-GW1	3.86 – 6.86 m Silty Sand	X	X	To assess for potential impacts resulting from the presence of a former on-site underground fuel storage tank nest.
DUP-1[1]	3.86 – 6.86 m Silty Sand	X		For laboratory QA/QC purposes.
MW21-02-GW3	4.82 – 7.82 m Silty Sand	X		To confirm the groundwater quality at this monitoring well location.
MW21-04-GW3	3.10 – 6.10 m Silty Sand	X		To confirm the groundwater quality at this monitoring well location.

1 – Duplicate sample of BH3-22-GW1

Paracel Laboratories (Paracel), of Ottawa, Ontario, performed the laboratory analysis on the samples submitted for analytical testing. Paracel is a member of the Standards Council of Canada/Canadian Association for Laboratory Accreditation (SCC/CALA) and is accredited and certified by the SCC/CALA for specific tests registered with the association.

4.8 Residue Management

All soil cuttings were removed from the site following the field program, while all purge water and equipment cleaning fluids were retained on-site.

4.9 Elevation Surveying

The ground surface elevations at each borehole location were surveyed using a GPS device by Paterson personnel and referenced to a geodetic datum.

4.10 Quality Assurance and Quality Control Measures

A summary of the quality assurance and quality control (QA/QC) measures, undertaken as part of this assessment, is provided in the Sampling and Analysis Plan in Appendix 1.

5.0 REVIEW AND EVALUATION

5.1 Geology

In general, the subsurface soil profile encountered at the borehole locations consists of a surficial pavement structure (asphaltic concrete and granular sub-grade fill), underlain by fill material (brown silty sand with some clay, gravel, and cobbles) over top of multiple layers of compact to dense native brown sand with varying silt and clay contents, turning grey at deeper depths in line with the long-term water table.

Bedrock was not encountered in any of the boreholes during the field drilling program, however, a dynamic cone penetration test was carried out at BH2-22, which was terminated on practical refusal on inferred bedrock at a depth of approximately 9.25 m below ground surface.

Site geology details are provided in the Soil Profile and Test Data Sheets in Appendix 1.

5.2 Groundwater Elevations, Flow Direction, and Hydraulic Gradient

Groundwater levels beneath the Phase II Property were most recently measured using an electronic water level meter on March 19, 2024. The groundwater levels are summarized below in Table 5.

Table 5
Groundwater Level Measurements

Borehole Location	Ground Surface Elevation (m)	Water Level Depth (m below grade)	Water Level Elevation (m ASL)	Date of Measurement
BH1-22	62.80 m	5.65 m	57.15 m	March 19, 2024
BH2-22	62.88 m	5.67 m	57.21 m	
BH3-22	62.33 m	5.14 m	57.19 m	
MW21-01	62.96 m	5.83 m	57.13 m	
MW21-02	62.95 m	5.79 m	57.16 m	
MW21-03	62.39 m	5.27 m	57.12 m	
MW21-04	62.41 m	5.26 m	57.15 m	

The groundwater at the Phase II Property was encountered within the overburden at depths ranging from approximately 5.14 m to 5.83 m below the existing ground surface.

No unusual visual observations were identified within the recovered groundwater samples, with the exception of the groundwater purged from MW21-04, which was noted to contain a slight petroleum hydrocarbon odour.

Using the groundwater elevations recorded during the sampling event, groundwater contour mapping was completed as part of this assessment. Due to the incongruity with the low variability in the measured groundwater levels, a flow direction and hydraulic gradient could not be accurately calculated as part of this assessment.

It should be noted that groundwater levels are expected to fluctuate throughout the year with seasonal variations.

5.3 Fine/Coarse Soil Texture

Grain size analysis was not completed as part of this investigation. As a result, the coarse-grained soil standards were chosen as a conservative approach.

5.4 Field Screening

Field screening of the soil samples collected during the drilling program resulted in organic vapour readings ranging from 0.3 ppm to 3.8 ppm, with one notable exception. In general, the organic vapour readings obtained from the field screening indicate that there is a negligible potential for the presence of volatile substances, however, the vapour measurement of one sample (BH2-22-SS5) returned an outlier reading of 92.4 ppm. Upon recovery, this sample was noted to contain a distinct fuel-like odour, though no unusual discolouration or visible fuel staining was observed.

This sample was obtained from the borehole placed within the footprint of a former fuel pump island, at a depth of approximately 3.05 to 3.66 m below ground surface. As a result of the high vapour reading, this sample was selected for further laboratory testing.

Field screening results of each individual soil sample are provided on the Soil Profile and Test Data Sheets appended to this report.

5.5 Soil Quality

March 2021

As part of the previous 2021 Phase II ESA completed by Golder, four soil samples were submitted for laboratory analysis of VOCs, PHCs (F_1-F_4), and metal parameters. The results of the 2021 analytical testing are presented below in Tables 6 to 8, as well as on the laboratory certificates of analysis included in Appendix 1.

Table 6

All detected metal parameter concentrations in the soil samples analyzed as part of the 2021 Phase II ESA were in compliance with the selected MECP Table 3 Coarse-Grained Residential Soil Standards.

May 2022

As part of this current Phase II ESA, six soil samples were submitted for laboratory analysis of VOCs, PHCs (F_1-F_4), metals, PAHs, lead, EC, SAR, and pH parameters. The results of the analytical testing are presented below in Tables 9 to 13, as well as on the laboratory certificates of analysis included in Appendix 1.

- **Bold and Underlined** – value exceeds selected MECP standards

The EC and SAR levels detected in Samples BH1-22-SS3/SS4A and BH3-22-SS6 are in excess of the selected MECP Table 3 Coarse-Grained Residential Soil Standards.

It should be noted that these EC and SAR exceedances are considered to be the result of a substance which has been applied to surfaces for the safety of vehicular or pedestrian traffic under conditions of snow or ice or both, which according to Section 49.1 of O. Reg. 153/04, the standards for these parameters are considered to have been met. As a result, these exceedances are not considered to represent a contaminant issue to the Phase I Property.

All other parameter concentrations analyzed were below the laboratory detection limits. The laboratory certificates of analysis are provided in Appendix 1.

5.6 Groundwater Quality

March 2021

As part of the previous 2021 Phase II ESA, four groundwater samples were submitted for laboratory analysis of VOCs and PHC (F_1-F_4) parameters. The results of the 2021 analytical testing are presented below in Tables 15 and 16, as well as on the laboratory certificates of analysis included in Appendix 1.

- nd – not detected above the MDL
- **Bold and Underlined** – value exceeds selected MECP standards

The concentration of chloroform in Sample MW21-02, as well as the concentrations of chloroform, 1-2-Dichloroethane, and benzene in Sample MW21-04 were in excess of the MECP Table 3 Non-Potable Groundwater Standards.

The elevated concentrations of chloroform were suspected to be the result of the use of municipal water during the drilling process, and thus are not considered to present a contaminant issue to the property.

The benzene exceedance was suspected to be the result of the historical presence of the former on-site retail fuel outlet. It should be noted that this benzene exceedance was identified in the monitoring well placed within the location of the former underground fuel storage tank nest in the southern portion of the site.

The presence of 1-2-Dichloroethane, which is not typical of fuel related impacts, was suspected to be related to the historical use of solvents in an auto service garage which was formerly present on the property.

March 2024

A second round of groundwater testing was carried out on March 19, 2024 to confirm the groundwater quality at MW21-02 and MW21-04. Groundwater samples were recovered from the two wells and submitted for laboratory analysis of VOCs parameters. The results of the analytical testing are presented below in Table 19, as well as on the laboratory certificates of analysis included in Appendix 1.

No VOC parameter concentrations were detected in the groundwater samples analyzed. The results are in compliance with the selected MECP Table 3 Non-Potable Groundwater Standards.

5.7 Quality Assurance and Quality Control Results

All samples submitted as part of this Phase II ESA were handled in accordance with the analytical protocols with respect to holding time, preservation method, storage requirement, and container type.

As per Subsection 47(3) of O. Reg. 153/04, as amended by the Environmental Protection Act, the certificates of analysis have been received for each sample submitted for laboratory analysis and have been appended to this report.

As per the Sampling and Analysis Plan, a duplicate soil sample was obtained from sample BH3-22-SS6 and submitted for laboratory analysis of VOC parameters. The relative percent difference (RPD) calculations for the original and duplicate samples are provided below in Table 20.

Table 19

Trichlorofluoromethane	1.0	nd	nd	0	Meets Target
Vinyl Chloride	0.5	nd	nd	0	Meets Target
Xylenes	0.5	nd	nd	0	Meets Target

Notes:
- MDL – Method Detection Limit
- nd – not detected above the MDL
- **Bold and Underlined** – value exceeds selected MECP standards

The relative percent difference (RPD) calculated for the majority of the parameters fell within of the acceptable range of 20%, with two exceptions. Due to the low concentrations measured, which are marginally in excess of the laboratory method detection limits and comply with the site specific standards, the results are considered sufficient to meet the data quality objectives outlined in the Sampling and Analysis Plan, appended to this report.

Based on the results of the QA/QC analysis, the quality of the field data collected during this Phase II ESA is considered to be sufficient to meet the overall objectives of this assessment.

5.8 Phase II Conceptual Site Model

The following section has been prepared in accordance with the requirements of O. Reg. 153/04 amended by the Environmental Protection Act. Conclusions and recommendations are discussed in a subsequent section.

Site Description

Potentially Contaminating Activity and Areas of Potential Environmental Concern

As described in Section 7.1 of the Phase I ESA report, as well as Section 2.2 of this report, the following PCAs, as defined by Table 2 of O. Reg. 153/04, are considered to result in APECs on the Phase II Property:

Table 22
Areas of Potential Environmental Concern

Area of Potential Environmental Concern	Location of APEC on Phase I Property	Potentially Contaminating Activity (Table 2 – O. Reg. 153/04)	Location of PCA (On-Site or Off-Site)	Contaminants of Potential Concern	Media Potentially Impacted (Groundwater, Soil, and/or Sediment)
APEC #1 Former Auto Service Garage	Northwestern Portion of Phase I Property	*"Item 52: Storage, maintenance, fuelling and repair of equipment, vehicles, and material used to maintain transportation systems"*	On-Site	VOCs PHCs (F_1-F_4)	Soil and/or Groundwater
APEC #2 Former Underground Fuel Storage Tank Nest	Southern Portion of Phase I Property	*"Item 28: Gasoline and Associated Products Storage in Fixed Tanks"*	On-Site	VOCs PHCs (F_1-F_4)	Soil and/or Groundwater
APEC #3 Former Fuel Pump Island	Eastern Portion of Phase I Property	*"Item 28: Gasoline and Associated Products Storage in Fixed Tanks"*	On-Site	VOCs PHCs (F_1-F_4)	Soil and/or Groundwater
APEC #4 Fill Material of Unknown Quality	Eastern and Southern Portions of Phase I Property	*"Item 30: Importation of Fill Material of Unknown Quality"*	On-Site	PAHs Metals	Soil
APEC #5 Application of Road Salt During Snow/Ice Conditions	Northern, Eastern, and Southern Portions of Phase I Property	*"No Item Number: Application of Road Salt During Snow and Ice Conditions"*	On-Site	EC SAR	Soil
APEC #6 Former Auto Service Garage	Eastern Portion of Phase I Property	*"Item 28: Gasoline and Associated Products Storage in Fixed Tanks"* *"Item 52: Storage, maintenance, fuelling and repair of equipment, vehicles, and material used to maintain transportation systems"*	Off-Site (20 m East)	VOCs PHCs (F_1-F_4)	Groundwater

Contaminants of Potential Concern (CPCs)

The contaminants of potential concern (CPCs) associated with the aforementioned APECs are considered to be:

- ❒ Volatile Organic Compounds (VOCs);
- ❒ Petroleum Hydrocarbons, fractions 1 – 4 (PHCs F_1-F_4);
- ❒ Polycyclic Aromatic Hydrocarbons (PAHs);
- ❒ Metals (including Mercury and Hexavalent Chromium);
- ❒ Electrical Conductivity (EC);
- ❒ Sodium Adsorption Ratio (SAR).

These CPCs have the potential to be present in the soil matrix and/or the groundwater situated beneath the Phase II Property.

Subsurface Structures and Utilities

Underground service locates were completed prior to the subsurface investigation. Underground utilities on the Phase II Property included electrical cables, natural gas pipelines, as well as municipal water and wastewater services.

Physical Setting

Site Stratigraphy

The stratigraphy of the Phase II Property generally consists of:

- ❒ Pavement structure (asphaltic concrete over crushed stone and gravel); encountered at ground level and extending to a maximum depth of approximately 0.20 m below ground surface.
- ❒ Fill material (brown silty sand with some clay, and gravel); extending to depths ranging from approximately 2.44 m to 2.97 m below ground surface.
- ❒ Compact reddish brown silty sand; extending to depths ranging from approximately 2.97 m to 4.34 m below ground surface.
- ❒ Grey silty clay with some sand and gravel; extending to depths ranging from approximately 3.66 m to 5.18 m below ground surface (BH1-22 and BH3-22 only).
- ❒ Dense brown silty sand to sandy silt with some clay and gravel; extending to depths ranging from approximately 4.27 m to 4.50 m below ground surface (BH1-22 and BH2-22 only).

- ❒ Dense light brown silty sand; extending to depths ranging from approximately 6.10 m to 7.62 m below ground surface (bottom of boreholes)

The site stratigraphy, from ground surface to the deepest aquifer or aquitard investigated, is provided in the Soil Profile and Test Data Sheets in Appendix 1.

Hydrogeological Characteristics

The groundwater at the Phase II Property was encountered within an overburden layer of grey silty sand at depths ranging from approximately 5.14 m to 5.83 m below the existing ground surface.

Approximate Depth to Bedrock

Bedrock was not confirmed in any of the boreholes during the field drilling program, however, a dynamic cone penetration test was carried out at BH2-22, which was terminated on practical refusal on inferred bedrock at a depth of approximately 9.25 m below ground surface.

Approximate Depth to Water Table

The depth to the water table is approximately 5.14 m to 5.83 m below the existing ground surface.

Sections 41 and 43.1 of Ontario Regulation 153/04

Section 41 of the Regulation does not apply to the Phase II Property, as there are no bodies of water or areas of natural significance located on or within 30 m of the Phase II Property. The Phase II Property is therefore not considered to be environmentally sensitive.

Section 43.1 of the Regulation does not apply to the Phase II Property, since the bedrock is situated at depths greater than 2 m below ground surface, and thus is not considered to be a shallow soil property.

Existing Buildings and Structures

The Phase II Property is currently occupied with a one-storey commercial retail building.

Environmental Condition

Areas Where Contaminants are Present

Based on the analytical test results of the 2021 Phase II ESA and this current assessment, petroleum hydrocarbon impacted soil was identified in MW21-04, which is located in the vicinity of the former underground fuel storage tank nest in the southern portion of the Phase II Property.

Some elevated levels of EC and SAR were identified within the shallow fill material in BH1-22 as well as the deeper native soils in BH3-22. It should be noted that these EC and SAR exceedances are considered to be the result of a substance which has been applied to the site surface for the safety of vehicular or pedestrian traffic under conditions of snow or ice or both, which according to Section 49.1 of O. Reg. 153/04, the standards for these parameters are considered to have been met. As a result, these exceedances are not considered to represent a contaminant issue to the Phase II Property.

Based on the analytical test results, the groundwater beneath the Phase II Property is not considered to be contaminated.

Types of Contaminants

The soil in MW21-04 contains a level of PHCs (F_1) in excess of the selected MECP Table 3 coarse-grained residential soil standards.

Elevated levels of EC and SAR were also identified within the shallow fill material in BH1-22 as well as the deeper native soils in BH3-22, however, these concentrations are considered to meet the site standards according to Section 49.1 of O. Reg. 153/04.

Based on the analytical test results, the groundwater beneath the Phase II Property is not considered to be contaminated.

Contaminated Media

Based on the findings of the 2021 Phase II ESA, the soil within the vicinity of the former underground fuel storage tank nest in the southern portion of the Phase II Property is contaminated with PHCs (F_1).

Based on the analytical test results, the groundwater beneath the Phase II Property is not considered to be contaminated.

What Is Known About Areas Where Contaminants Are Present

PHC impacted soil was identified in MW21-04, which is located in the vicinity of the former underground fuel storage tank nest in the southern portion of the Phase II Property. Based on the sample depth (3.66 to 4.27 m below ground surface), the source of this contaminant is suspected to have been the result of possible leaks or spillages from the former underground fuel storage tanks at this location.

The exceedances of EC and SAR, though not posing a contaminant issue to the Phase II Property, is considered to be a result of the use of a substance for safety purposes during conditions of snow or ice or both, and thus is deemed to meet the site standards.

Based on the analytical test results, the groundwater beneath the Phase II Property is not considered to be contaminated.

Distribution and Migration of Contaminants

As previously noted, PHC impacted soil was identified in the vicinity of MW21-04, located within the southern portion of the Phase II Property. Based on the clean groundwater test results, this contamination is anticipated to be limited to the soil within this location.

Discharge of Contaminants

The PHC impacted soil identified in the vicinity of MW21-04 is suspected to have been the result of possible leaks or spillages from the former underground fuel storage tanks at this location.

Climatic and Meteorological Conditions

In general, climatic and meteorological conditions have the potential to affect contaminant distribution. Two (2) ways by which climatic and meteorological conditions may affect contaminant distribution include the downward leaching of contaminants via the infiltration of precipitation, and the migration of contaminants via groundwater levels and/or flow, which may fluctuate seasonally.

The downward migration of PHC contaminants in the vicinity of MW21-04 is not suspected to have occurred, due to the clean groundwater test results.

Potential for Vapour Intrusion

During redevelopment of the Phase II Property, all soils exceeding the selected MECP Table 3 coarse-grained residential soil standards will be removed and disposed of off-site. As such, there is no anticipated potential for future vapour intrusion at the Phase II Property.

6.0 CONCLUSIONS

Assessment

A Phase II ESA was conducted for the property addressed 1166 Bank Street, in the City of Ottawa, Ontario. The purpose of the Phase II ESA was to address the potentially contaminating activities (PCAs) that were identified during the Phase I ESA and were considered to result in areas of potential environmental concern (APECs) on the Phase II Property.

The subsurface investigation for this assessment was conducted on May 3, 2022, and consisted of drilling three boreholes (BH1-22 to BH3-22) throughout the Phase II Property, all three of which were equipped with monitoring wells to allow for the collection of groundwater samples. The boreholes were advanced to depths ranging from approximately 6.10 m to 7.62 m below the existing ground surface and terminated within an overburden layer of dense brown silty sand.

It should be noted that additional subsurface information, including historical soil and groundwater testing data, was obtained from a previous Phase II ESA conducted for the Phase II Property in March 2021 by Golder Associates Ltd. and utilized as part of this assessment.

In general, the subsurface soil profile encountered at the borehole locations consists of a surficial pavement structure (asphaltic concrete and granular sub-grade fill), underlain by fill material (brown silty sand with some clay, gravel, and cobbles) over top of multiple layers of compact to dense native brown sand with varying silt and clay contents, turning grey at deeper depths in line with the long-term water table. Bedrock was not encountered in any of the boreholes during the field drilling program, however, a dynamic cone penetration test was carried out at BH2-22, which was terminated on practical refusal on inferred bedrock at a depth of approximately 9.25 m below ground surface. The groundwater beneath the Phase II Property was encountered within an overburden layer of grey silty clay at depths ranging from approximately 5.14 m to 5.83 m below ground surface.

Between Golder's 2021 and Paterson's 2022 subsurface investigations, a total of ten soil samples were submitted for laboratory analysis of VOCs, PHCs (F_1-F_4), metals, PAHs, lead, EC, SAR, and pH parameters. Based on the analytical test results, the concentration of PHCs (F_1) in Sample MW21-04-07 was in excess of the MECP Table 3 Coarse-Grained Residential Soil Standards. It should be noted that this borehole is located in the vicinity of the former underground fuel storage tank nest in the southern portion of the Phase II Property.

Some elevated levels of EC and SAR were identified within the shallow fill material in BH1-22 as well as the deeper native soils in BH3-22. It should be noted that these EC and SAR exceedances are considered to be the result of a substance which has been applied to the site surface for the safety of vehicular or pedestrian traffic under conditions of snow or ice or both, which according to Section 49.1 of O. Reg. 153/04, the standards for these parameters are considered to have been met. As a result, these exceedances are not considered to represent a contaminant issue to the Phase II Property.

Groundwater samples were recovered from monitoring wells MW21-01 to MW21-04 on April 8, 2021 as part of Golder's 2021 subsurface investigation and submitted for laboratory analysis of VOCs and PHCs (F_1-F_4). Based on the analytical test results, the concentration of chloroform in Sample MW21-02, as well as the concentrations of chloroform, 1-2-Dichloroethane, and benzene in Sample MW21-04 were in excess of the MECP Table 3 Non-Potable Groundwater Standards.

The elevated concentrations of chloroform were suspected to be the result of the use of municipal water during the drilling process, and thus was not considered to present a contaminant issue to the property. The benzene exceedance was suspected to be the result of the historical presence of the former on-site retail fuel outlet. It should be noted that this benzene exceedance was identified in the monitoring well placed within the location of the former underground fuel storage tank nest in the southern portion of the site. The presence of 1-2-Dichloroethane, which is not typical of fuel related impacts, was suspected to be related to the historical use of solvents in an auto service garage which was formerly present on the property.

As part of this current assessment, groundwater samples were recovered from BH1-22, BH2-22, BH3-22, MW21-02, and MW21-04 on May 11, 2022 and March 19, 2024 and submitted for laboratory analysis of VOCs and PHC (F_1-F_4) parameters. Based on the analytical test results, all detected parameter concentrations in the groundwater samples analyzed are in compliance with the selected MECP Table 3 Non-Potable Groundwater Standards. It should be noted that no chloroform was detected in the samples analyzed as part of the 2022 and 2024 groundwater sampling program, confirming our theory that the initial concentrations identified in the 2021 sampling program were likely the result of the use of municipal water. The benzene concentration detected in MW21-04 during the 2022 and 2024 groundwater sampling program was also significantly lower than initially identified in the 2021 sampling program. It is possible that the initially identified elevated levels of benzene could be the result of suspended sediment collected in the water samples due to improperly established wells.

Recommendations

Soil

Based on the findings of this assessment, PHC impacted soil was identified in the southern portion of the Phase II Property, in the vicinity of the former on-site underground fuel storage tank nest.

It is our understanding that the Phase II Property is to be redeveloped in the future, thus it is recommended that this contaminated soil be remediated at the time of site redevelopment. This contaminated soil will require disposal at a licensed waste disposal facility.

Prior to off-site disposal of impacted soil at a licensed waste disposal facility, a leachate analysis of a representative sample of contaminated soil must be conducted in accordance with Ontario Regulation 347/558.

It is recommended that Paterson personnel be present on-site during remediation activities to direct the excavation and segregation of impacted soil, as well as to conduct confirmatory sampling as required.

Based on the soil test results, the majority of the on-site soils comply with the MECP Table 2.1 Excess Soil Quality Standards (Ontario Regulation 406/19), for off-site disposal. Additional excess soil testing may be required prior to future site excavation activities.

Monitoring Wells

If the groundwater monitoring wells installed on-site are not going to be used in the future, or will be destroyed during future construction activities, then they must be decommissioned according to Ontario Regulation 903 (Ontario Water Resources Act), however, we recommend that the wells be maintained for future sampling purposes, at least until the excavation for the foundation has commenced. The monitoring wells will be registered with the MECP under this regulation. Further information can be provided upon request in this regard.

7.0 STATEMENT OF LIMITATIONS

This Phase II – Environmental Site Assessment report has been prepared in general accordance with O.Reg. 153/04, as amended, and CSA Z769-00. The conclusions presented herein are based on information gathered from a limited sampling and testing program. The test results represent conditions at specific test locations at the time of the field program.

The client should be aware that any information pertaining to soils and all test hole logs are furnished as a matter of general information only and test hole descriptions or logs are not to be interpreted as descriptive of conditions at locations other than those of the test holes themselves.

Should any conditions be encountered at the Phase II Property and/or historical information that differ from our findings, we request that we be notified immediately in order to allow for a reassessment.

This report was prepared for the sole use of Ambassador Realty Inc. Permission and notification from Ambassador Realty Inc. and Paterson Group will be required prior to the release of this report to any other party.

Sampling & Analysis Plan

Phase II – Environmental Site Assessment
1166 Bank Street
Ottawa, Ontario

Prepared For

Ambassador Realty Inc.

May 1, 2022

Report: PE5590-SAP

TABLE OF CONTENTS

1.0 SAMPLING PROGRAM

Paterson Group Inc. (Paterson) was commissioned by Ambassador Realty Inc., to conduct a Phase II – Environmental Site Assessment (Phase II ESA) for the property addressed 1166 Bank Street, in the City of Ottawa, Ontario.

Based on the findings of the Phase I ESA, the following subsurface investigation program was developed.

Borehole	Location & Rationale	Proposed Depth & Rationale
BH1-22	Northwestern portion of the subject site; to assess for potential impacts resulting from the presence of a former auto service garage and the use of road salt for de-icing purposes.	5-8 m; for geotechnical purposes and to intercept the groundwater table for the purpose of installing a groundwater monitoring well.
BH2-22	Northeastern portion of the subject site; to assess for potential impacts resulting from the presence of fill material of unknown quality, a former on-site fuel pump island, and a former off-site auto service garage.	5-8 m; for geotechnical purposes and to intercept the groundwater table for the purpose of installing a groundwater monitoring well.
BH3-22	Southern portion of the subject site; to assess for potential impacts resulting from the presence of fill material of unknown quality, the use of road salt for de-icing purposes, and a former on-site underground fuel storage tank nest.	5-8 m; for geotechnical purposes and to intercept the groundwater table for the purpose of installing a groundwater monitoring well.

Borehole locations are shown on “Drawing PE5590-3 – Test Hole Location Plan”, appended to the main report.

At each borehole, split-spoon samples of the overburden soils will be obtained at 0.76 m (2’6”) intervals. All soil samples will be retained, and samples will be selected for submission following a preliminary screening analysis.

Following the borehole drilling, groundwater monitoring wells will be installed in all three boreholes to allow for the collection of groundwater samples.

2.0 ANALYTICAL TESTING PROGRAM

The analytical testing program for soil at the Phase I Property is based on the following general considerations:

- ❒ At least one sample from each borehole should be submitted, in order to delineate the horizontal extent of contamination across the site.
- ❒ At least one sample from each stratigraphic unit should be submitted, in order to delineate the vertical extent of contamination at the site.
- ❒ In boreholes where there is visual or olfactory evidence of contamination, or where organic vapour meter or photoionization detector readings indicate the presence of contamination, the 'worst-case' sample from each borehole should be submitted for comparison with MECP site condition standards.
- ❒ In boreholes with evidence of contamination as described above, a sample should be submitted from the stratigraphic unit below the 'worst-case' sample to determine whether the contaminant(s) have migrated downward.
- ❒ Parameters analyzed should be consistent with the Contaminants of Potential Concern identified in the Phase I ESA.

The analytical testing program for soil at the Phase I Property is based on the following general considerations:

- ❒ Groundwater monitoring wells should be installed in all boreholes with visual or olfactory evidence of soil contamination, in stratigraphic units where soil contamination was encountered, where those stratigraphic units are at or below the water table (i.e. a water sample can be obtained).
- ❒ Groundwater monitoring well screens should straddle the water table at sites where the contaminants of concern are suspected to be LNAPLs.
- ❒ At least one groundwater monitoring well should be installed in a stratigraphic unit below the suspected contamination, where said stratigraphic unit is water-bearing.
- ❒ Parameters analyzed should be consistent with the Contaminants of Concern identified in the Phase I ESA and with the contaminants identified in the soil samples.

3.0 STANDARD OPERATING PROCEDURES

3.1 Environmental Drilling Procedure

Purpose

The purpose of environmental boreholes is to identify and/or delineate contamination within the soil and/or to install groundwater monitoring wells in order to identify contamination within the groundwater.

Equipment

The following is a list of equipment that is in addition to regular drilling equipment stated in the geotechnical drilling SOP:

- ❒ Glass soil sample jars
- ❒ two buckets
- ❒ cleaning brush (toilet brush works well)
- ❒ dish detergent
- ❒ methyl hydrate
- ❒ water (if not available on site - water jugs available in trailer)
- ❒ latex or nitrile gloves (depending on suspected contaminant)
- ❒ RKI Eagle organic vapour meter or MiniRae photoionization detector (depending on contamination suspected)

Determining Borehole Locations

If conditions on site are not as suspected, and planned borehole locations cannot be drilled, **call the office to discuss**. Alternative borehole locations will be determined in conversation with the field technician and supervising engineer.

After drilling is completed a plan with the borehole locations must be provided. Distances and orientations of boreholes with respect to site features (buildings, roadways, etc.) must be provided. Distances should be measured using a measuring tape or wheel rather than paced off. Ground surface elevations at each borehole should be surveyed relative to a geodetic benchmark, if one is available, or a temporary site benchmark which can be tied in at a later date if necessary.

Drilling Procedure

The actual drilling procedure for environmental boreholes is the same as geotechnical boreholes (see SOP for drilling and sampling) with a few exceptions as follows:

- ❒ Continuous split spoon samples (every 0.6 m or 2') or semi-continuous (every 0.76 m or 2'6") are required.
- ❒ Make sure samples are well sealed in plastic bags with no holes prior to screening and are kept cool but unfrozen.
- ❒ If sampling for VOCs, BTEX, or PHCs F_1, a soil core from each soil sample, which may be analyzed, must be taken and placed in the laboratory-provided methanol vial.
- ❒ Note all and any odours or discolouration of samples.
- ❒ Split spoon samplers must be washed between samples.
- ❒ If obvious contamination is encountered, continue sampling until vertical extent of contamination is delineated.
- ❒ As a general rule, environmental boreholes should be deep enough to intercept the groundwater table (unless this is impossible/impractical - call project manager to discuss).
- ❒ If at all possible, soil samples should be submitted to a preliminary screening procedure on site, either using a RKI Eagle, PID, etc. depending on type of suspected contamination.

Spoon Washing Procedure

All sampling equipment (spilt spoons, etc.) must be washed between samples in order to prevent cross contamination of soil samples.

- ❒ Obtain two buckets of water (preferably hot if available)
- ❒ Add a small amount of dish soap to one bucket
- ❒ Scrub spoons with brush in soapy water, inside and out, including tip
- ❒ Rinse in clean water
- ❒ Apply a small amount of methyl hydrate to the inside of the spoon. (A spray bottle or water bottle with a small hole in the cap works well)
- ❒ Allow to dry (takes seconds)
- ❒ Rinse with distilled water, a spray bottle works well.

The methyl hydrate eliminates any soap residue that may be on the spoon and is especially important when dealing with suspected VOCs.

Screening Procedure

The RKI Eagle is used to screen most soil samples, particularly where petroleum hydrocarbon contamination is suspected. The MiniRae is used when VOCs are suspected, however it also can be useful for detecting petroleum. These tools are for screening purposes only and cannot be used in place of laboratory testing. Vapour results obtained from the RKI Eagle and the PID are relative and must be interpreted.

Screening equipment should be calibrated on an approximately monthly basis, more frequently if heavily used.

- ❒ Samples should be brought to room temperature; this is specifically important in colder weather. Soil must not be frozen.
- ❒ Turn instrument on and allow to come to zero - calibrate if necessary
- ❒ If using RKI Eagle, ensure instrument is in methane elimination mode unless otherwise directed.
- ❒ Ensure measurement units are ppm (parts per million) initially. RKI Eagle will automatically switch to %LEL (lower explosive limit) if higher concentrations are encountered.
- ❒ Break up large lumps of soil in the sample bag, taking care not to puncture bag.
- ❒ Insert probe into soil bag, creating a seal with your hand around the opening.
- ❒ Gently manipulate soil in bag while observing instrument readings.
- ❒ Record the highest value obtained in the first 15 to 25 seconds
- ❒ Make sure to indicate scale (ppm or LEL); also note which instrument was used (RKI Eagle 1 or 2, or MiniRae).
- ❒ Jar samples and refrigerate as per Sampling and Analysis Plan.

3.2 Monitoring Well Installation Procedure

Equipment

- ❒ 5’ x 2” threaded sections of Schedule 40 PVC slotted well screen (5’ x 1 ¼” if installing in cored hole in bedrock)
- ❒ 5’ x 2” threaded sections of Schedule 40 PVC riser pipe (5’ x 1 ¼” if installing in cored hole in bedrock)
- ❒ Threaded end-cap
- ❒ Slip-cap or J-plug
- ❒ Asphalt cold patch or concrete
- ❒ Silica Sand
- ❒ Bentonite chips (Holeplug)
- ❒ Steel flushmount casing

Procedure

- ❒ Drill borehole to required depth, using drilling and sampling procedures described above.
- ❒ If borehole is deeper than required monitoring well, backfill with bentonite chips to required depth. This should only be done on wells where contamination is not suspected, in order to prevent downward migration of contamination.
- ❒ Only one monitoring well should be installed per borehole.
- ❒ Monitoring wells should not be screened across more than one stratigraphic unit to prevent potential migration of contaminants between units.
- ❒ Where LNAPLs are the suspected contaminants of concern, monitoring wells should be screened straddling the water table in order to capture any free product floating on top of the water table.
- ❒ Thread the end cap onto a section of screen. Thread second section of screen if required. Thread risers onto screen. Lower into borehole to required depth. Ensure slip-cap or J-plug is inserted to prevent backfill materials entering well.
- ❒ As drillers remove augers, backfill borehole annulus with silica sand until the level of sand is approximately 0.3 m above the top of the screen.
- ❒ Backfill with holeplug until at least 0.3 m of holeplug is present above the top of the silica sand.
- ❒ Backfill remainder of borehole with holeplug or with auger cuttings (if contamination is not suspected).
- ❒ Install flushmount casing. Seal space between flushmount and borehole annulus with concrete, cold patch, or holeplug to match surrounding ground surface.

3.3 Monitoring Well Sampling Procedure

Equipment

- ❒ Water level metre or interface probe on hydrocarbon/LNAPL sites
- ❒ Spray bottles containing water and methanol to clean water level tape or interface probe
- ❒ Peristaltic pump
- ❒ Polyethylene tubing for peristaltic pump
- ❒ Flexible tubing for peristaltic pump
- ❒ Latex or nitrile gloves (depending on suspected contaminant)
- ❒ Allen keys and/or 9/16" socket wrench to remove well caps
- ❒ Graduated bucket with volume measurements
- ❒ pH/Temperature/Conductivity combo pen
- ❒ Laboratory-supplied sample bottles

Sampling Procedure

- ❒ Locate well and use socket wrench or Allan key to open metal flush mount protector cap. Remove plastic well cap.
- ❒ Measure water level, with respect to existing ground surface, using water level meter or interface probe. If using interface probe on suspected NAPL site, measure the thickness of free product.
- ❒ Measure total depth of well.
- ❒ Clean water level tape or interface probe using methanol and water. Change gloves between wells.
- ❒ Calculate volume of standing water within well and record.
- ❒ Insert polyethylene tubing into well and attach to peristaltic pump. Turn on peristaltic pump and purge into graduated bucket. Purge at least three well volumes of water from the well. Measure and record field chemistry. Continue to purge, measuring field chemistry after every well volume purged, until appearance or field chemistry stabilizes.
- ❒ Note appearance of purge water, including colour, opacity (clear, cloudy, silty), sheen, presence of LNAPL, and odour. Note any other unusual features (particulate matter, effervescence (bubbling) of dissolved gas, etc.).
- ❒ Fill required sample bottles. If sampling for metals, attach 75-micron filter to discharge tube and filter metals sample. If sampling for VOCs, use low flow rate to ensure continuous stream of non-turbulent flow into sample bottles. Ensure no headspace is present in VOC vials.
- ❒ Replace well cap and flushmount casing cap.

4.0 QUALITY ASSURANCE/QUALITY CONTROL (QA/QC)

The QA/QC program for this Phase II ESA is as follows:

- ❒ All non-dedicated sampling equipment (split spoons) will be decontaminated according to the SOPs listed above.
- ❒ All groundwater sampling equipment is dedicated (polyethylene and flexible peristaltic tubing is replaced for each well).
- ❒ Where groundwater samples are to be analyzed for VOCs, one laboratory-provided trip blank will be submitted for analysis with every laboratory submission.
- ❒ Approximately one (1) field duplicate will be submitted for every ten (10) samples submitted for laboratory analysis. A minimum of one (1) field duplicate per project will be submitted. Field duplicates will be submitted for soil and groundwater samples
- ❒ Where combo pens are used to measure field chemistry, they will be calibrated on an approximately monthly basis, according to frequency of use.

5.0 DATA QUALITY OBJECTIVES

The purpose of setting data quality objectives (DQOs) is to ensure that the level of uncertainty in data collected during the Phase II ESA is low enough that decision-making is not affected, and that the overall objectives of the investigation are met.

The quality of data is assessed by comparing field duplicates with original samples. If the relative percent difference (RPD) between the duplicate and the sample is within 20%, the data are considered to be of sufficient quality so as not to affect decision-making. The RPD is calculated as follows:

$$RPD = \left|\frac{x_1 - x_2}{(x_1 + x_2)/2}\right| \times 100\%$$

Where x_1 is the concentration of a given parameter in an original sample and x_2 is the concentration of that same parameter in the field duplicate sample.

For the purpose of calculating the RPD, it is desirable to select field duplicates from samples for which parameters are present in concentrations above laboratory detection limits, i.e. samples which are expected to be contaminated. If parameters are below laboratory detection limits for selected samples or duplicates, the RPD may be calculated using a concentration equal to one half the laboratory detection limit.

It is also important to consider data quality in the overall context of the project. For example, if the DQOs are not met for a given sample, yet the concentrations of contaminants in both the sample and the duplicate exceed the MOE site remediation standards by a large margin, the decision-making usefulness of the sample may not be considered to be impaired. The proximity of other samples which meet the DQOs must also be considered in developing the Phase II Conceptual Site Model; often there are enough data available to produce a reliable Phase II Conceptual Site Model even if DQOs are not met for certain individual samples.

These considerations are discussed in the body of the report.

6.0 PHYSICAL IMPEDIMENTS

Physical impediments to the Sampling and Analysis plan may include:

- ❒ The location of underground utilities
- ❒ Poor recovery of split-spoon soil samples
- ❒ Insufficient groundwater volume for groundwater samples
- ❒ Breakage of sampling containers following sampling or while in transit to the laboratory
- ❒ Elevated detection limits due to matrix interference (generally related to soil colour or presence of organic material)
- ❒ Elevated detection limits due to high concentrations of certain parameters, necessitating dilution of samples in laboratory
- ❒ Drill rig breakdowns
- ❒ Winter conditions
- ❒ Other site-specific impediments

Site-specific impediments to the Sampling and Analysis plan are discussed in the body of the Phase II ESA report.

SYMBOLS AND TERMS

SOIL DESCRIPTION

Behavioural properties, such as structure and strength, take precedence over particle gradation in describing soils. Terminology describing soil structure are as follows:

Desiccated	-	having visible signs of weathering by oxidation of clay minerals, shrinkage cracks, etc.
Fissured	-	having cracks, and hence a blocky structure.
Varved	-	composed of regular alternating layers of silt and clay.
Stratified	-	composed of alternating layers of different soil types, e.g. silt and sand or silt and clay.
Well-Graded	-	Having wide range in grain sizes and substantial amounts of all intermediate particle sizes (see Grain Size Distribution).
Uniformly-Graded	-	Predominantly of one grain size (see Grain Size Distribution).

The standard terminology to describe the relative strength of cohesionless soils is the compactness condition, usually inferred from the results of the Standard Penetration Test (SPT) 'N' value. The SPT N value is the number of blows of a 63.5 kg hammer, falling 760 mm, required to drive a 51 mm O.D. split spoon sampler 300 mm into the soil after an initial penetration of 150 mm. An SPT N value of "P" denotes that the split-spoon sampler was pushed 300 mm into the soil without the use of a falling hammer.

Compactness Condition	'N' Value	Relative Density %
Very Loose	<4	<15
Loose	4-10	15-35
Compact	10-30	35-65
Dense	30-50	65-85
Very Dense	>50	>85

The standard terminology to describe the strength of cohesive soils is the consistency, which is based on the undisturbed undrained shear strength as measured by the in situ or laboratory shear vane tests, unconfined compression tests, or occasionally by the Standard Penetration Test (SPT). Note that the typical correlations of undrained shear strength to SPT N value (tabulated below) tend to underestimate the consistency for sensitive silty clays, so Paterson reviews the applicable split spoon samples in the laboratory to provide a more representative consistency value based on tactile examination.

Consistency	Undrained Shear Strength (kPa)	'N' Value
Very Soft	<12	<2
Soft	12-25	2-4
Firm	25-50	4-8
Stiff	50-100	8-15
Very Stiff	100-200	15-30
Hard	>200	>30

SYMBOLS AND TERMS (continued)

SOIL DESCRIPTION (continued)

Cohesive soils can also be classified according to their "sensitivity". The sensitivity, S_t, is the ratio between the undisturbed undrained shear strength and the remoulded undrained shear strength of the soil. The classes of sensitivity may be defined as follows:

Low Sensitivity:	$S_t < 2$
Medium Sensitivity:	$2 < S_t < 4$
Sensitive:	$4 < S_t < 8$
Extra Sensitive:	$8 < S_t < 16$
Quick Clay:	$S_t > 16$

ROCK DESCRIPTION

The structural description of the bedrock mass is based on the Rock Quality Designation (RQD).

The RQD classification is based on a modified core recovery percentage in which all pieces of sound core over 100 mm long are counted as recovery. The smaller pieces are considered to be a result of closely-spaced discontinuities (resulting from shearing, jointing, faulting, or weathering) in the rock mass and are not counted. RQD is ideally determined from NQ or larger size core. However, it can be used on smaller core sizes, such as BQ, if the bulk of the fractures caused by drilling stresses (called "mechanical breaks") are easily distinguishable from the normal in situ fractures.

RQD %	**ROCK QUALITY**
90-100	Excellent, intact, very sound
75-90	Good, massive, moderately jointed or sound
50-75	Fair, blocky and seamy, fractured
25-50	Poor, shattered and very seamy or blocky, severely fractured
0-25	Very poor, crushed, very severely fractured

SAMPLE TYPES

SS	-	Split spoon sample (obtained in conjunction with the performing of the Standard Penetration Test (SPT))
TW	-	Thin wall tube or Shelby tube, generally recovered using a piston sampler
G	-	"Grab" sample from test pit or surface materials
AU	-	Auger sample or bulk sample
WS	-	Wash sample
RC	-	Rock core sample (Core bit size BQ, NQ, HQ, etc.). Rock core samples are obtained with the use of standard diamond drilling bits.

SYMBOLS AND TERMS (continued)

PLASTICITY LIMITS AND GRAIN SIZE DISTRIBUTION

WC%	-	Natural water content or water content of sample, %
LL	-	Liquid Limit, % (water content above which soil behaves as a liquid)
PL	-	Plastic Limit, % (water content above which soil behaves plastically)
PI	-	Plasticity Index, % (difference between LL and PL)
Dxx	-	Grain size at which xx% of the soil, by weight, is of finer grain sizes These grain size descriptions are not used below 0.075 mm grain size
D10	-	Grain size at which 10% of the soil is finer (effective grain size)
D60	-	Grain size at which 60% of the soil is finer
Cc	-	Concavity coefficient = $(D30)^2 / (D10 \times D60)$
Cu	-	Uniformity coefficient = D60 / D10

Cc and Cu are used to assess the grading of sands and gravels:
Well-graded gravels have: $1 < Cc < 3$ and $Cu > 4$
Well-graded sands have: $1 < Cc < 3$ and $Cu > 6$
Sands and gravels not meeting the above requirements are poorly-graded or uniformly-graded.
Cc and Cu are not applicable for the description of soils with more than 10% silt and clay (more than 10% finer than 0.075 mm or the #200 sieve)

CONSOLIDATION TEST

p'_o	-	Present effective overburden pressure at sample depth
p'_c	-	Preconsolidation pressure of (maximum past pressure on) sample
Ccr	-	Recompression index (in effect at pressures below p'_c)
Cc	-	Compression index (in effect at pressures above p'_c)
OC Ratio		Overconsolidaton ratio = p'_c / p'_o
Void Ratio		Initial sample void ratio = volume of voids / volume of solids
Wo	-	Initial water content (at start of consolidation test)

PERMEABILITY TEST

k	-	Coefficient of permeability or hydraulic conductivity is a measure of the ability of water to flow through the sample. The value of k is measured at a specified unit weight for (remoulded) cohesionless soil samples, because its value will vary with the unit weight or density of the sample during the test.

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard

2322004-2322009 Results are based on sample dry weight.
The C6-C10 fraction is calculated using toluene response factor.
C6–C10 (F1 minus BTEX) is a calculated parameter. The calculated value is F1 minus BTEX. The calculated parameter is non-accredited. The parameters that are components of the calculation are accredited.
The C10 - C16, C16 - C34, and C34 - C50 fractions are calculated using the average response factor for n-C10, n-C16, and n-C34.
Gravimetric Heavy Hydrocarbons are not included in the Total C16-C50 and are only determined if the chromatogram of the C34 - C50 hydrocarbons indicates that hydrocarbons >C50 are present.
The chromatogram has returned to baseline by the retention time of nC50.
Total C6 - C50 results are corrected for BTEX contribution.
This method complies with the Reference Method for the CWS PHC and is validated for use in the laboratory.
nC6 and nC10 response factors are within 30% of Toluene response factor.
nC10, nC16 and nC34 response factors are within 10% of their average.
C50 response factor is within 70% of nC10 + nC16 + nC34 average.
Linearity is within 15%.
Extraction and holding times were met for this sample.
Fractions 1-4 are quantified without the contribution of PAHs. Under Ontario Regulation 153, results are considered valid without determining the PAH contribution if not requested by the client.

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard

2322004-2322009 The sample was analyzed using the high level technique. The sample was extracted using methanol, a small amount of the methanol extract was diluted in water and the purge & trap GC/MS analysis was performed. Results are based on the dry weight of the soil.
Xylenes total is a calculated parameter. The calculated value is the sum of m&p-Xylene + o-Xylene.
1,3-Dichloropropene total is a calculated parameter. The calculated value is the sum of Cis-1,3-Dichloropropene and Trans-1,3-Dichloropropene.
The calculated parameters are non-accredited. The parameters that are components of the calculation are accredited.

AGAT Laboratories is accredited to ISO/IEC 17025 by the Canadian Association for Laboratory Accreditation Inc. (CALA) and/or Standards Council of Canada (SCC) for specific tests listed on the scope of accreditation. AGAT Laboratories (Mississauga) is also accredited by the Canadian Association for Laboratory Accreditation Inc. (CALA) for specific drinking water tests. Accreditations are location and parameter specific. A complete listing of parameters for each location is available from www.cala.ca and/or www.scc.ca. The tests in this report may not necessarily be included in the scope of accreditation. RPDs calculated using raw data. The RPD may not be reflective of duplicate values shown, due to rounding of final results.

Results relate only to the items tested. Results apply to samples as received.

AGAT Laboratories is accredited to ISO/IEC 17025 by the Canadian Association for Laboratory Accreditation Inc. (CALA) and/or Standards Council of Canada (SCC) for specific tests listed on the scope of accreditation. AGAT Laboratories (Mississauga) is also accredited by the Canadian Association for Laboratory Accreditation Inc. (CALA) for specific drinking water tests. Accreditations are location and parameter specific. A complete listing of parameters for each location is available from www.cala.ca and/or www.scc.ca. The tests in this report may not necessarily be included in the scope of accreditation. RPDs calculated using raw data. The RPD may not be reflective of duplicate values shown, due to rounding of final results.

Results relate only to the items tested. Results apply to samples as received.

CONDITIONS OF CARRIAGE

IMPORTANT - PLEASE READ: The consignor agrees that the act of tendering the shipment to the carrier for transportation shall be sufficient to constitute signature of this bill of lading by the consignor and shall bind the consignor to the conditions of carriage stated below.

RECEIPT Carrier acknowledges receiving from the shipper, at the point of origin and on the date specified, the shipment described in this bill of lading in apparent good order, except as noted (contents and conditions of contents of shipment unknown), and agrees to carry and deliver the shipment to the receiver at the destination set out in this bill of lading, subject to payment of all lawful charges. "Carrier" refers to Purolator Inc. and any connecting and/or successive carriers involved in the transportation of the shipment herein described, including any of their respective subsidiaries, controlled entities, and their respective employees, agents and independent contractors

LIMITATION ON LIABILITY Carrier's liability in respect of the shipment described in this bill of lading (including for any loss, damage, delay, misdelivery, non-delivery or failure to deliver) is limited to $2.00 per pound ($4.41 per kilogram) computed on the total weight of the shipment, unless a higher value is declared in the specially marked Purolator Online Shipping user entry field, "Declared Value for Insurance ($)". Notwithstanding any disclosure of the nature or value of the goods carried or any special agreement to the contrary, carrier is not liable under any circumstances for the consequences of delay, or for any indirect or consequential damages (including lost profits) howsoever caused.

NOTICE OF CLAIM Carrier is not liable for any loss, damage or delay to any goods carried under this bill of lading unless notice of the claim setting out particulars of the origin, destination and date of shipment of the goods and the estimated amount claimed in respect of such loss, damage or delay is given in writing to the carrier within sixty (60) days after the delivery of the goods, or, in the case of failure to make delivery, within nine (9) months from the date of shipment. Subject to any overriding statutory provisions, the final statement of the claim must be filed within nine (9) months from the date of shipment, together with a copy of the paid freight bill. If the Convention applies, other notice periods may govern. No claim will be entertained until all transportation charges due in connection with this bill of lading have been paid in full. All claims are subject to proof of amount of loss.

TERMS INCORPORATED BY REFERENCE Every service to be performed under this bill of lading is subject to the conditions of carriage contained in this bill of lading, including the terms and conditions contained in Purolator Inc.'s published terms and conditions of carriage and the terms and conditions prescribed by the law of the jurisdiction where the goods originate (including the uniform conditions of carriage thereunder, if any). If the carriage involves an ultimate destination or a stop in a country other than the country of departure, the Convention (as defined below) may apply and limit the liability of the carrier in respect of loss of, damage to or delay of cargo. "Convention" means the Convention for the Unification of Certain Rules relating to International Carriage by Air, signed at Warsaw, Poland, 12 October, 1929, or the Convention for the Unification of Certain Rules for International Carriage by Air, signed at Montreal, Canada, 28 May, 1999, or those Conventions as amended or supplemented as may be applicable to the carriage hereunder

MISCELLANEOUS Unless otherwise indicated, the consignor's name and address is the sender's name and address indicated on this bill of lading, and the latter is the place of execution and the place of departure; the consignee's name and address is the receiver's name and address indicated on this bill of lading, and the latter is the place of destination; and the date indicated on this bill of lading is the date of execution. There are no specific stopping places which are agreed to, and the carrier reserves the right to select the route and the mode of transportation that the carrier deems appropriate. The consignor warrants that the shipment is properly described on this bill of lading and on any accompanying documentation, and that the shipment is properly marked, addressed and packed to ensure safe transportation in accordance with the carrier's ordinary care in handling. Unless otherwise indicated on this bill of lading, the consignor waives its right to determine the volume or dimensions of the shipment, and to indicate same on this bill of lading. The consignor appoints the carrier as its agent for the performance of customs clearance and selecting a customs broker

ENTIRE AGREEMENT The terms and conditions contained in this bill of lading, including those incorporated herein by reference, constitute the entire agreement relating to the carriage of the shipment described in this bill of lading, and no agent, servant or representative of the carrier or consignor has the authority to alter, waive or otherwise modify any provision of this agreement. In tendering the shipment described herein for carriage, the consignor agrees to these terms and conditions on his own behalf and on behalf of the consignee and any other party claiming an interest in this shipment.

VERSION*: 1

Should you require any information regarding this analysis please contact your client services representative at (905) 712-5100

*Notes

Disclaimer:

- All work conducted herein has been done using accepted standard protocols, and generally accepted practices and methods. AGAT test methods may incorporate modifications from the specified reference methods to improve performance.
- All samples will be disposed of within 30 days after receipt unless a Long Term Storage Agreement is signed and returned. Some specialty analysis may be exempt, please contact your Client Project Manager for details.
- AGAT's liability in connection with any delay, performance or non-performance of these services is only to the Client and does not extend to any other third party. Unless expressly agreed otherwise in writing, AGAT's liability is limited to the actual cost of the specific analysis or analyses included in the services.
- This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
- The test results reported herewith relate only to the samples as received by the laboratory.
- Application of guidelines is provided "as is" without warranty of any kind, either expressed or implied, including, but not limited to, warranties of merchantability, fitness for a particular purpose, or non-infringement. AGAT assumes no responsibility for any errors or omissions in the guidelines contained in this document.
- All reportable information as specified by ISO/IEC 17025:2017 is available from AGAT Laboratories upon request.

Member of: Association of Professional Engineers and Geoscientists of Alberta (APEGA)
Western Enviro-Agricultural Laboratory Association (WEALA)
Environmental Services Association of Alberta (ESAA)

AGAT Laboratories is accredited to ISO/IEC 17025 by the Canadian Association for Laboratory Accreditation Inc. (CALA) and/or Standards Council of Canada (SCC) for specific tests listed on the scope of accreditation. AGAT Laboratories (Mississauga) is also accredited by the Canadian Association for Laboratory Accreditation Inc. (CALA) for specific drinking water tests. Accreditations are location and parameter specific. A complete listing of parameters for each location is available from www.cala.ca and/or www.scc.ca. The tests in this report may not necessarily be included in the scope of accreditation. Measurement Uncertainty is not taken into consideration when stating conformity with a specified requirement.

Toluene-d8	% Recovery	50-140			118	106	98.8	98.2
Terphenyl	%	60-140			71	76	69	66

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard

2330088-2330113 The C6-C10 fraction is calculated using Toluene response factor.
C6–C10 (F1 minus BTEX) is a calculated parameter. The calculated value is F1 minus BTEX. The calculated parameter is non-accredited. The parameters that are components of the calculation are accredited.
The C10 - C16, C16 - C34, and C34 - C50 fractions are calculated using the average response factor for n-C10, n-C16, and nC34.
Gravimetric Heavy Hydrocarbons are not included in the Total C16 - C50 and are only determined if the chromatogram of the C34 - C50 Hydrocarbons indicated that hydrocarbons >C50 are present.
The chromatogram has returned to baseline by the retention time of nC50.
Total C6-C50 results are corrected for BTEX contribution.
This method complies with the Reference Method for the CWS PHC and is validated for use in the laboratory.
nC6 and nC10 response factors are within 30% of Toluene response factor.
nC10, nC16 and nC34 response factors are within 10% of their average.
C50 response factor is within 70% of nC10 + nC16 nC34 average.
Linearity is within 15%.
Extraction and holding times were met for this sample.
Fractions 1-4 are quantified with the contribution of PAHs. Under Ontario Regulation 153, results are considered valid without determining the PAH contribution if not requested by the client.
Sediment parameter is comment only based on visual inspection of the sample prior to extraction and is not an accredited test.

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard

2330088-2330113 Xylenes total is a calculated parameter. The calculated value is the sum of m&p-Xylene and o-Xylene.
1,3-Dichloropropene total is a calculated parameter. The calculated value is the sum of Cis-1,3-Dichloropropene and Trans-1,3-Dichloropropene.
The calculated parameter is non-accredited. The parameters that are components of the calculation are accredited.

AGAT Laboratories is accredited to ISO/IEC 17025 by the Canadian Association for Laboratory Accreditation Inc. (CALA) and/or Standards Council of Canada (SCC) for specific tests listed on the scope of accreditation. AGAT Laboratories (Mississauga) is also accredited by the Canadian Association for Laboratory Accreditation Inc. (CALA) for specific drinking water tests. Accreditations are location and parameter specific. A complete listing of parameters for each location is available from www.cala.ca and/or www.scc.ca. The tests in this report may not necessarily be included in the scope of accreditation. RPDs calculated using raw data. The RPD may not be reflective of duplicate values shown, due to rounding of final results.

Results relate only to the items tested. Results apply to samples as received.

Certificate of Analysis

Paterson Group Consulting Engineers

154 Colonnade Road South
Nepean, ON K2E 7J5
Attn: Nick Sullivan

Client PO: 54500
Project: PE5590
Custody: 64385

Report Date: 12-May-2022
Order Date: 5-May-2022

Order #: 2219554

This Certificate of Analysis contains analytical data applicable to the following samples as submitted:

Paracel ID	Client ID
2219554-01	BH1-22-SS3/SS4A
2219554-02	BH1-22-SS8
2219554-03	BH2-22-SS4A
2219554-04	BH2-22-SS5
2219554-05	BH3-22-SS3
2219554-06	BH3-22-SS6
2219554-07	DUP-1

Approved By:

Dale Robertson, BSc
Laboratory Director

Qualifier Notes:

Sample Qualifiers :

1 : Complete separation of paint from substrate not possible for this sample and a small amount of substrate has been included in the paint digestion.

QC Qualifiers :

QM-05 : The spike recovery was outside acceptance limits for the matrix spike due to matrix interference.

Sample Data Revisions

None

Work Order Revisions / Comments:

None

Other Report Notes:

n/a: not applicable
ND: Not Detected
MDL: Method Detection Limit
Source Result: Data used as source for matrix and duplicate samples
%REC: Percent recovery.
RPD: Relative percent difference.
NC: Not Calculated

Soil results are reported on a dry weight basis when the units are denoted with 'dry'.
Where %Solids is reported, moisture loss includes the loss of volatile hydrocarbons.

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.
- When reported, data for F4G has been processed using a silica gel cleanup.

Certificate of Analysis

Paterson Group Consulting Engineers

154 Colonnade Road South
Nepean, ON K2E 7J5
Attn: Nick Sullivan

Client PO: 54648
Project: PE5590
Custody: 136598

Report Date: 19-May-2022
Order Date: 12-May-2022

Order #: 2220555

This Certificate of Analysis contains analytical data applicable to the following samples as submitted:

Paracel ID	Client ID
2220555-01	BH1-22-GW1
2220555-02	MW21-02-GW2
2220555-03	BH2-22-GW1
2220555-04	BH3-22-GW1
2220555-05	MW21-04-GW2
2220555-06	Dup-1

Approved By:

Dale Robertson, BSc
Laboratory Director

Any use of these results implies your agreement that our total liabilty in connection with this work, however arising, shall be limited to the amount paid by you for this work, and that our employees or agents shall not under any circumstances be liable to you in connection with this work.

Analysis Summary Table

Analysis	Method Reference/Description	Extraction Date	Analysis Date
PHC F1	CWS Tier 1 - P&T GC-FID	16-May-22	17-May-22
PHCs F2 to F4	CWS Tier 1 - GC-FID, extraction	18-May-22	18-May-22
REG 153: VOCs by P&T GC/MS	EPA 624 - P&T GC-MS	16-May-22	17-May-22

Qualifier Notes:

QC Qualifiers :

QR-04 : Duplicate results exceeds RPD limits due to non-homogeneous matrix.

Sample Data Revisions

None

Work Order Revisions / Comments:

None

Other Report Notes:

n/a: not applicable
ND: Not Detected
MDL: Method Detection Limit
Source Result: Data used as source for matrix and duplicate samples
%REC: Percent recovery.
RPD: Relative percent difference.
NC: Not Calculated

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.
- When reported, data for F4G has been processed using a silica gel cleanup.

Surrogate: 4-Bromofluorobenzene	*82.4*		*%*		*103*	*50-140*			
Surrogate: Dibromofluoromethane	*89.9*		*%*		*112*	*50-140*			
Surrogate: Toluene-d8	*83.9*		*%*		*105*	*50-140*			

Qualifier Notes:

QC Qualifiers:

QR-07 Duplicate result exceeds RPD limits due to non-homogeneity between multiple sample vials. Remainder of QA/QC is acceptable.

Sample Data Revisions:

None

Work Order Revisions / Comments:

None

Other Report Notes:

n/a: not applicable

ND: Not Detected

MDL: Method Detection Limit

Source Result: Data used as source for matrix and duplicate samples

%REC: Percent recovery.

RPD: Relative percent difference.

NC: Not Calculated
