1.0 INTRODUCTION

1.1 Background

In 2021, J.L. Richards & Associates Limited (JLR) was retained by Smart Living Properties (SLP) to prepare a Site Servicing Report (SSR) and detailed design drawings of civil infrastructure in support of a three-storey building addition to the east side of the existing six-storey residential apartment building sited at 280 Laurier Avenue East, in the City of Ottawa. In 2023, SLP revised the Site Plan to include a fourth storey on the building addition which will now require a sprinkler system. It is noted that the new building addition will be given a different municipal address (282 Laurier Avenue East) however the lot will not be severed from the existing building. This SSR has been prepared to document the detailed civil engineering design for the Site Plan Application (SPA) to the City of Ottawa.

This report has been prepared to outline the design objectives and criteria, servicing constraints and strategies for developing the subject lands with water, wastewater, storm and stormwater management services in accordance with:

i) The November 2009 Servicing Study Guidelines for Development Applications in the City of Ottawa (City);
ii) The Ottawa Sewer Design Guidelines (2012) and associated Technical Bulletins;
iii) The discussions held during a pre-consultation meeting (November 23, 2023) with City staff, and
iv) Subsequent email correspondence with the owner (SLP), its architect and the City.

A copy of the Topographical Survey is included in Appendix ‘A’ while a copy of the pre-consultation meeting and follow-up email correspondence has been included in Appendix ‘B’.

1.2 Site Description

The subject property is located within the urban limits of the City of Ottawa. The site is bounded by Laurier Avenue East to the north and by Sweetland Avenue to the west (refer to Figure 1 for Location Plan). The subject site currently consists of an existing building which is surrounded by a paved “L” shaped parking area. Based on the aerial image, the subject site currently consists primarily of asphalt and the building with a small strip of grass adjacent to the neighbouring property on Laurier Avenue East.

A topographical survey was completed by Annis, O’Sullivan, Vollebekk (AOV) Limited and compiled on February 12, 2021 (refer to Appendix ‘A’). The current topography of the subject property indicates an existing drainage boundary to the east of the existing building, which causes the current parking area to slope north towards Laurier Avenue East and west towards Sweetland Avenue. Currently, storm runoff generated on the site either sheet flows onto Laurier Avenue East, sheet flows onto Sweetland Avenue, or is collected by an on-site catch basin that discharges into the Sweetland Avenue storm sewer system. The existing building roof is assumed to discharge into the Sweetland Avenue storm sewer system. There is also an existing drain at the bottom of the exterior basement stairs which is assumed to be a standalone sump pit that infiltrates into the ground.

1.3 Building Configuration and Zoning

SLP wishes to construct a four-storey building addition (18 units) to the east side of the existing six-storey building (40 units), for which the existing building services (sanitary and storm) are proposed to remain. It is proposed to upgrade the water service from a 76 mm diameter service to a 108 mm diameter service.

The subject property is currently zoned Residential Fourth Density Zone, Subzone UD [R4UD (480)], which allows for a maximum building height of 14.5 m (By-law 2020-290). It has been assumed that this SSR can also be used as a Design Brief to support a Zoning By-Law Amendment (ZBLA), should one be required.

1.4 Existing Infrastructure

This report was prepared to demonstrate that the site redevelopment can be supported by the existing municipal infrastructure. The subject property is bounded by existing municipal infrastructure as illustrated below in Figure 2, which consists of the following (refer to Appendix 'C' for a copy of the background drawings):

Watermain

- Existing 203 mm diameter PVC watermain along Laurier Avenue East;
- Existing 203 mm diameter PVC/DI watermain along Sweetland Avenue.

Sanitary

- Existing 250 mm diameter PVC sanitary sewer along Laurier Avenue East;
- Existing 225/250 mm diameter PVC sanitary sewer along Sweetland Avenue.

Storm

- Existing 1050 mm diameter CONC storm sewer along Laurier Avenue East;
- Existing 375 mm diameter CONC storm sewer along Sweetland Avenue.

Figure 2: Existing Infrastructure

The Sewer CCTV Inspection Report and accompanying CCTV footage completed by Clean Water Works (CWW) on October 13, 2021 indicated that the sanitary and storm service laterals from the existing building discharged into the sewers along Sweetland Avenue.

Based on the CCTV footage, three (3) sanitary service laterals connect to the existing 250 mm diameter sanitary sewer on Sweetland Avenue in the vicinity of the existing building. Upon review, it has been assumed that the two (2) sanitary laterals between MHSA38944 and MHSA39430 are inactive. Meanwhile, there is a 200 mm diameter service lateral located ±1.8 m south of MH38944 which appears to be the active sanitary service lateral for the existing building. The length of this lateral is ±11 m. A camera view from the mainline sewer into the assumed sanitary service lateral for the existing building was provided in the CCTV footage. There is very little debris shown in the lateral and clear water is flowing out of it. Hence, the lateral appears to be in acceptable condition. The wastewater plumbing for the building addition will be serviced from the existing building.

Water supply to the existing building is assumed to be provided by a 76 mm (3 in.) diameter water service lateral that connects to the 203 mm diameter watermain on Sweetland Avenue. The size and location of this lateral will be confirmed by the contractor prior to construction. The water supply for the building addition will be serviced from the existing building. An additional water supply line will be constructed though the existing building to the new building to supply the sprinkler system in the four-storey addition.

Also based on the CCTV footage, there appears to be one (1) 200 mm diameter storm service lateral extending from the existing 375 mm diameter storm sewer on Sweetland Avenue toward the existing building. This storm lateral is ±1.7 m south of MHST39435 and is ±13 m in length. The assumed locations of the existing services are shown on the Site Servicing, Grading, Erosion & Sediment Control Plan (Drawing C1).

As shown on the Site Plan (Appendix ‘A’), the new residential building addition would replace the current asphalt parking area, with rooftop stormwater storage being provided for the building addition. The new roof drains and foundation drains (weeping tile) for the building addition will connect to the on-site storm pipe (catch basin lead) and convey stormwater into the existing storm sewer on Sweetland Avenue. As noted on the Site Servicing, Grading, Erosion & Sediment Control Drawing (Drawing C1), the existing catch basin lead that discharges into the storm sewer on Sweetland Avenue will be removed and reinstated with a 200 mm diameter sewer pipe.

1.5 Pre-Consultation, Permits and Approvals

A pre-consultation meeting was held between the Owner’s representatives and staff from the City on April 30, 2021. A copy of the pre-consultation meeting notes has been provided in Appendix ‘B’. As per the consultation notes, the Rideau Valley Conservation Authority (RVCA) was consulted to determine the stormwater quality criterion. The City also provided subsequent comments regarding stormwater management. The updated relevant comments are listed below:

- Coefficient (C) of runoff determined as per existing conditions but in no case more than 0.5.
- Time of Concentration (Tc) = To be calculated, minimum 10 minutes.
- Foundation drains are to be independently connected to sewer main unless being pumped with appropriate back up power, sufficient sized pump and back flow prevention.
- Roof shall be controlled to the 2-year storm event with a C-value of 0.5.

- Roof drains are to be connected downstream of any incorporated ICD within the SWM system.
- Remainder of the site can be left uncontrolled as confirmed by the City.
- Noise study required – property fronts on Major Collector Road (Laurier Avenue).
- If the property is not to be severed only one set of municipal services are permitted.
- No stormwater quality measures are required.

1.6 Engineering Drawings

Engineering drawings have been prepared in support of a Site Plan Application to the City of Ottawa. The following drawing is included in this application:

- Site Servicing, Grading, Erosion & Sediment Control Plan (Drawing C1); and
- Storm Drainage and Ponding Plan (Drawing SWM)

2.0 WATER SERVICING

2.1 Water Supply and Design Criteria

A Hydraulic Network Analysis (HNA) was carried out for the proposed site to confirm that the existing watermain and upgraded water service can provide adequate supply while complying with both the Ottawa Design Guidelines for Water Distribution (July 2010) and Technical Bulletins ISDTB-2014-02, ISTB-2018-02 and ISTB-2021-03.

Section 4.2.2 of the Water Design Guidelines requires that all new development additions to the public water distribution system be designed such that the minimum and maximum water pressure, as well as the fire flow rates, conform to the following:

- Under maximum hourly demand conditions (peak hour), the pressures shall not be less than 276 kPa;
- During periods of maximum day and fire flow demand, the residual pressure at any point in the distribution system shall not be less than 140 kPa (20 psi);
- In accordance with the Ontario Building Code in areas that may be occupied, the static pressure at any fixture shall not exceed 552 kPa (80 psi);
- The maximum pressure at any point in the distribution system in unoccupied areas shall not exceed 689 kPa (100 psi); and
- Feedermains, which have been provided primarily for the purpose of redundancy, shall meet, at a minimum, the basic day plus fire flow demand.

Table 2-1 summarizes the design criteria for water servicing, which will serve as the basis of the detailed design for the site.

Table 2-1: Water Design Criteria

Design Criteria	Design Value
Density (apt) 1-bedroom	1.4
Density (apt) 2-bedroom	2.1
Density (apt) 3-bedroom	3.1
Population < 500	
Residential average day demand	280 L/cap/day
Peaking Factors	MECP Table 3-3
Fire Flow Requirements	
Municipal ROW	FUS
Within Private Property	OBC
Scenario	
Peak hour	>275 kPa (40 psi)
Maximum day plus fire flow	>140 kPa (20 psi)
Minimum hour (maximum HGL)	<552 kPa (80 psi)

2.2 Domestic Water Demands

The water demands presented in this section reflect the unit count proposed on the Site Plan. Domestic water demands were calculated for both the existing building and proposed four-storey addition, which includes 41 bachelor units, 11 1-bedroom units, 2 2-bedroom units, 3 3-bedroom units, and 1 4-bedroom unit for a total of 58 units. A corresponding total population of 89 people was calculated based on population densities from Section 4.2.8 of the Water Design Guidelines. The water demand calculation sheet can be found in Appendix ‘D1’.

The residential consumption rate for average day demand was set to 280 L/c/d as per the Water Design Guidelines. Since the proposed population for the entire site is less than 500 people, peaking factors interpolated from Table 3-3 of the Ministry of the Environment, Conservation and Parks (MECP) Design Guidelines were used to generate the maximum day and peak hour demands. Since receiving the boundary conditions from the City (Appendix ‘D2’), the following revisions were made to the water demand calculations:

- three (3) bachelors, one (1) 1-bedroom unit, and one (1) 2-bedroom unit were removed and three (3) 3-bedroom units and one (1) 4-bedroom unit were added thus reducing the overall number of units by 1; and
- the peaking factors were recalculated and interpolated based on equivalent populations from Table 3-3 of the MECP Design Guidelines.

As a result of these revisions, both the maximum day demand and peak hour demand increased by less than 2 L/s. Considering that the changes in these demands are minor, the boundary conditions provided by the City (Appendix ‘D2’) are still expected to remain applicable. Table 2-2 summarizes the water consumption rates and peaking factors used in the HNA.

Table 2-2: Water Consumption Rates and Peaking Factors

Demand Scenario	Residential
Average Day	280 L/c/d
Maximum Day	7.22 x Avg Day
Peak Hour	10.88 x Avg Day

Table 2-3 summarizes the water demands based on the proposed site details and the peaking factors from Table 2-2 (refer to Appendix D1 for detailed calculations).

Table 2-3: Water Consumption Rates and Peaking Factors

Demand Scenario	Water Demand (L/s)
Average Day	0.30
Maximum Day	2.17
Peak Hour	3.27

2.3 Existing Water Service

As discussed in Section 1.4, water supply to the existing building is currently provided by a 76 mm diameter water service lateral. It is proposed to upgrade the service lateral to a 108mm diameter service to ensure adequate pressure for the sprinkler system in the four-storey addition. The assumed location of the existing water service from Sweetland Avenue is shown on the Site Servicing, Grading, Erosion & Sediment Control Plan (Drawing C1).

The watermain roughness coefficient for the proposed 108 mm diameter water service was taken to be 100 and the internal pipe diameter was analyzed as 108 mm.

2.4 Required Fire Flow

The required fire flow (RFF) was calculated using the FUS method assuming the existing building is classified as non-combustible construction (concrete) and the four-storey addition will be considered wood frame with a sprinkler system (refer to Appendix ‘D3’ for correspondence from Architect and Mechanical Engineer). Therefore, per the FUS (2020), the RFF was calculated as 9,000 L/min (150 L/s) for the proposed four-storey addition (refer to Appendix ‘D3’ for detailed FUS calculations). The boundary conditions were provided by the City on Sweetland Avenue which is the assumed location of the existing service connection. The boundary conditions are summarized in Table 2-4 (refer to Appendix ‘D2’ for email correspondence).

Table 2-4: Hydraulic Boundary Conditions

Water Demand Scenario	HGL Laurier Avenue East (m)
Peak Hour	106.1
Maximum HGL	115.4
Max. Day + Fire Flow	105.8

2.5 Headloss Calculations

The proposed functional servicing as presented on Drawing C1 was evaluated under the demand scenarios listed in Section 2.2. The existing water service is assumed to connect from the existing watermain on Sweetland Avenue. The length of the service lateral is ±9 m. This length has been used to evaluate the expected headloss along the service lateral.

Headlosses were calculated using the Hazen-Williams headloss equation. The operating pressures at the building (finished floor elevation) were calculated under the water demand scenarios listed in Table 2-4. The Headloss Calculation Spreadsheet (Appendix 'D4') summarizes the operating pressures estimated at the building under peak hour, maximum pressure, and maximum daily demand plus sprinkler flow scenarios. Detailed calculations for all three water demand scenarios are shown in Appendix 'D4'.

2.5.1 Peak Hour

The peak hour demand shown in Table 2-3 was applied at the boiler room where the existing service lateral is assumed to be located. Using the boundary conditions shown in Table 2-4, the anticipated pressure at the building was found to be 337 kPa (48.9 psi). Based on the calculated results, the minimum pressure criterion of 276 kPa (40 psi) is exceeded.

2.5.2 Maximum Day Plus Fire Flow

A total fire flow of 9,000 L/min (150 L/s) per the FUS is required for the site. There are three (3) existing hydrants (refer to Appendix 'D3' for aerial image of hydrant location) located within 75 m of the proposed building addition (on Laurier Avenue East (±52 m), Friel Street (±33 m), and Sweetland Avenue (±38 m)). Based on Google streetview mapping, the three hydrants have blue caps which would indicate they are Class AA hydrants. Based on ISTB-2018-02, each of these hydrants can supply 5,700 L/min (95 L/s) and the aggregate sum of the hydrant flow from these three (3) hydrants is 17,100 L/min (285 L/s), which exceeds the fire flow requirement of 9,000 L/min (150 L/s) as per the FUS.

The four-storey addition will have a sprinkler system and a maximum daily demand plus sprinkler flow was modelled. Using the boundary conditions shown in Table 2-4 and a sprinkler demand of 250 gpm (15.77 L/s) as provided by the Owner's mechanical engineer,

the anticipated pressure at the building was found to be 329 kPa (47.7 psi), which exceeds the minimum pressure criterion of 140 kPa (20 psi).

2.5.3 Maximum HGL

The Water Design Guidelines require that a high pressure check (maximum hydraulic grade elevation) be performed to ensure that the maximum pressure constraint of 552 kPa (80 psi) is not exceeded. Based on a zero (0 L/s) demand condition and a maximum HGL boundary condition (refer to Table 2-4), a maximum pressure of 429 kPa (62.1 psi) is expected at the building. This result is below the maximum pressure constraint of 552 kPa (80 psi) and no pressure reducing valve (PRV) is required.

2.6 Summary and Conclusions

Based on the HNA presented above, it is expected that the proposed 108 mm diameter watermain service lateral can provide adequate domestic water supply and the existing municipal hydrants can satisfy the fire flow requirement for the subject site.

3.0 WASTEWATER SERVICING

3.1 Existing Conditions

Wastewater flows generated by the site are assumed to be conveyed to the existing 250 mm diameter sanitary sewer on Sweetland Avenue via an existing 200 mm diameter sanitary service lateral as discussed in Section 1.4 and depicted on the Site Servicing, Grading, Erosion & Sediment Control Plan (Drawing C1). The corresponding sanitary drainage area for the subject property is shown on Figure 3.

3.2 Design Criteria

The sanitary service lateral was assessed based on the City of Ottawa Sewer Design Guidelines (OSDG - October 2012) and associated Technical Bulletins. Key design parameters have been summarized in Table 3-1.

Table 3-1: Wastewater Servicing Design Criteria

Design Criteria	Design Value	Reference
Residential average flow	280 L/cap/day	ISTB-2018-01
Residential peaking factor	Harmon Formula x 0.8	City Section 4.4.1
Infiltration Allowance 0.05 L/s/ha (dry I/I) 0.28 L/s/ha (wet I/I)	0.33 L/s/ha	ISTB-2018-01
Minimum velocity	0.6 m/s	OSDG Section 6.1.2.2
Maximum velocity	3.0 m/s	OSDG Section 6.1.2.2

Design Criteria	Design Value	Reference
Manning Roughness Coefficient (for smooth wall pipes)	0.013	OSDG Section 6.1.8.2
Minimum allowable slopes	Varies	OSDG Table 6.2, Section 6.1.2.2

3.3 Theoretical Sanitary Peak Flow and Proposed Sanitary Servicing

Wastewater flows from the existing six-storey building and the proposed four-storey addition is assumed to be collected by a series of internal drains that will converge into the boiler room. The captured wastewater flows are assumed to discharge into the existing 250 mm diameter sanitary sewer on Sweetland Avenue through the same service lateral as assumed for existing conditions.

Based on the proposed densities for apartment buildings (as recommended by the OSDG), the peak wastewater flow was calculated based on the design value of 280 L/c/d and an overall population of 89 as per the design parameters listed in Table 3-1. The sanitary service lateral has a length of ±11 m and was assessed based on the City of Ottawa Sewer Design Guidelines (OSDG – October 2012) and associated Technical Bulletins. Key design parameters have been summarized in Table 3-1. The peak wastewater flow of 1.06 L/s was calculated based on a peaking factor of 3.61. A total infiltration allowance of 0.02 L/s was calculated based on 0.33 L/s/ha (dry and wet I/I), in accordance with the OSDG and ISTB-2018-01.

It is proposed that the existing 200 mm diameter sanitary lateral continue to be used to convey the captured flows. Assuming the existing lateral has a slope of 1.0%, the free-flowing capacity of the pipe is 34.2 L/s, which exceeds the design flow of 1.06 L/s. A copy of the sanitary design sheet for 282 Laurier Avenue East can be found in Appendix ‘E’.

3.4 Summary and Conclusions

Based on the above wastewater servicing details, it is anticipated that the existing 200 mm diameter sanitary service shown on the Site Servicing, Grading, Erosion & Sediment Control Plan (Drawing C1) can adequately provide sanitary servicing for the existing six-storey building and the proposed four-storey addition.

4.0 STORM SERVICING AND STORMWATER MANAGEMENT

4.1 Strategy

The existing six-storey building on the site is proposed to remain undisturbed. The existing rooftop is assumed to outlet through a storm service to Sweetland Avenue. The existing building frontage sheet drains to Laurier Avenue East and the grading in this area is proposed to be maintained. Since this portion of the site shall remain undisturbed, only the proposed disturbed area is considered for the stormwater management analysis.

Storm runoff generated by the disturbed portion of the site will be conveyed either to Laurier Avenue East or to Sweetland Avenue. The storm sewers on these two streets are not connected at the ROW intersection and are therefore considered as two separate systems. The existing topography (Appendix ‘A’) indicates that the disturbed portion of this site currently drains toward both systems.

At the direction of the City (refer to Appendix ‘B’ for email correspondence), only the proposed building’s rooftop will need to be controlled to the 1:2 year pre-development allowable release rate based on a C-factor of 0.5. As such, under post-development conditions, there will be no requirement for storage outside of the rooftop and the rest of the site will sheet flow to either Laurier Avenue East or Sweetland Avenue.

The building addition will outlet stormwater via roof drains into the storm lead at the back of the site (south portion). Runoff from the south portion of the site will be collected by one (1) on-site catch basin (CB1) which will discharge into the Sweetland Avenue storm sewer system via the reinstated 200 mm diameter storm lead. Furthermore, stormwater from the small corridor area between the existing building and the proposed addition will be collected by a trench drain and conveyed to the Sweetland Avenue storm system via the reinstated 200 mm diameter storm lead. The foundation drainage will also be directed to the Sweetland Avenue storm system via the uncontrolled storm lead. The City has confirmed that only a tee connection is required at the connection between the reinstated catch basin lead and the existing storm sewer on Sweetland Avenue. A copy of the Storm Sewer Design Sheet can be found in Appendix ‘F1’.

Storm flows generated from the disturbed surfaces are to be controlled to the criterion described in the pre-consultation meeting notes and subsequent correspondence with the City (refer to Appendix ‘B’ for email correspondence).

4.2 Storm Criteria

During the pre-consultation meeting held on April 30, 2021 (refer to Appendix ‘B’), the following storm servicing criteria for the proposed redevelopment was provided by the City, which consists of the following:

- The Coefficient (C) of runoff determined as per existing conditions but in no case more than 0.5.
- Time of Concentration (TC) to be calculated, with a minimum of TC = 10 minutes.
- Any storm events greater than 5 year, up to 100 year, and including 100-year storm event must be detained on site.
- Foundation drains are to be independently connected to sewer main unless being pumped with appropriate back up power, a sufficiently sized pump and back flow prevention.
- Roof drains are to be connected downstream of any incorporated ICD within the SWM system.
- Stormwater quality control measures not required per the RVCA.

Since this meeting, the City has provided additional direction on the storm servicing requirements for this project (refer to Appendix 'B'). It should be noted that these comments have amended some of the criteria presented during the pre-consultation meeting. In summary, the additional comments are as follows:

- The proposed roof will need to be controlled to the 1:2 year storm event, using a C-factor of 0.5, while the remainder of the site can be left uncontrolled;
- An inlet control device (ICD) in the rear yard CB is not required to control flows since the flow rate of 3.55 L/s is too small and will likely clog up with debris and sediments over time.
- The proposed 200mm catch basin lead connecting to the storm sewer on Sweetland Ave would require a manhole connection. This is required because the lead is greater than 50% of the diameter of the mainline sewer.

The storm servicing identified on Drawings C1 and SWM have been developed to meet the above criteria.

4.3 Allowable Release Rate

Storm servicing and stormwater management for the subject site is to be controlled to the criteria listed in Section 4.2. The proposed roof will need to be controlled to the 1:2 year pre-development release rate of the proposed building footprint while the rest of the site will sheet flow uncontrolled to the existing trunk sewers on Laurier Avenue East and Sweetland Avenue. A Pre-Development Drainage Plan for the disturbed surfaces is shown on Figure 4. It should be noted that the proposed building footprint is currently all pavement (i.e., having a runoff coefficient of 0.9). However, as requested by the City, a maximum runoff coefficient of 0.5 was used to calculated the allowable release rate of this catchment area. The calculations for the pre-development release rate at 282 Laurier are provided in Appendix 'F2'.

Since the site area is small, the allowable peak flow was calculated based on the minimum time of concentration of 10.00 minutes. The pre-development release rate of the proposed building area under a 1:2 year design event was estimated at 2.14 L/s. Hence, as per the City's instructions, the proposed roof top storage must be controlled to this rate, and the rest of the site will flow uncontrolled to the mainline sewers.

4.4 Storm Servicing

The general storm and stormwater servicing constraints used to develop the detailed design for the site are listed in Table 4-1.

Table 4-1: Storm Servicing Design Criteria

General Design Criteria
Storm drains are to be designed by the mechanical engineer to convey the calculated flows presented herein in accordance with the Ontario Building Code. The calculated peak flows were estimated with the Rational Method and the City of Ottawa Intensity-Duration-Frequency (IDF) curves.
Peak flows estimated based on an inlet time of ten (10) minutes, as per the Technical Bulletin ISDTB-2012-4.
Calculated peak flows to be estimated based on weighted average C-Factors. The weighted C-Factors have been calculated based on 0.90 for all hard surfaces and 0.20 for all landscaped areas.
The 1:100-year peak flows to be detained by means of on-site retention measures of rooftop storage.
Provide measures to ensure that site preparation and construction is in accordance with the current Best Management Practices for Erosion and Sediment Control.

4.5 Proposed Stormwater Management Solution and Calculations

4.5.1 Water Quantity

Storm servicing and stormwater management was developed to limit the proposed rooftop to the allowable peak flow of 2.14 L/s while allowing the rest of the site to sheet flow uncontrolled. In order to achieve this criterion, rooftop restrictors were deemed necessary to allow for rooftop storage.

The disturbed surfaces under post-development conditions are shown on the Storm Drainage and Ponding Plan (Drawing SWM). This drawing illustrates the various drainage areas along with their C-Factor and outlet. Drawing SWM also shows the ponding limits at the rooftop as described in the detailed stormwater management calculations (Appendix ‘F3’) using the Modified Rational Method (MRM). In accordance with the OSDG, the runoff coefficients under the 1:100-year MRM calculation were increased by 25% up to the maximum of 0.90. The grass areas were therefore, accounted for at a C-Factor of 0.25 (125% x 0.20). Table 4-2 and Table 4-3 summarize the runoff volume requirements as estimated by the MRM and detailed in Appendix ‘F3’.

Roof Top	200.0	2.14	N/A	4.64	4.64

Based on the SWM calculations, and by designing the roof scupper elevations to provide enough rooftop storage for the 1:100 year storm event, sufficient roof storage will be provided. Furthermore, under the 1:100 year condition, 1.71 L/s will sheet flow uncontrolled to Laurier Avenue East and 7.25 L/s will sheet flow uncontrolled to Sweetland Avenue.

4.5.2 Climate Change Event (CCE)

Under a climate change event (CCE - +20% above the 1:100 year), the stormwater management calculations (Appendix ‘F3’) show the available storage difference between the CCE and 1:100-year storm. Table 4-4 and Table 4-5 summarize the runoff volume requirements as estimated by the MRM and detailed in Appendix ‘F3’.

Table 4-4: Flow to Laurier Avenue East (CCE)

Area Type	Area (m^2)	Controlled Peak Flow (L/s)	Uncontrolled Peak Flow (L/s)	Storage Required (m^3)	Storage Provided (m^3)
Uncontrolled Sheet Flow	62.5	N/A	2.05	N/A	N/A

Table 4-5: Flow to Sweetland Avenue (CCE)

Area Type	Area (m^2)	Controlled Peak Flow (L/s)	Uncontrolled Peak Flow (L/s)	Storage Required (m^3)	Storage Provided (m^3)
Uncontrolled Sheet Flow	231.8	N/A	8.70	N/A	N/A
Roof Top	200.00	2.14	N/A	6.15	4.64

Based on the SWM calculations and rooftop scupper design, sufficient roof storage will be provided to detain the 1:100 year storm event on the roof and the additional volume of 1.51 cubic meters will outlet via the scuppers. Meanwhile, under the CCE condition 2.05

L/s will sheet flow uncontrolled to Laurier Avenue East and 8.70 L/s will sheet flow uncontrolled to Sweetland Avenue.

4.5.3 Water Quality

The RVCA was consulted to determine whether quality measures were necessary for this redevelopment. Based on an email correspondence from the RVCA (Appendix 'B'), the stormwater servicing does not require any quality measures.

4.6 Summary and Conclusions

The detailed storm and stormwater servicing as well as the proposed grading will meet the design criteria highlighted in Section 4.2. As per the City comments (Appendix 'B'), the proposed rooftop will be controlled to an allowable release rate of 2.14 L/s using roof drains. The remaining post development flows will discharge uncontrolled to the Laurier Avenue East and Sweetland Avenue outlets. Rooftop ponding limits are shown in Drawing SWM, however the exact scupper elevations and ponding surface elevations on the roof of the new building addition shall be set by the architect in consultation with the mechanical engineer and structural engineer. The maximum scupper elevations shall be set at the 100-year ponding elevation.

5.0 EROSION AND SEDIMENT CONTROL

Erosion and sediment control measures, as outlined in the Ontario Ministry of Natural Resources (MNR) Guidelines on Erosion and Sediment Control for Urban Construction Sites, will be implemented to trap sediment on site. The following erosion and sediment control measures could be implemented during construction (refer to Drawing C1):

- Supply and installation of a silt fence barrier, as per OPSD 219.110, if required;
- Supply and installation of filter fabric between the frame and cover of catch basins and maintenance holes adjacent to the project area during construction, to prevent sediment from entering the sewer system. The filter fabric is to be inspected regularly and corrected as required;
- Sandbags are to be placed blocking part of the sewer pipe in the existing catch basin to eliminate construction debris from entering the existing storm sewer system. The sandbags are to be removed after the proposed storm sewers have been fully cleaned.

The proposed removal and reinstatement measures as well as the erosion control measures shall conform to the following documents:

- "Guidelines on Erosion and Sediment Control for Urban Construction Sites" published by Ontario Ministries of Natural Resources, Environment, Municipal Affairs, and Transportation & Communication, Association of Construction Authorities of Ontario and Urban Development Institute, Ontario, May 1987.
- "MTO Drainage Manual", Chapter F: "Erosion of Materials and Sediment Control", Ministry of Transportation & Communications, 1985.
- "Erosion and Sediment Control" Training Manual by Ministry of Environment, Spring 1998.
- Applicable Regulations and Guidelines of the Ministry of Natural Resources.

TOPOGRAPHICAL PLAN OF SURVEY OF

LOT 5 AND PART OF LOT 6 (SOUTH LAURIER AVENUE) REGISTERED PLAN 14349 CITY OF OTTAWA

Surveyed by Annis, O'Sullivan, Vollebekk Ltd.

Scale 1 : 150

6 4.5 3.0 1.5 0 3 6 Metres

Metric

DISTANCES SHOWN ON THIS PLAN ARE IN METRES AND CAN BE CONVERTED TO FEET BY DIVIDING BY 0.3048

Surveyor's Certificate

I CERTIFY THAT :

1. This survey and plan are correct and in accordance with the Surveys Act and the Surveyors Act and the regulations made under them.
2. The survey was completed on the 5th day of February, 2021.

Feb 12/21
Date

T. Hartwick
Ontario Land Surveyor

SITE AREA = 895.8 m²

Bearings are astronomic, derived from the easterly limit of Sweetland Avenue, shown as N30°38'40"W on Plan 5R-6213.

ELEVATION NOTES

1. Elevations shown are geodetic and are referred to the CGVD28 geodetic datum.
2. It is the responsibility of the user of this information to verify that the job benchmark has not been altered or disturbed and that it's relative elevation and description agrees with the information shown on this drawing.

UTILITY NOTES

1. This drawing cannot be accepted as acknowledging all of the utilities and it will be the responsibility of the user to contact the respective utility authorities for confirmation.
2. Only visible surface utilities were located.
3. A field location of underground plant by the pertinent utility authority is mandatory before any work involving breaking ground, probing, excavating etc.

SMART LIVING PROPERTIES – 282 LAURIER AVENUE EAST

DEVELOPMENT SERVICING STUDY CHECKLIST

REFERENCED STUDIES AND REPORTS	REFERENCE
Site Servicing Report for Smart Living Properties, 282 Laurier Avenue East (J.L. Richards & Associates Limited, March 8, 2024)	SSR

4.1	GENERAL CONTENT	REFERENCE
☐	Executive Summary (for larger reports only).	N/A
☒	Date and revision number of the report.	SSR (Title Page)
☒	Location map and plan showing municipal address, boundary, and layout of proposed development.	SSR (Figure 1) Site Servicing, Grading, ESC Plan (C1)
☒	Plan showing the site and location of all existing services.	Site Servicing, Grading, ESC Plan (C1)
☒	Development statistics, land use, density, adherence to zoning and official plan, and reference to applicable subwatershed and watershed plans that provide context to which individual developments must adhere.	SSR (Section 1.3)
☒	Summary of Pre-consultation Meetings with City and other approval agencies.	SSR (Appendix 'B')
☐	Reference and confirm conformance to higher level studies and reports (Master Servicing Studies, Environmental Assessments, Community Design Plans), or in the case where it is not in conformance, the proponent must provide justification and develop a defendable design criteria.	N/A
☒	Statement of objectives and servicing criteria.	SSR (Section 1.5, 2.1, 3.2, 4.2, 4.4)
☒	Identification of existing and proposed infrastructure available in the immediate area.	SSR (Section 1.4, 2.3, 3.3, 4.5) Site Servicing, Grading, ESC Plan (C1)
☒	Identification of Environmentally Significant Areas, watercourses and Municipal Drains potentially impacted by the proposed development (Reference can be made to the Natural Heritage Studies, if available).	SSR (Section 1.5, 4.2) Site Servicing, Grading, ESC Plan (C1)
☒	Concept level master grading plan to confirm existing and proposed grades in the development. This is required to confirm the feasibility of proposed stormwater management and drainage, soil removal and fill constraints, and potential impacts to neighbouring properties. This is also required to confirm that the proposed grading will not impede existing major system flow paths.	Site Servicing, Grading, ESC Plan (C1)

☐	Identification of potential impacts of proposed piped services on private services (such as wells and septic fields on adjacent lands) and mitigation required to address potential impacts.	N/A
☐	Proposed phasing of the development, if applicable.	N/A
☐	Reference to geotechnical studies and recommendations concerning servicing.	To be confirmed
☒	All preliminary and formal site plan submissions should have the following information: ▪ Metric scale ▪ North arrow (including construction North) ▪ Key plan ▪ Name and contact information of applicant and property owner ▪ Property limits, including bearings and dimensions ▪ Existing and proposed structures and parking areas ▪ Easements, road widening and rights-of-way ▪ Adjacent street names	All Drawings

4.2	**DEVELOPMENT SERVICING REPORT: WATER**	**REFERENCE**
☐	Confirm consistency with Master Servicing Study, if available.	N/A
☒	Availability of public infrastructure to service proposed development.	SSR (Section 1.4, 2.3) Site Servicing, Grading, ESC Plan (C1)
☒	Identification of system constraints.	SSR (Section 2.4)
☒	Identify boundary conditions.	SSR (Section 2.4, Appendix 'D')
☒	Confirmation of adequate domestic supply and pressure.	SSR (Section 2.5)
☒	Confirmation of adequate fire flow protection and confirmation that fire flow is calculated as per the Fire Underwriter's Survey. Output should show available fire flow at locations throughout the development.	SSR (Section 2.5, Appendix 'D')
☒	Provide a check of high pressures. If pressure is found to be high, an assessment is required to confirm the application of pressure reducing valves.	SSR (Section 2.5)
☐	Definition of phasing constraints. Hydraulic modelling is required to confirm servicing for all defined phases of the project, including the ultimate design.	N/A
☒	Address reliability requirements, such as appropriate location of shutoff valves.	SSR (Section 2.3)
☐	Check on the necessity of a pressure zone boundary modification.	N/A

☒	Reference to water supply analysis to show that major infrastructure is capable of delivering sufficient water for the proposed land use. This includes data that shows that the expected demands under average day, peak hour and fire flow conditions provide water within the required pressure range.	SSR (Section 2, Appendix 'D')
☒	Description of the proposed water distribution network, including locations of proposed connections to the existing system, provisions for necessary looping, and appurtenances (valves, pressure reducing valves, valve chambers, and fire hydrants), including special metering provisions.	SSR (Section 2.3) Site Servicing, Grading, ESC Plan (C1)
☐	Description of off-site required feedermains, booster pumping stations, and other water infrastructure that will be ultimately required to service proposed development, including financing, interim facilities, and timing of implementation.	N/A
☒	Confirmation that water demands are calculated based on the City of Ottawa Design Guidelines.	SSR (Section 2.1, 2.2)
☒	Provision of a model schematic showing the boundary conditions locations, streets, parcels, and building locations for reference.	SSR (Appendix 'D')

4.3	**DEVELOPMENT SERVICING REPORT: WASTEWATER**	**REFERENCE**
☒	Summary of proposed design criteria (Note: Wet weather flow criteria should not deviate from the City of Ottawa Sewer Design Guidelines. Monitored flow data from relatively new infrastructure cannot be used to justify capacity requirements for proposed infrastructure).	SSR (Section 3.2)
☐	Confirm consistency with Master Servicing Study and/or justifications for deviations.	N/A
☒	Consideration of local conditions that may contribute to extraneous flows that are higher than the recommended flows in the Guidelines. This includes groundwater and soil conditions, and age and condition of sewers.	SSR (Section 3.2)
☒	Description of existing sanitary sewer available for discharge of wastewater from proposed development.	SSR (Section 1.4, 3.1, 3.3)
☒	Verify available capacity in downstream sanitary sewer and/or identification of upgrades necessary to service the proposed development. (Reference can be made to previously completed Master Servicing Study if applicable.)	SSR (Section 3.3)
☒	Calculations related to dry weather and wet weather flow rates from the development in standard MOE sanitary sewer design table (Appendix 'C') format.	SSR (Appendix 'E')

☒	Description of proposed sewer network, including sewers, pumping stations and forcemains.	SSR (Section 3.3) Site Servicing, Grading, ESC Plan (C1)
☒	Discussion of previously identified environmental constraints and impact on servicing (environmental constraints are related to limitations imposed on the development in order to preserve the physical condition of watercourses, vegetation, soil cover, as well as protecting against water quantity and quality).	SSR (Appendix 'B')
☐	Pumping stations: impacts of proposed development on existing pumping stations or requirements for new pumping station to service development.	N/A
☐	Forcemain capacity in terms of operational redundancy, surge pressure and maximum flow velocity.	N/A
☐	Identification and implementation of the emergency overflow from sanitary pumping stations in relation to the hydraulic grade line to protect against basement flooding.	N/A
☐	Special considerations, such as contamination, corrosive environment, etc.	N/A

4.4	**DEVELOPMENT SERVICING REPORT: STORMWATER**	**REFERENCE**
☒	Description of drainage outlets and downstream constraints, including legality of outlets (i.e., municipal drain, right-of-way, watercourse, or private property).	SSR (Section 1.4, 4.1)
☒	Analysis of available capacity in existing public infrastructure.	SSR (Section 4.2, 4.3)
☒	A drawing showing the subject lands, its surroundings, the receiving watercourse, existing drainage patterns, and proposed drainage pattern.	Storm Drainage and Ponding Plan (SWM)
☒	Water quantity control objective (e.g. controlling post-development peak flows to pre-development level for storm events ranging from the 2 or 5 year event (dependent on the receiving sewer design) to 100 year return period); if other objectives are being applied, a rationale must be included with reference to hydrologic analyses of the potentially affected subwatersheds, taking into account long-term cumulative effects.	SSR (Section 4.3)
☒	Water Quality control objective (basic, normal or enhanced level of protection based on the sensitivities of the receiving watercourse) and storage requirements.	SSR (Section 4.5.3)
☒	Description of the stormwater management concept with facility locations and descriptions with references and supporting information.	SSR (Section 4) Storm Drainage and Ponding Plan (SWM)
☐	Setback from private sewage disposal systems.	N/A

☐	Watercourse and hazard lands setbacks.	N/A
☒	Record of pre-consultation with the Ontario Ministry of Environment and the Conservation Authority that has jurisdiction on the affected watershed.	SSR (Appendix 'B')
☐	Confirm consistency with subwatershed and Master Servicing Study, if applicable study exists.	N/A
☒	Storage requirements (complete with calculations) and conveyance capacity for minor events (1:2 year return period) and major events (1:100 year return period).	SSR (Section 4, Appendix 'F')
☐	Identification of watercourses within the proposed development and how watercourses will be protected, or, if necessary, altered by the proposed development with applicable approvals.	N/A
☒	Calculate pre- and post-development peak flow rates, including a description of existing site conditions and proposed impervious areas and drainage catchments in comparison to existing conditions.	SSR (Section 4, Appendix 'F')
☒	Any proposed diversion of drainage catchment areas from one outlet to another.	SSR (Section 4, Appendix 'F')
☒	Proposed minor and major systems, including locations and sizes of stormwater trunk sewers, and stormwater management facilities.	Site Servicing, Grading, ESC Plan (C1) Storm Drainage and Ponding Plan (SWM)
☐	If quantity control is not proposed, demonstration that downstream system has adequate capacity for the post-development flows up to and including the 100-year return period storm event.	Quantity control proposed per SSR (Section 4)
☐	Identification of potential impacts to receiving watercourses.	N/A
☐	Identification of municipal drains and related approval requirements.	N/A
☒	Description of how the conveyance and storage capacity will be achieved for the development.	SSR (Section 4)
☒	100 year flood levels and major flow routing to protect proposed development from flooding for establishing minimum building elevations (MBE) and overall grading.	SSR (Section 4) Site Servicing, Grading, ESC Plan (C1) Storm Drainage and Ponding Plan (SWM)
☒	Inclusion of hydraulic analysis, including hydraulic grade line elevations.	SSR (Section 4, Appendix 'F')
☒	Description of approach to erosion and sediment control during construction for the protection of receiving watercourse or drainage corridors.	SSR (Section 5) Site Servicing, Grading, ESC Plan (C1)

☐	Identification of floodplains – proponent to obtain relevant floodplain information from the appropriate Conservation Authority. The proponent may be required to delineate floodplain elevations to the satisfaction of the Conservation Authority if such information is not available or if information does not match current conditions.	N/A
☐	Identification of fill constraints related to floodplain and geotechnical investigation.	N/A

4.5	**APPROVAL AND PERMIT REQUIREMENTS**	**REFERENCE**
The Servicing Study shall provide a list of applicable permits and regulatory approvals necessary for the proposed development, as well as the relevant issues affecting such approval. The approval and permitting shall include but not be limited to the following:		
☒	Conservation Authority as the designated approval agency for modification of floodplain, potential impact on fish habitat, proposed works in or adjacent to a watercourse, cut/fill permits and Approval under Lakes and Rivers Improvement Act. The Conservation Authority is not the approval authority for the Lakes and Rivers Improvement Act. Where there are Conservation Authority regulations in place, approval under the Lakes and Rivers Improvement Act is not required, except in cases of dams, as defined in the Act.	SSR (Section 1.5, Appendix 'B')
☐	Application for Environmental Compliance Approval (ECA) under the Ontario Water Resources Act.	N/A
☐	Changes to Municipal Drains.	N/A
☐	Other permits (National Capital Commission, Parks Canada, Public Works and Government Services Canada, Ministry of Transportation, etc.).	N/A

4.6	**CONCLUSION CHECKLIST**	**REFERENCE**
☒	Clearly stated conclusions and recommendations.	SSR (Section 2.6, 3.4, 4.6)
☒	Comments received from review agencies, including the City of Ottawa and information on how the comments were addressed. Final sign-off from the responsible reviewing agency.	Comment Response Letter to City of Ottawa
☒	All draft and final reports shall be signed and stamped by a Professional Engineer registered in Ontario.	SSR Site Servicing, Grading, ESC Plan (C1) Storm Drainage and Ponding Plan (SWM)

Subject: Pre-Consultation: Meeting Feedback
Proposed Site Plan Control Application – 280 Laurier Ave E

Please find below information regarding next steps as well as consolidated comments from the above-noted pre-consultation meeting held on November 23, 2023.

Pre-Consultation Preliminary Assessment

1 ☐	**2** ☐	**3** ☐	**4** ☐	**5** ☒

One (1) indicates that considerable major revisions are required while five (5) suggests that the proposal appears to meet the City's key land use policies and guidelines. This assessment is purely advisory and does not consider technical aspects of the proposal or in any way guarantee application approval.

Next Steps

1. A review of the proposal and materials submitted for the above-noted pre-consultation has been undertaken. Please proceed to complete a Phase 3 Pre-consultation Application Form and submit it together with the necessary studies and/or plans to planningcirculations@ottawa.ca.

2. In your subsequent pre-consultation submission, please ensure that all comments or issues detailed herein are addressed. A detailed cover letter stating how each issue has been addressed must be included with the submission materials. Please coordinate the numbering of your responses within the cover letter with the comment number(s) herein.

3. Please note, if your development proposal changes significantly in scope, design, or density before the Phase 3 pre-consultation, you may be required to complete or repeat the Phase 2 pre-consultation process.

Supporting Information and Material Requirements

1. The attached **Study and Plan Identification List** outlines the information and material that has been identified, during this phase of pre-consultation, as either required (R) or advised (A) as part of a future complete application submission.

    a. The required plans and studies must meet the City's Terms of Reference (ToR) and/or Guidelines, as available on Ottawa.ca. These ToR and Guidelines outline

the specific requirements that must be met for each plan or study to be deemed adequate.

Consultation with Technical Agencies

1. You are encouraged to consult with technical agencies early in the development process and throughout the development of your project concept. A list of technical agencies and their contact information is enclosed.

Planning

Comments:

Updated SPIL:

1. The accompanying Studies Plans Identification List outlines the required submission materials for the updated Site Plan Control application. Any previously prepared plans, reports and studies must be updated to the City's new Terms of Reference and must still be within their validity period.

2. As part of the City's updated processes, a zoning confirmation report will need to be submitted to identify all zoning compliance issues, if any, at the outset of a planning application.

Zoning:

3. Please ensure bike spaces meet all applicable provisions under Section 4.0 of the ZBL.

Please contact Jack Smith, Planner I, or Eric Forhan, Planner II, for follow-up questions.

Urban Design

Comments:

4. This proposal does not run along or does not meet the threshold in one of the City's Design Priority Areas and need not attend the City's UDRP. Staff will be responsible for evaluating the Urban Design Brief and providing design direction.

5. As this proposal has already received Site Plan approval and is only changing the height to add one floor, we have no additional design comments.

6. Please include updated drawings into the Urban Design Brief.

7. An Urban Design Brief is a required submittal. The Urban Design Brief should be structured by generally following the headings highlighted under Section 3 – Contents of these Terms of Reference. Please see the Urban Design Brief Terms of Reference provided.

a. ***Note. The Urban Design Brief submittal should have a section which addresses these pre-consultation comments.***

Please contact Christopher Moise, Urban Designer, for follow-up questions.

Engineering

Comments:

8. All applicable civil plans and reports to be updated accordingly to reflect the proposed changes. This includes, but not limited to:

    a. Geotechnical Report: Can be updated in a memo format to indicate that the previously approved report's investigation and results are still applicable to the revised proposal. Memo should speak to foundation design as well.

    b. Site Servicing and Stormwater Management Report: Shall be updated to reflect the changes with respect to number of units, height of building, etc.

    c. Noise Study Report can be updated in a memo format to indicate that previously approved Noise Report still applies.

    d. Grading and Servicing plan to be updated accordingly.

Feel free to contact Mohammad Fawzi, Infrastructure Project Manager, for follow-up questions.

Transportation

Comments:

General Comments

9. *The Laurier Avenue East and Sweetland Avenue intersection site triangle (5 m x 5 m) may not be applicable as the existing building is proposed to be retained.*
10. Sewer renewal along Sweetland Avenue to start 1-2 years.

Construction Contract	CP000784

11. The Screening Form has indicated that the Trip Generation Triggers have been met. Please proceed with the TIA Step 2 – Scoping report.
12. Laurier Avenue East Avenue is classified as a Major Collector Road. There are no additional protected ROW limits identified in the OP.
13. Sweetland Avenue is classified as a Local Road. There are no additional protected ROW limits identified in the OP.
14. Ensure that the development proposal complies with the Right-of-Way protection requirements of the Official Plan's Schedule C16.
15. The purchaser, tenant or sub-lessee acknowledges the unit being rented/sold is not provided with any on-site parking and should a tenant/purchaser have a vehicle for which they wish to have parking that alternative and lawful arrangements will need to be made to accommodate their parking need at an alternative location. The Purchaser/Tenant also acknowledges that the availability and regulations governing on-street parking vary; that access to on-street parking, including through residential on-street parking permits issued by the City cannot be guaranteed now or in the future; and that a purchaser, tenant, or sub-lessee intending to rely on on-street parking for their vehicle or vehicles does so at their own risk.
16. Ensure that potential tenants who are not assigned a parking space are aware that on street parking is not a viable option for tenants.
17. All underground and above ground building footprints and permanent walls need to be shown on the plan to confirm that any permanent structure does not extend

either above or below into the sight triangles and/or future road widening protection limits.

18. Permanent structures such as curbing, stairs, retaining walls, and underground parking foundation also bicycle parking racks are not to extend into the City's right-of-way limits.
19. The closure of an existing private approach shall reinstate the sidewalk, shoulder, curb, and boulevard to City standards.
20. The Owner shall be required to enter into maintenance and liability agreement for all pavers, plant and landscaping material placed in the City right-of-way and the Owner shall assume all maintenance and replacement responsibilities in perpetuity.
21. Bicycle parking spaces are required as per Section 111 of the Ottawa Comprehensive Zoning By-law. Bicycle parking spaces should be in safe, secure places near main entrances and preferably protected from the weather.
22. Should the property Owner wish to use a portion of the City's Road allowance for construction staging, prior to obtaining a building permit, the property Owner must obtain an approved Traffic Management Plan from the Manager, Traffic Management, Transportation Services Department. The city has the right for any reason to deny use of the Road Allowance and to amend the approved Traffic Management Plan as required.

Feel free to contact Wally Dubyk, Transportation Project Manager, for follow-up questions.

Environment and Trees

Forestry Comments:

23. Tree Conservation Report comments

    a. Contact the planning forester (mark.richardson@ottawa.ca) for information.

    b. The TCR may be combined with the Landscape Plan.

    c. The previously approved TCR may be used although it needs to be updated to reflect new Terms of Reference or changes to the proposal.

    d. The dying/dead Norway maple on the corner of Sweetland and Laurier may be removed without a permit if it is still present at the time of construction.

    e. Please employ a competent ISA certified arborist to prune the retained trees prior to start up to avoid any conflicts with construction equipment and the future building.

f. Please include soil volume information on the landscape plan for all proposed tree plantings.

Environmental Comments:

24. There are no triggers for an EIS and the addition of another storey does not change its status from an environmental perspective. We have no comments on the application.

Feel free to contact Matthew Hayley, Environmental Planner, or Mark Richardson, Forester, for follow-up questions.

Parkland

Comments:

25. Cash-in-lieu of parkland will be collected for this application. An updated calculation will be provided as part of the formal Site Plan Control application processes.

Feel free to contact Steve Gauthier, Parks Planner, for follow-up questions.

Heritage

Comments:

26. The property is not designated under Part IV or V of the Ontario Heritage Act, and not listed on the City's Heritage Register. We provide the following general comments for the applicant:

    a. Heritage Staff are supportive of infill on this property and encourage the removal of the portion of the parking lot that fronts onto Laurier Avenue.

    b. 280 Laurier Avenue is located within the Sandy Hill Cultural Heritage Character Area. Please refer to sections 5.3 (alterations and additions), 5.4 (infill), and 5.5 (streetscape) of the Character Area guidelines (attached) to help inform the detailed design.

    c. Ensure that the existing street trees are maintained to preserve the continuity of streetscape that exists within the Character Area.

    d. The proposed addition is located immediately adjacent to the Sweetland Avenue Heritage Conservation District (to the south) and to 284 Laurier Street (to the east), a property listed on the City's Heritage Register. Ensure that the addition is sympathetic to the character of these heritage resources and the overall neighbourhood.

Feel free to contact Taylor Quibell, Heritage Planner, for follow-up questions.

Other

27. The High Performance Development Standard (HPDS) is a collection of voluntary and required standards that raise the performance of new building projects to achieve sustainable and resilient design. The HPDS was passed by Council on April 13, 2022.

    a. At this time, the HPDS is not in effect and Council has referred the 2023 HPDS Update Report back to staff with direction to bring forward an updated report to Committee with recommendations for revised phasing timelines, resource requirements and associated amendments to the Site Plan Control By-law by no later than Q1 2024.

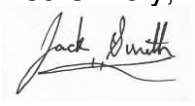
    b. Please refer to the HPDS information attached and ottawa.ca/HPDS for more information.

Submission Requirements and Fees

1. A Phase 3 Pre-consultation application will be required.
    a. Additional information regarding fees related to planning applications can be found here.
2. The attached **Study and Plan Identification List** outlines the information and material that has been identified as either required (R) or advised (A) as part of a future complete application submission.
    a. The required plans and studies must meet the City's Terms of Reference (ToR) and/or Guidelines, as available on Ottawa.ca. These ToR and Guidelines outline the specific requirements that must be met for each plan or study to be deemed adequate.
3. All of the above comments or issues should be addressed to ensure the effectiveness of the application submission review.

Should there be any questions, please do not hesitate to contact myself or the contact identified for the above areas / disciplines.

Yours Truly,



Jack Smith, Planner I

Subject: FW: Notice of Decision - 280 Laurier Avenue East - Site Plan Control - D07-12-21-0133

Hi Lisa,

The PM noted that the following changes are required to the Servicing Plan – please make the below changes so staff can update the approval.

Site Servicing, Grading, Erosion & Sediment Control Plan, C1, prepared by J.L. Richards & Associates Ltd., Revision 5, dated April 13, 2023

- No exterior surface drains can connect to the foundation drainage pipe (CB2). Please revise accordingly.
- Please provide a note indicating that where USF is less than 1.5m below grade, insulation is required. This is required for the area between the existing and proposed buildings.

Thanks,

Hi Annie,

The RVCA has reviewed the site plan provided. Based on this plan the RVCA would have no water quality control requirements. Best management practices are encouraged to be implemented where possible to encourage on-site protection and low impact design.

Thanks,

Eric Lalande, MCIP, RPP

Subject: 280 Laurier Avenue East - Stormwater Quality

Good afternoon,

We are completing the detailed design for a proposed site plan located at 280 Laurier Avenue East in downtown Ottawa (see attached Site Plan). The redevelopment consists of constructing a 3-storey building addition to the east side of an existing 6-storey building. The new residential building addition would replace the current asphalt parking area, with rooftop stormwater storage being provided for the new building addition.

The existing building contains 40 residential units, while the proposed 3-storey addition will add 19 units, resulting in a total of 59 residential units. Currently, it appears that some stormwater runoff drains overland towards Laurier Avenue East (there is also an existing catch basin that picks up a low area at the basement stairs), while another portion of the runoff drains to an existing on-site catch basin which presumably outlets to Sweetland Avenue.

Based on the above description of the site and the accompanying site plan and considering that we are replacing an asphalt parking area with a building rooftop, we would like to confirm that the proposed project will not require any stormwater quality control measures.

Please let me know if you have any questions.

Thank you,
Annie

Hi Mohammed,

Thank you again for confirming the water service connection so quickly. We have specified the below on our drawing.

With regards to the proposed storm pipe in between the building footings, we do not expect this to be an issue because the pipe is only about 0.3m below the underside of footing and it is outside the zone of influence. We will add notes to our drawing to indicate that the Contractor shall take measures not to undermine the footing during the pipe trenching and install. They may elect to use a trench box or a steel plate, etc. We will also indicate that the pipe should be placed before the new building addition foundation is constructed.

Thank you,
Annie

Subject: RE: 282 Laurier

Hi Annie,

As discussed, the City prefers the watermain connection to be made using a tee fitting, therefore an isolated connection. The City will carry out the connection, and the existing watermain is to blanked and removed from the ROW.

That being said, can you also please let me know if there any concerns with respect to the storm lateral and its offset from the foundation. I am mainly concerned with undermining the existing or proposed foundation.

Thanks Annie.

Hi Mohammed,

Would you mind giving me a quick call this morning?

I am looking to confirm with you how exactly the water service is to be replaced (will it be a live or isolated connection? Will the City make the connection to existing? Will the existing service be blanked with the new installed beside?)

We were hoping to wrap up our resubmission documents today.

Thank you,
Annie

Notes:

- Utilities shown are taken from best available records. Contractor is requested to check with all utility companies before digging.
- Soil information shown is not guaranteed and contractors are advised to collect additional soils information as deemed necessary.
- Reference bench mark:
- Proposed storm and sanitary sewers may be constructed in a common trench provided that a minimum horizontal distance of 460mm is maintained between outside barrels of pipe.
- All pipes shall conform to the Canadian Standards Association A257.2 (CSA) reinforced concrete sewer pipe with approved rubber gaskets.
- A minimum of 460 mm vertical clearance to be maintained between sewers and watermains where practical.
- Borehole soil descriptions are not based on sieve analysis but on visual inspection only, except where otherwise noted.
- Soil information taken from:
- Date of television inspection:
- This plan supercedes (in whole or in part) plan no:
- Actual rock line recorded during construction of existing sewer.
- Registered plan no.:
- Caution, while illustrations and utilities shown are taken from best available information, they cannot be guaranteed.
- See additional notes on sheet # 1

Subject: 280 Laurier - Updated Boundary Conditions

Hi Annie,

As promised by the end of the week!

The following are boundary conditions, HGL, for hydraulic analysis at 280 Laurier Avenue East (zone 1W) assumed to be connected to 203mm watermain on Sweetland Avenue (see attached PDF for location).

Minimum HGL: 106.1 m

Maximum HGL: 115.4 m

Max Day + Fire Flow (150 L/s): 105.8 m

These are for current conditions and are based on computer model simulation.

Disclaimer: The boundary condition information is based on current operation of the city water distribution system. The computer model simulation is based on the best information available at the time. The operation of the water distribution system can change on a regular basis, resulting in a variation in boundary conditions. The physical properties of watermains deteriorate over time, as such must be assumed in the absence of actual field test data. The variation in physical watermain properties can therefore alter the results of the computer model simulation.

Have a great weekend.

Best Regards,

Mohammed Fawzi, P.Eng.

February 26, 2024

Re: 280 Laurier Ave.

This letter is to confirm the following performance standards for water supply for public fire protection to the proposed 4 storey addition to existing 6 storey residential project at 280 Laurier Avenue.

1) Type of Construction / Construction Coefficient / Building Frame: Wood Frame Construction

2) Occupancy Coefficient and Combustibility Content: Limited Combustible

If you have any further concerns or questions feel free to contact me.

Thank you,

Levent Tatar

Re: **280 Laurier, Ottawa, Ontario**
JSC Project No.: 22-219

This is to confirm that sprinkler system in building will be automatic and fully supervised according with NFPA and OBC, Part 3.

Fire protection will include the standpipe system, designed and installed according to OBC, Part 3.2.9 and NFPA 14.

Yours very truly,

D. Jain, M.Eng., M.B.A., P.Eng., C.E.M., L.A.P.

Existing Peak Flow and
Allowable Peak Flow
Calculations

J.L.Richards
ENGINEERS · ARCHITECTS · PLANNERS

280 Laurier
Exisitng Peak Flow Calculations

Guidance on Approach to Estimate Allowable Peak Flow and SWM Calculations:

1 Allowable peak flow shall be estimated based on a 1:2 year intensity and based on a C-Factor of 0.5.
2 The 1:2-year intensity shall be calculated based on IDF statistics (per the OSDG).
3 Time of Concentration (Tc) calculated based on current conditions. Tc shall not be less than 10 mins.
4 Foundation drains are to be independently connected to sewer main unless being pumped with appropriate back up power, sufficient sized pump and back flow prevention.
5 At direction of City (refer to Appendix B), proposed roof is to be controlled to 1:2 year rate at proposed building area and the rest of site to flow uncontrolled to existing sewers.
6 Roof drains are to be connected downstream of any incorporated ICD within the SWM system.

Pre-Development Calculations (Proposed Building Area)

1:2 Year Pre-Development Rate

Type of Area	Area (ha)	C-Factor	C-Factor (Eff)
Pavement	0.02000	0.9	
Grass	0.00000	0.2	
Total	0.02000	0.90	0.50

Time of Concentration (existing):

Flow Path: Given size of site, the time of concentration will be significantly less than 10 mins. Therefore the minimum Tc = 10 min is used in calculations

Total Tc,	<<10 minutes	
Total Tc, (existing)	10.00 minutes	** min Tc = 10 minutes
$Intensity_{(2yr)}$ (I) =	76.81 mm/hr	

Allowable Peak Flow (2 Yr) Calculations (C-Factor = 0.50)

$Q2_{yr} = 2.78CAI$
$Q2_{yr} = (2.78) \times (0.50) \times (0.02\ ha) \times (76.81)$
$Q2_{yr} =$ 2.14 L/s

25	103.85	5.20	2.14	3.06	4.59	6.24	4.10	6.15	1.04
30	91.87	4.60	2.14	2.46	4.43	5.52	3.38	6.09	0.92
35	82.58	4.13	2.14	2.00	4.19	4.96	2.82	5.93	0.83
40	75.15	3.76	2.14	1.63	3.90	4.51	2.38	5.71	0.75
45	69.05	3.46	2.14	1.32	3.56	4.15	2.01	5.43	0.69
50	63.95	3.20	2.14	1.07	3.20	3.84	1.71	5.12	0.64
55	59.62	2.98	2.14	0.85	2.80	3.58	1.45	4.77	0.60
60	55.89	2.80	2.14	0.66	2.38	3.36	1.22	4.40	0.56
65	52.65	2.63	2.14	0.50	1.95	3.16	1.03	4.00	0.53
70	49.79	2.49	2.14	0.36	1.50	2.99	0.85	3.59	0.50

The following assumptions were made in regard to rooftop configuration:

Roof Top of Proposed 3-Storey	
Rooftop flow (L/s)	2.14
Area of Roof (m2) (from Architect)	193.6
60% of roof for storage (m2)	116.2
Vol. @ 0.15 m ponding (m3)	17.4

The SWM Calculations show rooftop storage volume requirements of 4.64m3 under the 1:100 year event.

Uncontrolled Flow to Sweetland Avenue	
Paved Area (m2)	135.5
SOD Area (m2)	96.3
Total Area (m2)	231.8
C (weighted 100 Yr)	0.63

Time (min)	Intensity 1:100 Yr (mm/hr)	Qp 1:100 Yr (L/s)	Qp 200 mm (L/s)	Qp stored (L/s)	Max Volume Requirement (m^3)	Qp CCE (L/s)	Qp stored (L/s)	Volume CCE Requirement (m^3)	Qp CCE - Qp100yr (L/s)
10	178.56	7.25	N/A	N/A	N/A	8.70	N/A	N/A	1.45
15	142.89	5.80	N/A	N/A	N/A	6.96	N/A	N/A	1.16
20	119.95	4.87	N/A	N/A	N/A	5.84	N/A	N/A	0.97
25	103.85	4.21	N/A	N/A	N/A	5.06	N/A	N/A	0.84
30	91.87	3.73	N/A	N/A	N/A	4.47	N/A	N/A	0.75
35	82.58	3.35	N/A	N/A	N/A	4.02	N/A	N/A	0.67
40	75.15	3.05	N/A	N/A	N/A	3.66	N/A	N/A	0.61
45	69.05	2.80	N/A	N/A	N/A	3.36	N/A	N/A	0.56
50	63.95	2.60	N/A	N/A	N/A	3.11	N/A	N/A	0.52
55	59.62	2.42	N/A	N/A	N/A	2.90	N/A	N/A	0.48
60	55.89	2.27	N/A	N/A	N/A	2.72	N/A	N/A	0.45
65	52.65	2.14	N/A	N/A	N/A	2.56	N/A	N/A	0.43
70	49.79	2.02	N/A	N/A	N/A	2.42	N/A	N/A	0.40

The 1:100 year event of 7.25 L/s and CCE of 8.70 L/s will sheet flow uncontrolled to Sweetland Avenue Trunk Sewer.
