1 Screening

This study has been prepared according to the City of Ottawa's 2017 Transportation Impact Assessment (TIA) Guidelines. Accordingly, a Step 1 Screening Form has been prepared and is included as Appendix A, along with the Certification Form for TIA Study PM. As shown in the Screening Form, a TIA is required including the Design Review component and the Network Impact Component.

2 Existing and Planned Conditions

2.1 Proposed Development

The proposed development, located at 2275 Mer-Bleue Road, is currently zoned General Mixed Use (GM15[2156] S330-H). The existing land is currently undeveloped. The proposed development consists of 32 back-to-back townhouse units, 80 standard townhouse units, and a 0.75 hectare mid-rise mixed-use development block. The site is proposed to have two accesses. The first (Site Access #1) will serve the townhouses only and will be provided through the residential development to the south and out to Mer-Bleue Road at Decoeur Drive. Decour Drive is a full-movement intersection and is approximately 430 metres south of Brian Coburn Boulevard and 310 metres north of Renaud Road. The second (Site Access #2) will be a right-in / right-out access on Brian Coburn Boulevard, and will serve the mid-rise mixed-use development block only. The access configuration and location will be discussed in further steps of the TIA. The anticipated full build-out and occupancy horizon is 2024. Figure 1 illustrates the Study Area Context. Figure 2 illustrates the proposed concept plan.

DRAFT

CAIVAN 2075 MER BLEUE | Ottawa, Ontario
PRELIMINARY LOTTED CONCEPT

2.2 Existing Conditions

2.2.1 Area Road Network

Mer-Bleue Road

Mer-Bleue is a City of Ottawa arterial road with a four-lane cross-section within the majority of the Study Area and a two-lane cross-section extending south at approximately 200 metres north of Renaud Road. The posted speed limit is 60 km/h north of Renaud Road and 50 km/h south of Renaud Road. Mer-Bleue Road has asphalt and gravel shoulders in conjunction with the two-lane cross section and switches to curbs and gutters where it widens to four lanes. Bike lanes and sidewalks are present where Mer-Bleue is four lanes. No cycling or pedestrian infrastructure is provided for the section of Mer-Bleue that is two lanes. The Ottawa Official Plan reserves a 37.5 metre right of way. Mer-Bleue is designated as a partial trucking route to the north of Brian Coburn Boulevard.

Brian Coburn Boulevard

Brian Coburn Boulevard is a City of Ottawa arterial road that has a two-lane cross-section with intermittent leftturn lanes east of Mer-Bleue Road and a posted speed-limit of 60 km/h to the east of Mer-Bleue Road and 70 km/h to the west of Mer-Bleue Road. Brian Coburn Boulevard has curbs and gutters within the Study Area. To the west of Mer-Bleue Road, a bike lane is provided on the north side and a multi-use pathway is provided on the south side. To the east Mer-Bleue Road, a sidewalk is provided on the north side and a bike plan is also provided on the north side between Mer-Bleue Road and Gerry Lalonde Drive / Jerome Jodoin Drive. The City Official Plan reserves a 40.0 metre right-of-way. Brian Coburn Boulevard is designated as a partial trucking route.

Gerry Lalonde Drive / Jerome Jodoin Drive

Gerry Lalonde Drive is a City of Ottawa collector road with a two-lane cross section to the north of Brian Coburn Boulevard and posted speed limit of 50 km/h. Information on Jerome Jodoin Drive is unknown as it is being constructed and is currently a gravel road used by construction vehicles only. Gerry Lalonde Drive has curbs and gutters and sidewalks on both sides of the road. Room for on-street parking is provided on both sides of the street. The measured right-of-way is 24.0 metres.

Renaud Road

Renaud Road is a City of Ottawa collector road with a two-lane cross-section and a posted speed limit of 50 km/h. Gravel shoulders are present on both sides of the road and no pedestrian or cycling facilities are provided. The City of Ottawa Official Plan reserves a 24.0 metre right-of-way.

2.2.2 Existing Intersections

A description and accompanying aerial photograph of the existing intersections within the Study Area can be found below.

Mer-Bleue Road at Brian Coburn Boulevard

The intersection of Mer-Bleue Road and Brian Coburn Boulevard is an unsignalized, two-lane, four-leg roundabout. The north and south approaches are both two lanes and consist of a shared left-turn through lane and a shared through / right-turn lane. The east and west approaches are single lanes and are both shared left-turn / through / right-turn movements. All approaches must vield to traffic within the roundabout. The speed limit within the roundabout is 30 km/h. No turn restrictions were noted.

Brian Coburn Boulevard at Gerry Lalonde Drive / Jerome Jodoin Drive

The intersection of Brian Coburn Boulevard and Gerry Lalonde Dive / Jerome Jodoin Drive is an unsignalized intersection with stopcontrol on the north and south approaches. The south leg is currently used as a construction access only and is assumed to be a single lane consisting of a shared left-turn /through / right-turn movement. The north and east approach consist of a shared left-turn / through / right-turn lane. The west approach has an auxiliary left-turn lane and a shared through / right-turn lane. No turn restrictions were noted.

Renaud Road at Mer-Bleue Road

The intersection of Renaud Road and Mer-Bleue Road is an unsignalized Tintersection with stop-control for all three legs. The south approach consists of a shared left-turn / through lanes, the north approach has a shared through / right-turn lane and the west approach has a shared left-turn / right-turn lane. No turn restrictions were noted.

2.2.3 Existing Driveways

Existing driveways are located along Brian Coburn Boulevard and Mer-Bleue Road within 200 metres of the proposed site accesses. All existing driveways are residential accesses and driveways to existing and future residential developments. Any significant traffic generation from these driveways and accesses will be considered in the background traffic of future scenarios and explored further in Section 2.3.2.

2.2.4 Cycling and Pedestrian Facilities

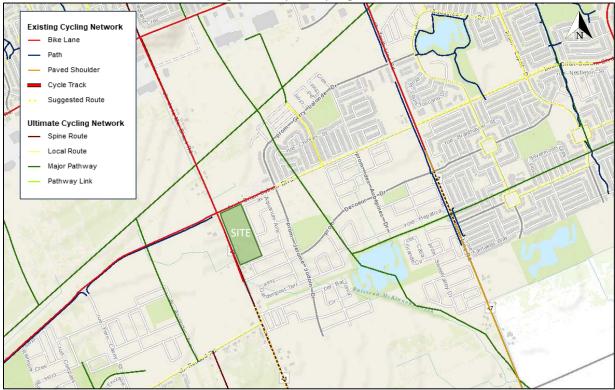

Sidewalks are provided along Mer-Bleue Road to the north and south of Brian Coburn Boulevard and stop approximately 200 metres north of Renaud Road (not shown below). Sidewalks are provided on the north side of Brian Coburn Boulevard to the east of Mer-Bleue Road as well as on both sides of Gerry Lalonde Drive. The cycling network consists of bike lanes to the north and south of Brian Coburn Boulevard which stop approximately 200 metres north of Renaud Road. Brian Coburn Boulevard has bike lanes on the north side to the west of Mer-Bleue Road and to the east it has bike lanes which stop at Gerry Lalonde Drive. A multi-use pathway on the south side of Brian Coburn Boulevard is present west of Mer-Bleue Road and Renaud Road is considered a local route. Figure 3 illustrates the pedestrian facilities in the Study Area and Figure 4 illustrates the cycling facilities.

Source: <u>http://maps.ottawa.ca/geoOttawa/</u> Accessed: January 7, 2021

Figure 4: Study Area Cycling Facilities

Source: http://maps.ottawa.ca/geoOttawa/ Accessed: January 7, 2021

2.2.5 Existing Transit

Within the Study Area, route #30 has four stops on Brian Colburn Boulevard between Mer-Bleue Road and Gerry Lalonde Drive with two of those stops almost directly beside the development site. Route #30 has four stops on Brian Colburn Boulevard to the east of Gerry Lalonde Drive with three of these stops also shared by route #234. Additionally, routes #30 and 302 share two stops on Mer-Bleue north of Brian Coburn Boulevard. The frequencies of these routes within the proximity of the proposed site currently are:

- Route #30— every 10-15 minutes in the peak directions, and every 30 minutes in the off-peak direction, off peak times and on weekends.
- Route #234— every 15 in the peak directions on weekdays. No weekend service.
- Route #302— Tuesdays at approximately 9:30 in the AM peak and 3:00 in the PM peak

Figure 5 illustrates the transit system map and Figure 6 illustrates the transit stops in the Study Area.

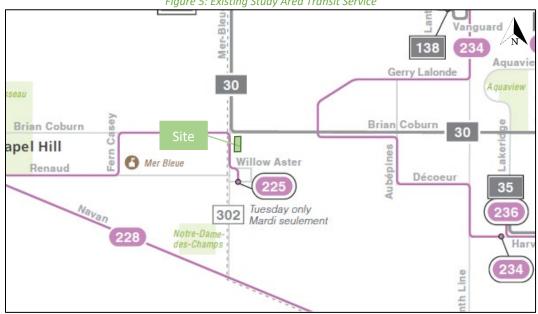

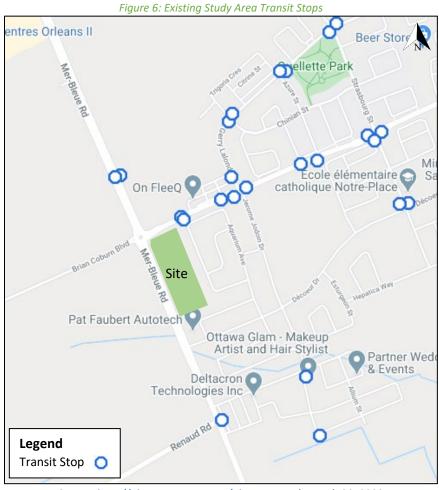

Figure 5: Existing Study Area Transit Service

Source: http://maps.ottawa.ca/geoOttawa/ Accessed: March 30, 2020

Source: http://plan.octranspo.com/plan Accessed: March 30, 2020

2.2.6 Existing Area Traffic Management Measures

There are no existing area traffic management measures within the Study Area with the exception of a radar speed sign on Gerry Lalonde Drive facing northbound vehicles.

2.2.7 Existing Peak Hour Travel Demand

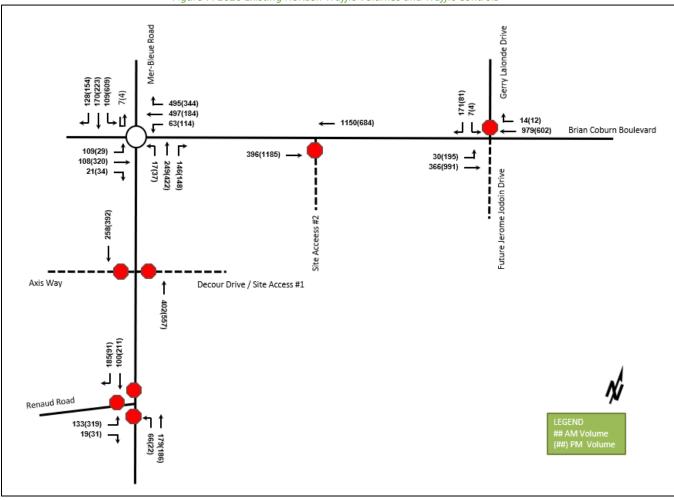

Existing turning movement counts were acquired for the existing Study Area intersections for both the AM and PM peak hours. Table 1 summarizes the intersection count dates and data sources.

Intersection	Count Date	Data Source
Mer-Bleue Road at Brian Coburn Boulevard	December 2017	2225 Mer-Bleue Road TIS (HDR, 2018)
Brian Coburn Boulevard at Gerry Lalonde Drive / Jerome Jodoin Drive	Wednesday October 17, 2018	City of Ottawa
Renaud Road at Mer-Bleue Road	Thursday November 15, 2018	City of Ottawa

Figure 7 illustrates the 2020 existing horizon traffic volumes and Table 18 summarizes the existing intersection operations. As shown above, the turning movement count data has been collected over different years. A background growth rate has been applied to the Study Area intersections to reflect a 2020 horizon and was determined based on adjacent transportation studies. A 1% annual growth rate was used in the following studies;

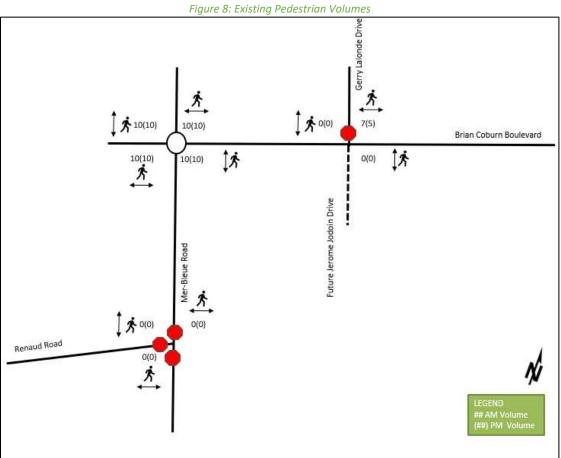

2025 Mer-Bleue Road Community Transportation Study (Stantec, 2017), Proposed TrailsEdge East Development Community Transportation Study (Castleglenn Consultants, 2016), and the Proposed Avalon West Community Development Phase 3 and 4 Addendum No. 2 Letter Report (Castleglenn Consultants, 2015). A 2% annual growth rate was used in the 2225 Mer-Bleue Road Transportation Impact Study (HDR, 2018). In order to reflect a conservative estimate of growth, a 2% background growth rate has been applied to the Study Area intersections. Detailed turning movement count data is included in Appendix B

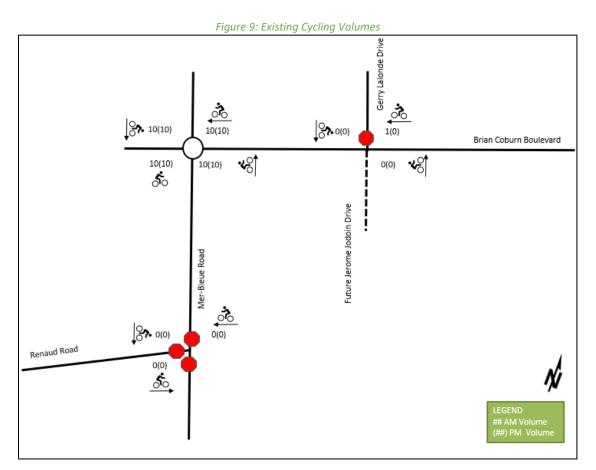

Additionally, the collected intersection counts also provided existing pedestrian and cyclist demands at the two of the Study Area intersections for both AM and PM peak periods. Both pedestrian and cyclist volumes were not available at the intersection of Brian Coburn Road and Mer-Bleue Road and as such, an assumed conservative pedestrian volume of 10 pedestrians / hour and 10 cyclists / hour has been entered for each leg of the roundabout. Figure 8 illustrates the existing pedestrian volumes and Figure 9 illustrates the existing cyclist volumes at the Study Area intersections

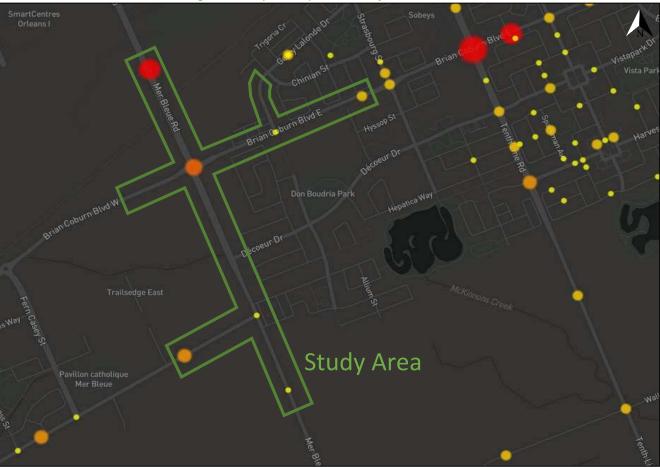

2.2.8 Collision Analysis

Collision data has been acquired from the City of Ottawa for five years (2014-2018) prior to the commencement of this TIA for the surrounding Study Area road network. Figure 10 illustrates the collisions at the intersections and road segments within the Study Area and Table 2 summarizes the collisions at the intersections and road segments within the Study Area. Table 3 summarizes the collision types and conditions of the 38 collisions recorded in the Study Area. Collision data is included in Appendix C.

Elaura 10, Ctua	ly Aroa Donrocont	ation of	Collicion	Locations
rigure 10. Stuu	ly Area Represent	uuon o	COMSION	LOCULIONS

Intersection / Segment	Number	%
Intersection / Segment	38	100%
Brian Coburn Boulevard @ Mer-Bleue Road	9	23%
Brian Coburn Boulevard @ Gerry Lalonde Drive	3	8%
Renaud Road @ Mer-Bleue Road	3	8%
Brian Coburn Boulevard btwn Chaperal Private & Mer-Bleue Road	2	5%
Brian Coburn Boulevard btwn Fern Casey Street & Mer-Bleue Road	3	8%
Brian Coburn Boulevard btwn Gerry Lalonde Drive & Strasbourg Street	5	13%
Gerry Lalonde Drive btwn Brian Coburn Boulevard & Trigoria Crescent	3	8%
Mer-Bleue btwn 210 S of Innes Road & Renaud Road	6	16%
Mer-Bleue Road btwn Renaud Road & Du Palais Street	1	3%
Renaud Road btwn White Street & Mer-Bleue Road	3	8%

Table 3: Collision Summary

		Number	%
Total Collisions		38	100%
	Fatality	0	0%
Classification	Non-Fatal Injury	5	13%
	Property Damage Only	33	87%
Initial Impact Type	Approaching	2	5%

	Angle	5	13%
	Rear end	13	34%
	Sideswipe	4	11%
	Turning Movement	3	8%
	SMV Unattended Vehicle	1	3%
	SMV Other	8	21%
	Other	2	5%
	Dry	26	68%
	Wet	6	16%
	Loose Snow	5	13%
Road Surface Condition	Slush	0	0%
	Packed Snow	0	0%
	Ice	1	3%
	Loose sand or gravel	0	0%
Pedestria	Pedestrian Involved		0%
Cyclists Involved		0	0%

Overall, no fatal collisions were documented in the Study Area and no collisions involving pedestrians or cyclists have been documented either. Of the 38 collisions recorded in the Study Area, 13% resulted in a non-fatal injury and the remaining 87% resulted in property damage only. The impact types are distributed throughout the various categories with the largest number of collisions, at 34%, found in the rear end impact type category. Weather/road conditions are considered a contributing factor for 32% of the collisions in the Study Area.

2.3 Planned Conditions

2.3.1 Changes to the Area Transportation Network

The subject development is within the Mer-Bleue Community Design Plan. As this design plan was published in 2006, many of the plans and recommendations have already been implemented or are no longer feasible. As such, applicable elements of the Ottawa Official Plan, Ottawa Transportation Master Plan, Ottawa Pedestrian Plan, and the Ottawa Cycling Plan have been used to identify changes to the area transportation network. The resulting changes to the road, pedestrian, and cycling network in the Study Area due to these plans are outlined below:

- As part of the 2031 Affordable Network, Brian Coburn Boulevard between Tenth Line Road and Blackburn Hamlet Bypass will be considered a Transit Priority Corridor (Isolated Measures). As a result, transit signal priority and queue jump lanes will be implemented. The exact timing of this is not clear.
- As part of the 2031 Affordable Network, Brian Coburn Boulevard between Navan Road and Mer-Bleue Road will be widened from a two to four-lane road. The exact timing of this is not clear.
- As part of the City of Ottawa Urban Road Network, Jerome Jodoin Drive has been designated as a future collector road. The exact timing of this is not clear.
- As part of the 2031 Ultimate Cycling Network, within the Study Area Mer-Bleue Road will be considered a spine route, Brian Coburn and Renaud Road will be considered a local route and a major pathway travelling north-south will intersect Brian Coburn Boulevard to the east of Gerry Lalonde Drive / Jerome Jodoin Drive. The exact timing of these have not been made clear.

While reviewing TrailsEdge East Development Community Transportation Study, it was noted that the signal warrants at Mer-Bleue Road and Axis Way / Decoeur Drive will be met in 2021 as a result of traffic generated by TrailEdge East and Avalon West developments. An excerpt from the Proposed TrailsEdge East Development

Community Transportation Study can be seen in Appendix D. Further, the Planning, Infrastructure, and Economic Development Department Report (March 2019) to City of Ottawa's Planning Committee and Council indicates that intersection of Brian Coburn Boulevard at Gerry Lalonde Drive / Jerome Jodoin Drive will be upgraded to a single-lane roundabout and can be found in Appendix E. Thus, these intersections will be coded as a signalized intersection and a roundabout, respectively, for future horizon operational analysis purposes only and are required to be designed by others.

2.3.2 Other Study Area Developments

A few development applications were available for the adjacent properties as listed on the City's Development Application Search tool:

 2025 Mer-Bleue Road Phases 1-3 – The SmartREIT Orleans commercial development Phases 1 to 3 will have approximately 183,000 ft² GFA of retail space, 30,000 ft² GFA of restaurant space and 10,000 ft² GFA of bank developments. Full-build-out is expected by 2019. The anticipated trip generation from this site can be seen in Figure 11 and is an excerpt from the Orleans Commercial Development Transportation Impact Study prepared by Stantec Consulting Ltd.

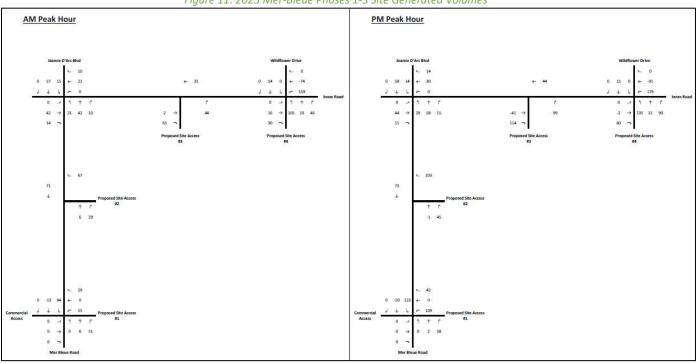

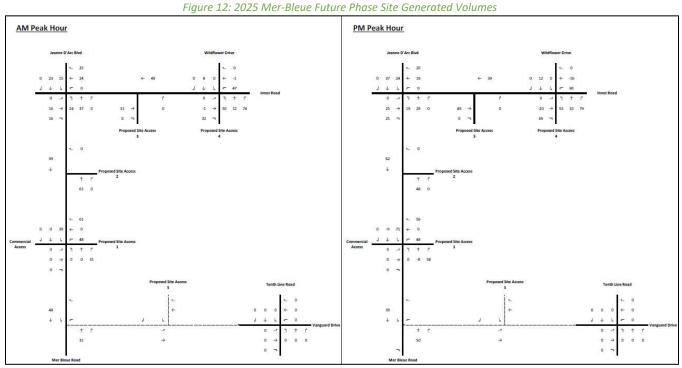

Figure 11: 2025 Mer-Bleue Phases 1-3 Site Generated Volumes

Source: Orleans Commercial Development Transportation Impact Study (Stantec Consulting, 2016)

 2025 Mer-Bleue Road Future Phase – The SmartREIT Orleans commercial development future phase will have approximately 42,000 ft² GFA of retail space, 14,000 ft² GFA of restaurant space and 118,000 ft² GFA of industrial space, 1200 apartment units, 350 senior housing units and a 256-bed assisted living building. Full-build-out is expected by 2026. The anticipated trip generation from this site can be seen in Figure 12 and is an excerpt from the 2025 Mer-Bleue Road Community Transportation Study prepared by Stantec Consulting Ltd.

Source: 2025 Mer-Bleue Road Community Transportation Study (Stantec Consulting, 2017)

 2405 Mer-Bleue Road / 2496 Tenth Line Road – The Summerside Phases 1 to 3 will have approximately 810 residential units consisting of 430 single family detached dwellings, 260 townhouse units and 210 apartment units. Full-build out is expected by 2020. The anticipated trip generation from this site can be seen in Figure 13 and Figure 14, and is an excerpt from the 2405 Mer-Bleue Transportation Impact Study prepared by Stantec Consulting Ltd.

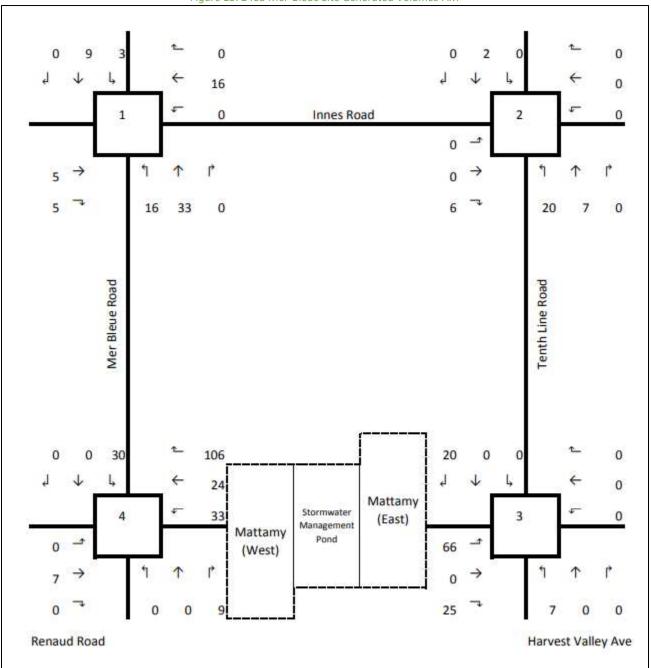

Figure 13: 2405 Mer-Bleue Site Generated Volumes-AM

Source: 2405 Mer-Bleue Road Transportation Impact Study (Stantec Consulting, 2014)

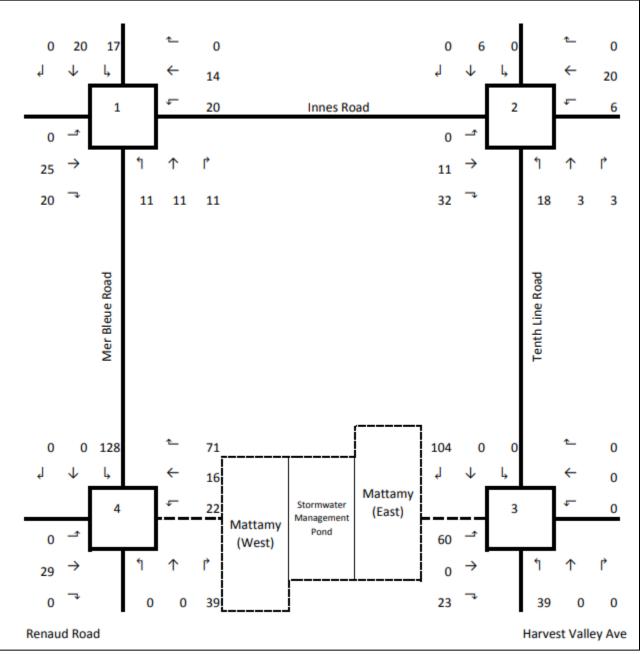

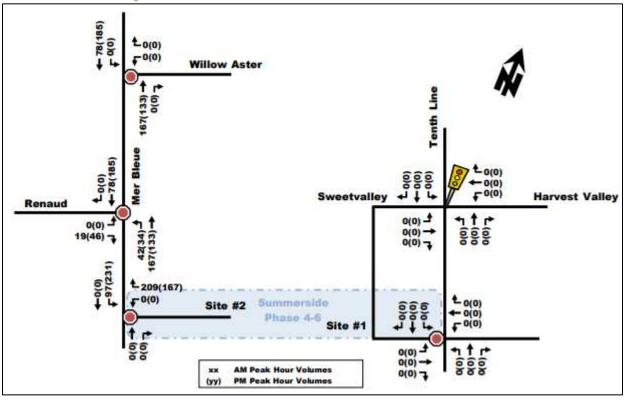

Figure 14: 2405 Mer-Bleue Site Generated Volumes-PM

2564 Tenth Line Road – The Summerside West Phases 5 to 6 will consist of 257 single family homes (Phase 5), and 236 townhomes (Phase 6). Full build out is expected to be 2024 for both Phase 5 and Phase 6. The anticipated trip generation from this site for Phase 5 and Phase 6 can be seen in Figure 15, and is an excerpt from the Summerside West Phase 4-6 Transportation Impact Assessment Strategy Report prepared by Parsons. The Phase 4 of the Summerside West development will not impact Study Area intersections and therefore has not been included in this study as one of the background developments.

Source: Summerside West Phase 4-6 TIA Strategy Report (Parsons, 2018)

• TrailsEdge East Development – approximately 900 residential units consisting of a mix of single, townhomes, and back-to-backs are to be completed by 2021. The anticipated trip generation from this site can be seen in Figure 16, and is an excerpt from the Proposed TrailsEdge East Development Community Transportation Study prepared by Castleglenn Consultants.

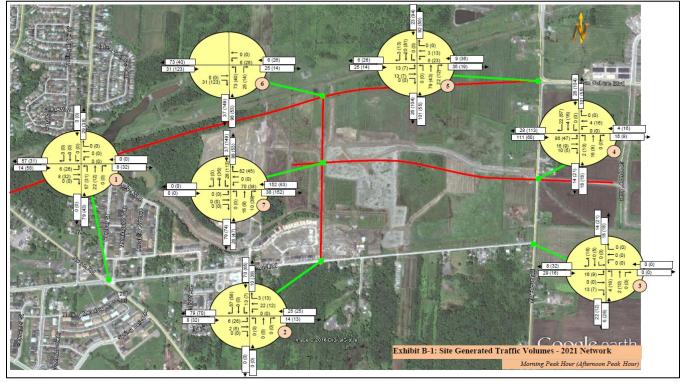

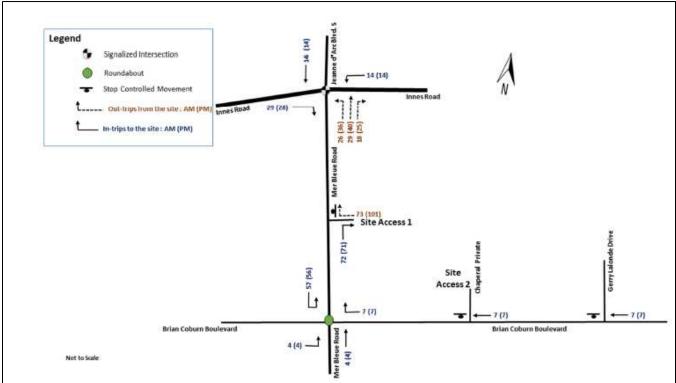

Figure 16: TrailsEdge East Development Generated Volumes

Source: Proposed TrailsEdge East Development Community Transportation Study (Castleglenn Consultants, 2016)

 2225 Mer-Bleue Road – the proposed Orleans Health Hub will be a 6040 square feet health services building with approximately 242 parking stalls and two site accesses. It is estimated that full-build out of this development will occur in 2021. The anticipated trip generation from this site can be seen in Figure 17 and is an excerpt from 2225 Mer-Bleue Road – Orleans Health Hub Transportation Impact Study prepared by HDR.

Source: 2225 Mer-Bleue Road Transportation Impact Study (HDR, 2018)

2159 Mer-Bleue Road – Blue Sea Village is a seven-block mixed use development with 45,000 square feet
of office space, 190,000 square feet of recreational space, 100 retirement residence units and 100
residential apartment units. One site access will be provided and full-build out is expected to occur in
2024. Trip distribution of this development will change once future Vaughan Drive extension is built in
2029, allowing southbound left turns into the site. The anticipated 2024 and 2029 trip distribution from
this site can be seen in Figure 18 and Figure 19, respectively and are excepts from the 2159 Mer-Bleue
Road Blue Sea Village Transportation Impact Assessment prepared by D.J. Halpenny & Associates Ltd.

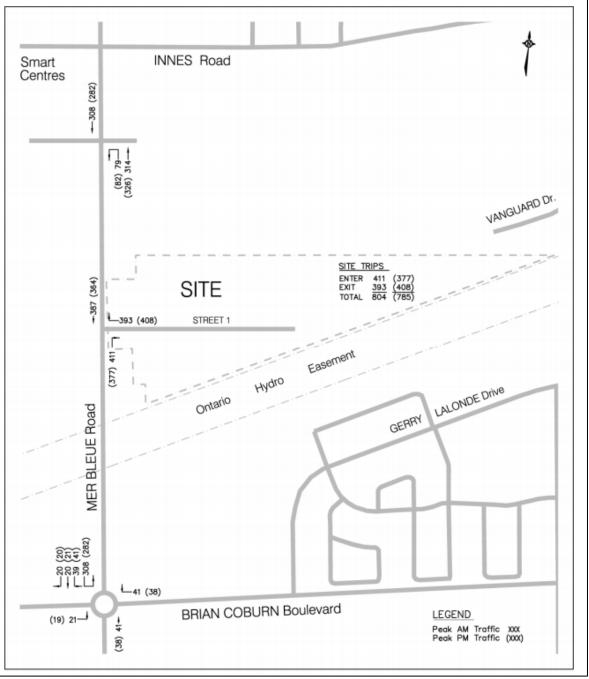

Figure 18: 2159 Mer-Bleue Road 2024 Development Generated Traffic Volumes

Source: 2159 Mer-Bleue Road Transportation Impact Assessment (D.J. Halpenny & Associates Ltd., 2018)

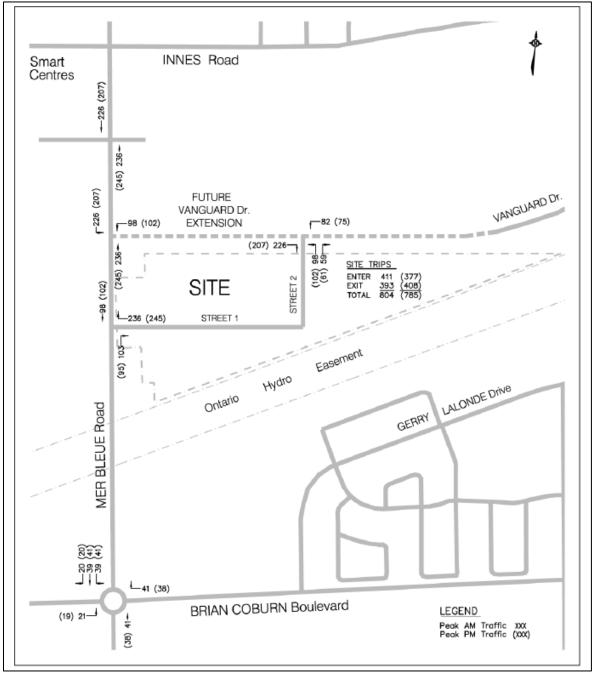

Figure 19: 2159 Mer-Bleue Road 2029 Development Generated Traffic Volumes

Source: 2159 Mer-Bleue Road Transportation Impact Assessment (D.J. Halpenny & Associates Ltd., 2018)

 2167 Tenth Line Road – a mixed-use development with 231 proposed apartment units and 500 square metres of retail. This property is expected to be built-out in 2021. Trip generation of this development can be seen in Figure 20 and is excerpt from the 2167 Tenth Line Road Traffic Impact Assessment prepared by Castleglenn Consultants in 2020.

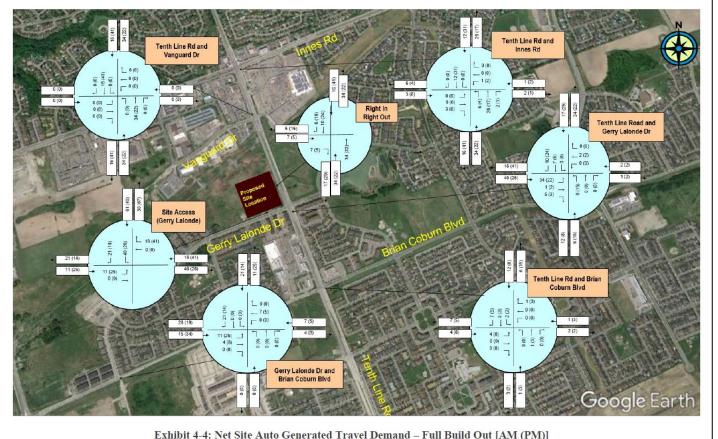

Exhibit 4-4. Itti Sitt Auto Otherattu Traver Demand – Fun Dund Out [Asit (Tivi)]

Source: 2167 Tenth Line Road Traffic Impact Assessment Final Draft (Castleglenn, 2020)

- 2605 Tenth Line Road a proposed 125 Ha residential subdivision with approximately 200 single family homes, 200 townhomes, and 200 stacked townhomes. Since the 2605 Tenth Line Community Transportation Study has been prepared by Delcan in 2014, changes were proposed to the east portion of the subdivision. Therefore, for this study a combination of the west-side site generated volumes outlined in the 2014 Delcan Study and the east-side site generated volumes prepared by CGH in 2020 was used to determine the background traffic volumes.
- Avalon West Community Phase 5 Phase 5 of the Avalon West community is proposed to include approximately 1,120 residential units, and a secondary school. Full-build out is expected to occur in 2021. As no Transportation Impact Study for this development is currently available, the anticipated movements In and Out of the Avalon West development through the intersection of Mer-Bleue Road at Decoeur Drive, and the intersection of Gerry Lalonde Drive at Brian Coburn Boulevard were determined using the background traffic volumes illustrated in TrailsEdge East Development Community Transportation Study, and 2167 Tenth Line Road TIA, respectively.

3 Study Area and Time Periods

3.1 Study Area

The Study Area will include the intersections of Brian Coburn Boulevard and Mer-Bleue Road, Brian Coburn Boulevard and Gerry Lalonde Drive / Jerome Jodoin Drive, and Mer-Bleue Road and Renaud Road. Brian Coburn Boulevard and Mer-Bleue Road will be examined as Boundary Roads.

3.2 Time Periods

As the proposed development is composed primarily of residential units the AM and PM peak hours will be examined.

3.3 Horizon Years

The anticipated build-out year is 2024. As a result, the full build-out plus five years horizon year is 2029.

4 Exemption Review

Table 4 summarizes the exemptions for this TIA.

Table 4: Exemption Review					
Module	Element	Explanation	Exempt/Required		
Design Review Com	ponent				
4.1 Development Design	4.1.2 Circulation and Access	Only required for site plans	Exempt		
	4.2.3 New Street Networks	Only required for plans of subdivision	Required		
4.2 Parking	4.2.1 Parking Supply	Only required for site plans	Exempt		
	4.2.2 Spillover Parking	Only required for site plans where parking supply is 15% below unconstrained demand	Exempt		
Network Impact Cor	nponent				
4.5 Transportation Demand Management	All Elements	Not required for site plans expected to have fewer than 60 employees and/or students on location at any given time	Required		
4.6 Neighbourhood Traffic Management	4.6.1 Adjacent Neighbourhoods	Only required when the development relies on local or collector streets for access and total volumes exceed ATM capacity thresholds	Required		
4.8 Network Concept		Only required when proposed development generates more than 200 person-trips during the peak hour in excess of equivalent volume permitted by established zoning	Required		

5 Development-Generated Travel Demand

5.1 Trip Generation and Mode Shares

This TIA has been prepared using the TRANS Trip Generation Study Report (2009) vehicle and person trip rates for the residential components, and the ITE Trip Generation Manual (10th Edition) average vehicle trip rates for the commercial components of the proposed development. To estimate commercial land use person trip generation, a factor of 1.28 has been applied to the ITE rates. Table 5 summarizes the vehicle and person trip rates for the proposed land uses.

Land Use	Land Use Code	Peak Hour	Vehicle Trip Rate	Person Trip Rates
Townhouses	224	AM	0.54	0.98
Townnouses	(TRANS)	PM	0.71	1.16
Mid-Rise Apartments	223	AM	0.29	0.66
Mid-Rise Apartments	(TRANS)	PM	0.34	0.84
Shanning Contro	820	AM	0.94	1.20
Shopping Centre	(ITE)	PM	3.81	4.88

Table 5: Trip Generation	Person	Trip Rates
--------------------------	--------	------------

Using the above Person Trip rates, the total person trip generation has been estimated. Table 6 below illustrates the total person trip generation by land use.

Table 6: Total Person Trip Rates							
Land Use	$ll_{n} = l_{n} = l_{n}$	AI	M Peak Hou	r	PM Peak Hour		
Land Use	Units/GFA (s.f.)	In Out Total				Out	Total
Townhouses	112	67	44	111	67	64	131
Mid-Rise Apartments	170	69	43	112	69	74	143
Shopping Centre	15,000	10	9	19	37	36	73
	Total Person Trips	146	96	242	173	174	347

Table 6: Total Person Trip Rates

To account for trips that are made within the proposed Mid-Rise Building (i.e. a building resident using retail portion of the mid-rise before coming home from work), an internal capture rate has been applied to the total person trip generation of the Retail land use. The ITE Trip Generation Handbook (3^d Edition) provides the internal trip capture rates for trip origins and destinations within a mixed-use development and can be found in Appendix F.

The Residential portion is the largest use of the Mid-Rise Apartment Building. Therefore, this land use is treated as the anchor for this part of the development and is not reduced based on the multi-use capture rate. The commercial portion of the development, which generates a lower number of trips, has been reduced to reflect building residents utilizing the on-site retail stores. The internal capture rates for the Residential and Retail uses are summarized in Table 7. The total net person trip generation can be seen in Table 8.

Table 7: Internal Capture Rates							
Land Use	AM Pea	ak Hour	PM Peak Hour				
Land Use	In	Out	In	Out			
Residential to/from Retail	17%	14%	10%	26%			

Table 8. Total Net Person Trip Generation								
Land Use	Units/GFA (s.f.)	AN	/I Peak H	our	PM Peak Hour			
Land Use		In	Out	Total	In	Out	Total	
Townhouses	112	67	44	111	67	64	131	
Mid-Rise Apartments	170	69	43	112	69	74	143	
Shopping Centre	15,000	7	8	15	34	26	60	
	Total Person Trips	143	95	238	170	164	334	

Table 8: Total Net Person Trip Generation

Using the most recent National Capital Region Origin-Destination (OD Survey), the existing mode shares for Orleans have been summarized in Table 9. The mode shares in the Study Area are expected to align with the OD Survey values, as the subject site is located in a typical suburban area with transit stops near the site frontage on Brian Coburn Boulevard which connect to various commercial/employment destinations to the north as well as other locations within the district.

Table 9: Mode Share					
Travel Mode	Orleans				
Auto Driver	60%				
Auto Passenger	20%				
Transit	15%				
Cyclist	0%				
Pedestrian	5%				
Total	100%				

Using the above mode shares and the person trip rates, the person trips by mode have been projected. Table 10 summarizes the trip generation by mode.

	Table	e 10: Trip Ge	eneration by	Mode			
Traval Mada	Mode Share	A	M Peak Ho	ur	PM Peak Hour		
Travel Mode	wode share	In	Out	Total	In	Out	Total
		Town	houses				
Auto Driver	60%	40	26	66	40	38	78
Auto Passenger	20%	13	9	22	13	13	26
Transit	15%	10	7	17	10	10	20
Cyclist	0%	0	0	0	0	0	0
Pedestrian	5%	4	2	6	4	3	7
Total	100%	67	44	111	67	64	131
	Mid-Rise Apartm	ents and S	hopping C	entre (Mix	ed-Use)		
Auto Driver	60%	45	31	76	62	60	122
Auto Passenger	20%	14	11	25	21	20	41
Transit	15%	12	7	19	15	15	30
Cyclist	0%	0	0	0	0	0	0
Pedestrian	5%	5	2	7	5	5	10
Total	100%	76	51	127	103	100	203
	Grand Total	143	95	238	170	164	334

As shown above, 238 AM and 334 PM new peak hour two-way vehicle trips are projected as a result of the proposed development. Out of these trips, 111 AM and 131 PM peak hour two-way vehicle trips are generated by the Townhouse portion of the development and will utilize Mer-Bleue Road at Decoeur Drive intersection to access the site, where 127 AM and 203 PM peak hour two-way vehicle trips will be generated by the mixed-use portion of the development and enter/exit the site via Site Access #2 at Brian Coburn Boulevard.

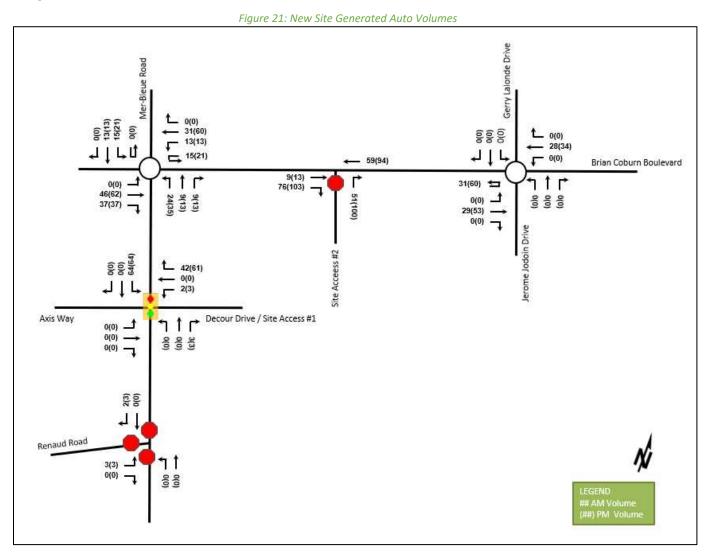

5.2 Trip Distribution

To understand the travel patterns of the subject development, the OD survey has been reviewed to determine the existing travel patterns that will be applied to the new vehicle trips. Table 11 below summarizes the distribution for Orleans.

Table 11: OD Survey Existing Directional Split Orleans								
	To/From							
	North	20%						
	South	0%						
	East	20%						
	West	60%						
	Total	100%						

5.3 Trip Assignment

Using the distribution outlined above, turning movement splits, and access to major transportation infrastructure, the trips generated by the site have been assigned to the Study Area road network. Figure 21 illustrates the new site generated volumes.

6 Background Network Travel Demands

6.1 Transportation Network Plans

The transportation network plans were discussed in Section 2.3.1. As a result of background developments, the intersection of Mer-Bleue Road and Axis Way / Decour Drive will be signalised, and the intersection of Brian Coburn Boulevard at Gerry Lalonde Drive / Jerome Jodion Drive will be a one-lane roundabout. These changes will be coded in Synchro and Sidra in all Future Background and Future Total scenarios for operational analysis purposes only and the intersections ae required to be designed by others.

6.2 Background Growth and Other Developments

Surrounding development Traffic Impact Assessments have used a 2% traffic growth within the Study Area of this report. As such, an annual background growth of 2% will be used in order to remain consistent with these studies.

The background developments explicitly considered in the 2024 and 2029 background conditions include:

- 2025 Mer-Bleue Road
- 2405 Mer-Bleue Road / 2496 Tenth Line Road
- 2564 Tenth Line Road
- TrailsEdge East Development
- 2225 Mer-Bleue Road
- 2159 Mer-Bleue Road
- 2168 Tenth Line Road
- 2605 Tenth Line Road
- Avalon West Community Phase 5

All of these developments are discussed in Section 2.3.2. Figure 22 illustrates the 2024 future background volumes and Figure 23 illustrates the 2029 future background volumes.

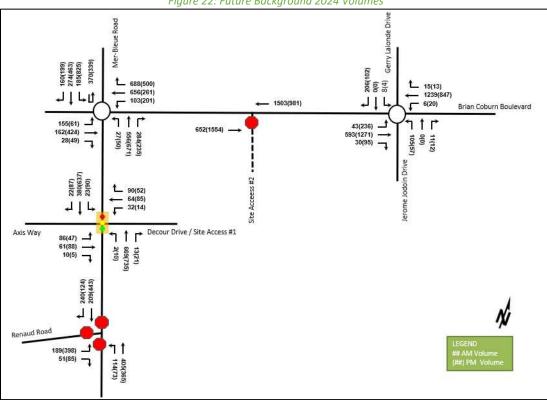

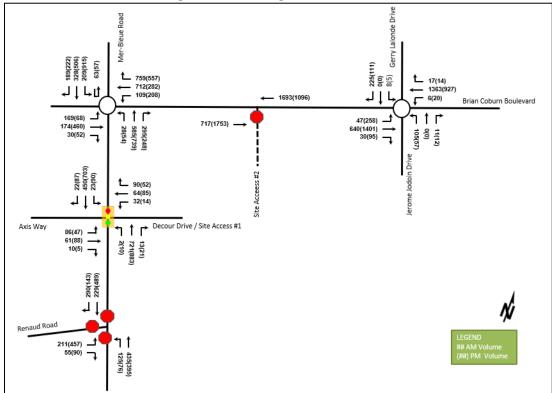

Figure 22: Future Background 2024 Volumes

7 Demand Rationalization

Based on background growth and the intersection upgrades required to support TrailsEdge East development, and Avalon West Community Phase 5 development, it is expected that the Study Area will experience capacity constraints in the next 4-9 years. As the timelines of Brian Coburn Boulevard transit improvements and widening are unknown, it is assumed that these changes to the network will be implemented beyond this study's horizons. Although the combination of background growth and delay of infrastructure projects will likely result in poor operational performance of the Study Area intersections, the Future Background volumes illustrated in Figure 22 and Figure 23 should be carried forward in the analysis to emphasise the need for infrastructure upgrades outlined in the City's 2031 Affordable Network. The 2024 and 2029 future total volumes are illustrated in Figure 24 and Figure 25, respectively.

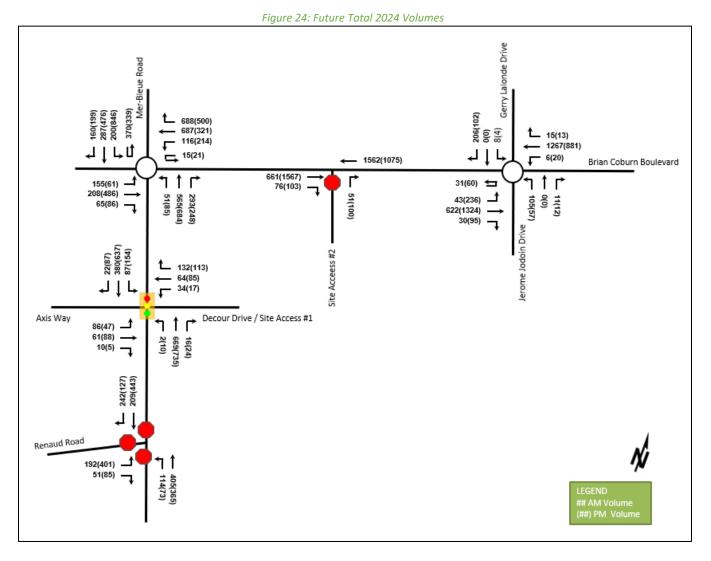

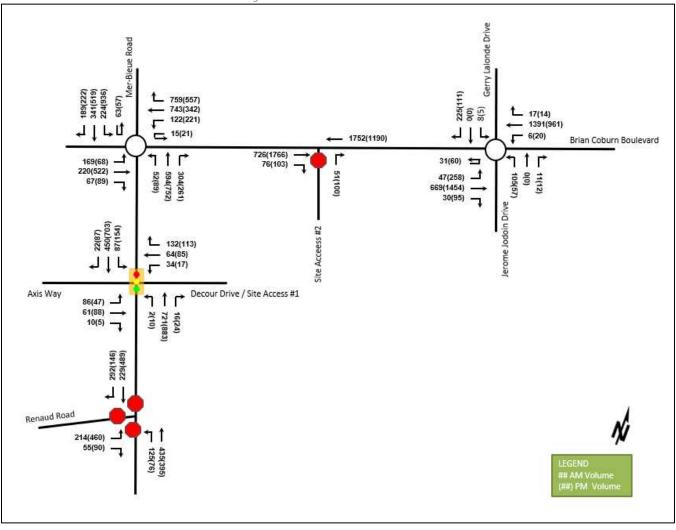

Figure 25: Future Total 2029 Volumes

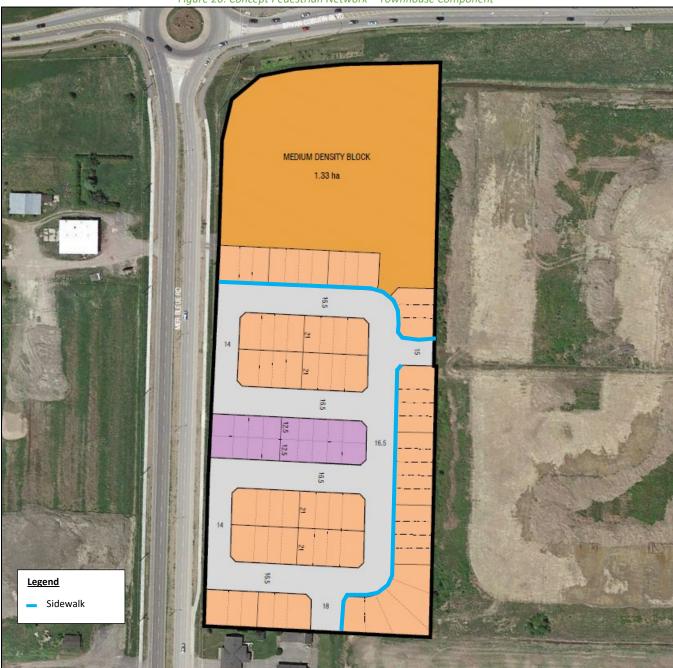

8 Development Design

8.1 Design for Sustainable Modes

The Townhouse component of the proposed development is a residential subdivision and therefore auto and bicycle parking areas will be within each resident's home. Figure 26 illustrates the concept pedestrian network. The cyclists will use the roadway within the subdivision as no cycling infrastructure is planned along local roads in the vicinity of the subject development.

The Mixed-Use component of the development includes residential and retail land uses with underground parking for both automobiles and bicycles. Pedestrian facilities will connect the building users to Bryan Coburn Boulevard, Mer-Bleue Road, and the residential subdivision to the south. Further, the sidewalk along the south side of Brian Coburn Boulevard will be extended past the Mer-Bleue Road at Brian Coburn Boulevard intersection along the subject site frontage.

Facilities that are supportive of sustainable modes in the City of Ottawa's TDM-supportive Development Design and Infrastructure Checklist, which are applicable to the Mixed-Use component of the proposed development and required for zoning and standard site design are recommended. The following additional measures are also recommended:

- Locate building close to the street, and do not locate parking between the street and building entrances
- Locate building entrances in order to minimize walking distances to sidewalks and transit facilities
- Locate building doors and windows to ensure visibility of pedestrians from the building
- Design roads used for access or circulation by cyclists using a target operating speed of 30 km/h

TDM Checklists can be found in Appendix G.

8.2 Circulation and Access

Turning Templates for the Mixed-Use component of the proposed development are not required as part of the Zoning ByLaw Amendment and will be developed in later stages as part of the Site Plan Application.

8.3 New Street Networks

The residential subdivision planned street network will include 14.0 metre window roads, and 16.5 metre local roadways. The local roads will provide parking on one side of the roadway and the proposed posted speed limit will be 30 km/h. The active transportation network is provided in Section 8.1.

To support the pedestrian and cycling connectivity within the subdivision, Figure 27 illustrates the concept traffic calming plan. The plan reduces crossing distances for the pedestrian and cyclists, as well as limits the speed of vehicles entering and exiting the local roads from the collector roads.

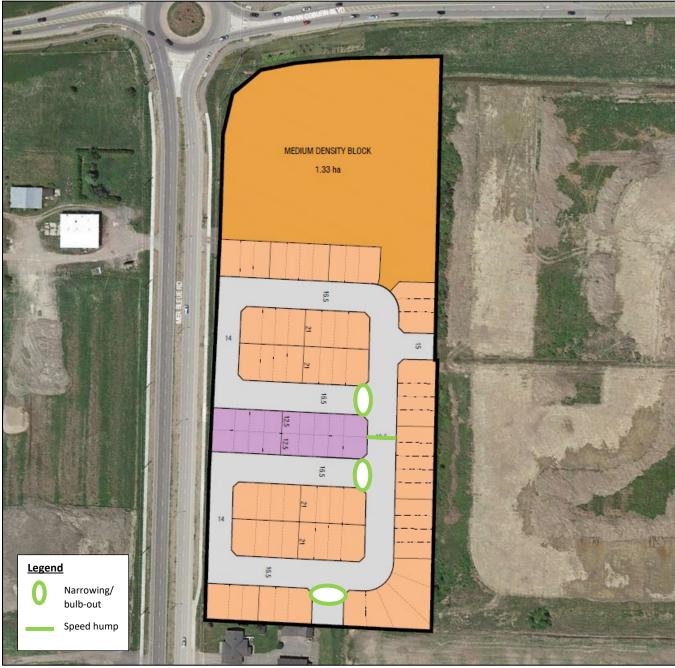

Figure 27: Traffic Calming Plan – Townhouse Component

The internal road intersections are recommended to be stop-controlled on the minor approaches of all intersections.

9 Parking

9.1 Parking Supply

The parking requirements and provisions for the Mixed-Use component of the proposed development are summarized in Table 12.

Land Use	Units / GFA (s.m.)	Parking Rate	Parking Required	Parking Provided
Mid-Rise Apartments	170	1.2 spaces / dwelling unit + 0.2 visitor spaces / dwelling unit	238	- 286
Retail	1,394	3.4 spaces / 100 m ² GFA	48	280
		Total	286	
Mid-Rise Apartments (Bicycle)	170	0.5 spaces / dwelling unit	85	
Retail (Bicycle)	1,394	1 spaces / 250 m ² GFA	6	91
	Total		91	

Table 12: Parking Provisions – Mixed Use Component

Based on the City of Ottawa Zoning By-laws, a minimum of 286 automobile and 91 bicycle parking spaces are required. As can be seen in Table 12, automobile and bike parking space requirements are met.

9.2 Spillover Parking

This TIA is exempt from this Module (see Section 4).

10 Boundary Street Design

Mer-Bleue Road, and Brian Coburn Boulevard are noted as boundary roads for the proposed development. Decoeur Drive will also be a future boundary road to the proposed development however as no detailed design is available, the segment MMLOS analysis along this road cannot be completed at this point in time.

The Segment Multi-Modal Level of Service (MMLOS) is broken down into the Pedestrian Level of Service (PLOS), Bicycle Level of Service (BLOS), Transit Level of Service (TLOS), and Truck Level of Service (TkLOS) and are all recorded in Table 13. As the Existing, Future Background, and Future Total scenarios are all different, they have been evaluated in their own MMLOS worksheets. The results however are the same across majority of horizons. Mer-Bleue Road, and Brian Coburn Boulevard have been evaluated against the target for a general urban area. The MMLOS Worksheets for each horizon can be found in Appendix H.

					MN	ILOS			
Road Segment	Horizon	PLOS		BLOS		TLOS		Tkl	OS
		Actual	Target	Actual	Target	Actual	Target	Actual	Target
Mer-Bleue Road -	Existing								
Brian Coburn	2024 FB				С	D			
Boulevard to	2024 FT	D	С	С			D	A	D
Decoeur Drive	2029 FB								
Decoeur Drive	2029 FT								
Brian Coburn	Existing	F						В	
Boulevard – Mer-	2024 FB	F							
Bleue Road to	2024 FT		С	F	В	D	D	А	D
Jerome Jodoin	2029 FB	E						~	
Drive	2029 FT								

Table 13: Boundary Street MMLOS

Once the proposed sidewalk along the south side of Brian Coburn Boulevard is constructed as part of the proposed development, the Pedestrian LOS along Brian Coburn Boulevard will improve. However, due to high vehicular volumes and speeds, the Pedestrian LOS before and after the planned sidewalk implementation is below the

general urban area target. The PLOS is also below the target LOS along Mer-Bleue Road as a result of vehicular volumes and speeds.

The Bicycle LOS along Brian Coburn Boulevard is also not met, as no cycling infrastructure is provided along this segment. However, according to GeoOttawa mapping tool, bike lanes will be implemented along this segment in future, which will improve the BLOS beyond this study's horizon.

Along all other segments, the Bicycle, Transit, and Truck LOS is met.

11 Access Intersections Design

11.1 Location and Design of Access

Access to the development lands will be accommodated via Mer-Bleue Road and Brian Coburn Boulevard. Although the Mixed-Use and the Townhouse portion of the development are adjacent to one another, no infrastructure will be provided to support vehicular movement between the two components of the development.

Access to the Townhouses will be accommodated via the future intersection of Mer-Bleue Road and Decoeur Drive / Axis Way (Site Access #1). No turn restrictions are planned at this intersection. After making a northbound right turn or a southbound left turn movement at this intersection, the subdivision residents will travel eastbound along future Decoeur Drive and then northbound along future Sculpin Street to reach their destination.

Access to the Mixed-Use component of the development will be accommodated via a right-in / right-out access at Brian Coburn Boulevard, located as close to the eastern edge of the property as possible (approximately 130 metres east from Mer-Bleue Road, measured from centreline to centreline). Using TAC Geometric Guide for Canadian Roads (TAC), Figure 8.8.2, the spacing between Site Access #2 and Mer-Bleue Road has been checked for suggested minimum corner clearances. It has been found that the suggested minimum clearance is 70 metres for an arterial road, and thus, Site Access #2 meets this guideline.

According to TAC Table 9.9.6, clear stopping sight distance for a 70 km/h design speed is 105 metres. The planned location of Site Access #2 meets this requirement, as the distance between the eastbound exit point of Mer-Bleue Road and Brian Coburn Boulevard roundabout and Site Access #2 is 105 metres. It is also expected as the approaching vehicles are exiting the roundabout, that their speeds will be lower than 70 km/h, which allows for a longer reaction time. The clear sight distance triangle between Site Access #2 and Mer-Bleue Road at Brian Coburn Boulevard roundabout should be maintained clear of obstruction by the City and the 2275 Mer-Bleue Road property owner when planning for and implementing any modifications to this road segment. Further clear sight distance analysis would be required once a more detailed site concept is available as part of the future RMA and functional design.

11.2 Access Intersection Control

Using OTM Book 12 Justification 7, and the volume projections herein the traffic control signal warrant for Site Access #1 at Mer-Bleue Road have been examined for 2024 and 2029 Future Background and Future Total horizons, and for Site Access #2 at Brian Coburn Boulevard for 2024 and 2029 Future Total horizons. It has been found that signals are warranted at Site Access #1 and Mer-Bleue Road in 2024 Future Background horizon using rural conditions (roads with operating speeds greater or equal to 70 km/h). This is in line with the TrailsEdge Community Transportation Study prepared by Castleglenn Consultants in 2016. As this mitigation was required as part of a Background scenario, the signalization was modeled for operational purposes only and the intersection is required to be designed by others. The signalization warrants for site accesses can be found in Appendix I.

As a result, Site Access #1 will be a signalized intersection, and Site Access #2 will have stop-controls on the minor approach.

11.3 Access Intersection Design

Based on the eastbound right-turning volumes at Site Access #2, an eastbound right-turn lane is warranted. The minimum right-turn lane storage length required by the TAC Geometric Design Guide is 25 metres. As no queuing issues have been noted with respect to this turning lane, 25 metres is considered sufficient. The proposed taper length is 55 metres which falls within the required taper length ratio outlined in the TAC Guide. The design of the eastbound right-turn lane at Site Access #2 will be further refined as part of the future RMA and functional design.

According to TAC Table 8.9.3, the suggested minimum clear throat lengths for major driveways for the Mixed-Use component of the proposed development are summarized in the Table 14 below.

	Table 14: Throat Length by Lan	d Use
Land Use*	Development Size Units / GFA (s.m.)	Required Clear Throat Length (m)
Apartments	170	25
Shopping Centre	1,394	15

*Note: Not all land uses are represented in Table 8.9.3. Where an exact match was not available, a reasonable assumption of a comparable land use was used. (i.e. for the proposed retail store Shopping Centre was used).

The planned throat length of Site Access #2 is 30 metres, which meets the clear throat length requirements.

12 Transportation Demand Management

12.1 Context for TDM

The mode shares used within the TIA represent this area of the City and have not been altered. The subject site is within an Isolated Measures Transit Priority Corridor according to the City's 2031 Affordable Transit Network Map. However, as the timing of this improvement is unknown, and to remain conservative, the existing transit mode share was carried forward in the analysis.

12.2 Need and Opportunity

Eighty percent of the development generated trips have been assumed to rely on auto travel mode and those assumptions have been carried through the analysis. The existing 15 percent transit mode share is a conservative estimate of the future 2024 and 2029 transit mode share, as it is expected that transit services will improve in the vicinity of the subject site as the Study Area builds out. Further, as mentioned in the subsection above, the subject development is located along an Isolated Measures Transit Priority Corridor outlined in the City's 2031 Affordable Transit Network. Therefore, it is unlikely that the transit mode share will decrease. It is also expected that the pedestrian mode share of five percent will not be reduced, as the pedestrian network in the Study Area will grow along with construction of adjacent developments, and more commercial options will become available within the walking distance of the subject site.

12.3 TDM Program

Transportation Demand Management measures are implemented to encourage the use of non-auto modes of travel. This is aimed at reducing the reliance on single occupant auto trips in the City of Ottawa.

The following measures, consistent with the TDM Checklist included in Appendix G, are recommended for the Mixed-Use component of the development to ensure that the travel mode shares meet the TOD targets:

- Display local area maps with walking/cycling access routes and key destinations at major entrances
- Display relevant transit schedules and route maps at entrances
- Provide a multimodal travel option package to new/relocating employees and students

Any "suite of post-occupancy TDM measures" for the subdivision component of the development are limited in their applicability. As a result, no TDM measures are recommended for the Townhouses component.

13 Neighbourhood Traffic Management

In this section, the Neighborhood Traffic Management along Decoeur Drive and Sculpin Street leading to the Townhouse component of the proposed development will be discussed. The TIA Guidelines outline a collector road threshold of 2,500 vehicles per day (AADT), or 300 vehicles in a given peak hour for Neighbourhood Traffic Management review. The threshold for local roads is 1,000 vehicles per day (AADT), or 120 vehicles for a given peak hour. This will give an indication of whether Decoeur Drive and Sculpin Street meet or exceed the theoretical thresholds. The implications of the anticipated traffic within the context of the existing/planned road network and any required mitigation measures are discussed in the following subsections.

13.1 Decoeur Drive

Table 15 summarizes the AADT in both directions on the collector road of Decoeur Drive in the PM peak period.

	East of Me	r-Bleue Road							
	PM Peak								
Development	Eastbound	% Theoretical Threshold	Westbound	% Theoretical Threshold					
2275 Mer-Bleue Road – Townhouse Component	67 (670 AADT)	27%	64	26%					
2029 Future Background Volumes	199 (1990 AADT)	78%	151	60%					
Total	266 (2660 AADT)	106%	215	86%					

Table 15: Decoeur Drive Volumes - NTM Review

Note: 1. AADT approximated using 10:1 ratio of PM peak hour traffic AADT calculated as one-way peak direction volumes

As shown above, the proposed site trip generation is expected to use 27% of the theoretical TIA AADT threshold of Decoeur Drive. When combined with the traffic from the background developments, the eastbound AADT along Decoeur Drive, east of Mer-Bleue Road is 2660, which is 106% of the daily theoretical threshold for a collector road. This is considered acceptable as other access alternatives such as adding another full-movement intersection along Mer-Bleue Road between Brian Coburn Boulevard and Decoeur Drive or allowing the Townhouse traffic to enter the site via Site Access #2 would have a negative impact on the operational performance of Mer-Bleue Road and Brian Corbun Boulevard intersection.

The incorporation of the new collector road guidelines and passive traffic calming measures, as outlined within the TIA guidelines, should ensure that the Decoeur Drive operates as intended. No additional measures are recommended to accommodate the projected volumes along the corridor. Beyond the horizons of this study, the transit network and service improvements will increase the transit mode share, reducing the auto volumes on Decoeur Drive.

13.2 Sculpin Street

Table 16 summarizes the AADT in both directions on the local road of Sculpin Street in the PM peak period. As no dwellings are currently fronting this street, it is assumed that 100% of the volume along Sculpin Street is generated by the subject development.

	North of D	ecoeur Drive		
		PM Pe	eak	
Development	Northbound	% Theoretical Threshold	Southbound	% Theoretical Threshold
2275 Mer-Bleue Road – Townhouse Component	67 (670 AADT)	67%	64	64%
Total	67 (670 AADT)	67%	64	64%

AADT calculated as one-way peak direction volumes

The proposed development generates 67 PM peak hour trips in the peak direction of Sculpin Street. As illustrated above, this does not exceed the City's ADDT threshold. No mitigation measures are proposed along this road.

14 Transit

14.1 Route Capacity

In Section 5.1, the trip generation by mode was estimated, including the number of transit trips that will be generated by the proposed development. Table 17 summarizes the site transit trip generation.

Table 17: Trip Generation by Transit Mode									
Troval Mada	Mada Shara		AM		PM				
Travel Mode	Mode Share	In	Out	Total	In	Out	Total		
Transit	15%	22	14	36	25	25	50		

Overall, the forecasted new transit trips would result in approximately one bus capacity equivalent (single bus, 55-person capacity) in the peak direction to accommodate the transit trips generated from the subject site. However, as these trips are distributed to different directions, it is anticipated that the existing routes would have sufficient residual capacity to accommodate site-generated transit trips. Further, once the Study Area builds out, it is anticipated that OC Transpo will re-evaluate demand and ensure that adequate capacity is provided.

14.2 Transit Priority

No transit priority is required/considered for the study area.

15 Review of Network Concept

Brian Coburn Boulevard may potentially approach or exceed a single lane capacity in the peak direction by 2024 Background and Future conditions. For example, in the PM peak period the west approach volume in the shared through / left-turn lane at Brian Coburn Boulevard and Gerry Lalonde Drive intersection is 1186 during Existing horizon, and 1602 in the 2024 Future Background horizon. These volume projections are dependent on surrounding development growth being realized, and on background growth proceeding at the same rate. The likely impact of the interim condition is extended queues along Brian Coburn Boulevard. The operations of the Study Area intersections along Brian Coburn Boulevard will be further examined in Section 16.

The network concept, as identified within the City of Ottawa's Transportation Master Plan, includes a widening of Brian Coburn Boulevard to a four-lane arterial between Navan Road and Mer-Bleue Road as well as between Trim Road and Frank Kenny Road. Sufficient ROW has been reserved for future Brian Coburn Boulevard widening including along the frontage of the proposed development.

16 Network Intersection Design

16.1 Network Intersection Control

As stated in Section 2.3.1, the network intersection of Brian Coburn Boulevard at Gerry Lalonde Drive / Jerome Jodoin Drive is expected to be a single lane roundabout.

A signal warrant analysis was performed for the intersection of Mer-Bleue Road at Renaud Road for the Future Background, and Future Total horizons using the OTM Book 12 Justification 7 criteria. Using this criterion, it was found that signals are warranted at this intersection in 2024 Future Background horizon using rural conditions (roads with operating speeds greater or equal to 70 km/h). The signalization warrants for intersection of Mer-Bleue Road at Renaud Road can be found in Appendix I.

The intersection methods of control for Mer-Bleue Road at Brian Coburn Boulevard will remain consistent with existing methods of control at both future horizons.

16.2 Network Intersection Design

To understand the intersection design, an MMLOS analysis of existing, 2024 future horizon, and 2029 future horizon demands is required. The existing and future segment MMLOS has been discussed in Section 10. The following sections will discuss the vehicle LOS at Study Area intersections which is based on the HCM criteria for average delay at unsignalized intersections and roundabouts. At signalized intersections, the level of service is based on the V/C ratio as required by the City of Ottawa. This will be followed by a discussion of the intersection MMLOS for other modes.

Synchro (Version 11) and Sidra (Version 8.0) were used to model the Study Area intersection. The Heavy Vehicle percentage (HV %) has been calculated for each turning movement at the Study Area intersection. All Heavy Vehicle percentages calculated to be less than 2% were entered into the Synchro model as 2% in order to produce a conservative analysis. These calculations are shown in Appendix J. All parameters have been coded using the City of Ottawa's TIA Guidelines and default parameters.

16.2.1 Existing Conditions

The existing intersection volumes have been analyzed to establish a baseline condition and determine the impact of the subject development as well as the surrounding background developments on the Study Area road network. Table 18 summarizes the operational analysis of the 2020 existing conditions. Appendix K contains the 2020 Existing Conditions Synchro and Sidra sheets.

1			AM Pe	ak Hour			PM Pe	ak Hour	
Intersection	Lane	LOS	V/C	Delay	Q (95 th)	LOS	V/C	Delay	Q (95 th)

Table 18: Existing Intersection Operations

Notes: Saturation flow rate of 1800 veh/h/lane PHF = 0.90

In the AM peak period, the westbound approach of Mer-Bleue Road at Brian Coburn Boulevard intersection is shown to operate with V/C > 1.0, high delays, and long queues. Other approaches of this intersection are within the City of Ottawa's operational thresholds.

As a result of high eastbound and westbound volumes along Brian Coburn Boulevard, the southbound approach of Brian Coburn Boulevard at Gerry Lalonde Drive / Jerome Jodoin Drive experiences high delays during the AM peak hour. As plans are in place for this intersection to be upgraded to a roundabout, no mitigation measures were proposed as part of the Existing scenario analysis.

Renaud Road at Mer-Bleue Road intersection operates satisfactorily during the peak hours.

16.2.2 2024 Future Background Operations

The 2024 future background intersection volumes and other development traffic have been analyzed to allow a comparison between the future volumes with and without the proposed development. As previously mentioned, signal warrants were met at Mer-Bleue Road and Renaud Road intersection, as well as Mer-Bleue Road and Decoeur Drive (Site Access #1) intersection. The intersection of Brian Coburn Boulevard at Gerry Lalonde Drive / Jerome Jodoin Drive is planned to be upgraded to a roundabout as a result of Avalon West Community Phase 5 development. These as well as additional improvements resulting from the operational analysis on the Study Area network were applied to the Synchro and Sidra models in the 2024 Future Background horizon and are discussed below. Table 19 summarizes the operational analysis of 2024 Future Background conditions. Appendix L contains the 2024 Future Background Synchro and Sidra sheets.

Table 19: 2024 Future Background Intersection Operations

Notes: Saturation flow rate of 1800 veh/h/lane PHF = 1.0

With the addition of background growth to reflect the 2024 horizon as well as traffic generated from surrounding developments, multiple movements fail at Mer-Bleue Road and Brian Coburn Boulevard and Brian Coburn Boulevard at Gerry Lalonde Drive / Jerome Jodoin Drive during the 2024 Future Background horizon.

At the intersection of Mer-Bleue Road and Brian Coburn Boulevard, the westbound approach fails during the AM peak period and all approaches fail during the PM peak period. At Brian Coburn Boulevard and Gerry Lalonde Drive / Jerome Jodoin Drive, the westbound approach fails during the AM peak hour, and northbound and southbound approaches fail during the PM peak hour. As anticipated, with the addition of background growth and approved/proposed developments in the Study Area, the capacity constraints along Brian Coburn Boulevard are clear.

As a mitigation measure, widening of Brian Coburn Boulevard from two to four lanes has been coded in Sidra and can be seen in Table 19. As a result, the operational performance of eastbound and westbound approaches at Mer-Bleue Road and Brian Coburn Boulevard has significantly improved. The westbound approach, however, is still failing at this intersection during the AM peak period. Th proposed mitigation measure has resulted in V/C ratio of 1.42 (previously 2.66) at this approach. The operational performance of northbound and southbound approaches remains at a LOS F. As such, this indicates that the capacity issues cannot be solved based on localized improvements and instead require regional network improvements throughout Orleans by the City of Ottawa.

At the intersection of Brian Coburn Boulevard and Gerry Lalonde Drive / Jerome Jodoin Drive, the widening of Brian Coburn Boulevard to four lanes improves the LOS at all approaches and the intersection operates well.

The signalized intersections of Mer-Bleue Road at Renaud Road, and Mer-Bleue Road at Decoeur Drive / Axis Way operate well.

16.2.3 2024 Future Total Operations

The 2024 Total Future intersection volumes, including the site generated traffic and other development traffic, have been analyzed to understand the impact of the subject development on the Study Area intersections. The mitigation measures outlined in 2024 Future Background Scenario Analysis were carried over to this scenario. Table 20 summarizes the operational analysis of the 2024 Total Future conditions. Appendix M contains the 2024 Future Total Synchro and Sidra Sheets.

Table 20: 2024 Future Total Intersection Operations

Notes: Saturation flow rate of 1800 veh/h/lane

With the addition of the site generated traffic, the Study Area is expected to operate with similar operational characteristics as the 2024 Future Background conditions at most intersection movements.

The operational performance of eastbound approach at Mer-Bleue Road and Brian Coburn Boulevard decreases from LOS E in 2024 Future Background horizon to LOS F in 2024 Future Total horizon during the PM peak period. A lower LOS is expected at this intersection with any additional traffic as many approaches fail or are approaching failure in the Background scenario.

The signalized intersections of Mer-Bleue Road at Renaud Road, and Mer-Bleue Road at Decoeur Drive / Axis Way, as well as the unsignalized intersection of Brian Coburn Boulevard and Site Access #2 operate well.

16.2.4 2029 Future Background Operations

The 2029 Future Background intersection volumes and other development traffic have been analyzed to allow a comparison between the future volumes with and without the proposed development. The mitigation measures outlined in 2024 Future Background Scenario Analysis were carried over to this scenario. Table 21 summarizes the operational analysis of the 2029 Future Background conditions. Appendix N contains the 2029 Future Background Synchro and Sidra sheets.

Table 21: 2029 Future Background Intersection Operations

Notes: Saturation flow rate of 1800 veh/h/lane

PHF = 1.0

- 95% percentile exceeds capacity; queue may be longer

The operational performance of the Study Area intersections remains relatively consistent with the 2024 Future Background horizon.

The operational performance of eastbound approach at Mer-Bleue Road and Brian Coburn Boulevard decreases from LOS E to LOS F during the PM peak period. As previously discussed in Section 16.2.3, a lower LOS is expected at this intersection with any additional traffic as many approaches fail or are approaching failure in the Background scenario.

The level of service of eastbound left, and southbound through/right movements at the intersection of Mer-Bleue Road and Renaud Road decrease from LOS B, and LOS C to LOS C, and LOS D, respectively. It was also noted that the volume for the 95th percentile cycle exceeds capacity at these movements. However, as V/C ratio of these approaches is less than one, it can be assumed that the 95th percentile queue will be rarely exceeded.

The signalized intersection of Mer-Bleue Road at Decoeur Drive / Axis Way operates well.

16.2.5 2029 Future Total Operations

The 2029 Total Future intersection volumes, including the site generated traffic and other development traffic, have been analyzed to understand the impact of the subject development on the Study Area intersections. Table 22 summarizes the operational analysis of the 2029 Future Total conditions. Appendix O contains the 2029 Future Total Synchro and Sidra Sheets.

Table 22: 2029 Future Total Intersection Operations

Notes: Saturation flow rate of 1800 veh/h/lane

PHF = 1.0

With the addition of the site generated traffic, the Study Area is expected to operate with similar operational characteristics as the 2029 Future Background conditions.

The signalized intersections of Mer-Bleue Road at Renaud Road, and Mer-Bleue Road at Decoeur Drive / Axis Way, as well as the unsignalized intersection of Brian Coburn Boulevard and Site Access #2 operate well.

16.2.6 Network Intersection MMLOS

Intersection MMLOS is only undertaken at signalized intersections. The two signalized intersections considered in this study are Mer-Bleue Road at Renaud Road, and Mer-Bleue Road at Decoeur Drive / Axis Way. These intersections are currently stop-controlled and have been signalized in Synchro analysis as an improvement measure. As such, several conservative assumptions about the intersection configuration were made to evaluate the intersection MMLOS and can be seen in MMLOS worksheets in Appendix H. Table 23 summarizes the MMLOS analysis for these intersections in the Study Area for the existing and future horizons. The analysis is based on the general urban area targets.

Interrection	Horizon	Pedest	rian LOS Bicycle I		le LOS	Trans	it LOS	Truc	k LOS	Auto	LOS										
Intersection	Horizon	PLOS	Target	BLOS	Target	TLOS	Target	TrLOS	Target	ALOS	Target										
Mer-Bleue	2024 FB					_				A(C)											
Road &	2029 FB	С		D				_		A(C)											
Renaud Road	2024 FT		č	5		D						A(C)									
nenduu nouu	2029 FT		с		D		D		Е	A(C)	D										
Mer-Bleue	2024 FB	F	F	F	F	F	F	F	F										A(A)		
Road &	2029 FB										F		Р				A(A)

/ Axis Way	2029 FT									A(A)											
Notes:	AM(PM)																				

 Table 23: Study Area Intersection MMLOS Analysis—All Horizons

Based on the new intersection configuration assumptions, the pedestrian LOS target is not met at Mer-Bleue Road and Decoeur Drive / Axis Way as a result of east-west crossing distances. The bicycle LOS is also not met at this intersection as a result of number of lanes and the operating speeds.

Transit LOS is only evaluated where there is an existing or a known future transit route, and Truck LOS is only evaluated along truck routes. Where applicable, these targets are met.

The Auto LOS is also met at both signalized Study Area intersections at all future horizons.

17 Recommendations

As can be seen in Sections 16.2.1 to 16.2.5, the need for modifications to the City's Road Network Concept is evident. During the 2024 Future Background horizon most of movements fail at Brian Coburn Boulevard and Mer-Bleue Road, and Brian Coburn Boulevard and Gerry Lalonde Drive / Jerome Jodoin Drive.

The volumes used in the model for the 2024 Future Background scenario consist of raw traffic counts, background growth, and developments found on the City's Development Application Search Tool. The Turning Movement Counts along at Brian Coburn Boulevard intersections were collected by the City for Brian Coburn Boulevard at Mer-Bleue Road in 2018 and by HDR for Brian Coburn Boulevard at Gerry Lalonde Drive in 2017. A 2% annual growth rate was applied to the traffic counts and is consistent with 2225 Mer-Bleue Road Transportation Impact Study (HDR, 2018). All background developments within one kilometre of the subject site, or those which impact

the Study Area intersections and were available through the City's Development Application Search Tool were added to the 2024 Future Background traffic volumes. These volumes were carried through the Study Area and distributed at major (arterial to arterial) road intersections using the existing turning movement splits.

The widening of Brian Coburn Boulevard from two to four lanes has been recommended as a mitigation measure. Sufficient ROW has been reserved by the City of Ottawa for this widening, including the segment along the subject site frontage. The widening alleviates congestion at both Study Area roundabouts, bringing the operational performance at Brian Coburn Boulevard and Gerry Lalonde Drive / Jerome Jodoin Drive to a satisfactory LOS. However, this is not sufficient to support growth at Mer-Bleue Road and Brian Coburn Boulevard intersection. As previously mentioned, this indicates that the capacity issues cannot be solved based on localized intersection improvements and instead require regional network improvements throughout Orleans by the City of Ottawa. These may include investments in transit infrastructure, incentivising businesses to provide work-from-home options for their employees and constructing alternative routes for vehicles to reach their destination. These potential regional road network modifications are outside of scope of this TIA.

18 Conclusions

- A. The proposed development, located at 2275 Mer-Bleue Road, is a two-part development consisting of a Residential subdivision and a Mixed-Use block. One hundred and twelve townhouses are proposed as part of the Residential subdivision, and the Mixed-Use component consists of 170 apartment units and 15,000 square feet of retail space.
- B. Approximately 285 vehicle parking spaces and 90 bicycle parking spaces will be provided as part of the Mixed-Use building.
- C. Access to the Townhouses will be accommodated via the future intersection of Mer-Bleue Road and Decoeur Drive / Axis Way (Site Access #1), and access to the Mixed-Use component of the development will be accommodated via a right-in / right-out access at Brian Coburn Boulevard (Site Access #2). Site Access #2 is adjacent to the eastern property line and is approximately 130 metres east from Mer-Bleue Road, measured from centreline to centreline.
- D. The existing Study Area is currently served by bus routes #30, #234, and #302.
- E. The previous five years of collision history at the existing Study Area intersections has been reviewed. No patterns emerged that indicated that mitigation measures or further monitoring was required.
- F. The residential trip generation rates were identified using TRANS Trip Generation Report (2009) and the retail trip rates were identified using the ITE Trip Generation Manual. The Orleans mode shares were used to determine the trip generation by mode. Internal capture trips were accounted for in the Mixed-Use component trip generation.
- G. It was found that the proposed development can be anticipated to generate 238 AM, and 334 PM net new peak hour two-way vehicle trips. Minimum vehicle and bicycle parking space requirements are met.
- H. It was found that the Pedestrin LOS is not met along Mer-Bleue Road and Brian Coburn Boulevard segments adjacent to the subject site as a result of high vehicular volumes and speeds. Bicycle LOS is not met along Brian Coburn Boulevard due to a lack of cycling infrastructure. The Bicycle, Transit, and Truck LOS is met.
- I. Both signalization warrants and left-turn lane warrants were evaluated at Mer-Bleue Road and Decoeur Drive / Axis Way (Site Access #1), and Mer-Bleue Road at Renaud Road. Signalization was not warranted at either intersection, however as a result of Synchro analysis, signalization was recommended at intersections in 2024 Future Background horizon. Auxiliary left-turn lanes were added to each approach of signalized intersections.

- J. An eastbound right-turn lane is warranted at the intersection of Brian Coburn Boulevard and Site Access
 #2. Preliminary storage and taper lengths have been designed for this turn lane for operational analysis purposes, however this will be further refined as part of the future RMA and functional design.
- K. In the existing conditions operational analysis, westbound approach fails at Mer-Bleue Road at Brian Coburn Boulevard intersection and southbound approach fails at Brian Coburn Boulevard and Gerry Lalonde Drive.
- L. In the 2024 Future Background horizon, mitigation improvements were required at all Study Area intersections to improve the operational performance. These measures are listed below:
 - Widening of Brian Coburn Boulevard from two to four lanes throughout the Study Area
 - Signalization at Mer-Bleue Road and Renaud Road, and at Mer-Bleue Road and Decoeur Drive / Axis Way (Site Access #1)

As a result of the mitigation measures, traffic operations within the Study Area improved significantly. However, the LOS at westbound, southbound, and northbound approaches at Mer-Bleue Road and Brian Coburn Boulevard remain poor. This indicates that the capacity issues cannot be solved based on localized intersection improvements and instead require regional network improvements throughout Orleans by the City of Ottawa.

- M. The Study Area intersections are expected to operate with similar operational characteristics as the 2024 Future Background conditions during the 2024 Future Total horizon. The operational performance of eastbound approach at Mer-Bleue Road and Brian Coburn Boulevard decreases from LOS E to LOS F during the PM peak period. A lower LOS is expected at this intersection with any additional traffic as many approaches fail or are approaching failure in the Background scenario. Site Access #2 at Brian Coburn Boulevard is shown to operate at a satisfactory LOS.
- N. In the 2029 Future Background horizon the operational performance of the Study Area intersections remains relatively consistent with the 2024 Future Background horizon. The operations of Mer-Bleue Road at Brian Coburn Boulevard remain poor. The operational performance of eastbound approach at Mer-Bleue Road and Brian Coburn Boulevard decreases from LOS E to LOS F during the PM peak period. A lower LOS is expected at this intersection with any additional traffic as many approaches fail or are approaching failure in the Background scenario. The level of service of eastbound left, and southbound through/right movements at the intersection of Mer-Bleue Road and Renaud Road decrease from LOS B, and LOS C to LOS C, and LOS D, respectively.
- O. With the addition of the site generated traffic, the Study Area is expected to operate with similar operational characteristics to the 2029 Future Background conditions in the 2029 Future Total horizon. The operations of Mer-Bleue Road at Brian Coburn Boulevard remain poor.
- P. Based on the new intersection configuration assumptions, the pedestrian LOS target is not met at Mer-Bleue Road and Decoeur Drive / Axis Way as a result of east-west crossing distances. The bicycle LOS is also not met at this intersection as a result of number of lanes and the operating speeds. Other MMLOS targets are met at all horizons.
- Q. As can be seen in Sections 16.2.1 to 16.2.5, the need for Network Concept modifications as a result of Background traffic is evident. The widening of Brian Coburn Boulevard from two to four lanes has been recommended as a mitigation measure. The widening improved operational performance; however, this was not sufficient to bring the LOS at Mer-Bleue Road and Brian Coburn Boulevard above LOS F. This indicates that the capacity issues cannot be solved based on localized intersection improvements and instead require regional network improvements throughout Orleans by the City of Ottawa.

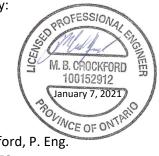

It has been noted that the proposed development accesses operate well and can be accommodated within the road network without negatively impacting the existing intersections. It is recommended that, from a transportation perspective, the proposed development application process proceeds.

TIA Screening Form and PM Certification Form

City of Ottawa 2017 TIA Guidelines	Date:	04-Dec-20
Step 1 - Screening Form	Project Number:	2020-82
	Project Reference:	Caivan 2275 Mer-Bleue
1.1 Description of Proposed Development		
Municipal Address	2275 Mer-Bleue Road	
Description of Location	CON 11 LOT 3	
Land Use Classification	General Mixed Use Zone - GN	115[2156] S330-h
Development Size	32 back-to-back townhouse u units, and a 0.75 ha. Mid-rise	nits, 80 standard townhouse mixed-use development block
		ne connection to the residential
Accesses	development to the south. Or	ne access on Brian Coburn
	Boulevard.	
Phase of Development	Single Phase	
Buildout Year	2024	
TIA Requirement	Full TIA	Required

1.2 Trip Generation Trigger	
Land Use Type	Townhomes or apartments
Development Size	112 Units
Trip Generation Trigger	Yes

1.3 Location Triggers	
Does the development propose a new driveway to a boundary street that is	
designated as part of the City's Transit Priority, Rapid Transit or Spine	No
Bicycle Networks?	
Is the development in a Design Priority Area (DPA) or Transit-oriented	No
Development (TOD) zone?	No
Location Trigger	No

1.4. Safety Triggers	
Are posted speed limits on a boundary street 80 km/hr or greater?	No
Are there any horizontal/vertical curvatures on a boundary street limits	Νο
sight lines at a proposed driveway?	NO
Is the proposed driveway within the area of influence of an adjacent traffic	
signal or roundabout (i.e. within 300 m of intersection in rural conditions,	Yes
or within 150 m of intersection in urban/ suburban conditions)?	
Is the proposed driveway within auxiliary lanes of an intersection?	No
Does the proposed driveway make use of an existing median break that	Νο
serves an existing site?	NO
Is there is a documented history of traffic operations or safety concerns on	No
the boundary streets within 500 m of the development?	No
Does the development include a drive-thru facility?	No
Safety Trigger	Yes

TIA Plan Reports

On 14 June 2017, the Council of the City of Ottawa adopted new Transportation Impact Assessment (TIA) Guidelines. In adopting the guidelines, Council established a requirement for those preparing and delivering transportation impact assessments and reports to sign a letter of certification.

Individuals submitting TIA reports will be responsible for all aspects of development-related transportation assessment and reporting, and undertaking such work, in accordance and compliance with the City of Ottawa's Official Plan, the Transportation Master Plan and the Transportation Impact Assessment (2017) Guidelines.

By submitting the attached TIA report (and any associated documents) and signing this document, the individual acknowledges that s/he meets the four criteria listed below.

CERTIFICATION

- 1. I have reviewed and have a sound understanding of the objectives, needs and requirements of the City of Ottawa's Official Plan, Transportation Master Plan and the Transportation Impact Assessment (2017) Guidelines;
- 2. I have a sound knowledge of industry standard practice with respect to the preparation of transportation impact assessment reports, including multi modal level of service review;
- 3. I have substantial experience (more than 5 years) in undertaking and delivering transportation impact studies (analysis, reporting and geometric design) with strong background knowledge in transportation planning, engineering or traffic operations; and
- 4. I am either a licensed¹ or registered² professional in good standing, whose field of expertise [check $\sqrt{}$ appropriate field(s)] is either transportation engineering $\sqrt{}$ or transportation planning \Box .

^{1,2} License of registration body that oversees the profession is required to have a code of conduct and ethics guidelines that will ensure appropriate conduct and representation for transportation planning and/or transportation engineering works.

Appendix D

Mer-Bleue Rd. at Decoeur Dr. Proposed Intersection Improvements - TrailsEdge East CTS

- *Mer Bleue Road / Axis Way / Decoeur*: This intersection would be the main access to the TrailsEdge East lands and Avalon West community to the east. It is anticipated that this intersection would initially operate as a two-way STOP-Controlled intersection until development progresses east and west of Mer Bleue Road and the need for a traffic control signal is met. For the purpose of this study, it is assumed that TrailsEdge East and Avalon West lands be fully developed by 2021 horizon year and therefore traffic signals were assumed to be in place by 2021. However, the intersection should be monitored at time closer to 2021 to ensure that development on either side is progressing as anticipated and traffic signals are warranted.
- *Mer Bleue Road / Renaud Road*: The existing All-Way STOP Controlled Tintersection would be converted to a 4-Way intersection by 2020 to serve the proposed Mattamy development east of Mer Bleue Road. The 4-Way STOP-Controlled intersection would operate at satisfactory overall LOS "D" during the afternoon peak hour of travel demand. The SB movement operates at a congested level of service during the afternoon peak hour. It should be noted that the 2405 Mer Bleue Road⁶ TIS assumed that traffic signals be in place by 2021 once the residential community (Mattamy) east of Mer Bleue Road is developed. It is recommended that the intersection be monitored at a time closer to 2021 as developments progress in the area to determine if signals are warranted. For the purpose of this study, the intersection was also simulated as a traffic signal with auxiliary lanes, which results in satisfactory level of service.
- All remaining study area intersections operate at satisfactory level of service during both peak hours of travel demand.

6.4 2026 FORECAST ANALYSIS

The 2026 forecast analysis indicates that:

- *Mer Bleue Road / Brian Coburn Boulevard*: The WB and EB movements continue to exhibit unsatisfactory level of service during the peak hour of travel demand as background traffic grows. Once again, this study assumed an aggressive build-out of adjacent developments, which assume a worst-case scenario on the adjacent roadway network.
- *Navan Road / Renaud Road*: The intersection exhibits satisfactory level of service on all approaches once the east leg of Renaud Road is closed. Traffic using Renaud Road is expected to divert to Brian Coburn Boulevard and head south on Navan Road to reach west of Navan Road (i.e. Anderson Road). This would alleviate pressure at the NB-LT movement and divert traffic to the SB-RT movement.
- All remaining study area intersections operate at satisfactory level of service during both peak hours of travel demand.

^{6 2405} Mer Bleue Road Transportation Impact Study, Stantec April 2014

File Number: ACS2019-PIE-PS-0030

SUBJECT: Front-Ending Report – Roundabout (Brian Coburn Boulevard at Gerry Lalonde Drive/Jerome Jodoin Drive)

OBJET: Rapport d'entente préalable – Carrefour giratoire (promenade Brian Coburn, à l'angle des promenades Gerry Lalonde et Jerome Jodoin)

REPORT RECOMMENDATIONS

That Planning Committee recommend that Council:

1. Delegate authority to the General Manager, Planning, Infrastructure and

Economic Development Department, to enter into a Front-Ending Agreement with Minto Communities - Canada for the design and construction of a roundabout at the intersection of Brian Coburn Boulevard and Gerry Lalonde Drive/Jerome Jodoin Drive as outlined in this report, to an upset limit of \$1,800,000 including applicable taxes and indexing, in accordance with the Front-Ending Agreement Principles and Policy set forth in Documents 1 and 2 and with the final form and content being to the satisfaction of the City Clerk and Solicitor;

- 2. Authorize the financial disbursement to reimburse the design and construction costs incurred by Minto Communities Canada pursuant to the execution of the Front-Ending Agreement;
- 3. Authorize the pre-committal of \$1,800,000 including applicable taxes (the upset limit of the Front-Ending Agreement) from the 2019 and 2020 Capital Budget/Development Charges Forecast subject to execution of the Front- Ending Agreement;
- 4. Authorize the expenditure of \$1,800,000 including applicable taxes (upset limit) in accordance with the reimbursement schedule set out in the Front-Ending Agreement.

RECOMMANDATIONS DU RAPPORT

Que le Comité de l'urbanisme recommande ce qui suit au Conseil :

- 1. Déléguer au directeur général de Planification, Infrastructure et Développement économique le pouvoir de conclure une entente préalable avec Minto Communities - Canada, en vue de procéder à la conception et à l'installation d'un carrefour giratoire à l'angle du boulevard Brian-Coburn et des promenades Gerry-Lalonde et Jerome-Jodoin, comme le décrit le présent rapport, jusqu'à concurrence de 1 800 000 \$, taxes applicables et indexation en sus, conformément aux principes et à la politique de l'entente préalable énoncés dans les documents 1 et 2, et dont la forme et le contenu définitifs seront à la satisfaction du greffier municipal et de l'avocat général;
- Autoriser la sortie des fonds nécessaires au remboursement des coûts de conception et de construction engagés par Minto Communities - Canada, dans le cadre de l'exécution de l'entente préalable;

- 3. Autoriser l'engagement préalable d'une somme de 1 800 000 \$, taxes applicables en sus, (la limite maximale de l'entente préalable) provenant du budget d'immobilisations de 2019 et 2020 et des prévisions de redevances d'aménagement, sous réserve de l'exécution de l'entente préalable;
- 4. Autoriser la dépense de 1 800 000 \$, taxes applicables en sus, (la limite maximale de l'entente préalable), conformément au calendrier de remboursement fixé dans l'entente préalable.

BACKGROUND

Minto Communities – Canada received draft plan of subdivision approval on January 9, 2007 and an extension and revision of that draft approval on October 2, 2014 for the lands at 2233 Mer-Bleue Road, which is located in Avalon West, between Mer-Bleue Road and Tenth Line Road in Orléans.

The intersection was originally to be a signalized intersection. An "Intersection Control and Roundabout Feasibility Study" prepared for the City of Ottawa by Robinson Consultants Inc. in January 2016 looked at roundabouts versus signals at Brian Coburn Boulevard for the intersections at Gerry Lalonde Drive, Strasbourg Street, Aquaview Drive, Esprit Drive and signals at Tenth Line Road. The study determined that mixed corridor with single-lane roundabouts at the intersections of Brian Coburn Boulevard at Gerry Lalonde Drive and Brian Coburn Boulevard at Strasbourg Street/Des Aubépines Drive and signals at Tenth Line Road, Aquaview Drive and Esprit Drive would operate at an acceptable level of service in both the 2021 and 2031 periods and is anticipated to have the lowest capital cost.

The proposed works include the design and construction of a single-lane roundabout at the intersection of Brian Coburn Boulevard and Gerry Lalonde Drive/Jerome Jodoin Drive in Orléans (Cumberland Ward 19). The roundabout is identified in the City of Ottawa 2014 Development Charge By-law as an intersection construction project.

The upset limit provided for the works is \$1,800,000 including applicable taxes for design and construction. Reimbursement for the roundabout is identified for 2020 if constructed in 2019. Minto Communities - Canada shall be required to enter into an agreement with the City for the design and construction of the roundabout as identified in the subdivision agreement. The construction of the roundabout will coincide with the opening of the intersection of Jerome Jodoin Drive at Brian Coburn Boulevard in 2019.

DISCUSSION

The intersection of Brian Coburn Boulevard and Gerry Lalonde Drive was originally to be a signalized intersection. An "Intersection Control and Roundabout Feasibility Study" prepared for the City of Ottawa by Robinson Consultants Inc. in January 2016 looked at roundabouts versus signals on Brian Coburn Boulevard. The study determined that a single-lane roundabout at this intersection would operate at an acceptable level of service in both the 2021 and 2031 periods and is anticipated to have the lowest capital cost.

The continuous, steady growth of the Minto Communities development south of Brian Coburn Boulevard requires a controlled intersection at Gerry Lalonde Drive/Jerome Jodoin Drive for access and egress. A roundabout is preferred to a traffic signal as it will provide the most efficient method for travelling along Brian Coburn Boulevard, without causing any additional delay to this road. The benefits of the roundabout are fewer conflict points, reductions in number and severity of collisions, slower speeds and therefore reduced pollution and fuel usages.

RURAL IMPLICATIONS

There are no rural implications associated with the proposed Front-Ending Agreement.

CONSULTATION

All development approvals were conducted according to the requirements of the *Planning Act* and the City's Public Notification and Consultation Policy. The frontending entities agree to the process outlined herein.

COMMENTS BY THE WARD COUNCILLOR

Councillor Blais fully supports the installation of the roundabout.

LEGAL IMPLICATIONS

There are no legal impediments to the implementation of this report's recommendation. Subject to Council approval, the City will be entering into a standard Front-Ending agreement with the developer to front end the cost of the roundabout at Brian Coburn Boulevard at Gerry Lalonde/Jerome Jodoin Drive, in accordance with the Council approved Front-Ending policy.

RISK MANAGEMENT IMPLICATIONS

There are no risk implications associated with the front-ending of the intersection.

ASSET MANAGEMENT IMPLICATIONS

The recommendations documented in this report are consistent with the City's <u>Comprehensive Asset Management (CAM) Program</u> objectives. The implementation of the CAM program results in timely decisions that minimize lifecycle costs and ensure the long-term affordability of assets. To fulfill its obligation to deliver quality services to the community, the City must ensure that assets supporting City services are managed in a way that balances service levels, risk and affordability.

Entering into Front-Ending Agreements with the Developers associated with the adjacent plan of subdivision for the design and construction of a roundabout at Brian Coburn Boulevard at Gerry Lalonde Drive/Jerome Jodoin Drive supports a level of service expectation and what needs to be done to achieve those levels.

FINANCIAL IMPLICATIONS

The front-ending report and subsequent agreement are in accordance with the Council approved Development Charges Background Study. The intersection of Coburn Boulevard at Gerry Lalonde Drive/Jerome Jodoin Drive is item number 1.XXX36 as listed in the 2014 Development Charges Background Study.

The project has an upset limit of \$1,800,000 including applicable taxes for reimbursement in 2020.

Development Charge	Up-Set Limit (including	Criteria for Repayment
Item	applicable taxes)	
A. Construction –	\$1,285,720	Repayment based on the
Intersection		actual value to upset limit.
roundabout		
B. 15% Engineering	\$192,855 (15% of construction)	Repayment based on the
		actual value to upset limit.
C.10% Project	\$128,570 (10% of Civil works	Repayment based on the
Management	for the intersection)	actual value to upset limit.

D. 15% Contingency	\$ 192,855 (15% contingency)	Repayment based on the
		actual value to upset limit.
		All contingencies must be
		justified and supported by
		invoices and payment

Repayment shall be based on the actual value to an upset limit of \$1,800,000 including applicable taxes. Should the actual costs exceed the upset limit, the additional costs shall be borne by the developer and the City shall not be obligated to compensate for additional costs.

Repayment is subject to fulfilment of the Front-Ending Agreement conditions, and will be based on the actual value of the costs incurred.

Pending Council approval for the City to enter into the Front-Ending Agreement, a capital account will be established with budget authority of \$1,800,000, 100 percent Roads and Related Services Development Charge funded.

Once the works are accepted, the City shall assume maintenance of the intersection roundabout. With this intersection currently in operation with stop control, the proposed geometric modifications will not have any additional operating impacts.

ACCESSIBILITY IMPACTS

All infrastructure will be designed in accordance with all relevant legislation and regulations.

ENVIRONMENTAL IMPLICATIONS

There are no environmental implications with the front ending of this intersection.

TERM OF COUNCIL PRIORITIES

This project addresses the following Term of Council Priority:

• TM4 – Improve safety for all road users.

SUPPORTING DOCUMENTATION

Document 1 Front-Ending Agreement Principles

Document 2 Council Approved Front-Ending Policy

Document 3 Location Map

DISPOSITION

Staff are recommending this report be considered at the April 24, 2019 Council meeting.

Legal Services to prepare the final form of the agreements in consultation with the Planning, Infrastructure and Economic Development Department.

The Treasurer to earmark funds for repayment as noted in this report.

Document 1 – Front-Ending Agreement Principles

- 1. Minto Communities Canada are required to post 100 per cent securities for the full cost of the design and construction of traffic signals for the intersection of Brian Coburn Boulevard and Gerry Lalonde Drive/Jerome Jodoin Drive, including all associated works, estimated at \$1,800,000 including engineering, land remuneration, project management and contingences, and applicable taxes.
- 2. The cost of the roundabout of the intersection of Brian Coburn Boulevard and Gerry Lalonde Drive/Jerome Jodoin Drive, including all associated works, is set at an upset limit of \$1,800,000 including engineering, land remuneration, project management and contingencies, and applicable taxes. All costs incurred shall be justified and include supporting invoices and payment certificates.
- 3. The City will reimburse Minto Communities Canada after the works have been accepted by the City. Reimbursement will take place following acceptance in 2020, provided the applicant satisfies all requirements in accordance with the Council approved Front-Ending Policies in Document 2.
- 4. The repayment of construction costs for the roundabout of the Brian Coburn Boulevard and Gerry Lalonde Drive/Jerome Jodoin Drive intersection shall be pursuant to Council-approved Front-Ending Agreement Policy as referenced under Document 2.

Document 2 – Council Approved Front-Ending Policy

Front-Ending Agreements are requested by developers who wish to have specific growth-related capital works in place in advance of the City's capital project plans for emplacement of these same works: developers agree to finance the works at the "front-end" and recover their costs from the City at a later date. The following conditions must be met in order for the City to enter into a Front-Ending Agreement:

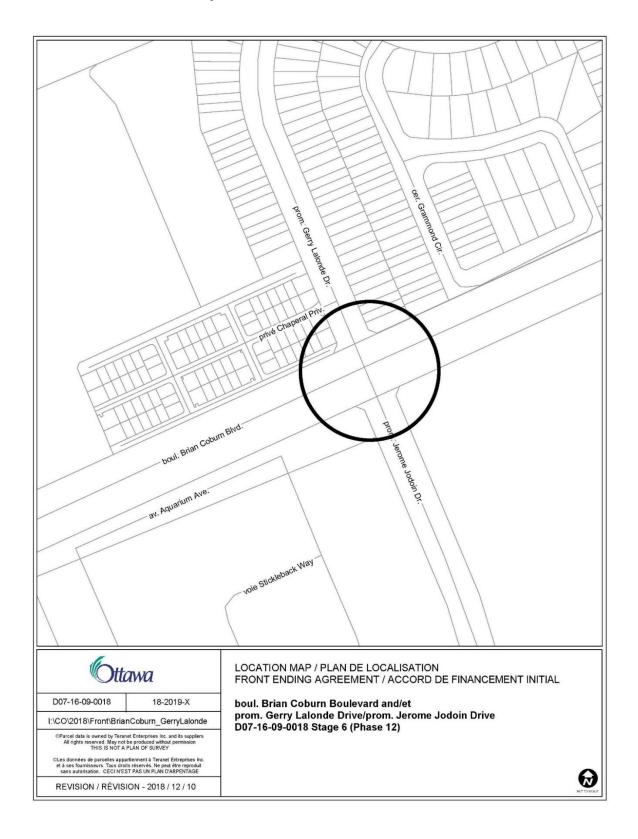

- 1. All Front-Ending Agreements with the City will be for growth-related capital works that have been included in a development charge study.
- 2. The contract for front-ended works shall be awarded by the front-ender in accordance with the City's Purchasing Policy of a competitive procurement process and subject to the review and satisfaction of the General Manager, Planning, Infrastructure and Economic Development Department. Where the front-ender does not award the work in accordance with the City's purchasing policy, they must demonstrate that competitive pricing has been obtained, through independent analysis of their engineer, to the satisfaction of the General Manager, Planning, Infrastructure and Economic Development Department. The contract for the work must be made available to the City to provide to the public.
- 3. Stormwater ponds and related sewer works that are 100 per cent development charge funded in the recommended by-laws will be paid back to the developer based on revenues as they are collected from the designated area. This means that at no time are the repayments to exceed the revenues received. Each Front-Ending Agreement will define the geographic area involved and a separate and specific deferred revenue account may be set up to keep track of the revenues collected and payments made. Crediting will also be allowed for the Front-Ending Agreements related to storm water ponds. Indexing shall apply to the outstanding balance in accordance with the rate of indexation pursuant to the Development Charge By-laws.
- 4. For all other capital projects, a lump sum payment, both the development charge portion and the City portion, will be made to the developer in the year the project is identified in the City's 10-year capital plan at the time the Front-Ending Agreement is approved. Should growth occur earlier than forecasted, then repayment would be accelerated to reflect the revised timing the City would have budgeted for the project. If growth occurs more slowly than forecasted, then the City will have an additional one to three years (one to three years from the year the project was identified in the 10-year plan) to make repayments. Only in this latter case will the City's portion of the payment be indexed beginning with the

year the project was identified in the 10-year plan.

- 5. Given that the City will be assuming operating costs earlier than anticipated through the Front-Ending Agreement process; the City is not to pay any carrying costs to the developer.
- 6. All development charges payable by developers must be paid up front in accordance with the City's by-law. With the exception of the stormwater ponds and related sewer works, there will not be any crediting allowed as a result of entering into a Front-Ending Agreement. On December 8, 2004, City Council approved, "That staff be directed to work with the industry to develop the details of a credit policy to be incorporated into the Front-Ending Policy".
- 7. In the case where multiple Front-Ending Agreements are in force in the same area-specific Development Charge By-law, and the City has approved the front-ended works for development charge reimbursements, the front-enders will share in the distribution of development charge revenues on a pro-rata basis with other storm water drainage projects. The pro-rated works shall be based on the balance of the outstanding amount owing on the date the repayment is due. Existing front-enders will be advised of new Front-Ending Agreements for stormwater works within the same benefiting area and area-specific development charge By-law.
- 8. The capital project upset limits for engineering, project management, and contingency shall be the established rates set in accordance with the City's Development Charge By-laws and accompanying background studies, as amended.
- 9. Land remuneration shall be subject to an appraisal by a professional land appraiser and the appraisal shall be conducted in accordance with the terms of reference as established in the City's Development Charge By-laws and accompanying background studies, as amended. The upset limit for land remuneration shall be the lesser of the appraised value and the upset limit in accordance with the City's Development Charge By-laws and accompanying background studies.
- 10. Indexing shall apply to the total project costs if the front-ended works have been delayed over a period of time; the front-ender provides justification for the delay, and with the written concurrence of the City.
- 11. Where a front-ender is eligible for development charge reimbursement, documentation is required to support the reimbursement in accordance with the

City's Purchasing Policy. The Front-Ending Agreement shall identify at which stage the documentation shall be required. The following documentation shall be forwarded to the City before payment is issued:

- An invoice summarizing the front-ended works, and separate cost items, if applicable, for land, construction costs, engineering fees, project management fees, contingency fees, and applicable taxes.
- Payment Certificates, including the final certificate, signed by the developer's civil engineer.
- All invoices supporting re-payment for the front-ended works.
- Statutory Declaration.
- Certificate of Substantial Performance.
- Workplace Safety and Insurance Board Clearance Certificate (WSIB).
- Certificate of Publication.
- 12. A report to Council is required to authorize staff to enter into a Front-Ending Agreement. The recommendation will include the financial commitment of the City, specify the funding source(s), the project timeline and where necessary, request that a specific deferred revenue account be established. The financial comment in the report will specify the timelines for the repayment, an operating budget impact and an estimate of the year in which the operating budget impact will begin. It should also indicate the year in which the project was originally identified in the City's 10- year capital plan. A capital project will be established upon Council approval to enter into a Front-Ending Agreement. The status of these projects will be provided to Council on a yearly basis.
- **13.** No capital project identified outside of the Council approved 10- year long range capital plan, shown in the Development Charge Background Study is eligible to be front-ended unless another item(s) of comparable value, funding allocation, and timing is delayed. A capital project identified with a post-period deduction applied to the gross cost will only have the development charge portion reimbursed if front-ended over the term of the by-law. Indexing would not be applicable to the repayment of the post-period component of the project cost. If growth occurs more slowly than forecasted, then the City Treasurer will have the authority to add an additional three years, without interest, to the repayment of the post-period component charges.

Non-Residential Developments (office, institutional, retail or industrial)

	Legend
REQUIRED	The Official Plan or Zoning By-law provides related guidance that must be followed
BASIC	The measure is generally feasible and effective, and in most cases would benefit the development and its users
BETTER	The measure could maximize support for users of sustainable modes, and optimize development performance

	TDM-s	supportive design & infrastructure measures: Non-residential developments	Check if completed & add descriptions, explanations or plan/drawing references
	1.	WALKING & CYCLING: ROUTES	
	1.1	Building location & access points	
BASIC	1.1.1	Locate building close to the street, and do not locate parking areas between the street and building entrances	
BASIC	1.1.2	Locate building entrances in order to minimize walking distances to sidewalks and transit stops/stations	
BASIC	1.1.3	Locate building doors and windows to ensure visibility of pedestrians from the building, for their security and comfort	
	1.2	Facilities for walking & cycling	
REQUIRED	1.2.1	Provide convenient, direct access to stations or major stops along rapid transit routes within 600 metres; minimize walking distances from buildings to rapid transit; provide pedestrian-friendly, weather-protected (where possible) environment between rapid transit accesses and building entrances; ensure quality linkages from sidewalks through building entrances to integrated stops/stations (see Official Plan policy 4.3.3)	
REQUIRED	1.2.2	Provide safe, direct and attractive pedestrian access from public sidewalks to building entrances through such measures as: reducing distances between public sidewalks and major building entrances; providing walkways from public streets to major building entrances; within a site, providing walkways along the front of adjoining buildings, between adjacent buildings, and connecting areas where people may congregate, such as courtyards and transit stops; and providing weather protection through canopies, colonnades, and other design elements wherever possible (<i>see Official</i> <i>Plan policy 4.3.12</i>)	

	TDM-s	supportive design & infrastructure measures: Non-residential developments	Check if completed & add descriptions, explanations or plan/drawing references
REQUIRED	1.2.3	Provide sidewalks of smooth, well-drained walking surfaces of contrasting materials or treatments to differentiate pedestrian areas from vehicle areas, and provide marked pedestrian crosswalks at intersection sidewalks (see Official Plan policy 4.3.10)	
REQUIRED	1.2.4	Make sidewalks and open space areas easily accessible through features such as gradual grade transition, depressed curbs at street corners and convenient access to extra-wide parking spaces and ramps (see Official Plan policy 4.3.10)	
REQUIRED	1.2.5	Include adequately spaced inter-block/street cycling and pedestrian connections to facilitate travel by active transportation. Provide links to the existing or planned network of public sidewalks, multi-use pathways and on- road cycle routes. Where public sidewalks and multi-use pathways intersect with roads, consider providing traffic control devices to give priority to cyclists and pedestrians (see Official Plan policy 4.3.11)	
BASIC	1.2.6	Provide safe, direct and attractive walking routes from building entrances to nearby transit stops	
BASIC	1.2.7	Ensure that walking routes to transit stops are secure, visible, lighted, shaded and wind-protected wherever possible	
BASIC	1.2.8	Design roads used for access or circulation by cyclists using a target operating speed of no more than 30 km/h, or provide a separated cycling facility	
	1.3	Amenities for walking & cycling	
BASIC	1.3.1	Provide lighting, landscaping and benches along walking and cycling routes between building entrances and streets, sidewalks and trails	
BASIC	1.3.2	Provide wayfinding signage for site access (where required, e.g. when multiple buildings or entrances exist) and egress (where warranted, such as when directions to reach transit stops/stations, trails or other common destinations are not obvious)	

	TDM-s	supportive design & infrastructure measures: Non-residential developments	Check if completed & add descriptions, explanations or plan/drawing references
	2.	WALKING & CYCLING: END-OF-TRIP FACILI	TIES
	2.1	Bicycle parking	
REQUIRED	2.1.1	Provide bicycle parking in highly visible and lighted areas, sheltered from the weather wherever possible (see Official Plan policy 4.3.6)	
REQUIRED	2.1.2	Provide the number of bicycle parking spaces specified for various land uses in different parts of Ottawa; provide convenient access to main entrances or well- used areas (see Zoning By-law Section 111)	
REQUIRED	2.1.3	Ensure that bicycle parking spaces and access aisles meet minimum dimensions; that no more than 50% of spaces are vertical spaces; and that parking racks are securely anchored <i>(see Zoning By-law Section 111)</i>	
BASIC	2.1.4	Provide bicycle parking spaces equivalent to the expected number of commuter cyclists (assuming the cycling mode share target is met), plus the expected peak number of customer/visitor cyclists	
BETTER	2.1.5	Provide bicycle parking spaces equivalent to the expected number of commuter and customer/visitor cyclists, plus an additional buffer (e.g. 25 percent extra) to encourage other cyclists and ensure adequate capacity in peak cycling season	
	2.2	Secure bicycle parking	
REQUIRED	2.2.1	Where more than 50 bicycle parking spaces are provided for a single office building, locate at least 25% of spaces within a building/structure, a secure area (e.g. supervised parking lot or enclosure) or bicycle lockers (see Zoning By-law Section 111)	
BETTER	2.2.2	Provide secure bicycle parking spaces equivalent to the expected number of commuter cyclists (assuming the cycling mode share target is met)	
	2.3	Shower & change facilities	
BASIC	2.3.1	Provide shower and change facilities for the use of active commuters	
BETTER	2.3.2	In addition to shower and change facilities, provide dedicated lockers, grooming stations, drying racks and laundry facilities for the use of active commuters	
	2.4	Bicycle repair station	
BETTER	2.4.1	Provide a permanent bike repair station, with commonly used tools and an air pump, adjacent to the main bicycle parking area (or secure bicycle parking area, if provided)	

	TDM-s	supportive design & infrastructure measures: Non-residential developments	Check if completed & add descriptions, explanations or plan/drawing references
	3.	TRANSIT	
	3.1	Customer amenities	
BASIC	3.1.1	Provide shelters, lighting and benches at any on-site transit stops	
BASIC	3.1.2	Where the site abuts an off-site transit stop and insufficient space exists for a transit shelter in the public right-of-way, protect land for a shelter and/or install a shelter	
BETTER	3.1.3	Provide a secure and comfortable interior waiting area by integrating any on-site transit stops into the building	
	4.	RIDESHARING	
	4.1	Pick-up & drop-off facilities	
BASIC	4.1.1	Provide a designated area for carpool drivers (plus taxis and ride-hailing services) to drop off or pick up passengers without using fire lanes or other no-stopping zones	
	4.2	Carpool parking	
BASIC	4.2.1	Provide signed parking spaces for carpools in a priority location close to a major building entrance, sufficient in number to accommodate the mode share target for carpools	
BETTER	4.2.2	At large developments, provide spaces for carpools in a separate, access-controlled parking area to simplify enforcement	
	5.	CARSHARING & BIKESHARING	
	5.1	Carshare parking spaces	
BETTER	5.1.1	Provide carshare parking spaces in permitted non- residential zones, occupying either required or provided parking spaces (see Zoning By-law Section 94)	
	5.2	Bikeshare station location	
BETTER	5.2.1	Provide a designated bikeshare station area near a major building entrance, preferably lighted and sheltered with a direct walkway connection	

	TDM-s	supportive design & infrastructure measures: Non-residential developments	Check if completed & add descriptions, explanations or plan/drawing references
	6.	PARKING	
	6.1	Number of parking spaces	
REQUIRED	6.1.1	Do not provide more parking than permitted by zoning, nor less than required by zoning, unless a variance is being applied for	
BASIC	6.1.2	Provide parking for long-term and short-term users that is consistent with mode share targets, considering the potential for visitors to use off-site public parking	
BASIC	6.1.3	Where a site features more than one use, provide shared parking and reduce the cumulative number of parking spaces accordingly <i>(see Zoning By-law</i> <i>Section 104)</i>	
BETTER	6.1.4	Reduce the minimum number of parking spaces required by zoning by one space for each 13 square metres of gross floor area provided as shower rooms, change rooms, locker rooms and other facilities for cyclists in conjunction with bicycle parking <i>(see Zoning By-law Section 111)</i>	
	6.2	Separate long-term & short-term parking areas	
BETTER	6.2.1	Separate short-term and long-term parking areas using signage or physical barriers, to permit access controls and simplify enforcement (i.e. to discourage employees from parking in visitor spaces, and vice versa)	
	7.	OTHER	
	7.1	On-site amenities to minimize off-site trips	
BETTER	7.1.1	Provide on-site amenities to minimize mid-day or mid-commute errands	

TDM-Supportive Development Design and Infrastructure Checklist:

Residential Developments (multi-family or condominium)

	Legend
REQUIRED	The Official Plan or Zoning By-law provides related guidance that must be followed
BASIC	The measure is generally feasible and effective, and in most cases would benefit the development and its users
BETTER	The measure could maximize support for users of sustainable modes, and optimize development performance

	TDM-s	supportive design & infrastructure measures: Residential developments	Check if completed & add descriptions, explanations or plan/drawing references				
	1.	WALKING & CYCLING: ROUTES					
	1.1	Building location & access points					
BASIC	1.1.1	Locate building close to the street, and do not locate parking areas between the street and building entrances					
BASIC	1.1.2	Locate building entrances in order to minimize walking distances to sidewalks and transit stops/stations					
BASIC	1.1.3	Locate building doors and windows to ensure visibility of pedestrians from the building, for their security and comfort					
	1.2	Facilities for walking & cycling					
REQUIRED	1.2.1	Provide convenient, direct access to stations or major stops along rapid transit routes within 600 metres; minimize walking distances from buildings to rapid transit; provide pedestrian-friendly, weather-protected (where possible) environment between rapid transit accesses and building entrances; ensure quality linkages from sidewalks through building entrances to integrated stops/stations <i>(see Official Plan policy 4.3.3)</i>					
REQUIRED	1.2.2	Provide safe, direct and attractive pedestrian access from public sidewalks to building entrances through such measures as: reducing distances between public sidewalks and major building entrances; providing walkways from public streets to major building entrances; within a site, providing walkways along the front of adjoining buildings, between adjacent buildings, and connecting areas where people may congregate, such as courtyards and transit stops; and providing weather protection through canopies, colonnades, and other design elements wherever possible <i>(see Official</i> <i>Plan policy 4.3.12)</i>					

	TDM-s	supportive design & infrastructure measures: Residential developments	Check if completed & add descriptions, explanations or plan/drawing references
REQUIRED	1.2.3	Provide sidewalks of smooth, well-drained walking surfaces of contrasting materials or treatments to differentiate pedestrian areas from vehicle areas, and provide marked pedestrian crosswalks at intersection sidewalks (see Official Plan policy 4.3.10)	
REQUIRED	1.2.4	Make sidewalks and open space areas easily accessible through features such as gradual grade transition, depressed curbs at street corners and convenient access to extra-wide parking spaces and ramps (see Official Plan policy 4.3.10)	
REQUIRED	1.2.5	Include adequately spaced inter-block/street cycling and pedestrian connections to facilitate travel by active transportation. Provide links to the existing or planned network of public sidewalks, multi-use pathways and on- road cycle routes. Where public sidewalks and multi-use pathways intersect with roads, consider providing traffic control devices to give priority to cyclists and pedestrians (see Official Plan policy 4.3.11)	
BASIC	1.2.6	Provide safe, direct and attractive walking routes from building entrances to nearby transit stops	
BASIC	1.2.7	Ensure that walking routes to transit stops are secure, visible, lighted, shaded and wind-protected wherever possible	
BASIC	1.2.8	Design roads used for access or circulation by cyclists using a target operating speed of no more than 30 km/h, or provide a separated cycling facility	
	1.3	Amenities for walking & cycling	
BASIC	1.3.1	Provide lighting, landscaping and benches along walking and cycling routes between building entrances and streets, sidewalks and trails	
BASIC	1.3.2	Provide wayfinding signage for site access (where required, e.g. when multiple buildings or entrances exist) and egress (where warranted, such as when directions to reach transit stops/stations, trails or other common destinations are not obvious)	

	TDM-s	supportive design & infrastructure measures: Residential developments	Check if completed & add descriptions, explanations or plan/drawing references
	2.	WALKING & CYCLING: END-OF-TRIP FACILI	TIES
	2.1	Bicycle parking	
REQUIRED	2.1.1	Provide bicycle parking in highly visible and lighted areas, sheltered from the weather wherever possible <i>(see Official Plan policy 4.3.6)</i>	
REQUIRED	2.1.2	Provide the number of bicycle parking spaces specified for various land uses in different parts of Ottawa; provide convenient access to main entrances or well- used areas (<i>see Zoning By-law Section 111</i>)	
REQUIRED	2.1.3	Ensure that bicycle parking spaces and access aisles meet minimum dimensions; that no more than 50% of spaces are vertical spaces; and that parking racks are securely anchored <i>(see Zoning By-law Section 111)</i>	
BASIC	2.1.4	Provide bicycle parking spaces equivalent to the expected number of resident-owned bicycles, plus the expected peak number of visitor cyclists	
	2.2	Secure bicycle parking	
REQUIRED	2.2.1	Where more than 50 bicycle parking spaces are provided for a single residential building, locate at least 25% of spaces within a building/structure, a secure area (e.g. supervised parking lot or enclosure) or bicycle lockers (see Zoning By-law Section 111)	
BETTER	2.2.2	Provide secure bicycle parking spaces equivalent to at least the number of units at condominiums or multi-family residential developments	
	2.3	Bicycle repair station	
BETTER	2.3.1	Provide a permanent bike repair station, with commonly used tools and an air pump, adjacent to the main bicycle parking area (or secure bicycle parking area, if provided)	
	3.	TRANSIT	
	3.1	Customer amenities	
BASIC	3.1.1	Provide shelters, lighting and benches at any on-site transit stops	
BASIC	3.1.2	Where the site abuts an off-site transit stop and insufficient space exists for a transit shelter in the public right-of-way, protect land for a shelter and/or install a shelter	
BETTER	3.1.3	Provide a secure and comfortable interior waiting area by integrating any on-site transit stops into the building	

	TDM-s	upportive design & infrastructure measures: Residential developments	Check if completed & add descriptions, explanations or plan/drawing references
	4.	RIDESHARING	
	4.1	Pick-up & drop-off facilities	
BASIC	4.1.1	Provide a designated area for carpool drivers (plus taxis and ride-hailing services) to drop off or pick up passengers without using fire lanes or other no-stopping zones	
	5.	CARSHARING & BIKESHARING	
	5.1	Carshare parking spaces	
BETTER	5.1.1	Provide up to three carshare parking spaces in an R3, R4 or R5 Zone for specified residential uses <i>(see Zoning By-law Section 94)</i>	
	5.2	Bikeshare station location	
BETTER	5.2.1	Provide a designated bikeshare station area near a major building entrance, preferably lighted and sheltered with a direct walkway connection	
	6.	PARKING	
	6.1	Number of parking spaces	
REQUIRED	6.1.1	Do not provide more parking than permitted by zoning, nor less than required by zoning, unless a variance is being applied for	
BASIC	6.1.2	Provide parking for long-term and short-term users that is consistent with mode share targets, considering the potential for visitors to use off-site public parking	
BASIC	6.1.3	Where a site features more than one use, provide shared parking and reduce the cumulative number of parking spaces accordingly <i>(see Zoning By-law</i> <i>Section 104)</i>	
BETTER	6.1.4	Reduce the minimum number of parking spaces required by zoning by one space for each 13 square metres of gross floor area provided as shower rooms, change rooms, locker rooms and other facilities for cyclists in conjunction with bicycle parking <i>(see Zoning By-law Section 111)</i>	
	6.2	Separate long-term & short-term parking areas	
BETTER	6.2.1	Provide separate areas for short-term and long-term parking (using signage or physical barriers) to permit access controls and simplify enforcement (i.e. to discourage residents from parking in visitor spaces, and vice versa)

Site Level of Service (LOS) Method: Delay & v/c (HCM 2010). Site LOS Method is specified in the Parameter Settings dialog (Site tab). Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010). Roundabout Capacity Model: US HCM 6.

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies. Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay & v/c (HCM 2010). Site LOS Method is specified in the Parameter Settings dialog (Site tab). Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010). Roundabout Capacity Model: US HCM 6.

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies. Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay & v/c (HCM 2010). Site LOS Method is specified in the Parameter Settings dialog (Site tab). Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010). Roundabout Capacity Model: US HCM 6.

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies. Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Parameter Settings dialog (Site tab). Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Roundabout Capacity Model: US HCM 6.

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies. Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay & v/c (HCM 2010). Site LOS Method is specified in the Parameter Settings dialog (Site tab). Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010). Roundabout Capacity Model: US HCM 6.

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies. Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Parameter Settings dialog (Site tab). Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Roundabout Capacity Model: US HCM 6.

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies. Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

All Ve	hicles	3650	2.0	1.226	66.3	LOS F	64.0	455.5	0.83	2.06	4.67	24.6

Site Level of Service (LOS) Method: Delay & v/c (HCM 2010). Site LOS Method is specified in the Parameter Settings dialog (Site tab). Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010). Roundabout Capacity Model: US HCM 6.

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies. Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay & v/c (HCM 2010). Site LOS Method is specified in the Parameter Settings dialog (Site tab). Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010). Roundabout Capacity Model: US HCM 6.

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies. Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Parameter Settings dialog (Site tab). Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Roundabout Capacity Model: US HCM 6.

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies. Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay & v/c (HCM 2010). Site LOS Method is specified in the Parameter Settings dialog (Site tab). Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010). Roundabout Capacity Model: US HCM 6.

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies. Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Parameter Settings dialog (Site tab). Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Roundabout Capacity Model: US HCM 6.

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies. Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

LOS	С	А	А	В	В

Colour code based on Level of Service

LOS A	LOS B	LOS C	LOS D	LOS E	LOS F

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Parameter Settings dialog (Site tab). NA (TWSC): Level of Service is not defined for major road approaches or the intersection as a whole for Two-Way Sign Control (HCM LOS rule).

Roundabout Level of Service Method: Same as Sign Control

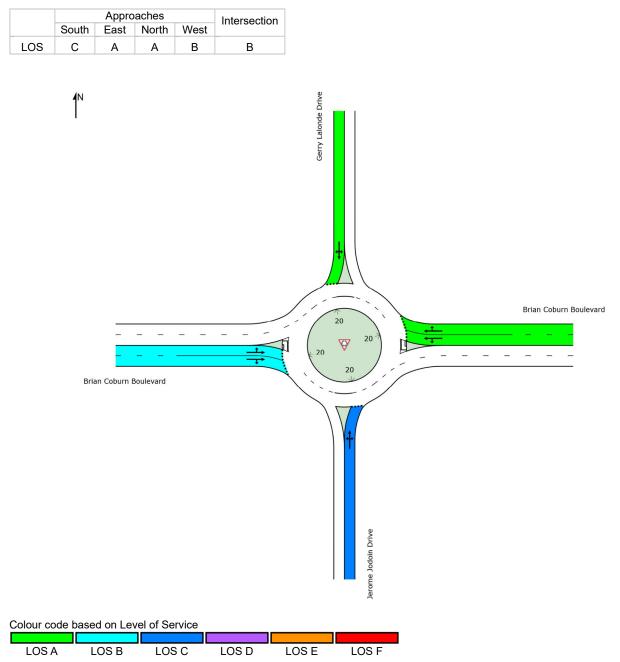

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.

LANE LEVEL OF SERVICE

Lane Level of Service

Site: 101 [Brian Coburn & Gerry Lalonde 2029 FT PM - Widened]

New Site Site Category: (None) Roundabout

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Parameter Settings dialog (Site tab). NA (TWSC): Level of Service is not defined for major road approaches or the intersection as a whole for Two-Way Sign Control (HCM LOS rule).

Roundabout Level of Service Method: Same as Sign Control

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.
