City of Ottawa

Attention: Sean Moore

Dear Sir:

Subject: Lansdowne 2.0 Event Centre Development for Site Plan Control Application

We are pleased to deliver this enclosed servicing report in support of the application for Site Plan Control for the subject Lansdowne 2.0 Phase 1 - New Event Centre. This report details the water and sanitary demands for the proposed development in coordination with the existing site and future phased works.

Should there be any questions or comments regarding this report, please do not hesitate to contact the undersigned.

Yours sincerely,

Delogho

Winston Yang, P.Eng. Lead Engineer – Technical Lead Land Development & Municipal Engineering, Ontario

1 **GENERAL**

1.1 EXECUTIVE SUMMARY

Following the Zoning By-Law Amendment submission in September 2023, the Lansdowne Park redevelopment project (Lansdowne 2.0) entered the Site Plan Control Application stage. WSP was again retained by the City of Ottawa to provide servicing, grading and stormwater management design services for the phase 1 (Event Centre) development of the project for Site Plan Control Application.

The Lansdowne site is home to many commercial, residential, and leisure facilities. This includes TD place Stadium, Aberdeen Pavilion, Horticultural Building, mixed-use retail/office/residential, and a subsurface parking lot. The overall site is approximately 15.4 ha, and borders Bank Street to the west, Holmwood Ave to the north, and Queen Elizabeth Drive to the south and east.

The overall proposed redevelopment of Lansdowne Park is divided into 3 phases: Phase 1 includes a new event centre and landscaping/south stands modifications, Phase 2 involves the reconstruction of the north stands and Grand Stairs, and Phase 3 is for a future commercial/residential block containing probably two residential towers and retail space. This report pertains to the overall infrastructure upgrades except watermain due to Lansdowne 2.0 redevelopment and specifically to Phase 1, the design of the Event Centre, Great Lawn, and other landscaping modifications. See Appendix A for the architectural design upon which this report is based.

The site is located in the City of Ottawa per the Topographic Sketch of Lansdowne Park dated June 2024 and completed by Stantec Geomatics Ltd. Based on the topographic survey, the site slopes from the existing berm to the great lawn and the swale on the south side of the site. The existing Lansdowne site has been previously developed to convey flow to various underground tanks and the existing Great Lawn for detention. The private storm network eventually discharges to a 1050mm storm sewer on O'Connor Street. And runoff will drain overland to the Queen Elizabeth Drive exceeding 100 year event.

Design of a drainage and stormwater management system in this development must be prepared in accordance with the following documents:

- Sewer Design Guidelines, City of Ottawa, October 2012;
- Stormwater Management Planning and Design Manual, Ministry of the Environment, March 2003; and
- Stormwater Management Facility Design Guidelines, City of Ottawa, April 2012

This report was prepared utilizing servicing design criteria obtained from the City of Ottawa and outlines the design for water, sanitary wastewater, and stormwater facilities, including stormwater management.

The format of this report matches that of the servicing study checklist found in Section 4 of the City of Ottawa's Servicing Study Guidelines for Development Applications, November 2009.

It is proposed that:

- On-site stormwater management systems, employing underground storage will be provided to attenuate flow rates leaving the site area to be redeveloped. Existing drainage patterns, previously established controlled flow rates and storm sewers will be maintained.
- The on-site storm and sanitary pipes will be re-routed around the proposed Event Centre and previously established conveyance patterns will be maintained.

1.2 DATE AND REVISION NUMBER

This version of the report is the fourth issue (3rd revision), dated March 07th, 2025.

1.3 LOCATION MAP AND PLAN

The proposed development is located at 1015 Bank Street, Ottawa, Ontario at the location shown in Figure 1-1 below.

Figure 1-1 Lansdowne Site Location

1.4 ADHERENCE TO ZONING AND RELATED REQUIREMENTS

The proposed property use will be in conformance with zoning and related requirements prior to approval and construction and is understood to be in conformance with current zoning.

1.5 PRE-CONSULTATION MEETINGS

Outstanding comments from the ZBLA stage and updated engineering comments were provided July 26, 2024. These comments are provided in Appendix A for reference.

1.6 HIGHER LEVEL STUDIES

The review for servicing has been undertaken in conformance with, and utilizing information from, the following documents:

- Ottawa Sewer Design Guidelines, Second Edition, Document SDG002, October 2012, City of Ottawa including:

- Technical Bulletin ISDTB-2012-4 (20 June 2012)
- Technical Bulletin ISDTB-2014-01 (05 February 2014)
- Technical Bulletin PIEDTB-2016-01 (September 6, 2018)
- Technical Bulletin ISDTB-2018-01 (21 March 2018)

- Technical Bulletin ISDTB-2018-04 (27 June 2018)
- Ottawa Design Guidelines Water Distribution, July 2010 (WDG001), including:
 - Technical Bulletin ISDTB-2014-02 (May 27, 2014)
 - Technical Bulletin ISTB-2018-02 (21 March 2018)

- Stormwater Management Planning and Design Manual, Ontario Ministry of the Environment and Climate Change, March 2003 (SMPDM).

- Functional Servicing and Stormwater Management Report for Lansdowne Live Ottawa Sports and Entertainment Group, Project No. 09-378, January 2012, by DSEL.

- Stormwater Management Design Report for Lansdowne Urban Park, February 2012, by Stantec Consulting Ltd.

- Functional Servicing and Stormwater Management Study for Lansdowne Park Redevelopment 2.0, Project No. CA0000286.1662, September 2023, by WSP.

- Stormwater Management Design Report for Lansdowne Park Event Centre, Report No.CA0033920.1056, January 2025, by WSP.

- Geotechnical Investigation – Proposed Event Centre Lansdowne Park Redevelopment, Report No. PG6655-1, May 2024, by Patterson Group.

- Fire Underwriters Survey, Water Supply for Public Fire Protection (FUS), 2020.

1.7 STATEMENT OF OBJECTIVES AND SERVICING CRITERIA

The objective of the site servicing is to meet the requirements for the proposed modification of the site while adhering to the stipulations of the applicable higher-level studies and City of Ottawa servicing design guidelines. The current phase of the site plan includes a new Event Centre building, a modified Great Lawn and south stands and other landscape features.

1.8 AVAILABLE EXISTING AND PROPOSED INFRASTRUCTURE

The site is currently serviced by a network of watermain, storm, and sanitary sewers constructed during the Lansdowne 1.0 redevelopment project completed between 2012 and 2015. The Sport and Entertainment Group provided an asbuilt services and grading plan after its completion, contained in Appendix A.

Based on the previous design information by DSEL and Stantec, portable water supply is available within the site, and there should be adequacy fire protection supply. The existing Lansdowne Park has a peak dry weather flow of 42.1 L/s and wet weather flow of 45.3 L/s. The existing minor storm system has been designed to convey all storms up to and including a 5-year storm event and detention up to and including a 100-year storm event has also been designed and provided on site with the use of existing subsurface tank and surface ponding within the existing Great Lawn.

Due to the placement of the Event Centre building and the modification to the Great Lawn area, it is proposed to internally reroute the on-site storm, sanitary and watermain infrastructure around the Event Centre footprint to service the redevelopment. In addition, it is proposed to flatten the Great Lawn in Lansdowne 2.0 and introduced a large new underground chamber that will be interconnected to the existing underground chamber to provide additional stormwater storage in place of the Great Lawn to accommodate the increased of imperviousness due to Lansdowne 2.0 redevelopment.

1.9 ENVIRONMENTALLY SIGNIFICANT AREAS, WATERCOURSES AND MUNICIPAL DRAINS

Rideau Canal is south to the Lansdowne site. From the previous design or the existing condition before Lansdowne 1.0 development, an outlet to the Rideau Canal exist. But the outlet to the Canal is no longer in used as per the current finding. And this outlet will be completely abandoned and removed to accommodate the changes for the proposed Lansdowne 2.0 redevelopment. Thus, the proposed changes to the site will not require any additional approvals or amendments to approvals pertaining to environmentally significant areas, watercourses or municipal drains.

1.10 CONCEPT LEVEL MASTER GRADING PLAN

As the design is being submitted for site plan approval, the grading plan has been developed for the Phase 1 modifications. The existing and proposed grading are shown on drawing C04 (Grading Plan). Existing grading information is based on the topographic survey of the site completed in June 2024. No changes in grading are proposed beyond the redevelopment area boundaries. The proposed grading plan confirms the feasibility of the proposed stormwater management system, drainage, soil removal and fills. The geotechnical investigation was completed in 2024 by Patterson Group. The grading along the redevelopment extents is proposed to meet the existing grade.

1.11 IMPACTS ON PRIVATE SERVICES

There are no existing domestic private services (septic system and well) located on the site. There are no neighbouring properties using private services.

The existing on-site storm, sanitary and watermain services will be re-routed around the Event Centre and connect back into the existing on-site systems just south of the Aberdeen Pavilion. The overall site drainage system will remain unaffected. The drainage areas around the modified Great Lawn will be modified based on the proposed grading and addition of a new underground storage chamber. Ultimately, all of the flows will still be conveyed through the same downstream on-site storm sewer system.

1.12 DEVELOPMENT PHASING

As previously mentioned, the redevelopment of Lansdowne 2.0 will be completed in 3 phases. This report focuses on phase 1 (New Event Centre, modified Great Lawn and surrounding landscaped areas). However, the civil design of storm conveyance, stormwater management and wastewater take into consideration the ultimate design/demands (i.e. all 3 phases are taking into account). Upgrading the existing watermain network for phase 1 and 2 is not anticipated since the domestic water demand for New Event Centre and New North Side Stands are assumed to be equal to or less than compared to existing condition, and the fire flow is less than existing. For phase 3, hydraulic analysis for the watermain network might be considered depending on the detail design of future residential and commercial development.

1.13 GEOTECHNICAL STUDY

A geotechnical investigation report was previously prepared by Patterson Group. on May 30, 2024. No additional geotechnical information was required for the design of the modified site services, including paving. This geotechnical report will be included with the contract documents to be issued for construction, and the recommendations of the reports will be referenced in the construction specifications. The geotechnical study specifies a design recommendation based on a maximum groundwater elevation of 60.78m.

1.14 DRAWING REQUIREMENT

The engineering plans submitted for site plan approval will be in compliance with City requirements.

2 WATER DISTRIBUTION

2.1 CONSISTENCY WITH ZBLA FUNCTIONAL SERVICING AND STORMWATER MANAGEMENT STUDY

Lansdowne Park resides within the City of Ottawa 1W Pressure Zone. Water supply is delivered to the subject property through existing 300mm on Bank Street, 400mm on Holmwood Ave and 200mm on Fifth Ave.

The existing on site 200mm watermain is proposed to be rerouted around and within the new addition (Event Centre) since it lays in the new addition's footprint. The Event Centre building's services (2 services will be required since the average day demands are greater than 50 m³/day) are proposed to connect to the on-site 200mm watermain. The new Event Centre will be protected with a fully supervised and automatic fire protection system sprinkler system. The water service system includes a water flow and control valve alarm service. Refer to Appendix B for correspondence from the mechanical engineer. The fire department connection is located near the main entrance on the north side of the building.

No changes are required to the existing City water distribution system to allow servicing for this property.

The Ottawa Sports and Entertainment Group have completed fire hydrant testing on site in September 2022. Table 2-1 summarizes the results of the hydrant testing. The associated hydrant testing results are located Appendix B.

Hydrant Location	Color Code	Static Pressure (psi)	Dynamic Pressure (psi)	Pitot Pressure (psi)	Measured Flow (Gallons/min L/s)	Available Fire Flow at 20 psi (Gallons/min L/s)

*Fire hydrants proposed to meet the fire flow demands of the Event Centre and North Side Stands.

2.2 SYSTEM CONSTRAINTS AND BOUNDARY CONDITIONS

The existing water supply network is shown on As-Built Site Servicing Plan C01003 by DSEL. Boundary condition from the Lansdowne 1.0 post development is summarized below. A conservative estimate for the required fire supply of 9,000 L/min (150 L/s) was used for the analysis. Table 2-2 summarizes the DSEL anticipated water demands and boundary conditions under existing conditions.

Table 2-2: Water Demand and Boundary Conditions Existing Conditions from DSEL's analysis

Design Parameter	Existing Demand (L/s)	Boundary Condition (Hydraulic m/kPa)
Average Daily Demand	11.8	115.6/481.7
Max Day + Fire Flow	19.9+150=169.9	106.4/391.4
Peak Hour	38.0	103.1/359.0

*Boundary conditions supplied by the City of Ottawa during Lansdowne 1.0. Assumed ground elevation 65.50m.

This report will focus on the existing total site and future total site water demands. Due to the lack of information for Phase 3, a hydraulic check should be conducted at the beginning of Phase 3 design to determine if modification to the existing watermain network is required.

A boundary request for the proposed Lansdowne 2.0 development for the entire site has been submitted to the City on December 11, 2024, based on the recent fire flows and domestic demands for the total site. It is assumed that the future demand from the Lansdowne 2.0 development (phase 1 and 2 only) will be equal to or less than the demand of the existing system. The existing system's real-world demands were determined from the provided actual metering data as described below. The purpose of this exercise is to ensure the pre and post water pressure are consistent from the existing water network. The new Event Centre and North Side Stands have fire flow demands of 5000 L/min (83 L/s) and 6000 L/min (100 L/s), respectively. Refer to Appendix B for the fire flow calculations. Note that the fire flow of 150 L/s (as per existing conditions) was used to analyze the Lansdowne 2.0 development as this is more conservative, and thus, is why it was provided for boundary conditions.

Table 2-3 summarizes the anticipated Water Demands (per metering data) and Boundary Conditions under proposed conditions.

 Table 2-3: Water Demand and Boundary Conditions
 Proposed Conditions

Design Parameter	Proposed Demand (L/s)	Boundary Condition 1 (Hydraulic m/kPa)	Boundary Condition 2 (Hydraulic m/kPa)
Average Daily Demand	5.41	114.6/481.4	114.6/465.7
Max Day + Fire Flow	13.52+150=163.52	107.8/414.7	106.5/386.3
Peak Hour	29.73	105.7/394.1	105.6/377.5

*Boundary conditions supplied by the City of Ottawa. Assumed ground elevation 65.50m at Connection 1 and 67.10m at Connection 2. See Appendix B for detail boundary condition.

As demonstrated in Table 2-2 and 2-3, the pressure range is similar during Maximum Day plus Fire Flow as well as Peak Hour demands. Therefore, the existing water supply is available per the design requirement and conforms to all relevant City Guidelines and Policies.

For the purposes of determining accurate water demands for the ultimate condition, it has been assumed that the existing average day demands derived from the OSEG CARMA metering data for 2023 and 2024 will be equivalent, or greater than, the ultimate condition demands (see Appendix B for correspondence with the City of Ottawa regarding the use of metering data to determine the total site water demands and the OSEG CARMA metering data spreadsheet).

Based on the 12-month average of the November to December 2023 Metered Total readings in the OSEG CARMA Metering data and the January to October 2024 Metered Total readings, an average water consumption of 14,012,838 L/month was calculated. This is equivalent to 5.41 L/s. As per the City correspondence, 5.41 L/s and residential peaking factors is acceptable as the average day demand for the total site. The water demands for the entire site are as follows:

= 5.41 L/s
= Average Day Demand x 2.5 (Residential Peaking Factor)
= 5.41 L/s x 2.5
= 13.52 L/s
= Max. Day Demand x 2.2 (Residential Peaking Factor)
= 13.53 L/s x 2.2
= 29.73 L/s

As previously stated, the fire flow of 150 L/s was used in the boundary condition request for the entire site to determine the adequacy of the watermain network.

The water demands of the individual buildings as	per the CARMA metering report is as follows:
The water demands of the mutvidual bundings as	per the CARMA metering report is as follows.

Building	Avg. Day (L/mo)	Avg. Day (L/s)	Max. Day (L/s)	Peak Hour (L/s)
Abeerdeen	133,208	0.05	0.13	0.28

Bldg H - Retail	992,625	0.38	0.96	2.11

2.3 CONFIRMATION OF ADEQUATE DOMESTIC SUPPLY AND PRESSURE

Existing water demands are based on existing information that was used in Lansdowne 1.0. The existing (Lansdowne 1.0) and proposed (Lansdowne 2.0) condition total site demands are listed in Table 2-5. As shown in the table, the Lansdowne 2.0 demands, as determined from the CARMA metering report, are lower than the DSEL approved demands. Since it is assumed that the ultimate demands will be less than or equal to the existing (CARMA metering) demands, therefore, the existing watermain network should be adequate to support the proposed developments. Refer to Appendix B for detail existing demands (as used in Lansdowne 1.0) calculation provided by DSEL.

	Avg Day (L/s)	Max Day (L/s)	Peak HR (L/s)	FUS (L/s)
Lansdowne 1.0 Demands (as per DSEL calculations)	11.8	19.9	38.0	150
Lansdowne 2.0 Demands (as per OSEG CARMA Metering Data)	5.41	13.52	29.73	150*

*FUS as per existing Lansdowne Park Building Service Summary by DSEL (Appendix B) to be conservative.

The 2010 City of Ottawa Water Distribution Guidelines stated that the preferred practice for design of a new distribution system is to have normal operating pressures range between 345 kPa (50 psi) and 552 kPa (80 psi) under maximum daily flow conditions. Other pressure criteria identified in the guidelines are as follows:

Minimum Pressure	Minimum system pressure under peak hour demand conditions shall not be less than 276 kPa (40 psi)
Fire Flow	During the period of maximum day demand, the system pressure shall not be less than 140 kPa (20 psi) during a fire flow event.
Maximum Pressure	Maximum pressure at any point the distribution system shall not exceed 689 kPa (100 psi). In accordance with the Ontario Building/Plumbing Code, the maximum pressure should not exceed 552 kPa (80 psi). Pressure reduction controls may be required for buildings where it is not possible/feasible to maintain the system pressure below 552 kPa.

To demonstrate the proposed service connections are able to provide the required building fire sprinkler and peak hour demand, conservative approach has been taken into account that the watermain analysis would not be looped or interconnected. The residual pressure for the proposed building is calculated by subtracting the total headloss from the residual pressure measured on the two connections on Holmwood Ave and Bank Street from City Boundary Condition.

The flow capacity of a water pipe is commonly modelled by the Hazen-Williams equation to confirm the physical properties of the pipe and the pressure drop caused by friction:

$$H_L = \frac{10.67 * L * Q^{1.852}}{C^{1.852} * D^{4.87}}$$

Where: Q is volumetric flow rate

C is the Hazen-Williams friction coefficient L is the pipe length D is the pipe diameter H_L is the friction head loss

Sample calculation for residual pressure at Event Centre using Connection 1 and the Max. Day plus Fire Flow condition:

С	= 110 (204mm diameter PVC pipe)
D	= 0.205 m
Pipe Length	= 395 m
Flow	= 83 L/s + 13.52 L/s (use total site flow to be conservative)
	= 97 L/s
	$= 0.097 \text{ m}^{3}/\text{s}$

Friction Head Loss is determined as follows:

$$H_L = \frac{10.67 * L * Q^{1.852}}{C^{1.852} * D^{4.87}}$$
$$H_L = \frac{10.67 * 395 \text{ m} * \left(\frac{0.097 \text{ }m^3}{s}\right)^{1.852}}{(110)^{1.852} * (0.204 \text{ }m)^{4.87}}$$
$$H_L = 21.17 \text{ m}$$

Total Head Loss	= Friction Head Loss + Static Head (elevation different between boundary condition and building)
	= 21.17 m + 1.80 m
	= 22.97 m
Residual Pressure	= Ex. Residual Pressure – Total Head Loss
	= 415 kPa – (22.97 m * 9.81)
	= 190 kPa > 140 kPa

Residual pressure and pipe sizing check are summarized as shown in Table 2-6 and Table 2-7 in respect to the provided boundary condition. Refer to Appendix B for detail water services sizing and pressure analysis.

	Event Centre		North Side Stand	
Boundary Condition	Connection 1	Connection 2	Connection 1	Connection 2
Max Day + Fire Flow (l/s)	83.6	83.6	103.7	103.7
Existing Residual Pressure (kPa)	415	386	415	386
Length (m)	395	415	360	125
Total Headloss (kPa)	225	220	261	94
Residual Pressure for Site (kPa)	190	166	154	292

Table 2-6: Fire Service Pipe Sizing and Pressure Check for Event Centre and North Side Stand

Table 2-7: Domestic Service Pipe Sizing and Pressure Check for Event Centre and North Side Stand

	Event Centre		North Side Stand	
Boundary Condition	Connection 1	Connection 2	Connection 1	Connection 2
Peak Hour (l/s)	1.40	1.40	8.02	8.02
Existing Residual Pressure (kPa)	394	378	394	378
Length (m)	395	415	360	125
Total Headloss (kPa)	41	27	26	12
Residual Pressure for Site (kPa)	353	351	368	365

The minimum water pressure inside the building at the connection is determined with the minimum HGL condition, resulting in a pressure of 351 kPa for Event Centre and 365 kPa for North Side Stand which exceed the minimum requirement of 276 kPa per the guidelines.

Fire flow pressure at building connection is determined with the max day + fire HGL condition resulting in a pressure of 166 kPa for Event Centre and 154 kPa for North Side Stand which exceed the minimum requirement of 140 kPa during a fire flow event.

And based on the on-site hydrant flow test, the residual pressures of both hydrants that will be used to service the Event Centre (Field Entrance and On Field) are 414 kPa and 427 kPa, respectively. Thus, the hydrants meet the requirements for minimum system pressure. The measured hydrant flow at 20 psi were 2086 gpm (131.6 l/s) and 2471 gpm (155.9 l/s), respectively, which is greater than the existing hydrant maximum rating of 95 L/s.

2.4 CONFIRMATION OF ADEQUATE FIRE FLOW PROTECTION

The fire flow rate has been calculated using the Fire Underwriters Survey (FUS) method. The method takes into account the type of building construction, the building occupancy, the use of sprinklers and the exposures to adjacent structures.

Assuming fire resistive construction for North Side Stands and Event Centre and a fully supervised sprinkler system, the following have been determined: Fire flow demand of 6,000 l/min (100 l/s) for the North Side Stands and fire flow demand of 5,000 l/min (83 l/s) for the Event Centre. Copies of the FUS calculation sheets are included in Appendix B.

The existing available fire flow for the nearby private hydrants at 140 kPa range from 131.6 l/s to 176.0 l/s. Each proposed building can be serviced by two or more existing fire hydrants. The combined available fire flow exceeds the required fire flow by FUS for each proposed building.

And the boundary condition for Maximum Day and Fire Flow results from Table 2-5 in a pressure of 166 kPa at the ground floor level for Event Centre and 154 kPa for North Side Stand. In the guidelines, a minimum residual pressure of 140 kPa must be maintained in the distribution system for a fire flow and maximum day event. As a pressure of 166 kPa and 154 kPa is achieved, the fire flow requirement is exceeded.

The existing fire hydrants that will be used to meet the required Event Centre's fire flow demand of 5,000 l/min (83 l/s) are located at the Field Entrance and On Field as listed on Table 2-1. These two hydrants are proposed to be slightly shifted to accommodate the new Event Centre footprint and the proposed rerouted servicing. These 2 hydrants can provide up to 95 l/s with a combined total of 190 l/s which is greater than the FUS demand of 6,000 l/min (100 l/s) are located at the Field Entrance, On Field, Goodlife and Milestones as listed on Table 2-1. These hydrants can provide a total flow greater than the FUS demand for the North Side Stands, Therefore, the watermain system will have adequate capacity to service the Phase 1 and Phase 2 Lansdowne 2.0 development for new Event Centre and North Side Stands.

2.5 CHECK OF HIGH PRESSURE

High pressure is not a concern.

Water pressure at building connection (at average day) check:

Max. HGL – Finished floor elevation = 114.6m - 67.3m = 47.3m = 463.7 kPa

The maximum water pressure inside the Event Centre at the connection is determined with the maximum HGL condition, resulting in a pressure of 463.7 kPa which is less than the 552 kPa threshold in the guideline in which pressure control is required. Based on this result, pressure control is not required for the building.

2.6 PHASING CONSTRAINTS

There will be three different phases for the Lansdowne 2.0 redevelopment. Phase 1 and 2 will be the new Event Centre and North Side Stand. Phase 3 will be the Air Rights residential tower and commercial podium. The ultimate design condition, which assumes the ultimate condition is to be equal to or less than the existing conditions, is used for design consideration of this report. No on site and off-site upgrades are anticipated during the Phase 1 and 2 developments.

2.7 RELIABILITY REQUIREMENTS

Existing shut off valves will remain as per existing conditions. Additional shut off valves have been provided on the domestic services connecting to the Event Centre and North Side Stand.

2.8 NEED FOR PRESSURE ZONE BOUNDARY MODIFICATION

There is no need for a pressure zone boundary modification.

2.9 CAPABILITY OF MAJOR INFRASTRUCTURE TO SUPPLY SUFFICIENT WATER

The capability of the major infrastructure to supply sufficient water is confirmed.

2.10 DESCRIPTION OF PROPOSED WATER DISTRIBUTION NETWORK

The existing on-site network is proposed to be rerouted around the Event Centre and will be connected back onto the existing on-site watermain. New domestic services connecting to the on-site watermain is proposed to connect to the new Event Centre and North Side Stand. Two private hydrants will be slightly shifted to accommodate the Event Centre footprint and watermain rerouting. The overall site will continue to be serviced through existing 400mm and 200mm diameter watermains on Holmwood Avenue and Bank Street.

2.11 OFF-SITE REQUIREMENTS

No off-site improvements to watermains, feedermains, pumping stations, or other water infrastructure are required to maintain existing conditions and service the adjacent developments.

2.12 CALCULATION OF WATER DEMANDS

Water demands were calculated as described in Sections 2.3 and 2.4 above.

2.13 MODEL SCHEMATIC

The water works for phases 1 and 2 consist only a dual building services, the proposed condition are exactly the same as existing, a model schematic is not required for this development.

3 WASTEWATER DISPOSAL

3.1 DESIGN CRITERIA

In accordance with the City of Ottawa's Sewer Design Guidelines, the following design criteria have been utilized in order to predict wastewater flows generated by the subject site and complete the sewer design.

•	Minimum Velocity	0.6 m/s
•	Maximum Velocity	3.0 m/s
•	Manning Roughness Coefficient	0.013
•	Total est. hectares commercial and residential use	15.4
•	Average residential daily flow	280 L/cap/day
•	Average sanitary flow for institutional use	28,000 L/Ha/day
•	Commercial/Institutional Peaking Factor	1.5
•	Infiltration Allowance (Total)	0.33 L/Ha/s
•	Minimum Sewer Slopes – 200 mm diameter	0.32%

The area of 15.4 ha represents the lot area of the Lansdowne Park. This is the sanitary collection area that is being considered to contribute to the existing 600mm trunk sanitary sewer along Holmwood Ave.

3.2 CONSISTENCY WITH ZBLA FUNCTIONAL SERVICING AND STORMWATER MANAGEMENT STUDY

The outlet for the sanitary service from the proposed buildings is the 375 mm diameter private sewer. The Ottawa Sewer Design Guidelines provide estimates of sewage flows based on residential development.

The criteria to determine anticipated actual peak flow based on site used as described in Ottawa Sewer Design Guidelines Appendix 4-A are described in the sanitary sewer design sheet in Appendix C.

The contributing flows for the north stands, south stands and the Event Centre are based on the DSEL sanitary design sheet and Building Service Summary for Lansdowne Park (also found in Appendix C). The new Event Centre is assumed to provide 5.2 l/s of sanitary flow.

The proposed Lansdowne 2.0 increases the peak dry weather flow from 42.1 l/s to 48.92 l/s. Under wet weather flow condition, the peak discharge is also increased from 45.3 l/s to 53.54 l/s. The release rate of 53.54 l/s is the approved ultimate release rate as per the zoning approval.

Based on the correspondence with the City, the capacity of the downstream sewer is 77.07 l/s which is greater than the peak wet weather discharge of 53.54 l/s. Refer to Appendix C for correspondence.

3.3 REVIEW OF SOIL CONDITIONS

There are no specific local subsurface conditions that suggest the need for a higher extraneous flow allowance. Soil conditions have been reviewed by Patterson Group. Bedding and backfill will be provided as recommended, conventional sewer materials will be utilized, and dewatering will be undertaken as necessary in accordance with the geotechnical recommendations and conditions encountered. The geotechnical study specifies a design recommendation based on a maximum groundwater elevation of 60.78m. Therefore, groundwater should not be an issue for the sanitary network.

3.4 DESCRIPTION OF EXISTING SANITARY SEWER

The subject site lies within the Rideau River Interceptor catchment. The existing development is serviced by a 600mm diameter sanitary trunk sewer on Holmwood Street. The existing peak wastewater flow rates have been determined employing City guidelines based on building type and usage. The anticipated dry weather peak wastewater discharge from the site is 42.1 l/s while the wet weather peak is 45.3 l/s. The peak discharge from the development assumes that both the retail and stadium will be operating at maximum capacity. The existing sanitary design sheet is found in Appendix C.

3.5 VERIFICATION OF AVAILABLE CAPACITY IN DOWNSTREAM SEWER

The capacity of the downstream 375 mm diameter private sewer from existing sanitary manhole 7 to existing sanitary manhole 6 has 67.91 l/s capacity with slope at 0.15%, which is adequate for the flow assumptions from the proposed addition as noted above. The servicing pipe capacity is capable to handle the estimated peak sanitary flow rate of 53.54 l/s for the site include both existing and proposed. Please refer to sanitary sewer design sheet in Appendix C.

3.6 CALCULATIONS FOR NEW SANITARY SEWER

The new sanitary network consists of varying pipe sizes and slopes. The downstream pipe size that conveys all the combined wastewater flows from the site is a 375 mm diameter sewer at a minimum slope of 0.15%. This size and slope of sewer provides a capacity of 67.91 l/s.

For the subject area, the post-development sanitary peak flow is calculated at a total flow of 53.54 l/s. Both the proposed and existing sanitary sewers will have adequate capacity to convey this flow. Refer to Appendix C for the sanitary design sheet for details.

3.7 DESCRIPTION OF PROPOSED SEWER NETWORK

The proposed sanitary sewer network on site will consist of a sanitary network of varying sized pipes ranging from 250mm to 375mm and ten 1200mm maintenance holes. The proposed sanitary network function to reroute the existing sanitary network around the Event Centre footprint and eventually connect back into the existing network.

3.8 ENVIRONMENTAL CONSTRAINTS

There are no previously identified environmental constraints that impact the sanitary servicing design in order to preserve the physical condition of watercourses, vegetation, or soil cover, or to manage water quantity or quality.

3.9 PUMPING REQUIREMENTS

The proposed development will have no impact on existing pumping stations and will not require new pumping facilities.

3.10 FORCEMAINS

There are no sanitary forcemains proposed on this site.

3.11 EMERGENCY OVERFLOWS FROM SANITARY PUMPING STATIONS

No sanitary pumping stations are proposed on this site.

3.12 SPECIAL CONSIDERATIONS

There is no known need for special considerations for sanitary sewer design related to existing site conditions.

4 SITE STORM SERVICING

4.1 EXISTING CONDITION

The existing conditions on the Lansdowne site are as designed in the Stantec Stormwater Management Design Report – Lansdowne Urban Park (2012). The primary site stormwater outlet is to the storm sewer on O'Connor Street, which discharges to a combined sewer at the intersection with Fifth Street. During large storm events (i.e. exceeding 100-year return period) runoff is directed to the Rideau Canal through overland flow.

The existing stormwater management system consists of two subsurface storage tanks, surface storage on the Great Lawn, outlet controls, and quality control structures. The two underground storage tanks provide 600 m³ in Basin 1 and 2200 m³ in Basin 2, with 700 m³ provided in pipe storage (total of 3500 m³ subsurface storage). A minimum storage volume of 3000 m³ is also provided on the surface of the Great Lawn.

Based on the design criteria identified in the Stantec 2012 report (as per the OSDG 8.3.7.2 design criteria), the allowable release rate has been set to 616 l/s to O'Connor Street for all events from the 2-year to the 100-year return period.

4.2 ANALYSIS OF AVAILABLE CAPACITY IN PUBLIC INFRASTRUCTURE

As the allowable release rate from the site will be unchanged and was determined in conjunction with the design of the public infrastructure, there are no concerns related to the adequacy and available capacity of the downstream network. Capacity in the minor system is not a concern.

4.3 DRAINAGE DRAWING

Drawing C105A/C105B shows the detailed site sewer network. Drawings C104 provides proposed grading and drainage and includes existing grading information. Drawing C08 provides post-development drainage areas. Site subarea information is also provided on the storm sewer design sheet attached in Appendix C. Drainage patterns and storm sewers outside of the study limits are to remain per the existing condition.

4.4 WATER QUANTITY CONTROL OBJECTIVE

Refer to the Stormwater Management Report for the water quantity objective for the site.

4.5 WATER QUALITY CONTROL OBJECTIVE

On-site quality control measures are expected for the proposed development per the previous studies. Stormwater shall be treated to MOE enhanced protection (80% TSS removal of suspended solids). The 80% TSS removal will be provided from the Stormtech chamber via an OGS unit at STMH201. Most of the runoff from the redeveloped area going to the chambers comes from grassed areas, Event Centre roof, and other pedestrian/landscaped areas and thus the runoff is considered clean.

4.6 DESIGN CRITERIA

The stormwater system was designed following the principles of dual drainage, making accommodation for both major and minor flow.

Some of the key criteria include the following:

Design Storm (minor system)Rational Method Sewer Sizing	1:5-year return (Ottawa)
Initial Time of Concentration	10 minutes
Runoff Coefficients	
 Landscaped Areas 	C = 0.20
• Asphalt/Concrete	C = 0.90
 Traditional Roof 	C = 0.90
Pipe Velocities	0.80 m/s to 6.0 m/s
Minimum Pipe Size	250 mm diameter (200 mm CB Leads and service pipes)

4.7 PROPOSED MINOR SYSTEM

Under proposed conditions the majority of the site land use remains as it is under existing conditions, except for the new Event Centre with a traditional roof. The new event centre requires some rerouting of storm sewers and encroaches on the surface storage previously provided in the Great Lawn. The proposed design involves routing storm sewers south of the new Event Centre and installing subsurface storage beneath the Great Lawn to account for the additional storage required from the change in land use and elimination of storage available on the surface.

The subject site will be serviced by a storm sewer system designed in accordance with the amendment to the storm sewer and stormwater management elements of the Ottawa Design Guidelines. The minor system has been designed to convey the 5-year storm without ponding on the surface. Storm sewer design sheets are included in Appendix C.

The site outlets remain the same as they are in existing conditions. The primary outlet is to O'Connor Street to the north. During large storm events exceeding 100-year, runoff is directed to the Rideau Canal overland.

The major system will remain similar to how it is in existing conditions. The site is graded toward the Great Lawn where catch basins and trench drain around the perimeter will intercept overland runoff and direct it to the proposed underground storm chamber under the Great Lawn. Runoff within the Great Lawn will also be first intercepted by the subdrain along the perimeter, excess runoff that absorbed by the grass medium will also be intercepted by the weeper of the underground chamber down at the bottom, and ultimately directed to the piping system. Emergency overland flow is directed toward the Rideau Canal during extreme events exceeding the 100-year design storm.

4.8 STORMWATER MANAGEMENT

Refer to the Stormwater Management Report.

4.9 INLET CONTROLS

Refer to the Stormwater Management report.

4.10 ON-SITE DETENTION

Refer to the Stormwater Management report.

4.11 WATERCOURSES

There will be no modification to watercourses as a result of this proposed site plan.

4.12 PRE AND POST DEVELOPMENT PEAK FLOW RATES

Pre and post development peak flow rates have been noted in the Stormwater Management Report.

4.13 DIVERSION OF DRAINAGE CATCHMENT AREAS

There will be no diversion of existing drainage catchment areas arising from the proposed work described in this report.

4.14 DOWNSTREAM CAPACITY WHERE QUANTITY CONTROL IS NOT PROPOSED

This checklist item is not applicable to this development as quantity control is provided.

4.15 IMPACTS TO RECEIVING WATERCOURSES

No significant negative impact is anticipated to downstream receiving watercourses due to proposed quantity and quality control measures.

4.16 MUNICIPAL DRAINS AND RELATED APPROVALS

There are no municipal drains on the site or associated with the drainage from the site.

4.17 MEANS OF CONVEYANCE AND STORAGE CAPACITY

The means of flow conveyance and storage capacity are described in Sections 4.7, 4.8, 4.9 and 4.10 above.

4.18 HYDRAULIC ANALYSIS

Hydraulic calculations for the site storm sewers are provided in the storm sewer design sheet.

4.19 IDENTIFICATION OF FLOODPLAINS

There are no designated floodplains on the site of this development.

4.20 FILL CONSTRAINTS

There are no known fill constraints applicable to this site related to any floodplain. The site is generally being raised higher relative to existing conditions.

5 SEDIMENT AND EROSION CONTROL

5.1 GENERAL

During construction, existing storm sewer system can be exposed to sediment loadings. A number of construction techniques designed to reduce unnecessary construction sediment loadings will be used including:

- Silt sacks will remain on open surface structures such as manholes and catchbasins until these structures are commissioned and put into use.
- Installation of silt fence, where applicable, around the perimeter of the proposed work area.
- The installation of straw bales within existing drainage features surround the site.
- Bulkhead barriers will be installed in the outlet pipes.

During construction of the services, any trench dewatering using pumps will be fitted with a "filter sock." Thus, any pumped groundwater will be filtered prior to release to the existing surface runoff. The contractor will inspect and maintain the filter sock as needed including sediment removal and disposal.

All catchbasins, and to a lesser degree, manholes, convey surface water to sewers. Consequently, until the surrounding surface has been completed, these structures will be covered to prevent sediment from entering the minor storm sewer system. These measures will stay in place and be maintained during construction and build-out until it is appropriate to remove them.

During construction of any development both imported and native soils are placed in stockpiles. Mitigative measures and proper management to prevent these materials entering the sewer system are needed.

During construction of the deeper watermains and sewers, imported granular bedding materials are temporarily stockpiled on site. These materials are however quickly used up and generally placed before any catchbasins are installed.

Refer to the Erosion and Sedimentation Control Plan (drawing C06) provided in Appendix D.

6 APPROVAL AND PERMIT REQUIREMENTS

6.1 GENERAL

The proposed development is subject to site plan approval.

No approvals related to municipal drains are required.

An ECA amendment through the Transfer of Review process is anticipated for the new stormwater management facility. No other permits or approvals are anticipated to be required from the Ontario Ministry of Transportation, National Capital Commission, Parks Canada, Public Works and Government Services Canada, or any other provincial or federal regulatory agency.

7 CONCLUSION CHECKLIST

7.1 CONCLUSIONS AND RECOMMENDATIONS

It is concluded that the proposed development can meet all provided servicing constraints and associated requirements. It is recommended that this report be submitted to the City of Ottawa in support of the application for site plan approval.

7.2 COMMENTS RECEIVED FROM REVIEW AGENCIES

The outstanding comments from the ZBLA stage and preliminary review have been addressed. Further comments will be provided after the complete review. This is the revision 2 of the report.

APPENDIX

CITY AND NCC COMMENTS
 LANSDOWNE CIVIL DRAWINGS - STANTEC
 CONCEPTUAL ARCHITECTUAL PLAN
 AS-BUILT DRAWINGS
 TOPOGRAPHICAL SURVEY PLAN

ZBLA/OPA Comments to be Addressed During Site Plan Control Application

1. In addition to the above comment please see the previous comment from the ZBLA/OPA review regarding the underground storm water storage facility.

Geotechnical comments Section 5.8 states the following "It is understood that an underground stormwater infiltration tank system will be included as part of the proposed development. The tank is expected to be founded on a combination of in-situ, undisturbed silty sand/sandy silt and sandy fill. Based on the above, a bearing resistance value for the proposed structure may be considered to be 120 kPa (SLS) and a factored bearing resistance value at ULS of 180 kPa may be considered for the system and associated infrastructure/structures."

Please provide rational to how the subsurface soil data was determined. Based on the City guidelines we believe that an additional borehole be performed to determine the bearing capacity for the proposed storage tank.

The above comment remains outstanding, please revise the report to include information addressing the foundation design of the under-ground storm storage cistern. The geotechnical design should include discussion regarding the elevation of ground water table in relation to the underside of footing of the storage facility and how this may affect the design.

It is understood that the Great Lawn subsurface profile includes contaminated soil, the geotechnical report should speak to the contamination and any potential mitigation measures that may be required to ensure that migration of the contamination does not enter the underground storage facility.

- 2. Outstanding comments from ZBLA/OPA
 - a. Storm Water Management Modeling:

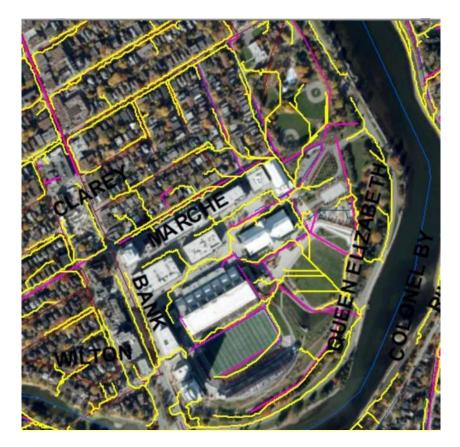

Please see comments from City of Ottawa Asset Management Branch regarding the storm water management model reviewed during the ZBLA and OPA. Comments were not addressed at the ZBLA and OPA, it is assumed that comments would be addressed during SPC.

In summary, the modeling approach appears overly generalized as it lacks detailed consideration of the primary system. Assumptions are made regarding the flow being directed solely into the minor storage system, without sufficient clarity on the management of overland drainage. Potential issues arising from overland drainage remain unaddressed. While the approach is

conservative regarding the minor system's storage and release rates, certain key factors are overlooked.

Of note, external areas draining onto the site, as evidenced by the GIS Stream Builder snapshot provided, are not accounted for. Additionally, the current design indicates flow into the canal during a 5-year storm event, contrary to the presented model. It's worth noting that our authorization allows for controlled releases into the canal up to a specified rate, as outlined in the previous report. Leveraging this authorization could be beneficial.

Further detailed comments are available below. It may be prudent to arrange a meeting with the consultant to articulate these concerns effectively.

Existing model

- a) There are IDs for the storm network based on city sources. Please use appropriate storm IDs and info to reflect the existing system. This will give us ease to review model files and documents.
- b) Storage node at Great lawn can be defined by a storage curve as opposed to a constant value of 8150. Not sure where does it come from?

- c) CB contributions in many areas are missing. Please consider CB captures where appropriate. For example, A3 subcatchment at TD place stadium– there are CBs within it, require assigning all CB captures to the minor system, and then excess runoff will travel to further downstream, similarly for A2, A4 etc.
- d) All underground storage areas need to be clearly shown on a map/drawing or in the model. At basin2 node for underground storage, DICB needs to be included. Also confirm the existence of 450 mm dia backflow preventor. I don't see any orifice control at that location as per drawing. Also, not sure how DICB, orifice and underground reservoir are connected to what?
- e) Area or catchbasin capture should be assigned at the beginning of the node, otherwise the system will lose its actual contributions, for example OPGG and Great lawn area/TD place stadium areas etc.
- f) At J19 node, this is used as a ponding location but no area is being assigned to that.
- g) Excess flow to Rideau Canal operating level at El 64.1 during a 5 year is 480 l/s (DSEL) after surcharging on-site, but WSP shows a 0.0 l/s during a 5 year (WSP). Appears to be quite different than previous findings. Please explain.
- h) Some external area (from the area in between of Clarey and Holmwood) for overland flow contribution may require including in the model and eventually drains to the Great lawn area as per city streambuilder.
- i) Please show the extent of ponding in the Great Lawn area.
- j) Major system modelling is kind of unclear. The major systems were modelled by weir, looks like everything is drained to the minor system first before overflowing to the next segment. Should be other way around, yes/no?
- k) As per Stantec schematic, 2x900 mm overflow from Basin 2 is connected to Great lawn area. This is not reflected in the existing model.

Proposed New Arena

 The proposed system for the new arena was not properly modelled as per functional drawing. Also, the drawing info in the Great Lawn area is not clear or labelled to follow the model files.

- m) The proposed pipe segment that connects to the existing outlet pipe to Rideau Canal should be included in the model.
- n) Basin 1 connecting to J32 was modelled a bit differently though the pre and post remains the same. What's the reason behind it where water comes in and out of Basin1 node in the proposed condition?
- o) The existing system (C8, C9, C11, C12) model should be in the proposed model as pipe storage as well unless these are proposed to be retired as per functional drawing. Please confirm
- p) Flow releasing to Rideau Canal was controlled by a orifice plate. This is not found in the existing model or in the drawing. Please confirm or show on a drawing for consistency.
- q) What size of underground storage facility is required instead of surface storage at Great lawn (basin3 node) if it is for recreational use? Modeling this storage node should be consistent with other underground storage curves. How many CBs are required to immediate capture flows to the proposed underground system to avoid ponding ? Require to include in the model as well.

Additional modeling comments post meeting on Monday 22nd 2024

- 3. WSP to confirm in the body of the servicing report that external flow from neighboring properties will not spill onto the Lansdowne property during the 100year event and below.
- 4. The major system needs to be included in the model to confirm flooding on the street.
- 5. Please provide pipe loss coefficients to the model.
- 6. My idea is that the **Rideau canal outlet** functions as an emergency flow. If the proposed great lawn storage is popped up by chance for the 100 year storm and above, then you may need an emergency exit. Please confirm the feasibility of decommissioning the Rideau Canal outfall. Note that this has been there for many years.
- 7. At node 40 linked to Basin2, please check the flow continuity at these locations.
- 8. Assuming the existing perforated system will be replaced by Great Lawn storage tank, still you may need some catch basins to capture local flows to the tank.

Comments:

9. Stormwater Management Quantity and Quality Criteria

It is assumed that the stormwater management criteria for the subject site, is to follow the recommendations of the Functional Servicing and Stormwater

Management Study prepared by WSP May 25, 2023, which was based on the design criteria as identified in the Stantec Stormwater Management Design Report – Lansdowne Urban Park (2012) as per OSDG 8.3.7.2. Design criteria are as follows:

- a. Peak flow rate of 616 L/s to O'Connor Street sewer for all events from the 2year to the 100-year return period
- b. Stormwater shall be treated to MOE "enhanced" standard (80% TSS removal)
- c. The "first flush" (i.e. 10mm event) shall be directed to the O'Connor Street sewer for the entire site drainage area.
- d. The 600mm pipe to the Rideau Canal may be used as an overflow, with a peak flow of 480 L/s once the water level is above the operating level of the canal (64.08 m).
- e. Outflow to O'Connor Street Sewer will be restricted if the downstream system surcharges and will be cut off when the receiving sewer HGL is higher than the onsite HGL.
- f. Minor system shall be design for a 5-year level of service with minimal surface ponding.
- g. Major system shall provide a 100-year level of service while minimizing outflow to the canal.
- h. The 5-yr storm event using the IDF information derived from the Meteorological Services of Canada rainfall data, taken from the MacDonald Cartier Airport, collected 1966 to 1997.
- i. For separated sewer system built pre-1970 the design of the storm sewers are based on a 2 year storm.
- j. The pre-development runoff coefficient or a maximum equivalent 'C' of 0.5, whichever is less (§ 8.3.7.3).
- k. A calculated time of concentration (Cannot be less than 10 minutes).
- I. Flows to the storm sewer in excess of the 5-year storm release rate, up to and including the 100-year storm event, must be detained on site.

10. Deep Services (Storm, Sanitary & Water Supply)

a. Provide existing servicing information and the recommended location for the proposed connections. Services should ideally be grouped in a common trench to minimize the number of road cuts.

- b. Connections to trunk sewers and easement sewers are typically not permitted.
- c. Provide information on the monitoring manhole requirements should be located in an accessible location on private property near the property line (ie. Not in a parking area).
- d. Review provision of a high-level sewer.
- e. Sewer connections to be made above the springline of the sewermain as per:
 - i. Std Dwg S11.1 for flexible main sewers connections made using approved tee or wye fittings.
 - ii. Std Dwg S11 (For rigid main sewers) lateral must be less that 50% the diameter of the sewermain,
 - Std Dwg S11.2 (for rigid main sewers using bell end insert method)

 for larger diameter laterals where manufactured inserts are not available; lateral must be less that 50% the diameter of the sewermain,
 - When the connection is to rigid main sewers where the lateral exceeds 50% the diameter of the sewermain connection via Maintenance hole is required. – Connect obvert to obvert with the outlet pipe.
 - v. No submerged outlet connections.
- 11. Water Boundary condition requests must include the location of the service (map or plan with connection location(s) indicated) and the expected loads required by the proposed development, including calculations. Please provide the following information:

Location of service

Type of development and the amount of fire flow required (as per FUS).

Average daily demand: ____ l/s.

Maximum daily demand: ____l/s.

Maximum hourly daily demand: ____ l/s.

Please **review Technical Bulletin ISTB-2018-02**, maximum fire flow hydrant capacity is provided in Section 3 Table 1 of Appendix I. A **hydrant coverage**

figure shall be provided and demonstrate there is adequate fire protection for the proposal.

[Fire flow demand requirements shall be based on **ISTB-2021-03**] Exposure separation distances shall be defined on a figure to support the FUS calculation and required fore flow (RFF).

Hydrant capacity shall be assessed to demonstrate the RFF can be achieved. Please identify which hydrants are being considered to meet the RFF on a fire hydrant coverage plan as part of the boundary conditions request.

- 12. An MECP Environmental Compliance Approval **[Industrial Sewage Works or Municipal/Private Sewage Works]** will be required for the proposed development. Please contact the Ministry of the Environment, Conservation and Parks, Ottawa District Office to arrange a pre-submission consultation:
 - a. Charlie Primeau at (613) 521-3450, ext. 251 or Charlie.Primeau@ontario.ca
 - b. Emily Diamond at (613) 521-3450, ext. 238 or Emily.Diamond@ontario.ca
- 13. Water

As per ISTB-2021-03, Industrial, commercial, institutional service areas with a basic day demand greater than 50 m³/day and residential areas serving 50 or more dwellings shall be connected with a minimum of two watermains, separated by an isolation valve, to avoid the creation of a vulnerable service area. Individual residential facilities with a basic day demand greater than 50 m³/day shall be connected with a minimum of two water services, separated by an isolation valve, to avoid the creation of a vulnerable service area.

- 14. Sewer (sanitary and storm)
 - a. Sanitary sewer capacity, Please provide the new Sanitary sewer discharge and we confirm if sanitary sewer main has the capacity.
 - b. Sanitary sewer monitoring maintenance hole is required to be installed at the property line (on the private side of the property) as per City of Ottawa Sewer-Use By-Law 2003-514 (14) *Monitoring Devices*.
 - c. A storm sewer monitoring maintenance hole is required to be installed at the property line (on the private side of the property) as per City of Ottawa Sewer-Use By-Law 2003-514 (14) *Monitoring Devices*.

15. Stormwater

a. Underground Storage: Please note that the Modified Rational Method for storage computation in the Sewer Design Guidelines was originally intended to be used for above ground storage (i.e. parking lot) where the change in head over the orifice varied from 1.5 m to 1.2 m (assuming a 1.2 m deep CB and a max ponding depth of 0.3 m). This change in head was small and hence the release rate fluctuated little, therefore there was no need to use an average release rate.

When underground storage is used, the release rate fluctuates from a maximum peak flow based on maximum head down to a release rate of zero. This difference is large and has a significant impact on storage requirements. We therefore require that an average release rate equal to 50% of the peak allowable rate shall be applied to estimate the required volume. Alternatively, the consultant may choose to use a submersible pump in the design to ensure a constant release rate.

In the event that there is a disagreement from the designer regarding the required storage, The City will require that the designer demonstrate their rationale utilizing dynamic modelling, that will then be reviewed by City modellers in the Water Resources Group.

Provide information on type of underground storage system including product name and model, number of chambers, chamber configuration, confirm invert of chamber system, top of chamber system, required cover over system and details, interior bottom slope (for self-cleansing), chart of storage values, length, width and height, capacity, entry ports (maintenance) etc. UG storage to provide actual 2- and 100-year event storage requirements.

In regard to all proposed UG storage, ground water levels (and in particular HGW levels) will need to be reviewed to ensure that the proposed system does not become surcharged and thereby ineffective.

Modeling can be provided to ensure capacity for both storm and sanitary sewers for the proposed development by City's Water Distribution Dept. – Modeling Group, through PM and upon request.

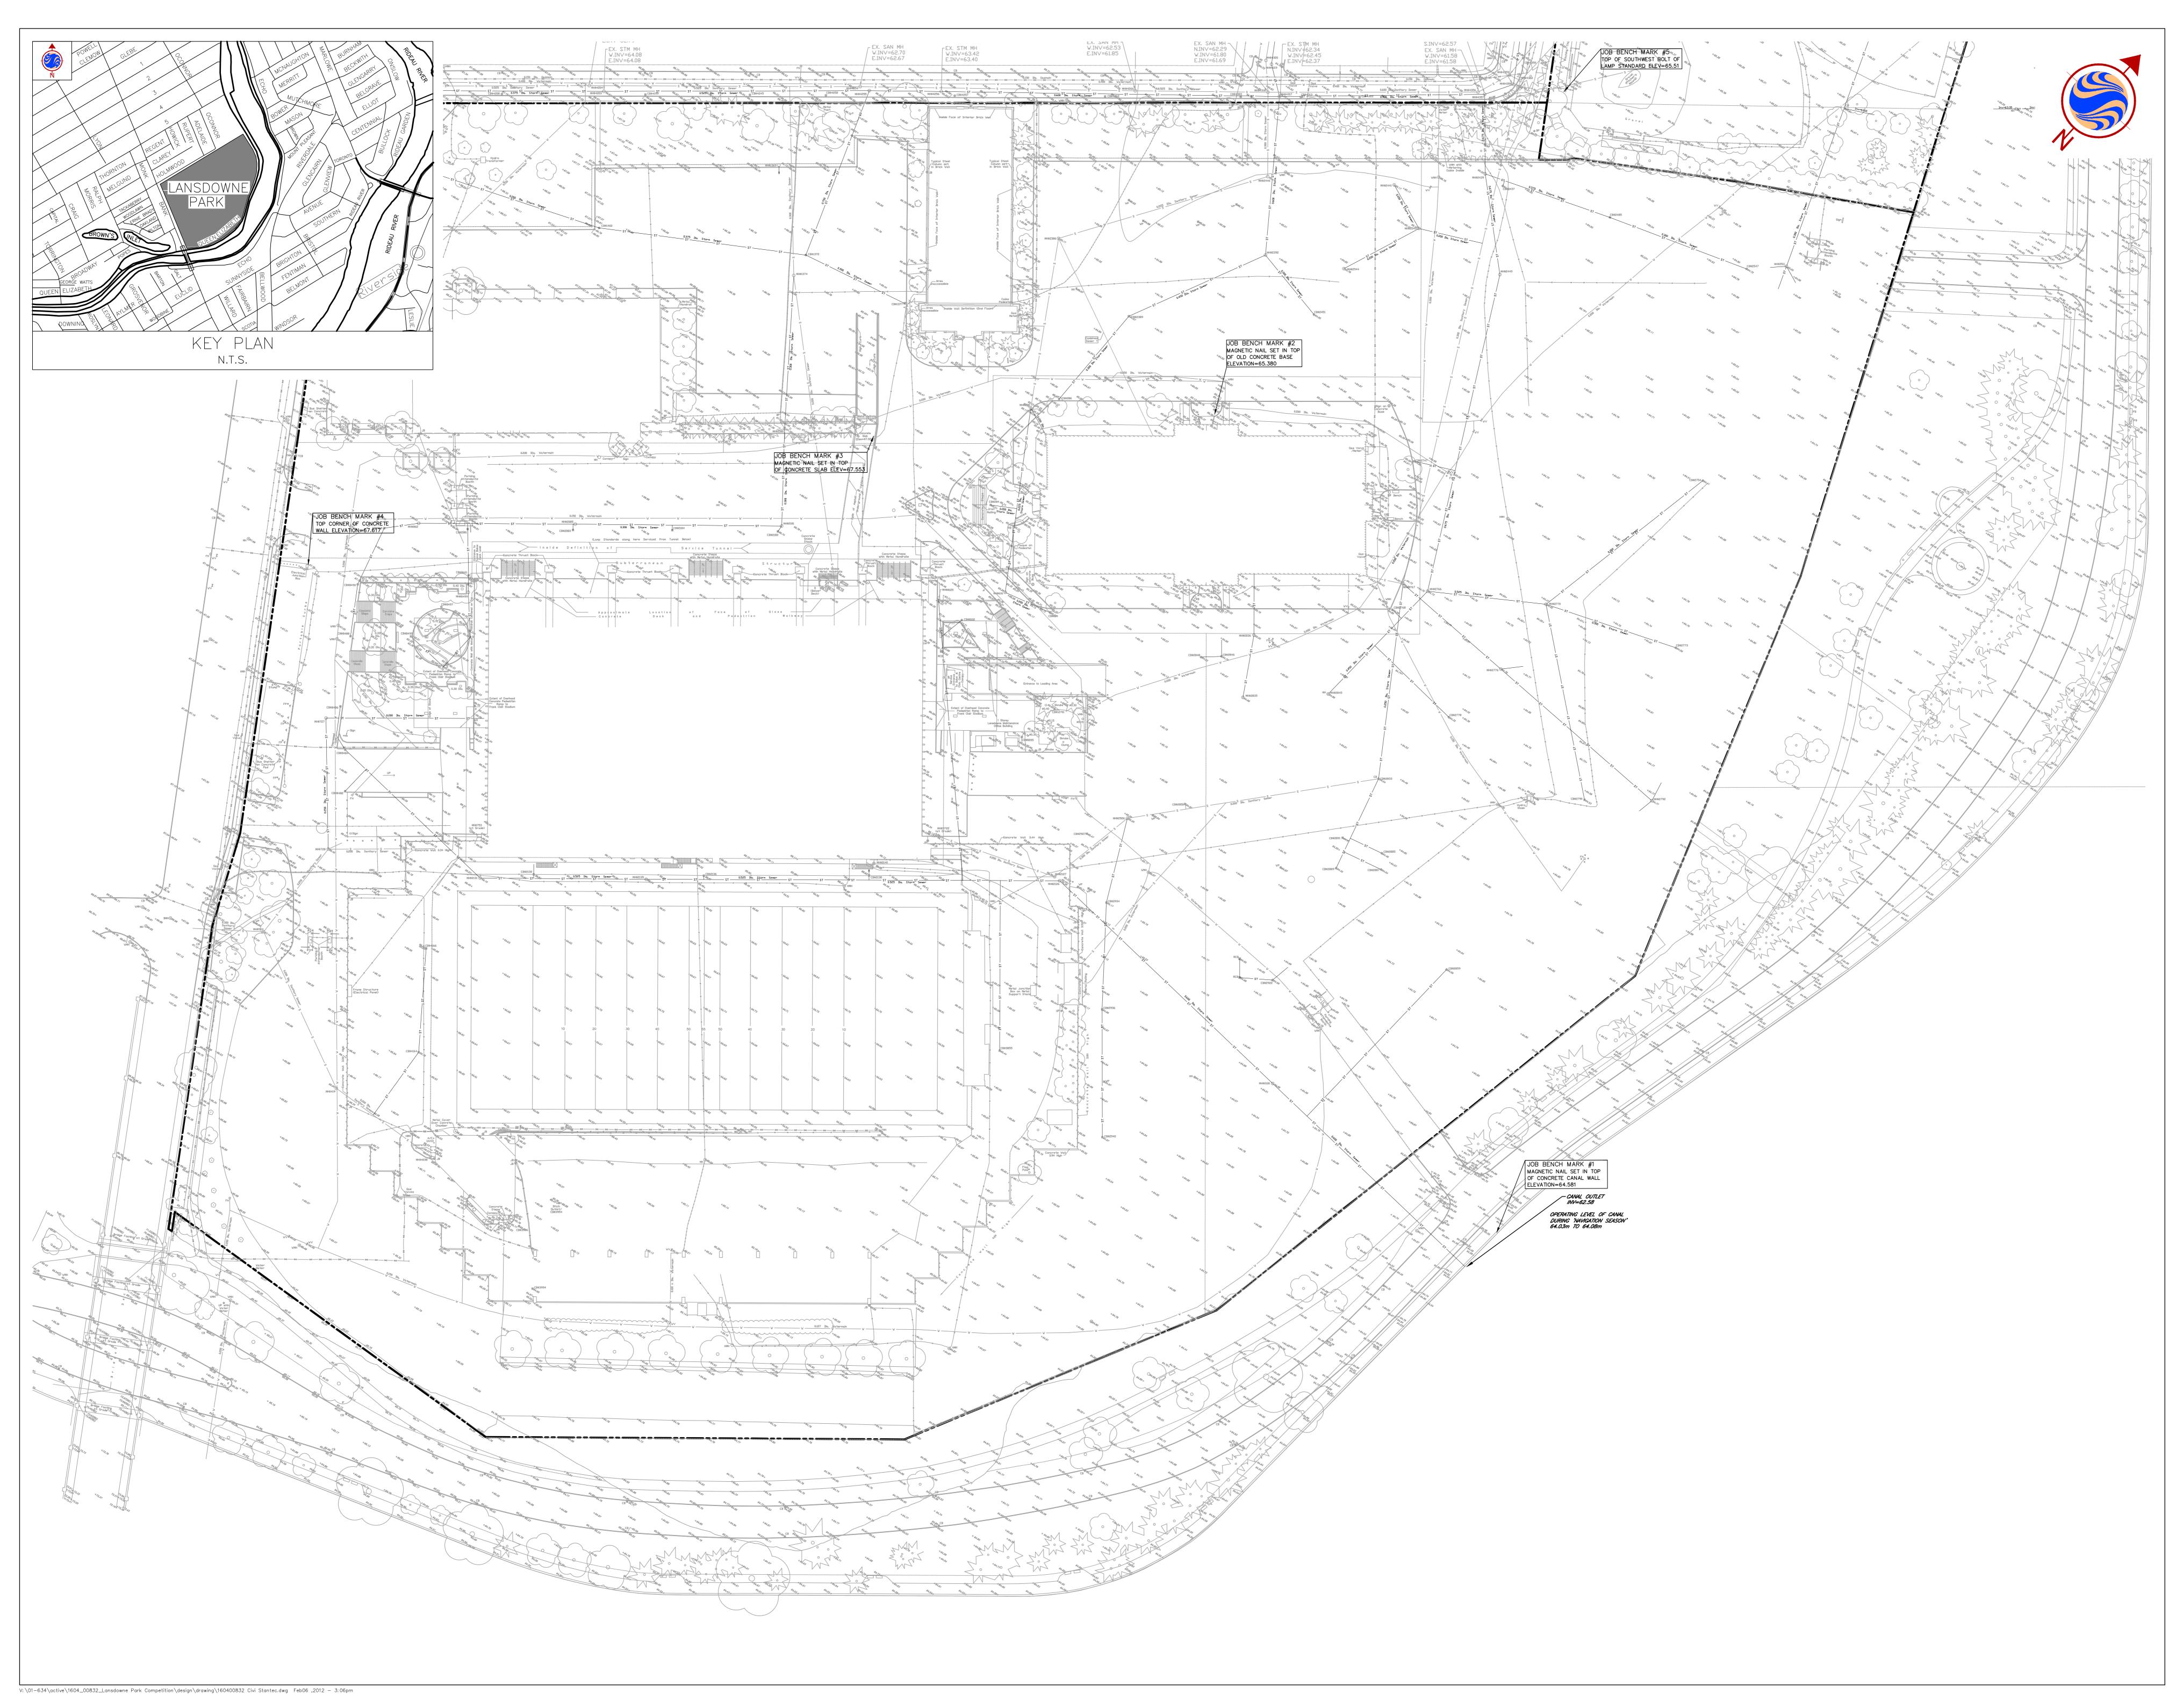

- b. **If rooftop control** and storage is proposed as part of the SWM solutions sufficient details (Cl. 8.3.8.4) shall be discussed and document in the report and on the plans. Roof drains are to be connected downstream of any incorporated ICDs within the SWM system and not to the foundation drain system. Provide a **Roof Drain Plan** as part of the submission.
- c. Please note that the minimum orifice dia. for a plug style ICD is 83mm and the minimum flow rate from a vortex ICD is 6 L/s in order to reduce the likelihood of plugging.
- d. Quality Control Stormwater shall be treated to MOE "enhanced" standard (80% TSS removal)

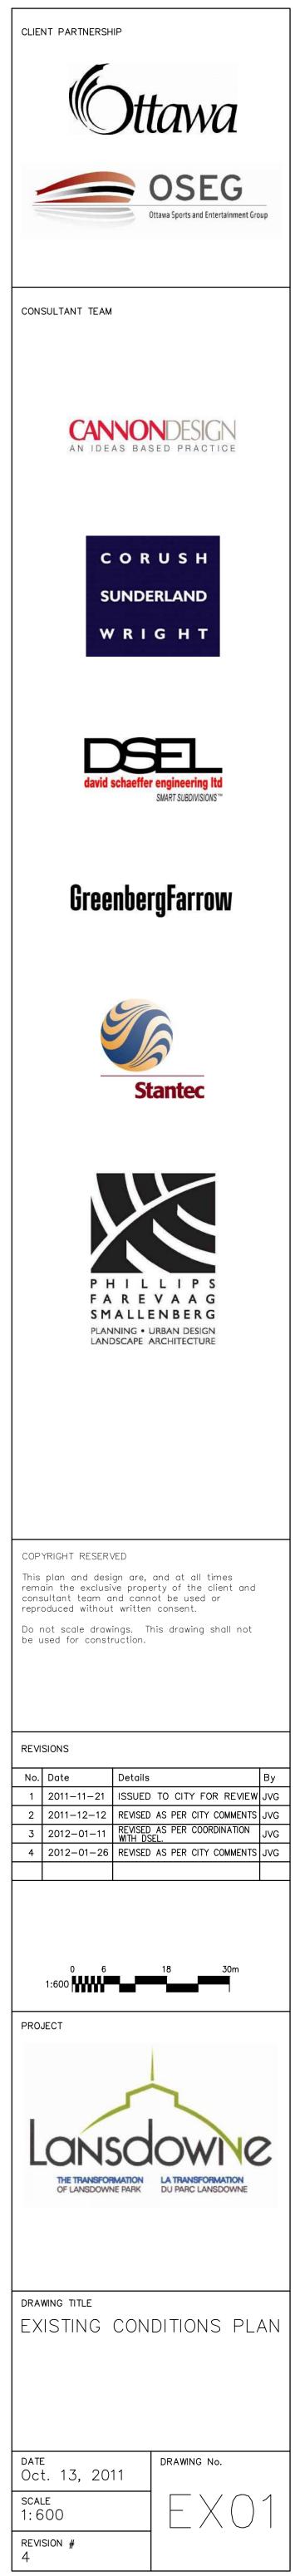

- e. The "first flush" (i.e. 10mm event) shall be directed to the O'Connor Street sewer for the entire site drainage area.
- f. Document how any foundation drainage system will be integrated into the servicing design and show the positive outlet on the plan. Foundation drainage is to be independently connected to sewer main unless being pumped with appropriate back up power, sufficient sized pump and back flow prevention. It is recommended that the foundation drainage system be drained by a sump pump connection to the storm sewer to minimize risk of basement flooding as it will provide the best protection from the uncontrolled sewer system compared to relying on the backwater valve.

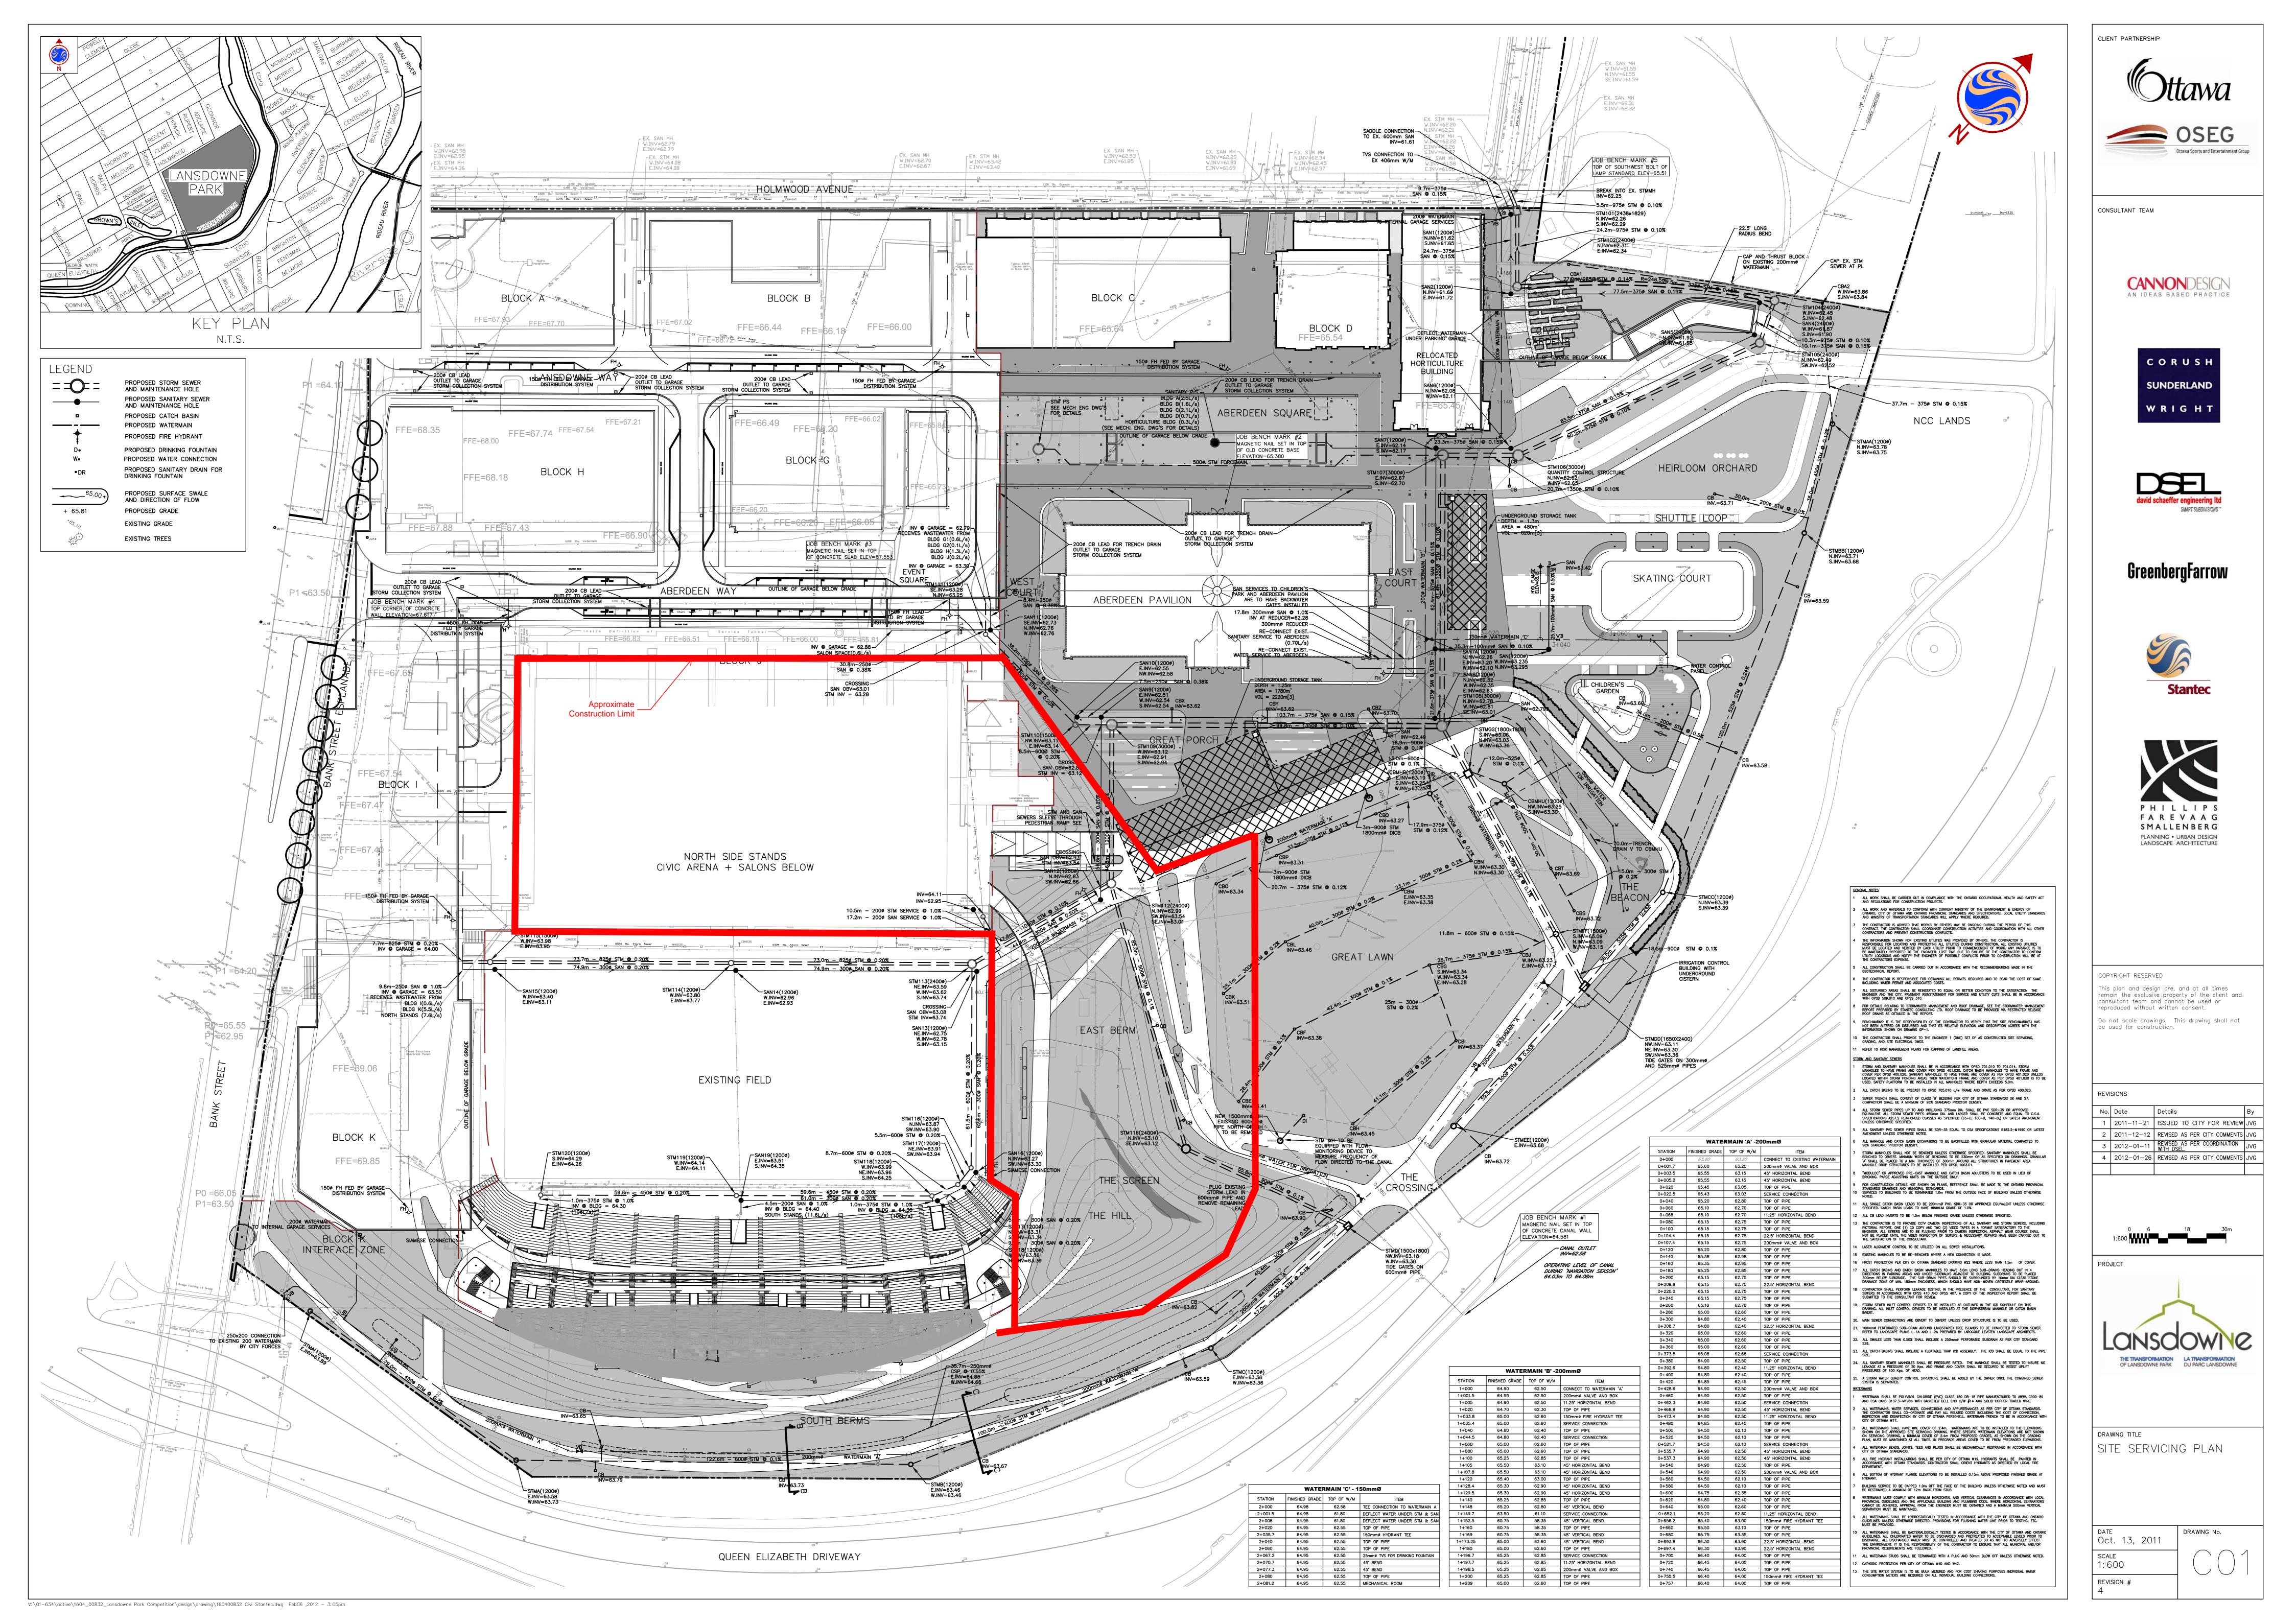

16. Grading

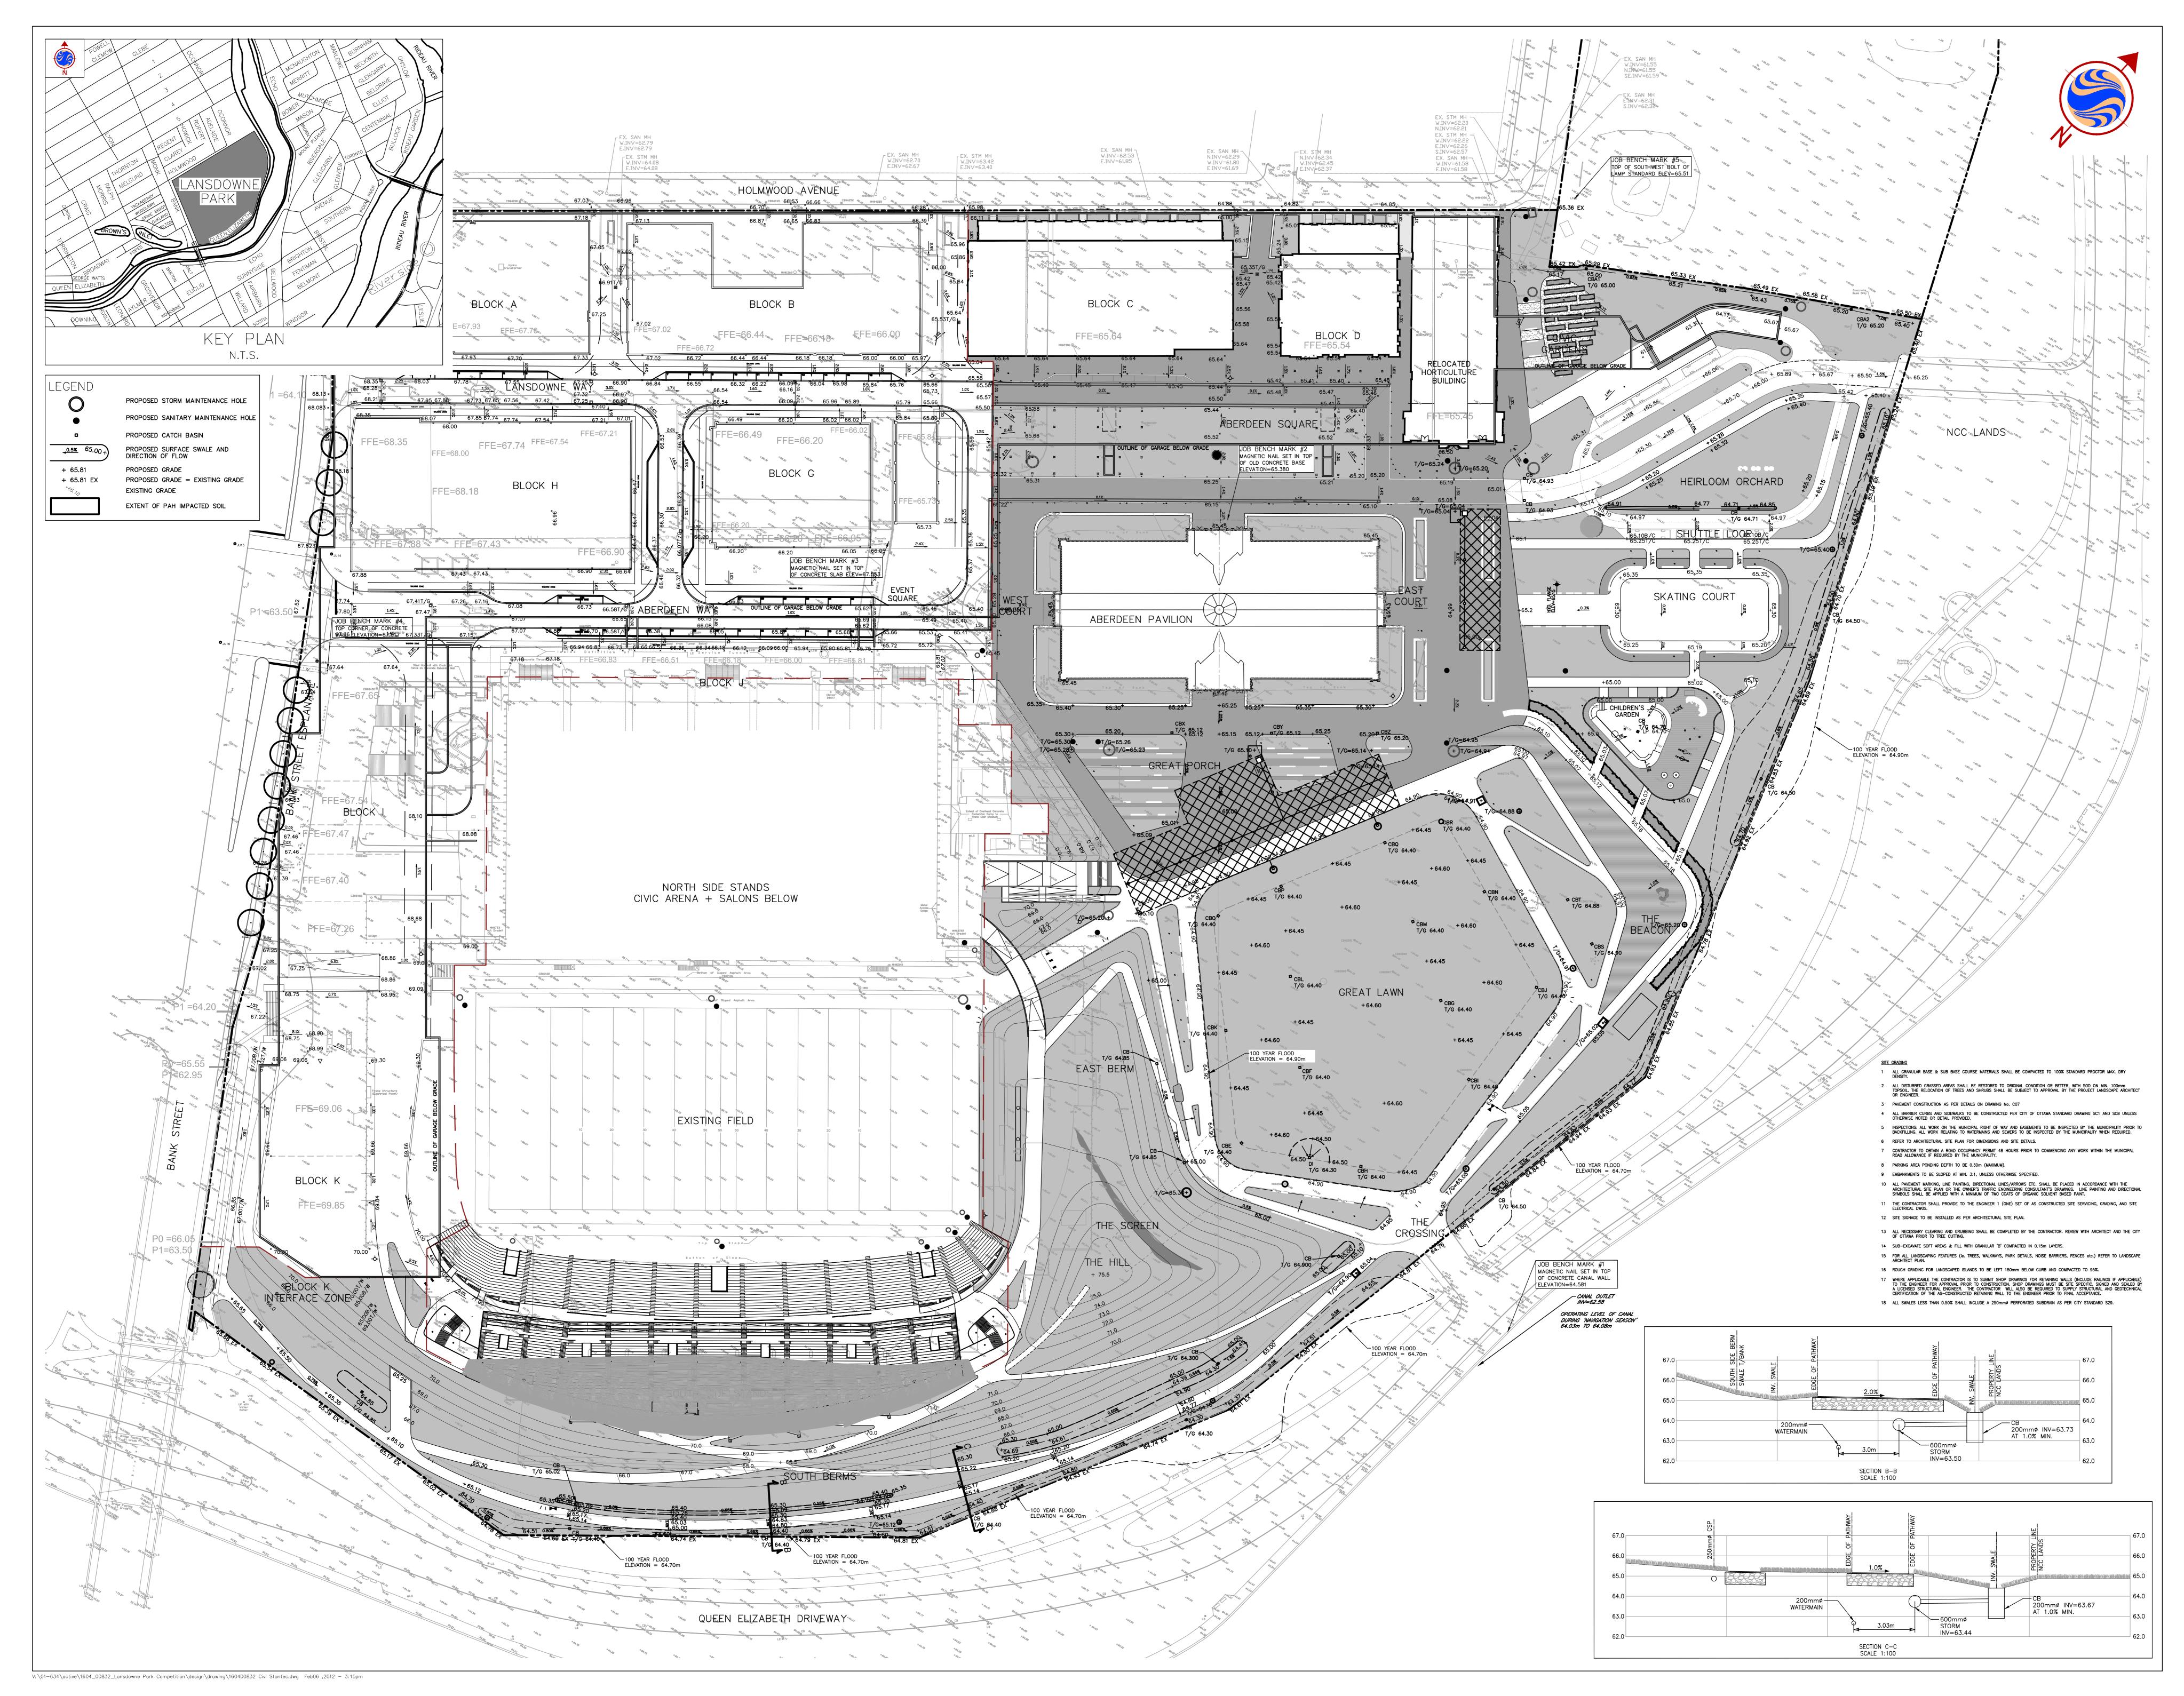

Post-development site grading shall match existing property line grades to minimize disruption to the adjacent residential properties. A **topographical plan of survey** shall be provided as part of the submission and a note provided on the plans.

- r) Are these extracted values from the model shown in Table 4-3? Please explain. Also, for comparison available storage can be added in the table.
- s) Detailed info in the model should be laid on a drawing to follow, for example J30, J31 and so on. Also, show a separate drawing sheet for post development condition only for clarity.

Subject:	RE: Lansdowne Park - Existing Building Water Demands	
Attachments:	Lansdowne 2.0 Redevelopment REVISED December 2024.pdf	

Good morning Ali,

Please find the results of the boundary condition request below:

Not much change in results from last BC that was provided. Fire flow governs. Since FF was the same there's no significant change in the BC.

Information Provided: (Water demands with New Additions) Average Day= 5.2 L/s Max Day= 13.0 L/s Peak Hour= 28.6 L/s Fire flow (RFF)= 150 L/s Development type: Commercial - New North Stands and New Event Center (Lansdowne 2.0 Redevelopment excluding Towers 1&2)

The following are boundary conditions, HGL, for hydraulic analysis at 1015 Bank Street, Lansdowne 2.0 Redevelopment (excluding Towers 1 &2), (zone 1W) assumed to be privately connected to the 305 mm watermain on Bank Street, AND the 406 mm watermain on Holmwood Avenue (see attached PDF for location).

Both Connections: Min HGL: 105.7 m Max HGL: 114.6 m Max Day + FF (150L/s): 107.8 m (Connection 1-Holmwood Avenue), 106.5 m (Connection 2-Bank Street)

These are for current conditions and are based on computer model simulation. Disclaimer: The boundary condition information is based on current operation of the city water distribution system. The computer model simulation is based on the best information available at the time. The operation of the water distribution system can change on a regular basis, resulting in a variation in boundary conditions. The physical properties of watermains deteriorate over time, as such must be assumed in the absence of actual field test data. The variation in physical watermain properties can therefore alter the results of the computer model simulation. Classified as City of Ottawa - Internal / Ville d'Ottawa - classé interne

Hi Ali,

Thank you for your email. We have sent the request to our water resources group as an urgent request last week. We have not received a response, however we will follow up with the status. I will let you know as soon as possible.

Kind regards,

Amy Whelan, E.I.T

Hi Amy,

I am following up on my request below.

Please note that we will be using the Metered Totals readings from the CARMA Metering report spreadsheet instead of the City Main Totals readings. This is because the Metered Totals reading will allow us to determine the individual demands of each of the buildings. This slightly changes the overall water demands of the site to the following:

<u>NEW: Water Demands (using residential peaking factors and OSEG CARMA Metering Data):</u>

Avg Day Demand = 5.41 L/s Max Day + Fire Flow Demand = 13.53 + 150 = 163.53 L/s Peak Hour Demand = 29.77 L/s

Let me know if you have any questions.

Subject: RE: Lansdowne Park - Existing Building Water Demands

Hi Amy,

Thank you for the confirmation below. We will include the spreadsheet in the appendix and include discussion and assumptions in the body regarding the approach. We will also use the residential peaking factors to be conservative.

We will need to request new boundary conditions as now the water demands are different from boundary request submitted in September 2024. Can you please take of this as soon as possible?

OLD: Sept 5, 2024 Boundary Condition Request:

Avg Day Demand = 12.3 L/s Max Day + Fire Flow Demand = 20.8 + 150 = 170.8 L/s Peak Hour Demand = 39.3 L/s

NEW: Water Demands (using residential peaking factors and OSEG CARMA Metering Data):

Avg Day Demand = 5.2 L/s Max Day + Fire Flow Demand = 13 + 150 = 163 L/s Peak Hour Demand = 28.6 L/s

Regards,

vsp

Subject: RE: Lansdowne Park - Existing Building Water Demands

Hi Winston and Zarak,

The average daily demand of 5.2L/s from the metering data is acceptable, please be sure to include the spread sheet information in the appendix of the report and include a discussion of the approach in the body of the report.

Additionally, we are okay with the assumptions detailed in Winston's email, again please be sure to include discussion of all assumptions in the body of the report.

What peaking factor are you proposing to use for the calculation will the average daily demands from the entire site be multiplied by one peaking factor or will the demands be segregated by each type of use? For simplicity and to remain conservative we would accept that the total site max day demand is calculated with the residential peaking factor. unless it is calculated individually for each use type.

Kind regards,

Amy Whelan, E.I.T

Hi Amy/Abdul,

Based on the OSEG CARMA Metering City Main Total readings (see attached spreadsheet), I have calculated an average day demand of <u>5.2 L/s</u> over a 12 month span of data for the entire site.

I took the City Main Totals readings from January to October from 2024 data and November/December City Main Totals readings from 2023 data to determine an average 12-month consumption of 13,443,083 L/month or about 5.2 L/s.

Please let us know your thoughts.

Regards,

Hi Amy,

We can update the calculation with the provided overall water meter data without knowing the consumption from each building as long as you are satisfied with the assumption we are going to make. We will assume that the future water demand will be equivalent in value to the existing demand or less.

Then we will just need to plug the number in to the current calculation. If the result shows minimum pressure is achieved, then further computer modeling includes the looping is not required for Phase 1 and 2.

Kindly let me know what's your thought.

Yours truly,

Winston Yang

Hi Winston,

Thank you for your email, have you received more information about the meter account locations? Sean informed me that two chamber meters relating to four account numbers were identified. Please let me know if you would like me to reach out to Rick Nelson from facilities.

Unfortunately, although we understand that the approach is conservative we cannot accept fire flow calculations that do not meet the minimum pressure requirements under max day + fire flow. Since, the analysis does not meet the minimum pressure requirements with out analyzing the looping we suggest that you wait for the metering data or provide a computer model that includes the looping.

Understanding, that we are operating under tight timelines we could consider that the servicing report will be required to be updated as a condition of approval prior to building permit. The condition would require that you update the calculations with the metering data, if the minimum pressure under max day + fire flow is still not achieved then a hydraulic watermain analysis of the entire site would be required, finally if the hydraulic watermain analysis shows that minimum pressure still can not be achieved then the private infrastructure would need to be upsized accordingly. We would have to work on the exact wording with our legal team.

Kind regards,

Amy Whelan, E.I.T

Hi Amy and Abdul,

If it takes time to sort out the water meter data and to identify the usage from different buildings, I would suggest to proceed with the below approach.

I have updated the calculation to include the overall demand for the entire Lansdowne site for both fire flow and minimum pressure check. Please see the below results for the updated residual pressure for each scenario.

	EC		NNS	
	Max Day+Fire	Peak Hour	Max Day+Fire	Peak Hour
	Flow		Flow	
BC from Bank	<mark>131 kPa < 140</mark>	334 kPa > 276	299 kPa > 140	363 kPa > 276
	<mark>kPa</mark>	kPa	kPa	kPa
BC from Holmwood	158 kPa > 140	337 kPa > 276	<mark>122 kPa < 140</mark>	353 kPa > 276
Ave	kPa	kPa	kPa	kPa

There are two feeds from City main to the Lansdowne Site. One at Bank Street near scoreboard and the other at the NE corner of Horticulture at Holmwood Ave. And there is an internal watermain looping system at Lansdowne.

As you can tell from the above results, most of the design pressures exceeds the minimum requirement except the boundary condition from Bank St to EC and boundary condition from Holmwood Ave to NNS. These two scenarios show the resulting pressures drop slightly below the

minimum requirement. But keep it in mind that this is a conservative scenario, the above calculations assume that the watermain would not be looped or interconnected, and the water service connection is assumed to connect to the building directly from the city main.

Base on the assumption without updating the demand from the city water meter data, we can conclude that the existing private watermain network at Lansdowne has sufficient pressure to provide adequate fire flow protection and secure minimum pressure during Peak Hour use.

Are you satisfied with the above approach?

Yours truly,

wsp

Hello all,

I just had a quick phone call with Winston to discuss the metering data and he informed me that a request has ben made to OSEG and they confirmed that they could get the information that WSP requires. If for some reason we can not get that information from OSEG then we can ask Rick Nelson to see if he has the account information.

Kind regards,

Hi Sue,

There is currently no GIS layer showing exact locations of water meters. There is a water service location layer that shows those WSL#s in the table below. However, that layer puts a point in the middle of a parcel, which means it could be anywhere on the property, not necessarily where the meter is located. The address and detailed description of meter location is probably the best info to use.

Hope this helps,

Please let me know if you have any questions,

Subject: FW: Lansdowne Park - Existing Building Water Demands

Good morning,

I see some info on GeoOttawa with details of watermain structure numbers, and I cannot match the chart below to any ID numbers on GeoOttawa, although the address dsecriptions make sense.

Do we have a map that would include the info in the chart below so the designer for the Lansdowne project can proceed? Thanks Sue

Hi Sue,

Can you look at the email below (see the Table) and let me know if there is some way we can use the structure ID and location number to on point exactly where the water meter is at Lansdowne Park -does staff have a map?

Our consulting engineer needs the location to finish their water design.

Thx

Sean

Hi So Sorry for the delay, See answers below,

- 1. Unit of measure is cubic meters
- 2. Here is some info I pulled from our Asset Management system. The identifier I previously gave you is the "ACCT" number. I hope between the address and the description you can identify where these meters are.

Structure ID	Location	Description
WSL00540604	588275	Water Service Location, WSL00540604, ACCT# 00540604, CHAMBER OPP #1 5TH AVE PKG L
WSL00530738	391449	Water Service Location, WSL00530738, ACCT#00530738, R F W, LS, N, B, 150, 1.0, OC, F, CU
WSL30059411	705517	Water Service Location, WSL30059411, ACCT#10069217, F.W, R.F, F, B, 020, 1.0, OC, CUST T
WSL00530736	377334	Water Service Location, WSL00530736, ACCT# 00530736, LSCW IN BOILER ROOM, LSCW LT
WSL60010180	739433	Water Service Location, WSL60010180, ACCT# 10081618, IN CHAMBER - 200 YARDS FROM
WSL60005535	722563	Water Service Location, WSL60005535, ACCT# 10077975, OPP 1018 BANK IN LANDSDOWN
WSL60005532	722565	Water Service Location, WSL60005532, ACCT# 10077977, OPP 1018 BANK IN LANDSDOWN
WSL60005533	722564	Water Service Location, WSL60005533, ACCT# 10077978, EAST CORNER OF LANDSDOWN O
WSL30059412	705595	Water Service Location, WSL30059412, ACCT#10069216, FURNACE RM, R.F, F, B, 020, 1.0, C
WSL60005534	722566	Water Service Location, WSL60005534, ACCT# 10077976, EAST CORNER OF LANDSDOWN O

3. The calculated consumption column is just a simple delta of the meter read column and not something derived from the meter reading system so it can be ignored and you can calculate your own deltas with error correction from the "meter read column"

Subject: RE: Lansdowne Park - Existing Building Water Demands

Hi Sean/Jonathan,

Thank you for the water consumption data. We had a few questions we were hoping you could help us with.

- 1. Can you provide us the units of measurement for the "Calculater Consumption" column and the "MeterRead" column?
- 2. There seem to be 9 different account numbers/meters (see image below). Are you able to provide information

on which building on the Lansdowne campus corresponds to each meter?

Unique acc numbers			
530736			
530738			
540604			
10069216			
10077975			
10077976			
10077977			
10077978			
10081618			

3. Can you verify that the 0 value data points (calculated consumption column) are correct data points and that the negative/large positive numbers (also calculated consumption column) are readings which can be ignored for purposes of determining average daily consumptions?

Regards,

Zarak Ali

Hi Sean,

I have some water consumption data as requested by WSP.

I do not have a working relationship with WSP so I do not know what level of data we can share with them. I have included account numbers and water consumption for the Lansdown meters.

If you see no issue with sharing this data with the consultant you may fwd it along.

Subject: RE: Lansdowne Park - CODE REPORT to interconnection

Good afternoon Sean,

Please find the updated boundary conditions enclosed in this email. Upon further internal discussion it was determined that due to the rationale that WSP consulting had indicated in the meeting held September 5th 2024 from 11:00am-12:00pm the City is willing to accept a spreadsheet type hydraulic watermain analysis. Please note that the requirement to model the entire private network has been lifted on an exceptional basis, for this specific application, and does not set precedent for future applications.

The applicant is required to demonstrate how the internal private network can support the proposed development i.e. the future event centre through the above mentioned hydraulic watermain analysis and include the results in their servicing report. The City does not accept hydrant pressure testing in place of a hydraulic watermain analysis.

The following details/changes are required for approval:

-Submit an updated boundary condition request to the City of Ottawa for the proposed event center only. (Completed)

-Include the boundary condition request correspondence email in the appendix of the servicing report.

-Remove all language in the site servicing report that states that the design is considering all three phases of the proposed Lansdowne design as it pertains to drinking water servicing.

-Provide the domestic demand calculations of the existing event center and provide the domestic demand calculations of proposed the event center.

-Provide the required fire flow calculations of the existing event center and the required fire flow calculations of the proposed event center.

-Provide discussion in the site servicing report explaining the rational discussed in the meeting detailing how the demands of the proposed event center can be met with the existing watermain network. In addition the report should justify that the proposed development will not negatively impact the existing hydraulic condition. This rational is required as a basis for the City to make an exception for this site to accept a hydraulic analysis using the spreadsheet approach.

-Provide a hydraulic watermain analysis that incorporates the hydraulic losses in the system from the boundary condition connection locations to the proposed event center. The hydraulic watermain analysis is required to include the existing demands from the existing buildings, please

contact water metering division to obtain the existing domestic water demand data (alice.zhang@ottawa.ca).

-Provide results of the spread sheet analysis demonstrating that the private system meets the criteria of section 4.2.2 of the Ottawa Design Guidelines – Water Distribution for the proposed event centers demands. This includes data that shows that the expected demands under average day, peak hour and fire flow conditions provide water within the required pressure ranges.

Requirements for future phases:

-All subsequent phases will require updated boundary conditions, and an updated hydraulic watermain analysis.

-Phase 3 Lansdowne project (towers and podium) will be required to demonstrate, via a hydraulic watermain analysis that the private system meets the criteria of section 4.2.2 of the Ottawa Design Guidelines – Water Distribution. The hydraulic watermain analysis will be required to analyze the entire private system and include the existing site demands and the proposed demands for the project.

If you have any questions or wish to arrange a meeting to discuss further, please let us know.

Kind regards,

Amy Whelan, E.I.T

Good morning Sean,

I am just following up to inform you that we are currently awaiting the boundary condition results from the updated request that Winston had sent yesterday. We would like to review the results of the boundary conditions internally and get back to you regarding the hydraulic watermain analysis requirement. As per the meeting we believe that we should be receiving the boundary condition results by Monday or Tuesday next week.

Kind regards,

Amy Whelan, E.I.T

Hi Sean and Abdul,

Attached is the code report prepared specifically for OSEG by Morrison Hershfield dated May 17, 2012 for the Lansdowne site and this information should be used on future developments on site.

The approach used at Lansdowne is unique and took some detailed conversations with the Authority having jurisdiction to come to an agreeable arrangement.

As you are aware that most of the existing watermain network is within the building garage, they are part of the building mechanical system, all these network are also inter-connected within the building plumping system and designed using the O.B.C requirement. The typical hydraulic water model that City uses to work on is not applicable for this site. The existing water network was designed and completed by few different consultants, Civil and Building Mechanical, etc., we are not able to put up a unique model that it's suitable for this site.

And as I have mentioned during the meeting, the worse case scenario is the max daily demand + fire flow within the development site shall be governed.

This is typical for all subdivision or site plan developments that we have to make sure there will be adequate demand available from each junction through the hydraulic analysis to meet the targeting max daily and fire.

As per previous approved design, fire flow of 150 l/s has been used for all the buildings within Lansdowne site.

For the current redevelopment phase 1 EC and phase 2 NNS, the max daily demand are almost the same, the fire flow is way less than 150 L/s. This is better off from the existing condition. If the existing network is working, issues for phase 1 and 2 should not be anticipated.

For future residential development (the two towers), hydraulic analysis is also not required because tower 1 and 2 will be part of the existing building, it should be treated as a single building as per the attached Code report since the underground parking is attached. The two towers will be serviced internally from the existing garage system.

Further analysis should be provided by the Architect and Mechanical consultant to verify the pressure for daily demand and fire protection during the design of the residential towers.

I am agree that we can obtain an updated boundary condition for city's record, but hydraulic analysis for the entire Lansdowne site is not necessary.

Simple hydraulic check on water pressure using the new boundary condition should be enough to verify the maximum and minimum pressures for phase 1 and 2.

And the hydrant flow test result can be used to confirm the adequate flow within the system down to 140 Kpa (20 psi) to meet the targeting the max daily + fire flow.

Feel free to reach out if you would like to discuss.

Yours truly,

wsp

Good afternoon Sean,

Please find the updated boundary conditions enclosed in this email. Upon further internal discussion it was determined that due to the rationale that WSP consulting had indicated in the meeting held September 5th 2024 from 11:00am-12:00pm the City is willing to accept a spreadsheet type hydraulic watermain analysis. Please note that the requirement to model the entire private network has been lifted on an exceptional basis, for this specific application, and does not set precedent for future applications.

The applicant is required to demonstrate how the internal private network can support the proposed development i.e. the future event centre through the above mentioned hydraulic watermain analysis and include the results in their servicing report. The City does not accept hydrant pressure testing in place of a hydraulic watermain analysis.

The following details/changes are required for approval:

-Submit an updated boundary condition request to the City of Ottawa for the proposed event center only. (Completed)

-Include the boundary condition request correspondence email in the appendix of the servicing report. -Remove all language in the site servicing report that states that the design is considering all three phases of the proposed Lansdowne design as it pertains to drinking water servicing.

-Provide the domestic demand calculations of the existing event center and provide the domestic demand calculations of proposed the event center.

-Provide the required fire flow calculations of the existing event center and the required fire flow calculations of the proposed event center.

-Provide discussion in the site servicing report explaining the rational discussed in the meeting detailing how the demands of the proposed event center can be met with the existing watermain network. In addition the report should justify that the proposed development will not negatively impact the existing hydraulic condition. This rational is required as a basis for the City to make an exception for this site to accept a hydraulic analysis using the spreadsheet approach.

-Provide a hydraulic watermain analysis that incorporates the hydraulic losses in the system from the boundary condition connection locations to the proposed event center. The hydraulic watermain analysis is required to include the existing demands from the existing buildings, please contact water metering division to obtain the existing domestic water demand data (<u>alice.zhang@ottawa.ca</u>).

-Provide results of the spread sheet analysis demonstrating that the private system meets the criteria of section 4.2.2 of the Ottawa Design Guidelines – Water Distribution for the proposed event centers demands. This includes data that shows that the expected demands under average day, peak hour and fire flow conditions provide water within the required pressure ranges.

Requirements for future phases:

-All subsequent phases will require updated boundary conditions, and an updated hydraulic watermain analysis. -Phase 3 Lansdowne project (towers and podium) will be required to demonstrate, via a hydraulic watermain analysis that the private system meets the criteria of section 4.2.2 of the Ottawa Design Guidelines – Water Distribution. The hydraulic watermain analysis will be required to analyze the entire private system and include the existing site demands and the proposed demands for the project.

If you have any questions or wish to arrange a meeting to discuss further, please let us know.

Kind regards,

Amy Whelan, E.I.T

Good morning Sean,

I am just following up to inform you that we are currently awaiting the boundary condition results from the updated request that Winston had sent yesterday. We would like to review the results of the boundary conditions internally and get back to you regarding the hydraulic watermain analysis requirement. As per the meeting we believe that we should be receiving the boundary condition results by Monday or Tuesday next week.

Kind regards,

Amy Whelan, E.I.T Project Manager, Infrastructure Approvals Development Review, Central | Examen des projets d'aménagement, Central Planning, Development and Building Services Department (PDBS) | Direction générale des services de la planification, de l'aménagement et du bâtiment (DGSPAB) City of Ottawa | Ville d'Ottawa 110 Laurier Avenue West Ottawa, ON | 110, avenue. Hi Sean and Abdul,

Attached is the code report prepared specifically for OSEG by Morrison Hershfield dated May 17, 2012 for the Lansdowne site and this information should be used on future developments on site.

The approach used at Lansdowne is unique and took some detailed conversations with the Authority having jurisdiction to come to an agreeable arrangement.

As you are aware that most of the existing watermain network is within the building garage, they are part of the building mechanical system, all these network are also inter-connected within the building plumping system and designed using the O.B.C requirement.

The typical hydraulic water model that City uses to work on is not applicable for this site.

The existing water network was designed and completed by few different consultants, Civil and Building Mechanical, etc., we are not able to put up a unique model that it's suitable for this site.

And as I have mentioned during the meeting, the worse case scenario is the max daily demand + fire flow within the development site shall be governed.

This is typical for all subdivision or site plan developments that we have to make sure there will be adequate demand available from each junction through the hydraulic analysis to meet the targeting max daily and fire. As per previous approved design, fire flow of 150 L/s has been used for all the buildings within Lansdowne site. For the current redevelopment phase 1 EC and phase 2 NNS, the max daily demand are almost the same, the fire flow is way less than 150 L/s. This is better off from the existing condition.

If the existing network is working, issues for phase 1 and 2 should not be anticipated.

For future residential development (the two towers), hydraulic analysis is also not required because tower 1 and 2 will be part of the existing building, it should be treated as a single building as per the attached Code report since the underground parking is attached.

The two towers will be serviced internally from the existing garage system.

Further analysis should be provided by the Architect and Mechanical consultant to verify the pressure for daily demand and fire protection during the design of the residential towers.

I am agree that we can obtain an updated boundary condition for city's record, but hydraulic analysis for the entire Lansdowne site is not necessary.

Simple hydraulic check on water pressure using the new boundary condition should be enough to verify the maximum and minimum pressures for phase 1 and 2.

And the hydrant flow test result can be used to confirm the adequate flow within the system down to 140 Kpa (20 psi) to meet the targeting the max daily + fire flow.

Feel free to reach out if you would like to discuss.

Yours truly,

Winston Yang

Hi John/Tarik,

Can you provide confirmation that the new Event Centre will be a Fully Supervised System as per the 2020 Fire Underwriter's Survey. A fully supervised system requires a proper supervision system including water flow and control valve alarm service. The City would like us to provide confirmation from mechanical consultant that the water service system for this building will have this arrangement.

Regards,

Zarak Ali Designer E.I.T Land Development & Municipal Engineering - Ontario

Hi John,

Please see attached CAD file for the 90% DD package and the pdf we have discussed on Tuesday.

By the way, we are looking for the domestic water demand for the New Event Centre and North Side Stand.

Do you have these finalized?

Yours truly,

wsp

Evening Winston,

I am hoping you can share your 90% DD package as we do not seem to have this on file.

Further to our discussion, please see attached plan for our EC storm, sanitary, and DCW connections.

For the fire protection line, we are currently determining whether we are feeding both EC & NNS from one fire service, or if we will provide a dedicated FSP line to NNS.

We are also working through the foundation drainage and hope to have the connection and detailed info to you by end of week, if not first thing next week.

Regards,

C: 647-454-1806 tmptoronto.com

Hi Winston,

Now that you have been retained by the City for new duct bank scope we would like to set up a coordination mtg for this and few other civil items to be captured in the civil package.

Can everyone pls confirm their availability for a mtg next: Monday Nov 25 between 1-4 Tuesday Nov 26 between 1-4

Regards, Sylvia

Fire Flow Design Sheet (FUS) Lansdwone Park Redevelopment City of Ottawa WSP Project No. CA000286.1662

Date: 22-Sep-23

Proposed North Stands

Fire Flow Requirements Based on Fire Underwriters Survey (FUS) 2020

1. An estimate of the Fire Flow required for a given fire area may be estimated by:

F = 220 C 🔨 A

 F = required fire flow in litres per minute

 C = coefficient related to the type of construction

 1.5 for Type V Wood Frame Construction

 0.8 for Type IV-A Mass Timber Construction

 0.9 for Type IV-B Mass Timber Construction

 1.0 for Type IV-C Mass Timber Construction

 1.5 for Type IV-D Mass Timber Construction

 1.6 for Type IV-D Mass Timber Construction

 1.6 for Type III Ordinary Construction

 0.8 for Type II Noncombustible Construction

 0.6 for Type I Fire resistive Construction

 A = 2-b) The single largest Floor Area plus 25% of each of the two immediately adjoining floors

 A =

 9318.1 m²

 C =
 0.6

C = 0.6F = 12742.0 L/min

rounded off to 13,000 L/min (min value of 2000 L/min)

2. The value obtained in 1. may be reduced by as much as 25% for occupancies having a low contents fire hazard.

Non-combustible -25%	
Limited Combustible -15%	
Combustible 0%	
Free Burning 15%	
Rapid Burning 25%	
Reduction due to low occupancy hazard	-25% x 13,000 = 9,750 L/min

3. The value obtained in 2. may be reduced by as much as 50% for buildings equipped with automatic sprinkler protection.

Adequate Sprinkler confirms to NFPA	13		-30%	6
Water supply common for sprinklers &	fire hoses		-10%	6
Fully supervised system			-10%	6
No Automatic Sprinkler System			0%	6
		r		=1
Reduction due to Sprinkler System	- <mark>50%</mark> _X 9,750	=	-4,8/5	5 L/min

4. The value obtained in 2. is increased for structures exposed within 45 metres by the fire area under consideration.

<u>Separation</u> 0 to 3 m 3.1 to 10 m 10.1 to 20 m 20.1 to 30 m 30.1 to 45 m	20% 15%

Notes

1) Retail floor areas for buildings A, B, C, D, G1, G2, H, I, J, J - Salon provided by Perkins Eastman - Novemeber 18, 2011. Above table uses total GFA.

2) Residential for Buildings A, B, C, D, and K component extracted from RFO Addendum 3 - October 20, 2011 as follows:

Parcel A1 = Residential Tower above Bldg A. 240units (280units max less townhomes) proportionate between Bldg A and K. Therefore, 240units x 66,000/316,000 = 50units.

Parcel A2 = Townhomes abutting buildings A, B, C, D. Assuming 1,225sq.ft townhomes = 40units. Divided between buildings per ground floor area shown on Perkins Eastman November 19, 2011 merchandising plan.

Bldg A = 3,426/19,104 x 40 = 7 units

Bldg B = 7,188/19,104 = 15 units

Bldg C = 5,096/19,104 = 11 units

Bldg D = 3,394/19,104 = 7units

Parcel B = Office tower above Building I, 90,000sq.ft.

Parcel C = Building K 240units (280units max less townhomes) proportionate between Bldg A and K. Therefore, 240units x 250,000/316,000 = 190units.

3) Mech. Eng. Servcing for Bldgs A, B, C, D, G1, G2, H provided by LKM, dated July 19, 2011. Revised Storm and Sanitary flow per November 29, 2011 email.

4) City of Ottawa rates were estimated accordingly

Water Supply

Retail: Average Day 2.5L/m²/d, Max Day = Avg Day x 1.5, Peak Hour = Avg Day x 2.7

Residential:

Townhouse Avg Day = 2.7p/unit x 350m³/d, Max Day = Avg Day x 2.5, Peak Hour = Avg Day x 5.5

Apartement Avg Day = 1.8p/unit x 350m³/d, Max Day = Avg Day x 2.5, Peak Hour = Avg Day x 5.5

Office: Average Day 75L/9.3m²/d, Max Day = Avg Day x 1.5, Peak Hour = Avg Day x 2.7

North and South Stands: City of Ottawa completed Flow Monitoring in 2005. A peak dry weather flow for a capacity game was recorded to be 15.1L/s.

Report titled "Lansdowne Park - 2005, Combined Sewer Flow Monitoring Report," G.A. Clark & Associates Limited, Proj. No: 200524

Interpolated Average Day, Max Day and, Peak Hour accordingly: Peak Hour = 15.1L/s, Max Day = Peak Hour / 1.8, Average Day = Peak Hour / 2.7

North and South stands flow proportioned by number of seating: North Stands = 14,542 South Stands = 14,284, as decribed in Lansdowne Park information material.

Civil Centre: Flow monitoring completed in 2005 indicated a peak a 4L/s. However, this recorded flow did not account for wastewater directed to Holmwood.

Civil Centre Flow estimated based on Stadium monitored flow and seating: 9,836 / 28,826 x 15.1 = 5.2L/s

Interpolated Average Day, Max Day and, Peak Hour accordingly: Peak Hour = 5.2L/s, Max Day = Peak Hour / 1.8, Average Day = Peak Hour / 2.7 <u>Wastewater</u>

Potoil: Avora

Retail: Average Day 5L/m²/d x 24hour day / 12hour operation, Peak = Average Day x 1.5

Residential: Townhouse Avg Day = 2.7p/unit x 350m³/d, Peak = Avg Day x 3.95

Townhouse Avg Day = 2.7p/unit x 350m / d, Peak = Avg Day x 3.95

Apartment Avg Day = $1.8p/unit \times 350m^3/d$, Peak = Avg Day x 3.95

Office: Average Day 75L/9.3m²/d, Peak = Avg Day x 1.5

North and South Stands: City of Ottawa completed Flow Monitoring in 2005. A peak dry weather flow for a capacity game was recorded to be 15.1L/s. Report titled "Lansdowne Park - 2005, Combined Sewer Flow Monitoring Report," G.A. Clark & Associates Limited, Proj. No: 200524

Peak flow interpreted as peak monitored flow (15.1L/s)

North stands flow proportioned by number of seating: North Stands = 14,542 South Stands = 14,284, as decribed in Lansdowne Park information material. Civil Centre: Flow monitoring completed in 2005 indicated a peak a 4L/s. However, this recorded flow did not account for wastewater directed to Holmwood.

Civil Centre Flow estimated based on Stadium monitored flow and seating: 9,836 / 28,826 x 15.1 = 5.2L/s

South Stands - Mechanical Consultant provided estimated peak Wastewater Flow Rate (Smith and Anderson (2011-12-02) servicing sketch)

<u>Storm</u>

See Separate Analysis - Estimated per City of Ottawa IDF curves and Control Flow roof drains where appropriate

North and South Stands assumed to have roof drains sized to accommodate 5-year storm only. To be confirmed by DSEL through modeling.

The proposed water supply network is illustration on *Drawing C01003* and the associated hydraulic analysis is located *Appendix B*. *Table 3* summarizes the anticipated Water Demand and Boundary Conditions under proposed conditions.

Table 4Water Demand and Boundary ConditionsProposed Conditions

Design Parameter	Anticipated Demand ¹ (L/s)	Boundary Condition ² (m H ₂ O / kPa)
Average Daily Demand	11.8	115.6 / 481.7
Max Day + Fire Flow	19.9 + 150 = 169.9	106.4 / 391.4
Peak Hour	38.0	103.1 / 359.0
 Water demand calcula detailed calculations. 	tion per Water Supply Guidelin	es. See Appendix B for

2) Boundary conditions supplied by the City of Ottawa. Assumed ground elevation *65.50m*. See *Appendix B.*

3.3 Fire Flow Requirements

Section 4.2.11 of the City Design guidelines for water distribution provides guidance for determining the method for estimating Fire Demand. As indicated, the requirements for levels of fire protection on private property are covered in the Ontario Building code. Section 7.2.11 of the OBC addresses the installation of water service pipes and fire service mains. Part 3 of the OBC outlines the requirement for Fire Protection, Occupant Safety, and Accessibility; and sub-section A-3.2.5.7 provides the provisions for fire fighting. Based on trained personnel responding to the emergency, and water supply being delivered through a municipal system, the required minimum provision for water supply shall not be less than 2,700L/min or greater than 9000L/min (OBC Section A.3.2.5.7, Table 2). Therefore, a conservative estimate for the required fire supply is 9000L/min (150L/s). A certified fire protection system specialist shall be employed to design the building fire suppression system(s) and confirm the actual fire flow demand.

City of Ottawa completed fire hydrant testing in **2007**. The testing indicated that water supply is available between **8,610/min** and **11,610L/min** at **140kPa**.

3.4 Water Supply Conclusion

Anticipated water demand under proposed conditions were submitted to the City of Ottawa for establishing boundary conditions considering the existing and proposed zoning.

As demonstrated in **Table 4**, the recommended pressure range is respected during Maximum Day plus Fire Flow as well as Peak Hour demands. A pressure check should be conducted at the completion of construction to determine if pressure control is required.

Table B2 - 200mm Domestic Service Pipe Sizing

WATERMAIN SIZING CALCULATIONS					COMMENTS
Average Day Flow:					
Project Area	Ha				
		=	5.41	L/s	As per City of Ottawa Water Distribution Guidelines and Existing
ADF _{BLDG} =	467,424 L/d		0	20	Consumption Data from Lansdowne 1.0
ADF _{TOTAL} =	467,424 L/d	=	5.41	L/s	Sum of ADF
	,				
Maximum Day Flow:					
Maximum Day Factor =	2.50				
		=	13.52	L/s	As per City of Ottawa Water Distribution Guidelines and Existing
MDF _{BLDG} =	1,168,128 L/d			20	Consumption Data from Lansdowne 1.0
	1,168,128 L/d		10 50	1/0	Sum of MDF
MDF _{TOTAL} =	1,100,120 L/U	=	13.52	L/S	
Peak Hour Flow:					
Peak Hour Factor =	2.20				
		=	29.73	l /c	As per City of Ottawa Water Distribution Guidelines and Existing
PHF _{BLDG} =	2,568,672 L/d	-	29.75	L/3	Consumption Data from Lansdowne 1.0
PHF _{TOTAL} =	2,568,672 L/d	=	29.7	L/s	Sum of PHF
Maximum Pressure =	552 kPa				As per City of Ottawa Water Distribution Guidelines
Minimum Pressure =	276 kPa				As per City of Ottawa Water Distribution Guidelines
Minimum Pressure under Fire Flow =	140 kPa				As per City of Ottawa Water Distribution Guidelines
Existing Static Pressure =	481 kPa				Boundary Condition provided by City at Holmwood Ave
Existing Residual Pressure =	394 kPa				Boundary Condition provided by City at Holmwood Ave
Ē					
Hazen-Williams Equation Parameters					
Design Flow =	29.7 L/s				From above - Peak Hour Flow
Length =	360 m				Measured (length from the Holmwood Watermain to Building Connection)
C =	110				As per City of Ottawa Water Distribution Guidelines
nside Diameter of Watermain =	204 mm				Assuming a PVC DR18 Watermain is used.
Solve for Friction Headloss =	2.18 m				Calculated using Hazen Williams Equation
Static Head =	<u>0.50</u> m				Estimated elevation difference (from boundary connection to building)
Total Headloss =	2.68 m	=	26	kPa	
Residual Pressure for Site =	368 kPa	>	276	kPa	Existing Residual pressure minus total headloss
	<u>300</u> Ki a	>	270	кга	Existing Residual pressure minus total headloss
The residual pressure for the proposed built	ding is calculated by	subtra	cting the	≏ total h	eadloss from the residual pressure measured on the connection on
			-		ove the minimum pressure for the given pipe size.
Fioliniwood Ave nom City Boundary Condition	on. The residual pres	Suicio			ove the minimum pressure for the given pipe size.
To present a conservative scenario, the abo	ove calculations assu	ime tha	at the se	ervice c	onnection must supply 100% of the building Peak Hour Flow and that the
watermain would not be looped or interconr	ected.

Subject:	FW: Sanitary sewer capacity confirmation for Lansdowne redevelopment

Hi Zarak,

See below email correspondence from Abdul Mottalib for the sanitary capacity confirmation during ZBLA. It should be good for **comment 3.41.**

Yours truly,

wsp

Winston Yang Lead Engineer – Technical Lead Land Development & Municipal Engineering, Ontario P.Eng., PMP.

Subject: FW: Sanitary sewer capacity confirmation for Lansdowne redevelopment

Hi Nwanise,

Please see below email. In terms of capacity, 77.07l/s is exceeding the city sewer capacity limit a bit. However as per the latest revised calculation, the demand is 54.82l/s which is lower than 77.07l/s, so the proposed development is acceptable.

--

Thanks,

Abdul Mohammad Abdul Mottalib, P. Eng. Extension: 27798 Sent: May 08, 2023 11:53 AM

Subject: RE: Sanitary sewer capacity confirmation for Lansdowne redevelopment

Hi Abdul

We ran the flow in the model and although there is a slight increase for all events, it is still withing acceptable levels. Regards

Subject: FW: Sanitary sewer capacity confirmation for Lansdowne redevelopment

Good afternoon,

Hope you are doing well. The below request is for sanitary capacity concern for Lansdown Project Phase 2.

Please take a look at it and let me know whether the city 600mm sanitary sewer on Holmwood Avenue has capacity to handle additional 27I/s flow from the proposed phase 2 development. With the additional flow, the total projected flow from the Lansdown Project will be 78I/s to the 600mm sanitary sewer on Holmwood Avenue.

It would be much appreciated if you could provide your response at your earliest possible time.

Thanks,

Abdul Mohammad Abdul Mottalib, P. Eng. Extension: 27798

Hi Abdul,

For my Lansdowne project can you action the below request about sanitary flows on Holmwood Ave

Thanks.

Sean.

Sean Moore, MCIP/RPP Director, Lansdowne Park Redevelopment Project | Directeur, Projet de réaménagement du parc Lansdowne Planning, Real Estate and Economic Development Department | Direction générale de la planification, des biens immobiliers et du développement économique City of Ottawa | Ville d'Ottawa

Hi Sean,

We would like to confirm if there is adequate capacity in the 600mm dia sanitary sewer on Holmwood Ave. to accommodate the projected additional sanitary sewer flows from the proposed Lansdowne 2.0 Redevelopment at 1015 Bank Street, Ottawa, ON.

The additional sanitary flows contributed by the site is estimated as 26.67L/s. The projected sanitary flows from the entire site will now be 77.07L/s.

See projected sanitary flow calculation and draft sanitary servicing plan attached.

Please do not hesitate to contact me if you have any questions.

Thank you.

Regards,

Regards,

Nwanise Nwanise, P.Eng. Project Engineer

Notes

1) Retail floor areas for buildings A, B, C, D, G1, G2, H, I, J, J - Salon provided by Perkins Eastman - Novemeber 18, 2011. Above table uses total GFA.

2) Residential for Buildings A, B, C, D, and K component extracted from RFO Addendum 3 - October 20, 2011 as follows:

Parcel A1 = Residential Tower above Bldg A. 240units (280units max less townhomes) proportionate between Bldg A and K. Therefore, 240units x 66,000/316,000 = 50units.

Parcel A2 = Townhomes abutting buildings A, B, C, D. Assuming 1,225sq.ft townhomes = 40units. Divided between buildings per ground floor area shown on Perkins Eastman November 19, 2011 merchandising plan.

Bldg A = 3,426/19,104 x 40 = 7 units

Bldg B = 7,188/19,104 = 15 units

Bldg C = 5,096/19,104 = 11 units

Bldg D = 3,394/19,104 = 7units

Parcel B = Office tower above Building I, 90,000sq.ft.

Parcel C = Building K 240units (280units max less townhomes) proportionate between Bldg A and K. Therefore, 240units x 250,000/316,000 = 190units.

3) Mech. Eng. Servcing for Bldgs A, B, C, D, G1, G2, H provided by LKM, dated July 19, 2011. Revised Storm and Sanitary flow per November 29, 2011 email.

4) City of Ottawa rates were estimated accordingly

Water Supply

Retail: Average Day 2.5L/m²/d, Max Day = Avg Day x 1.5, Peak Hour = Avg Day x 2.7

Residential:

Townhouse Avg Day = 2.7p/unit x 350m³/d, Max Day = Avg Day x 2.5, Peak Hour = Avg Day x 5.5

Apartement Avg Day = 1.8p/unit x 350m³/d, Max Day = Avg Day x 2.5, Peak Hour = Avg Day x 5.5

Office: Average Day 75L/9.3m²/d, Max Day = Avg Day x 1.5, Peak Hour = Avg Day x 2.7

North and South Stands: City of Ottawa completed Flow Monitoring in 2005. A peak dry weather flow for a capacity game was recorded to be 15.1L/s.

Report titled "Lansdowne Park - 2005, Combined Sewer Flow Monitoring Report," G.A. Clark & Associates Limited, Proj. No: 200524

Interpolated Average Day, Max Day and, Peak Hour accordingly: Peak Hour = 15.1L/s, Max Day = Peak Hour / 1.8, Average Day = Peak Hour / 2.7

North and South stands flow proportioned by number of seating: North Stands = 14,542 South Stands = 14,284, as decribed in Lansdowne Park information material.

Civil Centre: Flow monitoring completed in 2005 indicated a peak a 4L/s. However, this recorded flow did not account for wastewater directed to Holmwood.

Civil Centre Flow estimated based on Stadium monitored flow and seating: 9,836 / 28,826 x 15.1 = 5.2L/s

Interpolated Average Day, Max Day and, Peak Hour accordingly: Peak Hour = 5.2L/s, Max Day = Peak Hour / 1.8, Average Day = Peak Hour / 2.7 <u>Wastewater</u>

Retail: Average Day 5L/m²/d x 24hour day / 12hour operation, Peak = Average Day x 1.5

Residential: Townhouse Avg Day = $2.7p/unit \times 350m^3/d$, Peak = Avg Day x 3.95

Apartment Avg Day = $1.8p/unit \times 350m^3/d$, Peak = Avg Day $\times 3.95$

Office: Average Day 75L/9.3m²/d, Peak = Avg Day x 1.5

North and South Stands: City of Ottawa completed Flow Monitoring in 2005. A peak dry weather flow for a capacity game was recorded to be 15.1L/s. Report titled "Lansdowne Park - 2005, Combined Sewer Flow Monitoring Report," G.A. Clark & Associates Limited, Proj. No: 200524

Peak flow interpreted as peak monitored flow (15.1L/s)

North stands flow proportioned by number of seating: North Stands = 14,542 South Stands = 14,284, as decribed in Lansdowne Park information material. Civil Centre: Flow monitoring completed in 2005 indicated a peak a 4L/s. However, this recorded flow did not account for wastewater directed to Holmwood.

Civil Centre Flow estimated based on Stadium monitored flow and seating: 9.836 / 28,826 x 15.1 = 5.2L/s

South Stands - Mechanical Consultant provided estimated peak Wastewater Flow Rate (Smith and Anderson (2011-12-02) servicing sketch)

Storm

See Separate Analysis - Estimated per City of Ottawa IDF curves and Control Flow roof drains where appropriate

North and South Stands assumed to have roof drains sized to accommodate 5-year storm only. To be confirmed by DSEL through modeling.

Servicing study guidelines for development applications

4. Development Servicing Study Checklist

The following section describes the checklist of the required content of servicing studies. It is expected that the proponent will address each one of the following items for the study to be deemed complete and ready for review by City of Ottawa Infrastructure Approvals staff.

The level of required detail in the Servicing Study will increase depending on the type of application. For example, for Official Plan amendments and re-zoning applications, the main issues will be to determine the capacity requirements for the proposed change in land use and confirm this against the existing capacity constraint, and to define the solutions, phasing of works and the financing of works to address the capacity constraint. For subdivisions and site plans, the above will be required with additional detailed information supporting the servicing within the development boundary.

4.1 General Content

- Executive Summary (for larger reports only).
- Date and revision number of the report.
- □ Location map and plan showing municipal address, boundary, and layout of proposed development.
- Plan showing the site and location of all existing services.
- Development statistics, land use, density, adherence to zoning and official plan, and reference to applicable subwatershed and watershed plans that provide context to which individual developments must adhere.
- □ Summary of Pre-consultation Meetings with City and other approval agencies.
- Reference and confirm conformance to higher level studies and reports (Master Servicing Studies, Environmental Assessments, Community Design Plans), or in the case where it is not in conformance, the proponent must provide justification and develop a defendable design criteria.
- Statement of objectives and servicing criteria.
- □ Identification of existing and proposed infrastructure available in the immediate area.
- Identification of Environmentally Significant Areas, watercourses and Municipal Drains potentially impacted by the proposed development (Reference can be made to the Natural Heritage Studies, if available).
- Concept level master grading plan to confirm existing and proposed grades in the development. This is required to confirm the feasibility of proposed stormwater management and drainage, soil removal and fill constraints, and potential impacts to neighbouring properties. This is also required to confirm that the proposed grading will not impede existing major system flow paths.
- □ Identification of potential impacts of proposed piped services on private services (such as wells and septic fields on adjacent lands) and mitigation required to address potential impacts.
- Proposed phasing of the development, if applicable.

- Reference to geotechnical studies and recommendations concerning servicing.
- All preliminary and formal site plan submissions should have the following information:
 Metric scale
 - North arrow (including construction North)
 - Key plan
 - Name and contact information of applicant and property owner
 - Property limits including bearings and dimensions
 - Existing and proposed structures and parking areas
 - · Easements, road widening and rights-of-way
 - Adjacent street names

4.2 Development Servicing Report: Water

- Confirm consistency with Master Servicing Study, if available
- Availability of public infrastructure to service proposed development
- □ Identification of system constraints
- □ Identify boundary conditions
- □ Confirmation of adequate domestic supply and pressure
- □ Confirmation of adequate fire flow protection and confirmation that fire flow is calculated as per the Fire Underwriter's Survey. Output should show available fire flow at locations throughout the development.
- Provide a check of high pressures. If pressure is found to be high, an assessment is required to confirm the application of pressure reducing valves.
- Definition of phasing constraints. Hydraulic modeling is required to confirm servicing for all defined phases of the project including the ultimate design
- Address reliability requirements such as appropriate location of shut-off valves
- □ Check on the necessity of a pressure zone boundary modification.
- Reference to water supply analysis to show that major infrastructure is capable of delivering sufficient water for the proposed land use. This includes data that shows that the expected demands under average day, peak hour and fire flow conditions provide water within the required pressure range

- Description of the proposed water distribution network, including locations of proposed connections to the existing system, provisions for necessary looping, and appurtenances (valves, pressure reducing valves, valve chambers, and fire hydrants) including special metering provisions.
- Description of off-site required feedermains, booster pumping stations, and other water infrastructure that will be ultimately required to service proposed development, including financing, interim facilities, and timing of implementation.
- □ Confirmation that water demands are calculated based on the City of Ottawa Design Guidelines.
- Provision of a model schematic showing the boundary conditions locations, streets, parcels, and building locations for reference.

4.3 Development Servicing Report: Wastewater

- Summary of proposed design criteria (Note: Wet-weather flow criteria should not deviate from the City of Ottawa Sewer Design Guidelines. Monitored flow data from relatively new infrastructure cannot be used to justify capacity requirements for proposed infrastructure).
- □ Confirm consistency with Master Servicing Study and/or justifications for deviations.
- Consideration of local conditions that may contribute to extraneous flows that are higher than the recommended flows in the guidelines. This includes groundwater and soil conditions, and age and condition of sewers.
- Description of existing sanitary sewer available for discharge of wastewater from proposed development.
- Verify available capacity in downstream sanitary sewer and/or identification of upgrades necessary to service the proposed development. (Reference can be made to previously completed Master Servicing Study if applicable)
- □ Calculations related to dry-weather and wet-weather flow rates from the development in standard MOE sanitary sewer design table (Appendix 'C') format.
- Description of proposed sewer network including sewers, pumping stations, and forcemains.
- Discussion of previously identified environmental constraints and impact on servicing (environmental constraints are related to limitations imposed on the development in order to preserve the physical condition of watercourses, vegetation, soil cover, as well as protecting against water quantity and quality).
- Pumping stations: impacts of proposed development on existing pumping stations or requirements for new pumping station to service development.
- □ Forcemain capacity in terms of operational redundancy, surge pressure and maximum flow velocity.
- □ Identification and implementation of the emergency overflow from sanitary pumping stations in relation to the hydraulic grade line to protect against basement flooding.
- Special considerations such as contamination, corrosive environment etc.

4.4 Development Servicing Report: Stormwater Checklist

- Description of drainage outlets and downstream constraints including legality of outlets (i.e. municipal drain, right-of-way, watercourse, or private property)
- Analysis of available capacity in existing public infrastructure.
- A drawing showing the subject lands, its surroundings, the receiving watercourse, existing drainage patterns, and proposed drainage pattern.
- □ Water quantity control objective (e.g. controlling post-development peak flows to pre-development level for storm events ranging from the 2 or 5 year event (dependent on the receiving sewer design) to 100 year return period); if other objectives are being applied, a rationale must be included with reference to hydrologic analyses of the potentially affected subwatersheds, taking into account long-term cumulative effects.
- □ Water Quality control objective (basic, normal or enhanced level of protection based on the sensitivities of the receiving watercourse) and storage requirements.
- Description of the stormwater management concept with facility locations and descriptions with references and supporting information.
- Set-back from private sewage disposal systems.
- □ Watercourse and hazard lands setbacks.
- □ Record of pre-consultation with the Ontario Ministry of Environment and the Conservation Authority that has jurisdiction on the affected watershed.
- □ Confirm consistency with sub-watershed and Master Servicing Study, if applicable study exists.
- Storage requirements (complete with calculations) and conveyance capacity for minor events (1:5 year return period) and major events (1:100 year return period).
- □ Identification of watercourses within the proposed development and how watercourses will be protected, or, if necessary, altered by the proposed development with applicable approvals.
- □ Calculate pre and post development peak flow rates including a description of existing site conditions and proposed impervious areas and drainage catchments in comparison to existing conditions.
- Any proposed diversion of drainage catchment areas from one outlet to another.
- □ Proposed minor and major systems including locations and sizes of stormwater trunk sewers, and stormwater management facilities.
- ☐ If quantity control is not proposed, demonstration that downstream system has adequate capacity for the post-development flows up to and including the 100 year return period storm event.
- □ Identification of potential impacts to receiving watercourses
- □ Identification of municipal drains and related approval requirements.
- Descriptions of how the conveyance and storage capacity will be achieved for the development.
- 100 year flood levels and major flow routing to protect proposed development from flooding for establishing minimum building elevations (MBE) and overall grading.

- □ Inclusion of hydraulic analysis including hydraulic grade line elevations.
- Description of approach to erosion and sediment control during construction for the protection of receiving watercourse or drainage corridors.
- □ Identification of floodplains proponent to obtain relevant floodplain information from the appropriate Conservation Authority. The proponent may be required to delineate floodplain elevations to the satisfaction of the Conservation Authority if such information is not available or if information does not match current conditions.
- □ Identification of fill constraints related to floodplain and geotechnical investigation.

4.5 Approval and Permit Requirements: Checklist

The Servicing Study shall provide a list of applicable permits and regulatory approvals necessary for the proposed development as well as the relevant issues affecting each approval. The approval and permitting shall include but not be limited to the following:

- Conservation Authority as the designated approval agency for modification of floodplain, potential impact on fish habitat, proposed works in or adjacent to a watercourse, cut/fill permits and Approval under Lakes and Rivers Improvement Act. The Conservation Authority is not the approval authority for the Lakes and Rivers Improvement Act. Where there are Conservation Authority regulations in place, approval under the Lakes and Rivers Improvement Act is not required, except in cases of dams as defined in the Act.
- Application for Certificate of Approval (CofA) under the Ontario Water Resources Act.
- □ Changes to Municipal Drains.
- Other permits (National Capital Commission, Parks Canada, Public Works and Government Services Canada, Ministry of Transportation etc.)

4.6 Conclusion Checklist

- □ Clearly stated conclusions and recommendations
- □ Comments received from review agencies including the City of Ottawa and information on how the comments were addressed. Final sign-off from the responsible reviewing agency.
- All draft and final reports shall be signed and stamped by a professional Engineer registered in Ontario
