STORMWATER MANAGEMENT BRIEF: 4000 RIVERSIDE DR, OTTAWA, ON K1V 2E8

The intent of this letter is to address the Stormwater Management (SWM) strategy associated with the proposed site modification to reconfigure an existing drive-thru lane for the existing carwash and add a new drive-thru lane for a quick service restaurant for the subject site located at 4000 Riverside Drive in Ottawa, Ontario.

The existing site is approximately 0.527 ha in area and is located at the southwest quadrant of Riverside Drive and Hunt Club Road in Ottawa, ON. The site currently operates as an existing gas station with a carwash facility.

The current stormwater management onsite includes both quantity and quality controls, refer to the existing Site Services Plan prepared by Novatech Engineering Consultants Ltd and dated April 2002 located in the appendix. The quantity component is managed by a 165mm diameter orifice located at existing CBMH#3 which restricts the flow to an allowable release rate and creating storage via. surface ponding and storage within the piping and associated storm structures (CBs + MHs) prior to discharging offsite. The quality component is treated by an existing OWS (STC750) located downstream of the orifice. The treated flow will utilize existing 300mm storm outlet prior to discharging into 1350mm storm line within City Easement.

The proposed drive-thru modifications and addition will decrease overall site imperviousness by 1.0% and therefore confirming there is no increase in flow from the site as a result of the proposed modifications, refer to the comparison table below for the weighted surface runoff coefficient.

Surface Composition		Impervious	Pervious	Combined
Proposed Condition	(m^2)	3837.00	1437.20	5274.20
	(ha)	0.384	0.144	0.527
Runoff Coefficient		0.900	0.200	0.71

Surface Composition		Impervious	Pervious	Combined
Existing Condition	(m^2)	3900.80	1373.40	5274.20
	(ha)	0.390	0.137	0.527
Runoff Coefficient		0.900	0.200	0.72

Table 1. Runoff Coefficients for Existing and Proposed Conditions.

Considering the existing stormwater report for the subject site is not available we have recomputed the required stormwater storage required based on the modified rational method. Based on an existing orifice size of 165mm diameter and a 100-year ponding elevation (as illustrated in the existing Site Services prepared by Novatech Engineering Consultants Ltd) a storage volume of 55.21 m^3 is required and the site is able to achieve 71.38 m^3 via surface ponding and underground storage within the storm network. Refer to the tables below for the storage calculation.
