

FUS CLASSIFICATION DECLARATION FOR MULTI-STOREY BUILDINGS

Project Name and Civi	c Address: 30-48 Chamberlain Ave	Number of Floors:	16
Development Review F	PM:	City File No	D07-
The building's FUS of following).	calculation has been determined using the fo	ollowing criteria: (check	one of th
C = 1.5 □	Type V Wood Frame Construction		
	A building is considered to be of Wood Frastructural elements, walls, arches, floors, and partially of wood or other material.		
	Note: Includes buildings with exterior wall ass any materials that do not have a fire resistance criteria of CAN/ULC-S114. May include exter masonry materials where they do not meet the	e rating that meets the acc rior surface brick, stone,	ceptance
	Total Effective Area (A) = 100% of all Floor Ar	reas	
	Type IV Mass Timber		
C = 0.8	Mass timber construction, including Encapsuland other forms of Mass Timber are considerable types relating to the fire resistance ratings of a	ered as one of the follow	
C = 0.9	 Type IV-A Mass Timber Construction (Type IV-B Mass Timber Construction (Type IV-C Mass Timber Construction (Type IV-D Mass Timber Construction ((Rated Mass Timber) (Ordinary Mass Timber)	,
	*Refer to Water Supply for Public Fire Protection Timber Construction definitions and how to ca		
0-10	Type III Ordinary Construction		
C = 1.0 □	A building is considered to be of Ordinary con walls are of masonry construction (or other ap		

	1-hour fire resistance rating, but where other elements such as interior walls, arches, floors and/or roof do not have a minimum 1 hour fire resistance rating. Total Effective Area (A) = 100% of all Floor Areas	
C = 0.8	Type II Noncombustible Construction A building is considered to be of Noncombustible construction (Type II) when all structural elements, walls, arches, floors, and roofs are constructed with a minimum 1-hour fire resistance rating and are constructed with noncombustible materials. Total Effective Area (A) = 1362.7 + 0.25*(947.7 + 1362.7) = 1940.3 m² if any vertical openings in the building (ex. interconnected floor spaces, atria, elevators, escalators, etc.) are unprotected**, consider the two largest adjoining floor areas plus 50% of all floors immediately above them up to a maximum of eight; or if all vertical openings and exterior vertical communications are properly protected* in accordance with the National Building Code, consider only the single largest Floor Area plus 25% of each of the two immediately adjoining floors.	
C = 0.6	Type I Fire Resistive Construction A building is considered to be of Fire-resistive construction (Type I) when all structural elements, walls, arches, floors, and roofs are constructed with a minimum 2-hour fire resistance rating, and all materials used in the construction of the structural elements, walls, arches, floors, and roofs are constructed with noncombustible materials. Total Effective Area (A) = if any vertical openings in the building (ex. interconnected floor spaces, atria, elevators, escalators, etc.) are unprotected**, consider the two largest adjoining floor areas plus 50% of all floors immediately above them up to a maximum of eight; or if all vertical openings and exterior vertical communications are properly protected* in accordance with the National Building Code, consider only the single largest Floor Area plus 25% of each of the two immediately adjoining floors.	

Note: If a building cannot be defined within a single Construction Coefficient, the Construction Coefficient is determined by the predominate Construction Coefficient that makes up more than 66% of the Total Floor Area.

*Protected openings:

- a) Enclosures shall have walls of masonry or other limited or non-combustible construction with a fire resistance rating of not less than one hour.
- b) Openings including doors shall be provided with automatic closing devices
- c) Elevator doors shall be of metal or metal-covered construction, so arranged that the doors must normally be closed for operation of the elevator.

**Unprotected openings:

a) Any opening through horizonal separations that are unprotected or otherwise have closures that do not meet the minimum requirements for protected openings, above.

Mail code: 01-14

The building's FUS calculation has been determined using the following criteria: (check all that apply)

30% ⊠	Automatic sprinkler protection designed and installed in accordance with NFPA 13 The initial credit for Automatic Sprinkler Protection is a maximum of 30% based on the system being designed and installed in accordance with the applicable criteria of NFPA 13, Standard for Installation of Sprinkler Systems, NFPA 13R, Standard for the Installation of Sprinkler Systems in Low-Rise Residential Occupancies, or NFPA 13D, Standard for the Installation of Sprinkler Systems in One- and Two-Family Dwellings and Manufactured Homes and being maintained in accordance with the applicable criteria of NFPA 25, Standard for the Inspections, Testing and Maintenance of Water-Based Fire (see Recognition of Automatic Sprinkler Protection).
10% □	 Water supply is standard for both the system and Fire Department hose lines a) Sprinkler system is supplied by a pressurized water supply system (public or private) that is designed and built with no major non-conformance issues (i.e. water supply system is designed in accordance with Part 1 of the Water Supply for Public Fire Protection to qualify for fire insurance grading recognition). b) Calculated demand for maximum sprinkler design area operation in addition to hose stream requirements are below the available water supply curve (at the corresponding flow rate and pressure). An appropriate safety margin is used to take into account the difference between the available water supply curve at the time of hydrant flow testing as compared to the available water supply curve during Maximum Day Demand. c) Volume of water available is adequate for the total flow rate including the maximum sprinkler design area operation plus required hose streams plus Maximum Day Demand for the full duration of the design fire event. d) Residual pressure at all points in the water supply system can be maintained at not less than 150 kPa during the flowing of the sprinkler and required hose streams (plus Maximum Day Demand).
10% □	Fully supervised system a) a distinctive supervisory signal to indicate conditions that could impair the satisfactory operation of the sprinkler system (a fault alarm), that is to sound and be displayed, either at a location within the building that is constantly attended by qualified personnel (such as a security room), or at an approved remotely located receiving facility (such as a monitoring facility of the sprinkler system manufacturer); and

Visitez-nous: Ottawa.ca/urbanisme

b) a water flow alarm to indicate that the sprinkler system has been activated, which is to be transmitted to an approved, proprietary alarm-receiving facility, a remote station, a central station, or the fire department.

Note: Where only part of a building is protected by Automatic Sprinkler Protection, credit should be interpolated by determining the percentage of the Total Floor Area being protected by the automatic sprinkler system.

☐ Fully Supervised sprinkler system (per above description)

PROFESSIONAL SEAL APPLIED BY:

Civil Consultant: Lance Erion, P.Eng.

Consultancy: Arcadis IBI Group Inc.

Phone Number: 613 225 1311

Address: 500-333 Preston Street

LE (initial)

The FUS design parameters will be carried into the building's design

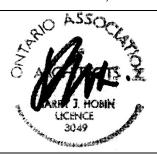

PROFESSIONAL SEAL APPLIED BY:

Architect or Building Engineer: Marc Thivierge, B.Arch, OAA

Consultancy: Hobin Architecture Inc.

Phone Number: 613-238-7200

Address: 63 Pamilla Street, Ottawa

Architect's or Building Engineer's Seal

(initial)

The FUS design parameters will be carried into the building's design
