Attention: **Mr. Jack Mangan**

Subject: **Excess Soil Quality Assessment**
210 Clearview Avenue

Dear Mr. Mangan,

Further to your request and authorization, Paterson Group (Paterson) conducted a preliminary excess soil quality assessment at the above noted site (the project area). It is our understanding that as part of the proposed development of the project area, excess soil will be generated, which will require off-site disposal at a local reuse site. The estimated total volume of excess soil is less than 2,000 m^3.

Background

Phase I – ESA

Paterson completed a Phase I – ESA for the project area in conjunction with the excess soil's quality management report. The Phase I – ESA involved a review of historical and current information on the project property and surrounding area to determine if there were any previous or currently existing potentially contaminating activities (PCAs) that resulted in areas of potential environmental concern on the Phase I Property. Based on the findings of the Phase I – ESA, four historical PCAs and one current PCA were identified on properties within the Phase I study area. Based on their separation distances, cross/down gradient orientation and/or nature of their operations, none of the identified PCAs were considered to result in APECs on the project area.

Observations

As part of a geotechnical investigation, Paterson supervised the advancement of seven boreholes across the project area throughout the interim of June 23, 2022, to July 5, 2022. Seven representative soil samples were collected and submitted for analytical testing based on vapour readings and observations made during the subsurface investigation.

The subsurface profile encountered across the project area consisted of a surficial layer of asphalt or topsoil underlain by fill material comprised of brown silty sand with gravel and crushed stone extending to a maximum depth of 1.85m. The fill material was underlain by native dense brown silty sand till with gravel and cobbles extending to a maximum depth of 2.92m in the majority of the boreholes. Bedrock consisting of dolostone interbedded with limestone was encountered immediately after the fill material within BH4-22 and BH6-22. The native till layer was underlain by dolostone interbedded with limestone bedrock. Coring was terminated at a maximum depth of 12.2 m.

All soil samples collected were subject to a preliminary screening procedure, which included visual screening for colour and evidence of metals, as well as soil vapour screening with a Photo Ionization Detector (PID). No apparent deleterious materials, signs of coal or slag, or any visual or olfactory signs of potential contamination were observed in the stockpiles at the time of the field program. All vapour readings were noted to be less than 25 ppm and are not considered to be representative of volatile organic compound impacts.

Analytical Test Results

Seven representative soil samples were submitted to Paracel Laboratories (Paracel) in Ottawa for bulk analysis of benzene, ethylbenzene, toluene and xylenes (BTEX), petroleum hydrocarbons (PHCs, Fractions F1 to F4), metals, electrical conductivity (EC) and sodium adsorption ratio (SAR). Three samples were submitted for analysis of pH.

The test results obtained during the current investigation are presented in Table 1, appended to this letter, along with the laboratory Certificates of Analysis.

Currently, a reuse site for any excess soil has not been selected, therefore, for general soil management purposes, analytical results have been compared to Ministry of the Environment, Conservation and Parks (MECP) Table 1 Residential standards, as well as Table 2.1 Residential/Parkland/Institutional standards (RPI).

pH

Three (3) samples were submitted for pH analysis. All samples were found to be between 5 and 9 and fall within the acceptable pH range for both surface soils and subsurface soils, with the exception of Sample BH4-22-AU1/SS2, which marginally exceeds the surface soil maximum of 9.0, but complies with subsurface standards of 11.0.

Metals

All metals analysis were found to be in compliance with MECP Table 1 and 2.1 standards.

BTEX

No detections of BTEX were identified in any of the samples. All BTEX analysis were found to be in compliance with MECP Table 1 and Table 2.1 standards.

PHCs (F1-F4)

All of the analysed PHC parameters were found to be in compliance with the MECP Table 1 standards with the exceptions of: the PHC fractions F_3 concentrations identified in BH4-22-AU1/SS2 and BH6-22-AU1/SS2, within a layer of brown silty sand fill layer, were found to exceed both MECP Table 1 and Table 2.1 standards. Additionally, the PHC fraction F_4 concentration identified in BH4-22-AU1/SS2, BH6-22-AU1/SS2 and BH7-22-SS2 also exceeded Table 1 standards, however, concentrations identified in BH4-22-AU1/SS2 and BH6-22-AU1/SS2 comply with the MECP Table 2.1 standards.

EC/SAR

The EC analysis for B4-22-AU1/SS2 and BH7-22-SS2 were found to exceed the MECP Table 1 and Table 2.1 standards. Additionally, the SAR analysis results for BH5-22-SS3, BH6-22-AU1/SS2 and BH7-22-SS2 exceed the MECP Table 1 standards, however, comply with the MECP Table 2.1 standards.

Conclusion

A total of seven boreholes were advanced in the project area, and seven soil representative samples were collected and submitted to Paracel Laboratories for analysis of benzene, ethylbenzene, toluene and xylenes (BTEX), petroleum hydrocarbons (PHCs, Fractions F1 to F4), metals, electrical conductivity (EC) and sodium adsorption ratio (SAR). Three samples were submitted for analysis of pH.

The subsurface profile encountered across the project area consisted of a surficial layer of asphalt or topsoil underlain by fill material comprised of brown silty sand with gravel and crushed stone extending to a maximum depth of 1.85 m.

The fill material was underlain by native dense brown silty sand till with gravel and cobbles extending to a maximum depth of 2.92m in the majority of the boreholes. No signs of deleterious materials were observed. Bedrock consisting of dolostone interbedded with limestone was encountered immediately after the fill material within BH4-22 and BH6-22. The native till layer was underlain by dolostone interbedded with limestone bedrock.

Three borehole locations, BH4-22, BH6-22 and BH7-22 were found to have PHCs exceeding MECP Table 1 standards.

EC and SAR were also identified at BH4-22, BH5-22, BH6-22 and BH7-22. However, given that the EC and SAR are present due to the use of salt or similar substance during conditions of snow or ice, they are not considered to exceed the site standard.

In addition to the three samples identified to exceed MECP Table 1 standards, two samples were found to exceed the MECP Table 2.1 RPI standards.

Recommendations

Soil in the vicinity of boreholes BH1-22, BH2-22, BH3-22 and BH5-22 complies with MECP Table 1 residential standards and can be beneficially reused on most reuse sites. Under specific reuse site settings, soil in the vicinity of BH7-22 may also be beneficially reused.

Soil in the vicinity of BH4-22 and BH6-22 had elevated PHC concentrations. This material exceeds most excess soil reuse site standards, beyond those compared in this report. Based on current results, the material will require offsite disposal at a licensed waste management facility. Given the shallow sample depths at these two locations, it is possible that PHC exceedances are due to residual fragments of the asphalt paving structure. Further delineation of these areas should be considered at the time of excavation.

Prior to disposal, a Toxicity Characteristic Leaching Procedure (TCLP) analysis will be required. Excavation and removal of this material can be carried out at the time of site redevelopment.

In general, it is recommended that any potential soil reuse site be assessed prior excavation activities, to ensure compatibility of the excess soil with those properties.

Statement of Limitations

A soils investigation of this nature is a limited sampling program. Should any conditions at the site be encountered which differ from those at the test locations, we request that we be notified immediately in order to permit reassessment of our recommendations/conclusions.

The present report applies only to the project described in this document. Use of this report for purposes other than those described herein or by person(s) other than Homestead Land Holdings Inc. or their agents, without review by this firm for the applicability of our recommendations to the altered use of the report, is prohibited.

Regards,

Paterson Group Inc.

Samuel Berube, EIT.

Adrian Menyhart, P.Eng

Qualifier Notes:

None

Sample Data Revisions

None

Work Order Revisions / Comments:

None

Other Report Notes:

n/a: not applicable
ND: Not Detected
MDL: Method Detection Limit
Source Result: Data used as source for matrix and duplicate samples
%REC: Percent recovery.
RPD: Relative percent difference.
NC: Not Calculated

Soil results are reported on a dry weight basis when the units are denoted with 'dry'.
Where %Solids is reported, moisture loss includes the loss of volatile hydrocarbons.

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.
- When reported, data for F4G has been processed using a silica gel cleanup.

RPD: Relative percent difference.
NC: Not Calculated

Soil results are reported on a dry weight basis when the units are denoted with 'dry'.
Where %Solids is reported, moisture loss includes the loss of volatile hydrocarbons.

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.
- When reported, data for F4G has been processed using a silica gel cleanup.

Certificate of Analysis

Report Date: 14-Jul-2022

Client: Paterson Group Consulting Engineers

Order Date: 6-Jul-2022

Client PO: 55215

Project Description: PE5751

Qualifier Notes:

Sample Qualifiers :

1 : Elevated detection limits due to the nature of the sample matrix.

2 : GC-FID signal did not return to baseline by C50

Sample Data Revisions

None

Work Order Revisions / Comments:

None

Other Report Notes:

n/a: not applicable
ND: Not Detected
MDL: Method Detection Limit
Source Result: Data used as source for matrix and duplicate samples
%REC: Percent recovery.
RPD: Relative percent difference.
NC: Not Calculated

Soil results are reported on a dry weight basis when the units are denoted with 'dry'.
Where %Solids is reported, moisture loss includes the loss of volatile hydrocarbons.

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.
- When reported, data for F4G has been processed using a silica gel cleanup.
