APPENDICES

1.0 INTRODUCTION

Morey Associates Ltd. was retained by Schouten Construction Ltd. to undertake a hydrogeological investigation at the site of the proposed residential subdivision located on the north side of Hemphill Street, Village of Richmond, within Part Lot 25, Concession 4, Geographic Township of Goulbourn, City of Ottawa, Ontario (see Key Plan, Figure 1).

The subject site for this assessment consists of about a 0.8 hectare 'L' shaped property. The proposed site development plan drawing prepared by H. A. Ken Shipman Surveying Ltd., Ref. No. GLB-467 for File 16-10896, indicates that the site will be subdivided into 7 lots for single family dwelling construction, with lot sizes of some 0.08 to 0.14 hectares (see Site Sketch Plan, Figure 3). The proposed dwellings will be serviced by individual on-site private wells. The dwellings will be serviced by a municipal sanitary sewer and accordingly a septic system impact assessment is not required.

For the purpose of this report Hemphill Street is considered to exist at the south side of the proposed subdivision (see Key Plan, Figure 1).

This investigation was carried out in general accordance with the Ministry of the Environment and Climate Change (MOECC) Procedure D-5-5 Technical Guideline for Private Wells: Water Supply Assessment (August 1996) and the applicable sections of the City of Ottawa Official Plan (2003) requiring that information be provided indicating the following:

- Sufficient quantity of groundwater exists on site to service the development.
- Water wells can be constructed on the proposed lots that will not be impacted by identified potential sources of groundwater contamination in the area.
- The quality of the groundwater meets or exceeds the Ontario Drinking Water Standards, Objectives and Guidelines.

The City of Ottawa provided us with a copy of a Hydrogeological Study Report previously carried out by Golder Associates Ltd. for a proposed residential development consisting of some 51 lots on the east side of Shea Road immediately opposite the site for this present report. That Golder Associates Ltd. Report is titled "Hydrogeological Study, Proposed Development, Part of Lot 26,

Concession 4, Geographic Township of Goulbourn, City of Ottawa (Richmond Village), Ontario", dated September 2017, Report Number 14118381-1000, Rev. 2, hereinafter collectively referred to as the "GAL report". The GAL report has not been relied upon for the conclusions presented in this present report, however the GAL report has been reviewed as one of several information sources with regards to the geological/hydrogeological setting in the general area of the present site.

1.1 SITE BACKGROUND

The site is bordered on the north and west by vacant agricultural fields, on the south by Hemphill Street with existing residential development beyond, and on the east by an existing single family dwelling with Shea Road and vacant agricultural fields beyond. The ground cover at the site consists of cultivated lands with some young to mature trees along the south property boundary. A tributary to Jock River exists some 130 metres east of the subject site. The regional groundwater flow is generally from southwest to northeast (MVC and RVCA, 2011).

A review of the surficial geology map for the site area indicates that the site is underlain by marine deposited clay, silt, and silty clay. The bedrock geology map indicates that the bedrock underlying the site consists of dolostone and sandstone of the Beekmantown Group (specifically the Oxford formation). The Oxford formation in the general area of the site is generally known (based on preparation and review of hydrogeological investigations carried out by the undersigned in the Ottawa area over the past some 30 years) as an adequate source of groundwater from a quality and quantity point of view for domestic use with localized occurrences of elevated iron, hardness, sodium, total dissolved solids and hydrogen sulphide.

2.0 PROCEDURES

2.1 GENERAL

The objectives of this investigation were:

- to investigate the potential quantity and quality of groundwater that would be expected from water supply wells drilled at the site to service the proposed residential development.

The test wells installed for this investigation will be used as water supply wells for the proposed development and constitute about 43 percent (3 out of 7) of the total number of water supply wells which will be required for the proposed 7 lot development.

2.2 TEST WELL CONSTRUCTION

To determine the quantity and quality of groundwater available for domestic water supply, three test wells, numbered TW1, TW2 and TW3 were pump tested and sampled. The approximate locations of the test wells are shown on the attached Site Sketch Plan, Figure 3. The test wells, TW1, TW2 and TW3 were drilled by Air Rock Drilling Co. Ltd., of Richmond, Ontario, on January 29, January 30 and February 6, 2018, respectively, for the purposes of this investigation. The water well records for the test wells are provided in Appendix A.

The water well records for the test wells supplied by the well driller indicate that nominal 16 centimetre inside diameter steel casings were installed through the overburden and were set well into the bedrock and grouted in place using cement slurry and bentonite. The well casings are indicated to extend some 15.8 to 16.5 metres (52 to 54 feet) below the ground surface at the test wells. The wells were drilled to final depths using a 15 centimetre diameter bit and completed as an open hole in the bedrock. TW1, TW2 and TW3 were drilled into the bedrock to final depths of some 48.8, 42.7 and 54.9 metres, respectively, below the existing ground surface.

The ground surface elevation at each test well location was surveyed using total station survey equipment in reference to a site benchmark, the Geodetic elevation of which was supplied by H. A. Ken Shipman Surveying Ltd. (see Site Sketch Plan, Figure 3). The ground surface elevations at TW1, TW2 and TW3 were 94.0, 94.0 and 93.7 metres and the stick-up of the well casing at each well is about 0.75, 1.2 and 0.75 metres, respectively.

2.3 WELL WATER QUALITY TESTING

2.3.1 TEST WELLS

Groundwater samples were collected from the test wells at about hours 3 and 6 of the pumping tests to characterize groundwater quality. The groundwater samples from the test wells were collected and prepared/preserved in the field using appropriate techniques and submitted to

Eurofins Environment Testing laboratory in Ottawa, Ontario for the chemical, physical and bacteriological analyses listed in the Ministry of the Environment and Climate Control (MOECC) guideline entitled Procedure D-5-5, Technical Guideline for Private Wells: Water Supply Assessment, August 1996. The temperature, conductivity, pH, total dissolved solids (TDS), turbidity and residual chlorine levels of the groundwater were measured at periodic intervals during the pumping tests.

2.3.2 NEIGHBOURING WELLS

An attempt was made to identify the MOECC well records associated with the 15 closest existing dwellings to the site located adjacent to the site, north of the site and south of Hemphill Street (see Appendix B). An attempt was also made to contact the residents of those 15 dwellings in order to carry out a well survey and/or collect samples of their well water. A well survey form was hand delivered to the residents of the 15 dwellings listed in the following table:

Table 2.1: Summary of Well Survey Form Distribution

Civic Address	*Survey Form Returned	Consented to Sampling for Laboratory Testing	Water Sample Obtained
3244 Shea Road	NO	NO	NO
3290 Shea Road	NO	NO	NO
4 Hemphill Street	NO	NO	NO
6 Hemphill Street	NO	NO	NO
39 Gamble Drive	YES	YES	YES
40 Gamble Drive	NO	NO	NO
41 Gamble Drive	NO	NO	NO
42 Gamble Drive	NO	NO	NO
43 Gamble Drive	NO	NO	NO
44 Gamble Drive	YES	YES	YES
22 Mary Hill Crescent	NO	NO	NO
24 Mary Hill Crescent	NO	NO	NO
26 Mary Hill Crescent	YES	YES	NO**
28 Mary Hill Crescent	NO	NO	NO
30 Mary Hill Crescent	NO	NO	NO

*At time of preparation of this report

**Several unsuccessful attempts to schedule a time for sampling were made between the time consent to sample was granted and time of preparation of this report. It is considered that the property owner became disinterested in a water sample being obtained from their well.

The completed well survey forms and consent to obtain a well water sample from the dwelling occupants from 39 Gamble Drive, 44 Gamble Drive and 26 Mary Hill Crescent had been provided to our office as of the date of this report. The completed well surveys are provided in Appendix B.

In addition to the above, the MOECC well records and the results of well surveys, conducted as part of the above mentioned GAL report, for the water wells associated with the dwellings located at 2 Hemphill Street and 3310, 3316 and 3326 Shea Road are provided in Appendix B.

2.4 WELL WATER QUANTITY TESTING

Pumping tests were conducted on TW1, TW2 and TW3 on January 7, January 12 and January 6, 2015, respectively. The testing consisted of six hour duration constant discharge rate pumping tests. During the pumping tests, water level measurements were made on a regular basis to monitor the drawdown of the water level in the wells in response to pumping. After the pumping period, the pump was shut off and the recovery of the water level in the test wells was monitored for a period of time. Water levels at adjacent test wells were monitored periodically during pumping tests to determine the potential interference effects between the wells. During the pump tests, the pump discharge outlet was located an adequate distance from the test wells to ensure the discharge did not interfere with the natural recharge to the wells in view of the relatively impermeable nature and thickness of the overburden (silty clay) at the site.

3.0 GROUNDWATER SUPPLY INVESTIGATION

3.1 SUPPLY AQUIFER

As mentioned above, the bedrock geology map for the site area indicates that dolomite of the Oxford formation underlies the site. The MOECC well records for the test wells indicate grey limestone was encountered during drilling. A review of the MOECC water well records for the test wells, attached in Appendix A, indicate that the test wells encountered water during drilling in the bedrock at depths of some 40.8 to 53.0 metres below the existing ground surface.

Table 3.1: Summary of Test Well Construction Details

Test Well	Total Depth of Well (m BGS)	Depth to Surface of Bedrock (m BGS)	Overburden Material Type	Bedrock Type	Depth of Well Casing (m BGS)	Depth Water Found (m BGS)
TW1	48.8	14.0	Clay	Limestone	15.8	46.9
TW2	42.7	14.3	Clay	Limestone	16.2	40.8
TW3	54.9	14.6	Clay	Limestone	16.5	33.8, 53.0

Note: m BGS = Metres Below Ground Surface

3.2 WATER QUALITY

The laboratory testing results of the chemical, physical and bacteriological analyses of water samples obtained from the test wells during the pumping tests are provided in the attached Appendix C and are summarized in the table below.

Table 3.2: Pumping Test Well Water Samples Laboratory Testing Results

				TW1			TW2			TW3

A = MOECC Advisory Limit (See Note 3)
Bold Italic = AO, OG or MAC Guideline Exceedence

The results of the chemical, physical and bacteriological analyses of water samples obtained from the test wells are provided in the attached Appendix C and in Table I. The water quality as determined from the results of the analyses is relatively favourable. The water meets all the Ontario Drinking Water Standards, Objectives and Guidelines (ODWSOG) health and aesthetic parameters tested for at the test wells except for the following:

- hardness at all of the wells
- TDS at TW1 and TW3
- Iron at TW2

The water samples obtained from all of the test wells is considered to be hard by water treatment standards with a hardness level above the ODWSOG operational guideline of 100 milligrams per litre. The hardness at the test wells ranges from about 113 to 123 milligrams per litre. However, based on the Technical Support Document for Ontario Drinking Water Standards, Objectives and Guidelines, Revised June 2006, the hardness levels of the water samples are less than what is considered unacceptable (greater than 500 milligrams per litre) for most domestic purposes and is considered treatable. Water with hardness above 80 to 100 milligrams per litre as $CaC0_3$ is often softened for domestic use. Water softening by conventional sodium ion exchange may introduce relatively high concentrations of sodium into the drinking water, which may contribute a significant percentage to the daily sodium intake for a consumer on a sodium restricted diet. Where ion exchange water softeners are used, a separate unsoftened water supply could be used for drinking and culinary purposes.

The levels of TDS measured at the laboratory for test wells TW1 and TW3 ranged from about 530 to 555 milligrams per litre and is above the ODWSOG aesthetic objective of 500 milligrams per litre. The in-situ measurements of TDS during the pumping tests, between hours 3 and 6, ranged from some 378 to 400 milligrams per litre for test well TW1 and from some 382 to 445 milligrams per litre for test well TW3, for an average TDS level of both laboratory measurement and in-situ measurements of about 381 milligrams per litre for test well TW1 and 473 milligrams per litre for test well TW3. TDS may result in corrosion or encrusting of plumbing/plumbing fixtures. Langelier Saturation Index (LSI) calculations (using the American Water Works Association spreadsheet) were carried out using the 3 hour and 6 hour water sample testing results for all of the test wells and gave LSI values ranging between 0.07 to 0.33 (see Table II). These LSI values are within the range (-0.5 to 0.5) considered to indicate an unlikely occurrence of encrusting/scale or corrosion on plumbing/plumbing fixtures.

The laboratory measured levels of iron for the water samples for test well TW2 ranged from 0.39 to 0.41 milligrams per litre and are above the ODWSOG aesthetic objective of 0.3 milligrams per litre. The above indicated iron levels are well within the MOECC maximum concentration considered reasonably treatable of 5.0 milligrams per litre. The levels of iron for the water samples are considered treatable using a water softener or manganese greensand filter.

The Total Coliform count at test well TW1 was 0 ct/100mL for the 3 hour sample and 4 ct/100mL for the 6 hour sample. On March 15, 2018 chlorination of test well TW1 was carried out and the well sampled after pumping and field testing confirmed that the free chlorine level for the well water was 0 milligrams per litre. The water sample was delivered to Eurofins Environment Testing for total coliform testing and gave a total coliform count of 0 ct/100mL. The total coliform count for the hour 6 sample at test well TW1 is considered typical of recently drilled wells.

The level of turbidity measured at the laboratory for test well TW2 was 9.1 NTU and 10.6 NTU for the 3 and 6 hour samples, respectively, which exceeds the ODWSOG aesthetic objective of 5 NTU. However, it is expected that the laboratory turbidity level reflects the precipitation of iron from the water sample during the time between when the water was sampled and then tested in the laboratory. Additional development of test well TW2 was carried out on March 15, 2018. Field measurements for turbidity were carried out at that time and gave values ranging from 12 NTU decreasing with time to 0.8 NTU.

The level of colour measured for the water samples at test well TW2 were 20 TCU and 14 TCU for the 3 and 6 hour samples, respectively, and are above the ODWSOG aesthetic objective of 5 TCU and the MOECC maximum concentration considered reasonably treatable of 7 TCU. As mentioned above the levels of iron measured for the water sample were above the ODWSOG aesthetic objective (but well within treatability limits) and as indicated in the Technical Support Document for Ontario Drinking Water Standards, Objectives and Guidelines, Revised June 2006, “Sometimes colour may be contributed to by iron and manganese compounds produced by processes occurring in natural sediments or in aquifers”. As mentioned above additional development of test well TW2 was carried out on March 15, 2018. At that time a water sample was obtained from the well and delivered to Eurofins Environmental laboratory for colour testing. The results of that testing gave a value of 3 TCU which meets the ODWSOG aesthetic objective.

It is pointed out that the levels of sodium for the water samples for all three test wells were measured above 20 milligrams per litre (112 to 123 milligrams per litre) and accordingly may be of interest to persons on a sodium restricted diet. According to the MOECC, the local Medical Office of Health should be notified where sodium levels are above 20 milligrams per litre in order that this information may be relayed to local physicians. The sodium levels are well within the ODWSOG aesthetic objective of 200 milligrams per litre.

3.2.4 NEIGHBOURING WELLS

The following table provides available well construction information for the 15 residential water wells indicated in the above mentioned Table 2.1 (with the exception of 3244 and 3290 Shea Road and 28 Mary Hill Crescent for which the well records could not be located) as well as for the 4 previously mentioned water wells located at 2 Hemphill Street, 3310, 3316 and 3326 Shea Road (see report section 2.3.2).

Table 3.3: Summary of Neighbouring Well Construction Details

Well ID	Likely Well Location	Year of Well Construction	Total Depth of Well (m BGS)	Depth to Surface of Bedrock (m BGS)	Static Water Level (assumed m BGS)	Available Drawdown (m)

Note: m BGS = Metres Below Ground Surface
**Well survey results available as of the date of this present report
***Well survey and water sample testing results available as of the date of this present report

As indicated in the above Table 3.3, the results of seven well surveys for the wells located at 39 and 44 Gamble Drive, 26 Mary Hill Crescent, 2 Hemphill Street, and 3310, 3316 and 3326 Shea Road are available and provided in the attached Appendix B. Further, the results of laboratory testing of

water samples obtained from the wells located at 39 and 44 Gamble Drive and 3310 Shea Road are available and provided in the attached Appendix D.

The above mentioned seven residential wells are indicated to have been constructed in 1968 (some 50 years old), except for the well located at 26 Mary Hill Crescent which is indicated to have been constructed in 2000 (some 18 years old). No well grouting details are indicated on the well records for the above mentioned wells constructed in 1968. The well record for the well at 26 Mary Hill Crescent indicates that the annular space around the well casing from a depth of some 15.8 metres up to the ground surface was grouted/sealed with 1 bag of cement and 1 bag of QuickGrout (bentonite).

The well surveys for the above noted seven residential wells indicate that the groundwater is used for drinking water. Water treatment systems (water softeners) are used at all of the above mentioned locations, except for 39 and 44 Gamble Drive. The owner at 26 Mary Hill Crescent indicated that a filter and a water softener was used. The interviewees all indicated that their water was acceptable to excellent with regards to water quality and the interviewees did not indicate any problems with regards to water quantity.

The well water samples obtained from 39 Gamble Drive, 44 Gamble Drive and 3310 Shea Road were tested for the MOECC “subdivision package” list of bacteriological parameters. The results of that testing indicate all three water samples are of acceptable bacteriological quality.

The well water samples obtained from 44 Gamble Drive and 3310 Shea Road were also tested for the MOECC “subdivision package” list of chemical and physical parameters. The results of that testing indicated the two water samples meet all the ODWSOG health and aesthetic parameters tested for except for hardness, TDS, colour and sulphide for the sample obtained from 44 Gamble Drive and hardness, TDS and iron for the sample obtained from 3310 Shea Road.

The level of hardness measured for the above two samples (117 milligrams per litre) is less than what is considered unacceptable (greater than 500 milligrams per litre) for most domestic purposes and is considered treatable. The levels of TDS measured for the above two samples (515 and 536 milligrams per litre) is slightly above the aesthetic objective of 500 milligrams per litre and the interviewees at 44 Gamble Drive and 3310 Shea Road did not indicate any issues with encrusting/scale or corrosion on plumbing/plumbing fixtures.

The level of colour measured for the water sample obtained from 44 Gamble Drive was 6 TCU and is slightly above the ODWSOG aesthetic objective of 5 TCU, however is within the MOECC maximum concentration considered reasonably treatable of 7 TCU.

The level of iron measured for the water sample obtained from 3310 Shea Road was 0.31 milligrams per litre and is slightly above the ODWSOG aesthetic objective of 0.3 milligrams per litre, however is well within the MOECC maximum concentration considered reasonably treatable of 5.0 milligrams per litre.

The level of sulphide measured for the water sample obtained from 44 Gamble Drive was 0.06 milligrams per litre and is slightly above the ODWSOG aesthetic objective of 0.05 milligrams per litre. The interviewee at 44 Gamble Drive indicated that their water was acceptable to excellent with regards to quality and specifically did not indicate a poor odour or sulphur smell.

It is pointed out that the levels of sodium for the above two samples were measured above 20 milligrams per litre (124 and 134 milligrams per litre) and accordingly may be of interest to persons on a sodium restricted diet. According to the MOECC, the local Medical Office of Health should be notified where sodium levels are above 20 milligrams per litre in order that this information may be relayed to local physicians. The sodium levels are well within the ODWSOG aesthetic objective of 200 milligrams per litre.

The water quality at the sampled neighbouring wells is indicated to be comparable to the water quality at the test wells constructed for this investigation, with the exception of the slightly elevated level of sulphide measured for the water sample obtained from 44 Gamble Drive. Based on the results of the neighbouring well surveys and laboratory testing of neighbouring well water samples carried out for this investigation, the water quality and quantity in the water supply aquifer is indicated to be acceptable for typical domestic use.

3.3 WATER QUANTITY

The drawdown and recovery data and plots for TW1, TW2 and TW3 are shown in Appendices E, F and G, respectively. The drawdown and recovery data provided were measured with reference to the top of the well casing at each test well location.

The pumping test data for the test wells were analyzed using the method of Cooper and Jacob (1946). Although the assumptions on which these equations are based are not strictly met, this method provides a reasonable estimate of the aquifer transmissivity. The analysis of the data obtained during the pumping tests is summarized in the attached Table III. The water levels in adjacent wells were monitored during the pumping tests for the three test wells. The drawdown in the observation wells was plotted as a function of time during pumping (see attached Appendices E, F and G) and a resulting storativity estimate was calculated (see attached Table IV).

The following sections discuss the results of the analysis of the data obtained during the pumping tests with respect to test well yields.

3.3.1 TEST WELL TW1

The six hour duration pumping test was carried out at a discharge rate of 36 litres per minute (8 Igpm). The static water level prior to testing was about 3.28 metres below the top of the well casing and the water level after six hours of pumping was about 15.17 metres below the top of the well casing for a total drawdown at the end of pumping of 11.89 metres. The available drawdown in the well is about 45 metres. The specific capacity of the well at this pumping rate is approximately 4.4 cubic metres per day per metre of drawdown.

Based on the pumping test drawdown data the transmissivity of the aquifer is estimated to be 34.2 m^2/day. Based on the pumping test recovery data the aquifer transmissivity is estimated to be 95.9 m^2/day. The average transmissivity of the bedrock aquifer in the area of TW1 is estimated to be 65.1 m^2/day. At the end of pumping, 120 minutes was required for 100 percent recovery of the total drawdown in the static water level created during pumping.

Based on the data obtained during the pumping test, it can be concluded that the well is capable of sustaining a short term yield of at least 36 litres per minute (8 Igpm) and that during the course of the six hour pumping period about 27 percent of the available drawdown in the test well was utilized.

3.3.2 TEST WELL TW2

The six hour duration pumping test was carried out at a discharge rate of 68 litres per minute (15 Igpm). The static water level prior to testing was about 2.51 metres below the top of the well casing and the water level after six hours of pumping was about 10.78 metres below the top of the well casing for a total drawdown at the end of pumping of 8.27 metres. The available drawdown in the well is about 40 metres. The specific capacity of the well at this pumping rate is approximately 11.9 cubic metres per day per metre of drawdown.

Based on the pumping test drawdown data the transmissivity of the aquifer is estimated to be 74.9 m^2/day. Based on the pumping test recovery data the aquifer transmissivity is estimated to be 112.3 m^2/day. The average transmissivity of the bedrock aquifer in the area of TW2 is estimated to be 93.6 m^2/day. At the end of pumping, 50 minutes was required for 100 percent recovery of the total drawdown in the static water level created during pumping.

Based on the data obtained during the pumping test, it can be concluded that the well is capable of sustaining a short term yield of at least 68 litres per minute (15 Igpm) and that during the course of the six hour pumping period about 21 percent of the available drawdown in the test well was utilized.

3.3.3 TEST WELL TW3

The six hour duration pumping test was carried out at a discharge rate of 46 litres per minute (10 Igpm). The static water level prior to testing was about 2.14 metres below the top of the well casing and the water level after six hours of pumping was about 13.62 metres below the top of the well casing for a total drawdown at the end of pumping of 11.48 metres. The available drawdown in the well is about 52 metres. The specific capacity of the well at this pumping rate is approximately 5.7 cubic metres per day per metre of drawdown.

Based on the pumping test drawdown data the transmissivity of the aquifer is estimated to be 54.5 m^2/day. Based on the pumping test recovery data the aquifer transmissivity is estimated to be 38.7 m^2/day. The average transmissivity of the bedrock aquifer in the area of TW3 is estimated to be 46.6 m^2/day. At the end of pumping, 70 minutes was required for 100 percent recovery of the total drawdown in the static water level created during pumping.

Based on the data obtained during the pumping test, it can be concluded that the well is capable of sustaining a short term yield of at least 46 litres per minute (10 Igpm) and that during the course of the six hour pumping period about 22 percent of the available drawdown in the test well was utilized.

3.3.4 SUMMARY OF TEST WELL YIELDS

The MOECC Guideline D-5-5 Section 4.3.2 for water quantity requirement indicates that the per-person requirement shall be 450 litres per day and relates that quantity to an equivalent peak per person demand rate of 3.75 litres per minute. The MOECC guideline indicates that for a single family dwelling the likely number of persons per well (per dwelling) is considered to be the number of bedrooms in the dwelling plus one. The MOECC guidelines further requires that regardless of the demand rate determined using the above mentioned calculation, the demand rate (minimum pumping rate of a well servicing a single family dwelling) shall not be less than 13.7 litres per minute.

The results of the pumping tests indicate that all of the test wells are capable of more than meeting MOECC minimum demand rate of 13.7 litres per minute and that TW1, TW2 and TW3 are capable of meeting the MOECC demand rate for an eight, seventeen and eleven bedroom single family dwelling, respectively, (a typical single family dwelling is considered to be a four bedroom dwelling).

3.3.5 SUMMARY OF TRANSMISSIVITY ANALYSIS

The above mentioned transmissivity values based on the pumping test drawdown and recovery data are summarized in Table 3.4 and classified regarding magnitude, designation and groundwater supply potential based on Krasny (1993).

Table 3.4: Classification of Transmissivity Values

[1]Magnitude (m^2/day)	[1]Class	[1]Designation	[1]Groundwater Supply Potential	Transmissivity Values from Pumping Tests (m^2/day)					
				TW1		TW2		TW3	
				Pump.	Rec.	Pump.	Rec.	Pump.	Rec.
>1000	I	Very High	Regional Importance						
100 - 1000	II	High	Lesser Regional Importance				112.3		
10 - 100	III	Intermediate	Local Water Supply	34.2	95.9	74.9		54.5	38.7
1 - 10	IV	Low	Private Consumption						
0.1 - 1	V	Very Low	Limited Consumption						
<0.1	VI	Imperceptible	Very difficult to Utilize for Water Supply						

[1]Kransy (1993) 'Classification of Transmissivity Magnitude and Variation", Vol.31, No.2 - Ground Water

Based on the above, all of the test wells are indicated to be capable of providing an adequate quantity of water for local water supply.

4.0 IMPACT ASSESSMENT

4.1 HYDROGEOLOGICAL SENSITIVITY

No karstic areas, areas of fractured bedrock exposed at the surface, areas of thin soil cover or areas of highly permeable soils were identified for the site. Accordingly, the site is not considered hydrogeologically sensitive.

4.2 INTERFERENCE EFFECTS

During the pumping of TW1, periodic water level measurements were made at TW2 and TW3 located some 62 and 100 metres, respectively, from TW1. During the pumping of TW2, periodic water level measurements were made at TW1 and TW3 located some 62 and 40 metres, respectively, from TW2. During the pumping of TW3, periodic water level measurements were made at TW1 and TW2 located some 100 and 40 metres, respectively, from TW3. The graphs of observation wells drawdown versus time during the pumping tests at TW1, TW2 and TW3 are shown in the attached Appendices E, F and G.

In order to estimate the maximum interference between future wells at the site, calculations were carried out to predict the cumulative twenty year drawdown due to the proposed 7 domestic wells at a central well in the proposed subdivision (central well being TW2, located at Lot 4 – see attached Figure 3). The cumulative drawdown at the wells was calculated for a twenty year pumping rate of 2250 litres per day, which allows for a four bedroom household in accordance with Section 4.3.2 of MOECC Procedure D-5-5. The previously mentioned nineteen neighbouring dwellings discussed in section 2.3.2 of this report were also included in the cumulative twenty year drawdown calculation. The calculation was carried out using the following Cooper-Jacob formula:

$$s = \frac{2.3Q}{4\pi T}\log\left(\frac{2.25Tt}{r^2 S}\right)$$

Where, Q = 20 year pumping rate, 2250L/day
T = lowest transmissivity, 34.2 m^2/day
t = duration, 20 years
S = lowest storativity estimate, 4.5 x 10^{-5}
s = expected drawdown due to the 26 domestic wells

The results of the calculations indicate that the cumulative twenty year drawdown at the centrally located well (TW2), including the interference from the other six wells in the proposed residential development and from the other nineteen neighbouring wells, is about 2.0 metres (see attached Table V). It is pointed out that it is considered, in Morey Associates Ltd. professional opinion, that the actual cumulative twenty year drawdown at the centrally located well could be more accurately estimated by the use of the average transmissivity value determined from the pumping tests, the average estimated storativity value and the use of a more likely daily pumping rate given today's more efficient plumbing. However, for the purpose of this present report and for an exceedingly conservative approach the cumulative twenty year drawdown at the centrally located well was estimated using the lowest transmissivity value determined during the pumping tests, the lowest estimated storativity value and a daily pumping rate of 2250 litres.

In addition to the above twenty year drawdown calculation, and in order to estimate the maximum interference between future wells at the site during daily peak water usage, calculations were carried out to predict the cumulative drawdown at the centrally located well due to simultaneous peak demand use of the proposed seven domestic wells. A simultaneous peak demand pumping rate at each well of 2250 litres over a two hour period was used in the calculation and is equivalent to the peak demand rate indicated in Section 4.3.2 of MOECC Procedure D-5-5. The calculation was carried out using the following Cooper-Jacob formula:

$$s = \frac{2.3Q}{4\pi T}\log\left(\frac{2.25Tt}{r^2 S}\right)$$

Where, Q = peak demand pumping rate, 2250L/2hr
T = lowest transmissivity, 34.2 m^2/day
t = duration, 2 hours
S = lowest storativity estimate, 4.5 x 10^{-5}
s = expected drawdown due to the 7 subject site proposed domestic wells

The results of the calculations indicate that the cumulative peak demand drawdown at the centrally located well (TW2), including the interference from the other six wells in the proposed residential development is about 2.5 metres (see attached Table VI). It is pointed out that it is considered, in Morey Associates Ltd. professional opinion, that the actual cumulative peak demand drawdown at the centrally located well could be more accurately estimated by the use of the average transmissivity value determined from the pumping tests, the average estimated storativity value and the use of a more likely peak demand water usage pumping rate given today's more efficient plumbing and that the actual two hour peak demand is divided up into two separate one hour periods (a morning hour and an evening hour), allowing for well recovery in between the two peak demand periods. However, for the purpose of this present report and for an exceedingly conservative approach the cumulative peak demand drawdown at the centrally located well was estimated using the lowest transmissivity value determined during the pumping tests, the lowest estimated storativity value and a peak demand pumping rate of 2250 litres over a two hour period.

Based on the above mentioned exceedingly conservative 20 year drawdown calculation, the expected drawdown was found to be about 2.0 metres at the centrally located well. Applying this drawdown value to all sixteen existing neighbouring wells indicated on Table 3.3 for which available drawdown information is known (which is also a conservative approach as the drawdown at the site boundaries would be less than estimated at a central lot) would result in the reduction of available drawdown at those existing wells of between about 3% to 19%.

Based on the above mentioned exceedingly conservative peak demand drawdown calculation, the expected drawdown was found to be about 2.5 metres at the centrally located well. Applying this drawdown value to all sixteen existing neighbouring wells indicated on Table 3.3 for which available drawdown information is known (which is also a conservative approach as the drawdown at the site boundaries would be less than estimated at a central lot) would result in the reduction of available drawdown at those existing wells of between about 4% to 25%.

The above estimated drawdown values provide a fair assurance of adequate water supply for the proposed residential development. Further, as indicated above it is considered that the above estimated drawdown values are exceedingly conservative and the actual cumulative drawdown values should be much less and interference with existing neighbouring wells should not result in significant reduction of available well drawdown for the proposed residential development as well as the nearby neighbouring wells.

4.3 DEVELOPMENT IMPACTS AND NEIGHBOURING LAND USES

The land use south of the site is currently residential, the land use west and north of the site is currently agricultural fields, the land use east of the site is currently vacant fields and it is understood that plans are being prepared for a proposed residential development east of the site. The results of the water quality testing at the test wells indicate that there is no significant impact on the groundwater at the site due to the surrounding existing land use. The proposed residential development east of the site is not considered a significant potential for interference on water quality for the site. Further, a Phase One Environmental Site Assessment (Phase I ESA) for the proposed residential development east of the subject site was carried out by Golder Associates Limited in 2015. The GAL report indicates that the Phase I ESA did not identify any areas of potential environmental concern within the Phase I ESA study area. The subject site is within the study area of that Phase I ESA and based on observations carried out by members of our engineering staff during the fieldwork for this present report, no significant changes in use since 2015 or areas of potential environmental concern were identified within or in close proximity to the subject site.

Based on the above, potential adverse impacts to the water quality of the proposed residential development from possible sources of groundwater contamination due to the above described neighbouring land use is not anticipated.

4.4 POST DEVELOPMENT MONITORING PROGRAM

The results of this investigation indicate acceptable existing and expected impact on the groundwater quality at this site due to existing neighbouring land uses and the proposed development. The local hydrogeological conditions and existing water quantity and quality, all indicate that the impact of the proposed development will not significantly impact the overall groundwater quality and quantity at the site. Accordingly, based on the findings of this current investigation no post development monitoring program is considered to be required.

5.0 CONCLUSIONS AND RECOMMENDATIONS

5.1 SUMMARY AND CONCLUSIONS

Based on the groundwater supply investigation and impact assessment carried out for the proposed residential subdivision, the following summary and conclusions are provided by Morey Associates Ltd. and are based on our professional opinion and our interpretation of the relevant sections of the guideline MOECC Procedure D-5-5 and applicable sections of the City of Ottawa Official Plan:

1) There is a sufficient groundwater supply of acceptable drinking water quality in the bedrock aquifer system to satisfy the water requirements of the proposed residential subdivision. It is indicated that most wells will have to be drilled to depths of about 43 to 55 metres and that individual well yields of 36 to 68 litres per minute (8 to 15 Imperial gallons per minute) will be typical. However, because it is impossible to predict with certainty the depth at which water-producing fractures will be encountered during drilling, it may be necessary to drill to depths greater than 55 metres on some lots to produce a sufficient water supply. It is pointed out that water bearing zones were encountered in the bedrock between about 33 and 53 metres depth at the test wells and that water quality from water bearing zones below 53 metres depth have not been evaluated as part of this present investigation.

2) The groundwater quality in the bedrock aquifer system at the three test wells at the site meets all the ODWSOG concentrations for all health related chemical, physical and bacteriological parameters tested, except for hardness at all of the test wells, TDS at two of the test wells and iron at one of the test wells. The levels of hardness measured at the three test wells are well within the acceptable range that is considered treatable. Based on the results of LSI calculations the levels of TDS measured at the test wells are considered unlikely to result in encrusting/scale or corrosion on plumbing/plumbing fixtures. The levels of iron measured at TW2 are well within the MOECC maximum concentration considered reasonably treatable. Water softeners are indicated to be adequate to lower hardness to acceptable levels. Water softeners or manganese greensand filters are indicated to be adequate to lower iron to acceptable levels.

3) Interviewees from seven neighbouring residences all indicated that their water was acceptable to excellent with regards to water quality and the interviewees did not indicate any problems with regards to water quantity.

4) Mutual well interference calculations indicate a sufficient groundwater supply for the proposed residential subdivision and interference with existing neighbouring wells should not result in significant reduction of available well drawdown for the proposed residential development as well as the nearby neighbouring wells.

5) It is considered that the type of existing surrounding land use adjacent to the subject property should not significantly impact the subject site from a water supply or water quality point of view.

6) It is understood that test wells TW1, TW2 and TW3 are planned to be used as domestic supply wells for the proposed dwellings located at Lot 1, Lot 4 and Lot 6, respectively. As such, it is considered that provided the three test wells are used as domestic supply wells they do not require decommissioning in accordance with O.Reg 903.

7) It is considered that with regards to proposed domestic supply wells the proposed residential subdivision meets the above mentioned applicable sections of the City of Ottawa Official Plan.

5.2 RECOMMENDATIONS

Morey Associates Ltd. provides the following recommendations regarding groundwater supply wells at the site:

1) Future wells drilled on the site should be constructed with steel casing through the overburden materials and set well into the bedrock. The steel casings for the test wells for this investigation are indicated by the well driller on the MOECC Well Records to be set 1.8 metres into the bedrock. As such, for future wells drilled on the site, setting the steel casing 1.8 metres into the bedrock should be considered a minimum. The steel casing placed in the boreholes should be pressure grouted into place for the full length of the casing. The material used to seal the annular space could consist of either a cement grout or a commercially available bentonite grout product. Cement grout mixtures should be allowed

to set for a minimum two day period for normal cement or twelve hours for a high early strength cement prior to advancing the well further into bedrock. If a bentonite grout product is used, drilling need only be suspended for a few hours depending on the product used. Bentonite grout has the additional advantage of remaining flexible when set and therefore should not crack or shrink thereby ensuring as well as possible that surface water or shallow groundwater will not migrate along the annular space and into the well bore.

Once the casing has been sealed, the well should be advanced uncased in the bedrock until a water supply of sufficient quantity and quality is encountered. The completed well should then be developed to maximize the yield. The well casings should be completed at least 400 millimetres above the highest point on the finished ground surface within three metres radially from the well after surface drainage is directed away from the well. The casing should be fitted with a pitless adapter to facilitate below ground plumbing and electrical connections. Surface grading should be completed to direct surface water away from the well in order to ensure that water will not collect or pond in the vicinity of the well.

In addition to the above, future wells drilled on the site are to be constructed in accordance with O.Reg 903.

2) Future wells drilled on the site should be constructed by licensed well drillers in accordance with O.Reg 903.

3) The well casing installation for future wells drilled on the site should be inspected by qualified professional engineering or geoscientist consulting firms to ensure that the well casings are constructed in accordance with the requirements.

4) The existing test wells (understood to be used as domestic supply wells for the proposed subdivision) and future wells drilled at the site shall be located a minimum 15 metres from a source of contamination which includes sanitary/storm sewer mains and service laterals. Further, the existing test wells and futures wells drilled at the site shall be made “accessible” for future well maintenance, in accordance with O.Reg 903. It is understood that D.B. Gray Engineering Inc. (consulting civil engineers for the proposed subdivision) have taken into consideration the above 15 metre separation distance and well accessibility in their

preparation of the proposed subdivision site plan. Future homeowners at the site should be made aware of the above requirements, particularly the well accessibility requirement.

5) In order to encourage domestic supply well education and best management practices future homeowners at the site should be made aware of and refer to the MOECC publication titled “Water Supply Wells: Requirements and Best Management Practices”, revised April 2015.

6) Future homeowners at the site should be made aware that the use of water softeners for treatment of hardness and the use of water softeners or manganese greensand filters for treatment of iron may be desired based on the results of the water quality testing carried out for this investigation.

7) Future homeowners at the site should be made aware that the use of conventional sodium ion exchange water softeners may introduce relatively high concentrations of sodium into the drinking water, which may contribute a significant percentage to the daily sodium intake for a consumer on a sodium restricted diet. Where ion exchange water softeners are used, a separate unsoftened water supply could be used for drinking and culinary purposes.

8) Future homeowners at the site should be made aware that the levels of sodium for the water samples for all three test wells at the site were measured above 20 milligrams per litre (112 to 123 milligrams per litre) and accordingly may be of interest to persons on a sodium restricted diet. According to the MOECC, the local Medical Office of Health should be notified where sodium levels are above 20 milligrams per litre in order that this information may be relayed to local physicians. The sodium levels are well within the ODWSOG aesthetic objective of 200 milligrams per litre.

6.0 LIMITATIONS AND USE OF REPORT

This report was prepared for the exclusive use of Schouten Construction Ltd. This report may not be relied upon by any other person or entity without the express written consent of Schouten Construction Ltd. and Morey Associates Ltd.

This report documents work that was carried out with generally accepted professional standards at the time and location in which the services were provided and in a manner consistent with a level of care and skill normally exercised by other professional engineering and geoscientist firms practicing under similar conditions and subject to the time limits and financial and physical constraints applicable to the services.

Any third party use of this report, including reliance of this report and/or decisions made based on this report, is the sole responsibility of the third party. Morey Associates Ltd. accepts no responsibility for damages, whether direct or indirect, suffered by any third party as a result of any third party use of this report.

The conclusions provided herein represent an opinion of Morey Associates Ltd. as of the time of preparation of this report. It is recognized that the passage of time affects the information provided in this report. This report should not be construed as legal advice. If new information is discovered during future work, including excavations, borings or other studies, Morey Associates Ltd. should be requested to re-evaluate the conclusions presented in this report and provide amendments as required.

7.0 SIGNATURES

We trust that this report is sufficient for your present requirements. If you have any questions concerning this report, please do not hesitate to contact our office.

Yours truly,
Morey Associates Ltd.

- Q: Test pumping rate (m^3/day)
- SC: Specific Capacity (m^3/day/m)
- ho: Static water level (below top of casing) at beginning of pumping test (metres)
- hf: Water level (below top of casing) at end of 6 hour pumping test (metres)
- Td: Total drawdown (metres)
- TD: Total depth of well (below ground surface) (metres)
- CS: Casing stickup above ground surface, as measured at time of pumping test (metres)
- AD: Approximate available drawdown (metres)

TABLE IV
ESTIMATE OF STORATIVITY BY COOPER-JACOB METHOD

$$S = \frac{2.25Tt_0}{r^2}$$

(A curve of drawdown versus time was generated for an observation well as an adjacent well was pumped)

Pumping Well	Observation Well	r (m)	Q (m^3/day)	t_o (s)	T (m^2/s)	S
TW1	TW2	61	52.4	36	3.7E-03	8.1E-05
	TW3	100		684	3.7E-03	5.7E-04
TW2	TW1	61	98.2	82	5.2E-03	2.6E-04
	TW3	40		88	3.5E-03	4.3E-04
TW3	TW1	100	98.2	29	6.9E-03	4.5E-05
	TW2	40		73	6.9E-03	7.1E-04
					Average Storativity	3.5E-04

TABLE V

MUTUTAL WELL INTERFERENCE AT CENTRAL WELL

20 YEAR ASSESSMENT

Centre Lot:	Lot 4	
S =	4.5E-05	
T =	34.2	m^2/day
T =	4.0E-04	m^2/s
Q =	2250	L/day
Q =	2.6E-05	m^3/s
Duration =	20	years
Duration =	6.3E+08	seconds

Calculated by Cooper-Jacob Method using:

Lowest Transmissivity value determined from pumping tests (conservsative)

Lowest Storativity value calculated from pumping tests (conservative)

Flow/pump rate (Q) using section 4.3.2 of MOECC Procedure D-5-5 for a four bedroom dwelling, [4 + 1] * 450 L/day = 2250 L/d

Lot	Distance (m)	20 year Drawdown (m)
1	62	0.08
2	44	0.08
3	28	0.09
4	0	0.13
5	20	0.09
6	40	0.08
7	60	0.08
3244 Shea	235	0.06
3290 Shea	87	0.07
4 Hemphill	79	0.07
6 Hemphill	61	0.08

WATER WELL SYSTEM SURVEY QUESTIONNAIRE

Our File No.:	017630

SECTION A: PROPERTY INFORMATION	
Address of Property:	26 MARY HILL CRES
* Name of Property Owner:	[redacted]
* Telephone Number (Home):	
Number of Occupants:	2
Number of Bedrooms:	3
How Long at Present Address:	3 YRS

*This information will NOT be included in any reporting

SECTION B: WELL CONSTRUCTION DETAILS				
Date or year well constructed:	2001 ?			
~~Do you have a copy of the MOE Well Record?~~		☑ YES	☐ NO	
Well record number (if known):				
Type of well:		☑ Drilled	☐ Dug	
Well casing diameter (inches):				
Location of well (e.g. front yard, back yard, etc.):	FRONT			
Present well depth:	200FT	Original well depth:		☐ Same as present
Is the well accessible?		☑ YES	☐ NO	
Is it vented and how?	?			

SECTION C: WATER SUPPLY			
Do you have a water treatment system?		☑ YES	☐ NO
If yes, what kind of treatment?:			
Chlorination:	☐ YES	☐ NO	
Softener:	☑ YES	☐ NO	
Filter:	☑ YES	☐ NO	
Other:			

SECTION D: WATER QUALITY & QUANTITY			
Do you drink the water?	☑ YES	☐ NO	
If no, since when and why?			
Have you ever run out of water?	☐ YES	☑ NO	
Has your well ever been deepened or a new well constructed?	☐ YES	☑ NO	
If yes, why?			
Have you ever experienced any problems with your well?	NO		
What was the cause of the problem?		☐ Drought	☐ Pump Failure
☐ Increased Usage	☐ Interference	☐ Other (Please Specify)	

SECTION D CONTINUED: WATER QUALITY & QUANTITY			
Quality: Taste	☑ Excellent	☐ Acceptable	☐ Poor
Odour	☑ Excellent	☐ Acceptable	☐ Poor
Colour	☑ Excellent	☐ Acceptable	☐ Poor
Hardness	☐ Excellent	☑ Acceptable	☐ Poor
Iron	☐ Excellent	☑ Acceptable	☐ Poor
Sulphur Smell	☑ Excellent	☐ Acceptable	☐ Poor
Has your water quality been tested previously?		☑ YES	☐ NO
If yes, for what?	☑ Bacteriological	☐ Chemical analysis	☐ Other
Does your well supply enough water for your use?		☑ YES	☐ NO
If no, is this the case?:	☐ Some of the time	☐ Seasonally	☐ Other
Do you use your well for?:	☑ Lawn watering	☐ Pool filling	☑ Gardening
Number of persons using water from your well?		2	

SECTION E: WATER SAMPLING		
Would you be interested in having a water sample collected?	☑ YES	☐ NO

Please return this questionaire in the included pre-addressed, stamped envelope.

* WATER WELL SYSTEM SURVEY QUESTIONNAIRE

TYPE OF DWELLING: ☐ Residential ☐ Commercial ☐ Institutional ☐ Other

I. OWNER/OCCUPANT INFORMATION AND GENERAL QUESTIONS:

OWNER/OCCUPANT:

Name: [redacted] Telephone No. (business) .....

Address: 2 Hemphill Street Telephone No. (home) [redacted]

Number of Bedrooms 3 Number of Occupants 2

GENERAL QUESTIONS

How long have you owned/occupied this dwelling? 43 years

Is well water used for drinking water supply? Yes ☒ No ☐

If no, why not?.....

If no, how long has it been since well water was used for drinking?.....

If no, what is the origin of drinking water?.....

II. WATER WELL

A. WELL CONSTRUCTION DETAILS:

Date or year constructed 1968 Contractor .....

Well record number (if known) .....

Type of well: Drilled ☒ Dug ☐ Well diameter (inches) 8 inch (?)

Location of well (e.g. front yard, back yard, etc.) Front yard

Present well depth 30 ft Original well depth ..... ☑ Same as present

Is the well accessible? Yes ☐ No ☐ By digging

Is well vented and how? ~~[illegible]~~e Yes - 1 inch plastic hose runs parallel with supply line

* *Water Well Survey Questionnaire from Golder Associates Ltd. Hydrogeological Study, dated September 2017, Report No. 1418381-1000, Rev.2, provided to us by the City of Ottawa*

B. WATER QUANTITY

Does your well supply enough water for your use? Yes ☒ No ☐

If no, is this is the case: all the time ☐ some of the time ☐ seasonally ☐ other .....

Use: Domestic: No ☐ Yes ☐ No. of persons using water from well .....

Lawn Watering: No ☐ Yes ☐ Other Uses .....

Have you ever experienced any problems with your well? ....1 once.....

What was the cause of the problem? ☐ Drought ☐ Pump Failure ☐ Plugging

☐ Increased Usage ☐ Interference ☒ Other (Please Specify) 90° elbow at well head broke (rusted)

Did you ever have your well deepened or cleaned, or a new well constructed? ....No.....

If so, why?.....

C. WATER QUALITY

Water Treatment equipment in use (if any).....softner.....

Has your well recently been chlorinated and, if so, when? ....No.....

How would you describe quality of your water? ☐Poor ☐Good ☒Excellent

Has your water quality previously been tested? No ☐ Yes ☒

If yes, for what and how often? (bacteriological, chemical analyses, etc.) .....

.....Probably once a year.....

D. WATER SAMPLING INFORMATION

Would you be interested in having a water sample collected? ☐No ☐Yes

Please return this questionnaire in the included pre- addressed, stamped envelope.

* *Water Well Survey Questionnaire from Golder Associates Ltd. Hydrogeological Study, dated September 2017, Report No. 1418381-1000, Rev.2, provided to us by the City of Ottawa*

TYPE OF DWELLING: ☑ Residential ☐ Commercial ☐ Institutional ☐ Other

I. OWNER/OCCUPANT INFORMATION AND GENERAL QUESTIONS:

OWNER/OCCUPANT:

Name: [redacted] Telephone No. (business) [redacted]

Address: 3317 Shea Rd Telephone No. (home) [redacted]

Number of Bedrooms 3 Number of Occupants 4

GENERAL QUESTIONS

How long have you owned/occupied this dwelling? 32 years:

Is well water used for drinking water supply? Yes ☑ No ☐

If no, why not?

If no, how long has it been since well water was used for drinking?

If no, what is the origin of drinking water?

II. WATER WELL

A. WELL CONSTRUCTION DETAILS:

Date or year constructed Late 60's Contractor don't know

Well record number (if known)

Type of well: Drilled ☑ Dug ☐ Well diameter (inches) 6"

Location of well (e.g. front yard, back yard, etc.) Front yard

Present well depth 45 ft Original well depth ☑ Same as present

Is the well accessible? Yes ☐ No ☑

Is well vented and how? yes 1" plastic pipe

* *Water Well Survey Questionnaire from Golder Associates Ltd. Hydrogeological Study, dated September 2017, Report No. 1418381-1000, Rev.2, provided to us by the City of Ottawa*

B. WATER QUANTITY

Does your well supply enough water for your use? Yes ☑ No ☐

If no, is this is the case: all the time ☐ some of the time ☐ seasonally ☐ other .....

Use: Domestic: No ☐ Yes ☑ No. of persons using water from well ....4....

Lawn Watering: No ☐ Yes ☑ Other Uses .....

Have you ever experienced any problems with your well? ....No....

What was the cause of the problem? ☐ Drought ☐ Pump Failure ☐ Plugging

☐ Increased Usage ☐ Interference ☐ Other (Please Specify) .....

Did you ever have your well deepened or cleaned, or a new well constructed? ....No....

If so, why? .....

C. WATER QUALITY

Water Treatment equipment in use (if any)....Softner....

Has your well recently been chlorinated and, if so, when? ....No....

How would you describe quality of your water? ☐ Poor ☑ Good ☐ Excellent

Has your water quality previously been tested? No ☐ Yes ☑

If yes, for what and how often? (bacteriological, chemical analyses, etc.) .....

.....E Coli..... every.....couple of months.....

D. WATER SAMPLING INFORMATION

Would you be interested in having a water sample collected? ☐ No ☑ Yes

Please return this questionnaire in the included pre- addressed, stamped envelope.

Is the well accessible? Yes ☐ No ☑

Is well vented and how? No

** Water Well Survey Questionnaire from Golder Associates Ltd. Hydrogeological Study, dated September 2017, Report No. 1418381-1000, Rev.2, provided to us by the City of Ottawa*

B. WATER QUANTITY

Does your well supply enough water for your use? Yes ☑ No ☐

If no, is this is the case: all the time ☐ some of the time ☐ seasonally ☐ other .....

Use: Domestic: No ☐ Yes ☑ No. of persons using water from well ....3.....

Lawn Watering: No ☒ Yes ☐ Other Uses .....

Have you ever experienced any problems with your well? ..no.....

What was the cause of the problem? ☐ Drought ☐ Pump Failure ☐ Plugging

☐ Increased Usage ☐ Interference ☐ Other (Please Specify) .....

Did you ever have your well deepened or cleaned, or a new well constructed? .....

If so, why? ..N.a.....

C. WATER QUALITY

Water Treatment equipment in use (if any)..Water Softener.....

Has your well recently been chlorinated and, if so, when? ....no.....

How would you describe quality of your water? ☐Poor ☑Good ☐Excellent

Has your water quality previously been tested? No ☐ Yes ☑

If yes, for what and how often? (bacteriological, chemical analyses, etc.) .When we bought the house, test came back good.....

D. WATER SAMPLING INFORMATION

Would you be interested in having a water sample collected? ☒No ☐Yes

Please return this questionnaire in the included pre- addressed, stamped envelope.

* *Water Well Survey Questionnaire from Golder Associates Ltd. Hydrogeological Study, dated September 2017, Report No. 1418381-1000, Rev.2, provided to us by the City of Ottawa*

Dear Dan Morey:

Please find attached the analytical results for your samples. If you have any questions regarding this report, please do not hesitate to call (613-727-5692).

Report Comments:

APPROVAL: _____
Dragana Dzeletovic, Team Leader

All analysis is completed in Ottawa, Ontario (unless otherwise indicated).

Eurofins Ottawa is accredited by CALA, Canadian Association for Laboratory Accreditation to ISO/IEC 17025 for tests which appear on our CALA scope of accreditation. It can be found at http://www.cala.ca/scopes/2602.pdf.

Eurofins (Ottawa) is certified and accredited for specific parameters by OMAFRA, Ontario Ministry of Agriculture, Food and Rural Affairs (for farm soils). Licensed by Ontario MOE for specific tests in drinking water.

Please note: Field data, where presented on the report, has been provided by the client and is presented for informational purposes only. Guideline values listed on this report are provided for ease of use (informational purposes) only. Eurofins recommends consulting the official provincial or federal guideline as required.

Dear Dan Morey:

Please find attached the analytical results for your samples. If you have any questions regarding this report, please do not hesitate to call (613-727-5692).

Report Comments:

APPROVAL: _____
Dragana Dzeletovic, Team Leader

All analysis is completed in Ottawa, Ontario (unless otherwise indicated).

Eurofins Ottawa is accredited by CALA, Canadian Association for Laboratory Accreditation to ISO/IEC 17025 for tests which appear on our CALA scope of accreditation. It can be found at http://www.cala.ca/scopes/2602.pdf.

Eurofins (Ottawa) is certified and accredited for specific parameters by OMAFRA, Ontario Ministry of Agriculture, Food and Rural Affairs (for farm soils). Licensed by Ontario MOE for specific tests in drinking water.

Please note: Field data, where presented on the report, has been provided by the client and is presented for informational purposes only. Guideline values listed on this report are provided for ease of use (informational purposes) only. Eurofins recommends consulting the official provincial or federal guideline as required.

Water well sample laboratory testing results from Golder Associates Ltd. Hydrogeological Study, dated September 2017, report No. 1418381-1000 Rev.2, provided to us by the City of Ottawa

Guideline = ODWSOG *** = Guideline Exceedence**
All analysis completed in Ottawa, Ontario (unless otherwise indicated by ** which indicates analysis was completed in Mississauga, Ontario).
Results relate only to the parameters tested on the samples submitted.
Methods references and/or additional QA/QC information available on request.

MRL = Method Reporting Limit, AO = Aesthetic Objective, OG = Operational Guideline, MAC = Maximum Acceptable Concentration, IMAC = Interim Maximum Acceptable Concentration, STD = Standard, PWQO = Provincial Water Quality Guideline, IPWQO = Interim Provincial Water Quality Objective, TDR = Typical Desired Range

APPENDIX H

TEST PIT LOGS FROM PREVIOUS MOREY ASSOCIATES LTD. GEOTECHNICAL INVESTIGATION

TABLE I

RECORD OF TEST PITS
PROPOSED RESIDENTIAL DEVELOPMENT
HEMPHILL STREET
OTTAWA, ONTARIO

TEST PIT NUMBER/ ELEVATION	DEPTH (METRES)	DESCRIPTION
TP1 ELEV. 93.5m	0.00 – 0.30	TOPSOIL
	0.30 – 3.35	Stiff to very stiff, grey brown SILTY CLAY
	3.35	End of test pit

Depth (m)	Strength, Cu (kPa)
0.3	>130
0.6	>130
0.9	>130
1.2	>130
1.5	>130
1.8	>130
2.1	120
2.4	105
2.7	89
3.0	65
3.3	62

Groundwater flow observed in test pit at about 2.3 metres below existing ground surface, November 22, 2017.
Water measured in standpipe at about 1.1 metres below existing ground surface, December 6, 2017.

TABLE I (CONTINUED)

TEST PIT NUMBER/ ELEVATION	DEPTH (METRES)	DESCRIPTION
TP2 ELEV. 93.7m	0.00 – 0.30	TOPSOIL
	0.30 – 4.00	Stiff to very stiff, grey brown SILTY CLAY
	4.00	End of test pit

Depth (m)	Strength, Cu (kPa)
0.3	>130
0.6	>130
0.9	>130
1.2	>130
1.5	>130
1.8	>130
2.1	120
2.4	110
2.7	90
3.0	71
3.3	67
3.6	78
3.9	84

Groundwater seepage observed in test pit at about 1.8 metres below existing ground surface, November 22, 2017. Water measured in standpipe at about 1.2 metres below existing ground surface, December 6, 2017.

TABLE I (CONTINUED)

TEST PIT NUMBER/ ELEVATION	DEPTH (METRES)	DESCRIPTION
TP3 ELEV. 93.8m	0.00 – 0.30	TOPSOIL
	0.30 – 4.00	Stiff to very stiff, grey brown SILTY CLAY
	4.00	End of test pit

Depth (m)	Strength, Cu (kPa)
0.3	>130
0.6	>130
0.9	>130
1.2	>130
1.5	>130
1.8	110
2.1	95
2.4	83
2.7	67
3.0	72
3.3	80
3.6	92

Groundwater flow observed in test pit at about 2.1 metres below existing ground surface, November 22, 2017.
Water measured in standpipe at about 1.2 metres below existing ground surface, December 6, 2017.

TABLE I (CONTINUED)

TEST PIT NUMBER/ ELEVATION	DEPTH (METRES)	DESCRIPTION
TP4 ELEV. 93.7m	0.00 – 0.30	TOPSOIL
	0.30 – 4.00	Stiff to very stiff, grey brown SILTY CLAY
	4.00	End of test pit

Depth (m)	Strength, Cu (kPa)
0.3	>130
0.6	>130
0.9	>130
1.2	>130
1.5	>130
1.8	125
2.1	100
2.4	96
2.7	90
3.0	74
3.3	80
3.6	96

Groundwater flow observed in test pit at about 2.1 metres below existing ground surface, November 22, 2017.
Water measured in standpipe at about 1.2 metres below existing ground surface, December 6, 2017.

APPENDIX I

CURRICULA VITAE

MOREY ASSOCIATES LTD.
CONSULTING ENGINEERS

D.G. MOREY, P.Eng.

LANGUAGE: English

EDUCATION: Bachelor of Applied Science, Civil Engineering
University of Ottawa, 2009

PROFESSIONAL AFFILIATIONS: Registered Professional Engineer Ontario

EXPERIENCE:

2012 – Present — **Morey Associates Ltd.**
Director/Senior Engineer

Responsible for the managerial and technical aspects of the operation of the firm carrying out geotechnical and hydrogeological investigations, environmental site assessments, and construction inspection and testing.

2010 – 2012 — **Levac Robichaud Leclerc Associates Ltd.**
Junior Engineer

Analysis, preparation and field work for geotechnical investigations, hydrogeological impact assessments and environmental assessments. Also carry out quality control testing (i.e. compaction, subgrade, concrete testing)

2009 – 2010 — **Kollaard Associates Inc.**
Junior Engineer

Analysis and preparation of geotechnical and slope stability evaluation reports. Responsible for field work and drafting (using AutoCAD) for geotechnical investigations, slope stability evaluations, environmental site assessments, hydrogeological investigations, site grading plans, roadway designs, and structural designs. Also carry out quality control testing (i.e. compaction, subgrade, concrete testing).

2005 – 2008 (Summers) — **Kollaard Associates Inc.**
Civil Engineering Student

Responsible for field work and drafting for geotechnical investigations, site grading plans, septic system designs, roadway designs, and structural designs.

2004 — **Morey Houle Chevrier Engineering Ltd.**
Technician

Carried out surveying and drafting for site grading plans and septic system designs. Also carried out well grouting inspections and well pump tests.

MOREY ASSOCIATES LTD.
CONSULTING ENGINEERS

C.R. MOREY, P.Eng

LANGUAGE: English

EDUCATION:
B.Sc., Geological Engineering, Queen's University, Kingston, Ontario, 1973.
M.Sc.,(Eng.), Civil Engineering, Queen's University, Kingston, Ontario, 1977.
Graduate courses in Civil and Geotechnical Engineering, Windsor and Carleton Universities, 1980 and 1982.

PROFESSIONAL AFFILIATIONS:
Registered Professional Engineer Ontario
Designated Consulting Engineer

EXPERIENCE:

2012 – PRESENT **Morey Associates (Kemptville, Ontario)**
Senior Engineer

Responsible for supervision of all technical aspects of projects carried out by the firm.

2010 - 2012 **Levac Robichaud Leclerc Associates Ltd. (Rockland & Kemptville, Ontario)**
Director of Geotechnical Department

Responsible for senior level supervision of geotechnical investigations, hydrogeological impact assessments and environmental site assessments and providing QA/QC for the related project letters, memos, reports and drawings.

2005 – 2010 **Kollaard Associates Inc. (Kemptville, Ontario)**
Principal

Responsible for mentoring of professional staff, project letter and report reviews, senior level project supervision, business development, and assisting in office administration.

1994 – 2005 **Morey Houle Chevrier Engineering Ltd. (Kemptville, Ontario)**
President

Responsible for the managerial and technical aspects of the operation of the firm carrying out geotechnical and hydrogeological investigations, environmental site assessments, and construction inspection and testing. Geotechnical and hydrogeological expert witness for Ontario Municipal Board hearings and Ontario Court Provincial Division trials.

1980 - 1994 **Golder Associates Ltd. (Windsor & Ottawa, Ontario)**
Geotechnical Engineer then Associate

Responsible for subsurface investigations and design of roadways, retaining walls, airport runways, residential and commercial developments, buried services, septic systems, wharves, building foundations, dams, municipal drains, stormwater management facilities, building flood proofing.

PUBLICATIONS: Co-author of two papers regarding retrogressive landslides in sensitive marine deposited silty clay of the Ottawa Valley area, published by the Geological Survey of Canada.
