1.0 Introduction

1.1 Background

In 2021, J.L. Richards & Associates Limited (JLR) was retained by 12714001 Canada Inc. (the Owner) to prepare a Functional Servicing Report in support of a Draft Plan of Subdivision Application for their subject properties sited at 2983, 3053 and 3079 Navan Road and 2690 Pagé Road. Once the draft plan of subdivision is approved, the owner intends to subdivide the properties into five (5) separate parcels with their own developmental application. The developmental breakdown is as follows:

- One (1) Plan of Subdivision;
- One (1) Residential Site Plan;
- Two (2) Mixed Use - Residential and Commercial Site Plans; and
- One (1) Commercial Site Plan.

This Functional Servicing Report has been prepared to outline the design objectives and criteria, servicing constraints and high-level strategies for developing the subject lands with water, wastewater, storm, and stormwater management services in accordance with the following:

- the November 2009 Servicing Study Guidelines for Development Applications in the City of Ottawa (City);
- the Ottawa Sewer Design Guidelines (2012) and associated Technical Bulletins;
- the 2005 Gloucester East Urban Community (EUC) Infrastructure Servicing Study Update (ISSU) prepared by Stantec Consulting Ltd.; and
- Response E-Mail (dated January 18, 2021) on servicing requirements.

A copy of the pre-consultation meeting notes is included in Appendix A.

1.2 Site Description and Proposed Development

The municipal addresses for this development are 2983, 3053, and 3079 Navan Road & 2690 Page Road. The properties are located within the urban limits of the City of Ottawa. The total developmental area is ±5.36 ha and is bounded by Pagé Road, Brian Coburn Boulevard and Navan Road (refer to Figure 1 for the Location Plan). A review of Google Maps and GeoOttawa indicate that the existing area is entirely vegetated.

The Owner intends to subdivide the site into five (5) separate parcels each with their own developmental application. Table 1-1 provides the developmental breakdown and area for the five (5) subject parcels. A schematic of this breakdown can be found in Figure 2.

PLOT DATE: December 1, 2022 11:01:25 AM

Table 1-1: Developmental Breakdown of the Subject Properties

Property	Area (ha)
One (1) Plan of Subdivision (Blocks 1 to 13 and Block 19)	2.95
One (1) Residential Site Plan (Block 17)	0.56
Two (2) Mixed Use - Residential and Commercial Site Plans (Block 14 and 15)	1.11
One (1) Commercial Site Plan (Block 16)	0.74
Total Area of the Five (5) Subject Parcels	**5.36**

A summary of the proposed developmental parcels is provided below:

- The subdivision covers ±2.95 ha and contains 67 townhouse units, one (1) public park, and one (1) dry pond. The subdivision is located within Blocks 1 to 13 and Block 19.

- The one (1) residential site plan is located on Block 17 (±0.56 ha) and contains two (2) mid-rise residential condos.

- The two (2) mixed use - residential and commercial site plans are located on Blocks 14 and 15 with a total area of ±1.11 ha. Each site plan features two (2) mid-rise residential condos with underground parking and one (1) storey of commercial space.

- The commercial site plan on Block 16 features a gas bar and McDonalds on a ±0.74 ha parcel of land.

At this time no phasing is proposed. It is anticipated that the approvals for the subdivision will proceed first, and once the approval of the site plans is obtained; they will be developed accordingly.

The Draft Plan of Subdivision and the proposed Concept Plan for the proposed development (prepared by PMA Architects) is included in Appendix B. The topographical survey for the properties prepared by Stantec Geomatics Ltd. is also included in Appendix B.

1.3 Existing Infrastructure and Future Navan Road Widening

A review of existing services was carried out along the frontages of the subject properties to identify existing sewers and watermains. Based on the review of the Drawings for Pagé Road, Navan Road and Brian Coburn Boulevard obtained from the City of Ottawa (Appendix C), the following infrastructure has been identified to exist within municipal right-of-way (R.O.W.):

Watermains:

- 305 mm diameter Ductile Iron watermain along Navan Road (circ. 1976)
- 305 mm diameter Ductile Iron watermain along Pagé Road (circ. 1974)

Sanitary Sewers:

- 250 mm diameter PVC sanitary sewer along Pagé Road (circ. 2005)

- 300 mm diameter PVC sanitary forcemain along Pagé Road (circ. 2005)
- 400 mm diameter PVC sanitary forcemain along Pagé Road (circ. 2007)

Storm Sewers:

- Short section of 750 mm diameter PVC storm sewer along Navan Road (circ. 2016)
- Short section of 525 mm diameter PVC storm sewer along Brian Cobourn Boulevard (circ. 2016)

Future Navan Road Widening

The City's Transportation Master Plan (2013) anticipates a future road widening of Navan Road, from Brian Coburn Boulevard to Mer Bleue Road, to four (4) lanes, therefore increasing the Right-of-Way to 37.5 meters. At the direction of the City, the servicing design and drawings have been revised to reflect this ultimate condition.

1.4 Existing Topography and Functional Grading Plan

Based on the topography of the subject properties (refer to Appendix B), there is a southeasterly slope from Brian Coburn Boulevard to the intersection of Navan Road and Pagé Road. The site topography indicates a 4 to 5 meter elevation drop from the center of the development to the entrance on Navan Road.

A Functional Grading Plan (refer to Drawing FG) has been developed for the proposed site. Centre line of road grades from the local streets were functionally designed to tie into existing roads from the adjacent streets (Navan Road and Pagé Road). The conceptual road grades were developed to convey and safely evacuate the minor system’s runoff excess to strategic low points and the 1:100-year runoff is to be contained on-site.

1.5 Pre-Consultation, Permits and Approvals

The pre-consultation meeting that was held on January 18, 2021 (Appendix A) summarizes the planning process and design criteria and servicing constraints. From a storm perspective, the storm discharge criteria and allowable peak flow used for the preparation of this Report is presented in Section 4.1 (below).

Once the Functional Servicing Report is approved, the development of the above-referenced properties will first be subject to a Draft Plan of Subdivision. Once rezoning is approved, the subdivision will proceed into detailed design where servicing constraints would be developed for the private properties (site plans) on Blocks 14, 15, 16 and 17. Following the approval of the Subdivision, the private properties (site plans) could proceed under Site Plan control.

In terms of the Ministry of the Environment, Conservation and Parks (MECP) requirements, an Application for an Environmental Compliance Approval (ECA) is expected to be required for the sanitary, storm and SWM works for the subdivision including works along Navan Road. However, an Application for an ECA is not anticipated for the individual site plans blocks.

2.0 Water Servicing

2.1 Water Supply Design Criteria

Any additions to the City of Ottawa water distribution system must be designed in accordance with the Ottawa Design Guidelines for Water Distribution (July 2010) and Technical Bulletins ISDTB-2014-02, ISTB-2018-02 and ISTB-2021-03. The Design Guidelines require that the proposed water distribution system will satisfy the pressure constraints for the peak hour demand, maximum day demand plus fire flow, and maximum pressure in the system.

Section 4.2.2 of the Design Guidelines require that all new development additions to the public water distribution system be designed such that the minimum and maximum water pressure, as well as the fire flow rates, conform to the following:

- Under maximum hourly demand conditions (peak hour), the pressures shall not be less than 276 kPa;
- During periods of maximum day and fire flow demand, the residual pressure at any point in the distribution system shall not be less than 140 kPa (20 psi);
- In accordance with the Ontario Building Code in areas that may be occupied, the static pressure at any fixture shall not exceed 552 kPa (80 psi);
- The maximum pressure at any point in the distribution system in unoccupied areas shall not exceed 689 kPa (100 psi); and

Feedermains, which have been provided primarily for the purpose of redundancy, shall meet, at a minimum, the basic day plus fire flow demand.

Table 2-1 summarizes the design criteria for water distribution systems, which will serve as the basis for the detailed design of the proposed watermains for the site.

Table 2-2: Water Design Criteria

Design Criteria	Design Value
Average demand	280 L/cap/day
Maximum demand	2.5 x Avg
Peak hour	2.2 x Max Day
Density Townhouse	2.7 ppu
Density Average Apt (used for Condo Units)	1.8 ppu
Commercial	
Average demand	28,000 L/gross ha/day
Fire Flow Requirements	
Municipal ROW / Private Site with Hydrants	FUS
Service Lateral Only	OBC & NFPA 13
Pressure/Flow	
Peak hour	>276 kPa (40 psi)
Maximum day plus fire flow	>140 kPa (20 psi)
Minimum hour (maximum HGL)	<552 kPa (80 psi)

2.2 Domestic Water Demands

The estimated domestic water demands presented in this section are based on the site layout and unit count proposed in the Concept Plan (Appendix D1). The proposed development consists of 67 row townhouse units, six (6) condominium buildings, and 0.93 hectares of commercial space. Refer to Appendix D1 for the detailed water demands calculation sheet.

The residential consumption rate for average day demand was set in accordance with the City's Technical Bulletin ISTB-2021-03. Since receiving the boundary conditions from the City (see Appendix D3), a portion of the residential units in the condominium buildings have been converted into retail space. Additionally, the number of row townhouse units within the proposed development has reduced. As a result of these changes, the boundary conditions provided by the City are expected to remain applicable. The water demand calculations for the latest site layout and unit count can be found in Appendix D1. Table 2-2 summarizes the theoretical water demand results based on the proposed site details and the Design Guidelines.

Table 2-3: Theoretical Water Demands

Demand Scenario	Residential Water Demand (L/s)	Commercial Water Demand (L/s)	Total Water Demand (L/s)
Average Day	2.12	0.30	2.43
Maximum Day	5.30	0.45	5.75
Peak Hour	11.66	0.81	12.47

2.3 Proposed Watermain Sizing and Roughness

The overall watermain layout for 2983, 3053, and 3079 Navan Road and 2690 Pagé Road is shown in Drawing FWM (Functional Watermain Servicing). Table 2-3 summarizes the watermain roughness coefficients that were determined using friction factors presented in Section 4.2.12 of the Design Guidelines. The internal pipe diameters were modelled based on Section 4.3.5 of the Design Guidelines and are summarized in Table 2-4.

Table 2-4: Watermain Roughness Coefficients

Watermain Diameter	C-Factor
150 mm	100
200 to 250 mm	110
300 to 600 mm	120

Table 2-5: Watermain Internal Diameters

Nominal Diameter	Inside Diameter
150 mm	155 mm
200 mm	204 mm
300 mm	297 mm

2.4 Fire Flow Requirements

2.4.1 General

In terms of required fire flow (RFF), the Fire Underwriters Survey (FUS) method shall be used for any public or private site where watermains and fire hydrants are being designed. Hence, the required fire flow (RFF) for the site was calculated using the FUS method. Specifically, the protocol for the application of the FUS method as outlined in Appendix H: Protocol to Clarify the Application of the Fire Flow Calculation Method Published by Fire Underwriters Survey (FUS) of TB-2018-02 was used.

2.4.2 Required Fire Flow

The required fire flow (RFF) per the FUS was calculated based on the building size, building properties, exposure to adjacent units and TB-2018-02 which includes the City Technical Bulletin ISDTB-2014-02.

Based on the proposed layout for the development, the critical RFF was calculated at six (6) locations as presented in Appendix D1:

- Critical Fire Area 1: One (1) proposed block of seven (7) townhouse units located in the centre of the development.
- Critical Fire Area 2: One (1) proposed block of four (4) townhouse units adjacent to the backs of the existing properties on Pagé Road.
- Critical Fire Area 3: The gas retail and drive-thru located east of the Navan Road and Brian Coburn Intersection.
- Critical Fire Area 4: A four (4) storey condominium building (Building A) located southwest of the Pagé Road cul-de-sac.
- Critical Fire Area 5: A four (4) storey condominium building (Building C) located west of the Navan Road and Pagé Road intersection.
- Critical Fire Area 6: One (1) proposed block of four (4) townhouse units located in the centre of the development east of the proposed gas station.

The RFF for each critical fire area was calculated in accordance with the Design Guidelines, and associated Technical Bulletins. According to ISDTB-2014-02, the required fire flows (based on FUS calculations) for the townhouse units can be capped at 10,000 L/min (167 L/s) since they satisfy the following two (2) conditions:

1. Firewalls are constructed to separate a town or row house block into fire areas of no more than the lesser of 7 dwellings, or 600 m^2 in building footprint; and

2. There is a minimum separation of 10 m between the backs of adjacent units.

Table 2-5 summarizes the calculated RFFs for the six (6) critical fire areas and the detailed RFF calculations are presented in Appendix D1.

Table 2-6: Fire Flow Requirements for Critical Fire Areas

Location	Block Number	Calculated RFF in L/min (L/s)
Critical Fire Area 1	Block 6	10,000 (167)
Critical Fire Area 2	Block 3	10,000 (167)
Critical Fire Area 3	Block 16	6,000 (100)
Critical Fire Area 4	Block 14	14,000 (233)
Critical Fire Area 5	Block 17	15,000 (250)
Critical Fire Area 6	Block 11	10,000 (167)

2.5 Water Servicing and Boundary Conditions

2.5.1 Water Servicing

The proposed water service for the Navan Road development will consist of a local 203 mm diameter watermain loop within the subdivision and a 203 mm water service for the gas station within Block 16 as illustrated in Drawing FWM (Functional Watermain Servicing). The 203 mm diameter loop for the subdivision will connect to the existing 305 mm diameter watermains at the two (2) proposed connection locations:

- the existing Pagé Road 305 mm diameter watermain, located at the intersection between Pagé Road and Brian Coburn Boulevard; and
- the existing Navan Road 305 mm diameter watermain, located west of the intersection between Navan Road and Pagé Road.

The 200 mm diameter water service for the gas station within Block 16 will have its own connection to the existing 305 mm diameter watermain on Navan Road, located adjacent to the intersection of Navan Road and Brian Colburn Boulevard. The water service to the gas station will not connect internally to the residential watermain loop.

The 200 mm diameter water service for the townhouses in Block 1 will connect to the existing 305 mm diameter watermain on Pagé Road and extend along Street 3.

During the detailed design phase, upsizing of the watermain from a 203 mm diameter system to a 305 mm diameter system within the municipal right of way will be investigated. The use of larger sized mains will be considered as required to ensure there are sufficient flows within the system for fire protection.

2.5.2 Fire Protection

Fire protection to the site is anticipated to be achieved by five (5) on-site hydrants and the existing hydrants on Pagé Road and Navan Road. As shown in Drawing FWM, the on-site hydrants will be located along the 203 mm diameter watermain loop. It should be noted that these hydrant locations are preliminary and will be refined during the detailed design phase.

Hydrant spacing is in accordance with ISTB-2018-02, which states that the aggregated fire flow capacity of all fire hydrants within 150 m of a building shall not be less than the required fire flow of the building. Furthermore, ISTB-2018-02 highlights that the maximum capacity of fire flow for a hydrant is 95 L/s if the hydrant is within 75 m of a building. For hydrants located between 75 to 150 m from a structure, the hydrant flow capacity shall be taken as 63 L/s.

Fire protection for the private site plans (Blocks 14, 15, 16 and 17) will be detailed as part of their respective Site Plan Applications. For the purposes of this report, it will be demonstrated that the proposed watermains are anticipated to have sufficient flow for fire protection of the four (4) blocks.

2.5.3 Boundary Conditions

The performance of the proposed water distribution system at 2983, 3053 and 3079 Navan Road and 2690 Pagé Road was evaluated under various domestic demands and fire flow conditions using the hydraulic boundary conditions provided by the City (refer to Appendix D3 for a copy of the City correspondence). The boundary conditions provided by the City were located down the street from the proposed connections to the site (refer to Appendix D1 for the proposed connection locations). In order to model the proposed connection on Pagé Road, Connection-1 from the City's boundary condition was used. Similarly, in order to model both proposed connections on Navan Road, Connection-3 from the City's boundary condition was used. The existing watermains on Navan Road and Pagé Road were modelled as required. Tables 2-6 and 2-7 summarize the hydraulic boundary conditions received from the City that were used in the HNA.

Table 2-7: Hydraulic Boundary Conditions at Connection-1 on Pagé Road

Demand Scenarios	Head (m)
Peak Hour	126.6
Maximum Day + Fire Flow 1 10,000 L/min (167 L/s)	126.2
Maximum Day + Fire Flow 2 15,000 L/min (250 L/s)	123.0
Maximum Pressure Check	130.7

Table 2-8: Hydraulic Boundary Conditions at Connection-3 on Navan Road

Demand Scenarios	Head (m)
Peak Hour	126.6
Maximum Day + Fire Flow 1 10,000 L/min (167 L/s)	125.8
Maximum Day + Fire Flow 2 15,000 L/min (250 L/s)	122.3
Maximum Pressure Check	130.7

2.6 Simulation Results

A Hydraulic Network Analysis (HNA) was carried out to assess preliminary water servicing. Boundary conditions were provided by the City (Appendix D3) and used in this HNA. Simulations were carried out under peak hour demand, maximum day demand plus fire flow, and maximum pressure conditions.

2.6.1 Peak Hour

The peak hour demand shown in Table 2-2 was distributed throughout the nodes within the site. Using the boundary conditions shown in Table 2-6 and Table 2-7, the simulation results found the minimum pressure on site to be 397 kPa (57.6 psi) as shown in Appendix D4. Based on the simulation results, the minimum pressure criterion of 276 kPa (40 psi) is anticipated to be met everywhere on this site.

2.6.2 Maximum Day Plus Fire Flow

To ensure adequate fire protection, the maximum day demand shown in Table 2-2 was analyzed simultaneously with the fire flow. The simulation was conducted using the boundary conditions presented in Table 2-6 and Table 2-7. As described in Section 2.2, the Concept Plan has been revised since receiving boundary conditions from the City. However, considering that the most critical required fire flow (RFF) of 250 L/s has not changed, the boundary conditions are expected to remain applicable for the purposes of reviewing the functional serviceability of this site.

The fire flow simulation was carried out by allowing WaterCAD® to calculate the maximum fire flow that can be drawn from each node without allowing any part of the system to experience pressures less than 140 kPa (20 psi). Using the 15,000 L/min (250 L/s) boundary condition provided by the City (refer to Table 2-6 and 2-7), the system is expected to deliver a minimum of 10,000 L/min (167 L/s) within the site. This demonstrates that the fire flow requirement of 10,000 L/min (167 L/s) for the townhouse units within the subdivision can be met. It is noted that the boundary conditions used in this scenario are conservative for most of the site, including for all of the townhouse units.

The critical RFF for the residential site plans on Blocks 14 and 15 is 14,000 L/min (233 L/s) as described in Section 2.4.2. Using the 15,000 L/min (250 L/s) boundary condition provided by the City (refer to Table 2-6 and 2-7), it is anticipated that a minimum flow of 14,280 L/min (238 L/s) is available within the mains fronting these two blocks as shown in Appendix D5.

For the other residential site plan on Block 17, the RFF was calculated as 15,000 L/min (250 L/s). The simulation results (Appendix D5) found that the hydraulic capacity in this area is capable of supplying 15,000 L/min (250 L/s). Thus, it is expected that fire protection will be met for all three (3) residential site plans.

The simulation results (Appendix D5) show that the industrial site plan (Block 16) will deliver fire flows in excess of 169 L/s, which is above the calculated RFF in Section 2.4.2. Hence, the RFF can be fulfilled everywhere within the site. As noted in Section 2.5.2, the RFF will be provided by a combination of fire hydrants that each have a maximum flow capacity of 95 L/s (as per ISTB-2018-02).

2.6.3 Maximum HGL

The Design Guidelines require that a high-pressure check (maximum hydraulic grade elevation) be performed on the proposed system to ensure that the maximum pressure constraint of 552 kPa (80 psi) is not exceeded. Based on a zero (0 L/s) demand condition and corresponding boundary conditions (refer to Table 2-5 and Table 2-6), a maximum pressure of 479 kPa (69.5 psi) is expected (refer to Appendix D6 model output results). These values are below the maximum pressure constraint of 552 kPa (80 psi), therefore pressure reducing valves (PRVs) are not anticipated to be required.

2.7 Water Servicing Conclusions

Based on the water simulation results, the proposed subdivision can be serviced by the 203 mm diameter watermains illustrated in Drawing FWM. Simulation results under peak hour demand and maximum hydraulic grade line (HGL) show that the pressure requirements listed in the Design Guidelines were achieved. Furthermore, fire flow requirements can be met for the site, noting that fire protection for the Site Plans (Blocks 14, 15, 16 and 17) will be detailed as part of their respective Site Plan Applications.

3.0 Wastewater Servicing

3.1 Background

East Urban Community Infrastructure Servicing Study Update (EUC ISSU, Stantec 2005)

The subject properties are tributary to a proposed sanitary sewer that will be part of the Navan Road right-of-way (ROW). The proposed system is intended to flow in a southeasterly direction, bypassing Pagé Road, and ultimately discharging into the existing Renaud Road 600 mm diameter trunk sanitary sewer. From that point, wastewater flows will be conveyed in a

southwesterly direction by the Renaud Road 600 mm diameter trunk sanitary sewer until discharging to the Forrest Valley Pump Station and pumped to the Forest Valley Trunk sewer.

The subject properties are part of two tributary areas denoted in the EUC ISSU as Area 13A and 13B. Appendix E1 contains a copy of the overall sanitary drainage plan from the EUC ISSU highlighting Area 13A and 13B.

Area 13A:
Based on the design sheet included in the EUC ISSU (Appendix E1), the subject properties are part of the 6.60 ha that forms Area 13A and tributary to the sewer reach identified as MH13A to MH13, spanning from Pagé Road to Renaud Road as per the EUC ISSU Design Sheet. A copy of this design sheet is attached to Appendix E1.

Area 13B:
Based on the design sheet included in the EUC ISSU (Appendix E1), the subject properties are also part of the 10.50 ha that forms Area 13B and tributary to the sewer reach identified as MH13B to MH13A, spanning from the subject properties' entrance to Pagé Road.

From a review of the planned sanitary servicing on Navan Road as well as the background documents presented in Appendix C, the following were key highlights:

- The existing Renaud Road trunk sanitary sewer at Navan Road has an invert of 77.17 m and obvert of 77.77 m.

- There are two (2) existing forcemains along Pagé Road (±157.6 m) with top of casing elevations of ±76.69 m that would need to be crossed to extend sanitary servicing along Navan Road.

- There is an existing 250 mm diameter sanitary sewer along Pagé Road that flows in a southerly direction from Navan Road to Renaud Road which was not part of the EUC ISSU Design. From the background documents provided the existing sanitary sewer has a south invert of 78.02 at existing MH 10 at the Pagé and Navan Road intersection as shown in Drawing FSAN (Functional Sanitary Servicing).

- The recommended strategy of a sanitary sewer connection to the Renaud Road trunk sanitary sewer at Navan Road along Navan Road (at a minimum 0.35% slope) from the Pagé Road intersection (i.e., ±158.0 m distance) cannot be proposed due to pipe conflicts. The pipe locations and existing inverts would not allow for flows to be conveyed in a southeasterly direction as intended in the EUC ISSU Design but rather flows would flow south via the 250mm sanitary sewer along Pagé Road. An alternative sanitary servicing solution is provided in Section 3.2.

3.2 Revised Sanitary Servicing

Given the linear infrastructure constraints at the Pagé Road intersection, an alternate sanitary servicing solution was reviewed to replace the recommended strategy developed as part of the EUC ISSU. The original strategy was to construct a 200 mm diameter sanitary sewer along Navan Road, that would extend from the site entrance to Pagé Road, and then to the sanitary sewer at the intersection of Renaud Road and Navan Road, for an overall length of ±300 m.

As shown in the Functional Sanitary Servicing (Drawing FSAN), the Renaud Road 600 mm diameter trunk sewer runs southwesterly from Navan Road towards Pagé Road. Hence, there is an opportunity to connect the proposed Navan Road 200 mm diameter sanitary sewer, from the site entrance to the existing MH 10 at the intersection of Pagé Road and Navan Road (refer to Drawing FSAN). Wastewater would then flow in a southeasterly direction along Pagé Road and discharge into the Renaud Road 600 mm diameter trunk sanitary sewer. Given that this revised sanitary sewer routing along Pagé Road is further downstream than the original servicing solution found in the EUC ISSU, there would not be any capacity issues and this strategy would limit the works crossing the existing forcemains on Pagé Road.

Refer to Drawing FSAN for the revised functional sanitary servicing which involves the above stated connection to existing MH 10 at the intersection of Pagé Road and Navan Road. In addition, the 2690 Pagé Road parcel is to be serviced via the existing 250 mm diameter sanitary sewer on Pagé Road in accordance with the EUC ISSU tributary to Area 13A.

3.3 Proposed Sanitary Sewer System

The proposed sanitary sewers within the subject properties and along Navan Road were conceptually sized in accordance with the Ottawa Sewer Design Guidelines ((OSDG) - (October 2012)) and associated Technical Bulletins. As described in Section 3.2, the sanitary servicing has slightly been modified from what was shown in the EUC ISSU to prevent a sub-standard connection.

The proposed sanitary sewers have also been designed to accommodate any catchment areas identified within the EUC ISSU Report (Stantec, 2005) as well as the future Navan Road widening. Refer to Drawing FDSAN for the Functional Sanitary Drainage Plan and Drawing FSAN for the Functional Sanitary Servicing.

Key design parameters reflecting the revised sanitary parameters have been summarized in Table 3-1 below.

Table 3-1: Wastewater Servicing Design Criteria

Design Criteria	Design Value	Reference
Residential average flow	280 L per capita/day	ISTB-2018-01
Residential peaking factor	Harmon Formula x 0.8	City Section 4.4.1
Commercial average flow	28,000 L/gross ha/day	ISTB-2018-01

3.4 Theoretical Sanitary Peak Flow

Wastewater flows from the subject properties were estimated based on the population associated with the Concept Plan, Draft Plan of Subdivision, the theoretical unit flow of 280 L/capita/day and the adjusted Harmon peaking factor. Based on this design criteria, a total combined peak wastewater flow of 8.95 L/s (Navan) + 0.37 L/s (Pagé) = 9.31 L/s was estimated. This peak wastewater flow represents part of the overall flows allocated for Areas 13B and 13A, which are shown as 10.50 ha and 6.60 ha in the EUC ISSU sanitary design sheet (Appendix E1). When the other areas of Area 13B is considered, the peak flow at Pagé Road was estimated at 12.65 L/s.

As presented in Section 3.2, it is proposed to connect the Navan Road 200 mm diameter sanitary sewer, from the site entrance to Pagé Road, and connect to the existing MH 10 at the intersection of Pagé and Navan Road.

Therefore, when the areas included in Area 13A (6.60 ha) as shown in the EUC ISSU, are combined with the flows from Area 13B (12.65 L/s) wastewater flows of 15.71 L/s were estimated to discharge southeasterly from existing MH 10 towards the Renaud Road 600 mm diameter trunk sanitary sewer. Although, the calculated peak flow of 15.71 L/s is above the allocated peak flow of 11.33 L/s as shown in the EUC ISSU design sheet (refer to Appendix E1 for the ISSU design sheet and Appendix E2 for the JLR Design Sheet). The design from the EUC ISSU was based on the previous OSDG of 350 L/p/day. Given the updated design parameters of 280 L/p/day prescribed in ISTB 2018-03 from the previous 350 L/cap/day, and the existing 250 mm sanitary sewer system on Pagé Road currently has a free-flowing capacity of 29.0 L/s (250mm diameter sewer with an As-Constructed slope of 0.74%), it is expected that this sewer will have adequate capacity to accommodate the flows generated from the subject site. The total amalgamated flows stated above of 15.71 L/s will only account for 55% of the existing sanitary pipe capacity (from Navan to Renaud) or flow 55% full.

3.5 Proposed Sanitary Sewer Sizing

The wastewater analysis described in Section 3.2 shows that the proposed sanitary sewers must be sized to accommodate: i) the peak wastewater flow in the subdivision of 8.95 L/s (for Navan Road connection) and 0.37 L/s (for Pagé road connection), ii) the peak flow of 12.65 L/s at Pagé Road, and iii) the design flow of 15.71 L/s at Renaud Road. To accommodate these design flow targets, proposed 200 mm diameter sanitary sewers are proposed. Refer to Appendix E2 for the Design Sheets for the subject properties and Drawing FSAN for the functional sanitary servicing plan.

3.6 Wastewater Servicing Conclusions

The subject properties will be serviced by a local sanitary system consisting of 200 mm diameter sewers discharging to two locations i) Navan Road and ii) Pagé Road (refer to Drawing FSAN).

The Navan Road system will discharge into an off-site 200 mm diameter sewer that will be tributary to the existing 250 mm diameter sanitary sewer located along Pagé Road east of Navan Road. The Pagé Road system will be discharged into an existing 250 mm diameter sanitary sewer located along Pagé Road. Both systems merging at the Pagé and Navan intersection and ultimately tributary to the Renaud Road trunk sewer. The theoretical peak wastewater flows of 9.01 L/s and 0.37 L/s were calculated based on the design criteria described in the Ottawa Sewer

Design Guidelines and associated Technical Bulletins as shown in the Design Sheet included in Appendix E.

4.0 Storm Servicing and Stormwater Management

4.1 Existing Conditions and Background

The subject properties are bounded on three (3) frontages; Navan Road, Pagé Road and Brian Coburn Boulevard. As noted in Section 1.3, short sections of storm sewers are existing on Navan Road and Brian Coburn Boulevard. These storm sewers have limited capacities and were not sized for the subject properties.

There are no existing storm sewers that have capacity for the subject properties. However, storm servicing and stormwater management for the subject properties have been reviewed as part of the East Urban Community Infrastructure Servicing Study Update (EUC ISSU, Stantec 2005). A summary of the EUC ISSU that pertains with the properties follows:

East Urban Community Infrastructure Servicing Study Update (Stantec, 2005)

The subject properties are tributary to a proposed storm sewer system that will be part of the Navan Road right-of-way (ROW). The proposed storm sewer system is intended to flow in a southeasterly direction, past the Pagé Road intersection, and to ultimately connect to the existing Renaud Road 1350 mm diameter trunk storm sewer. From that point, the captured storm sewer flows will be conveyed in a southwesterly direction by the Renaud Road 1350 mm diameter trunk storm sewer, pass the Pagé Road intersection until discharging to an existing end-of-pipe facility referred to as Pond #3, which in turn outlets to Mud Creek. This facility was designed to provide an enhanced protection level (80% total suspended solids removal), erosion control as well as providing quantity storage for its serviced area.

The minor system flow allowance for the subject properties should be set based on the design criteria developed as part of the EUC ISSU. The subject properties are within the drainage area for Pond 3 which requires control in the minor system to 85 L/s/ha and to the 1:10 year event on arterial roads, including Navan Road.

Mud Creek Cumulative Impact Study (Stantec, May 2020)

Pond #3 in the East Urban Community discharges into Mud Creek and therefore the development is contributes flows to Mud Creek. Historical land use alterations and land development within the Mud Creek watershed has led to erosion of stream bed and bank materials as evidenced by stream bank instabilities. The Mud Creek Cumulative Impact Study completed a cumulative impacts assessment for upper Mud Creek whereby the potential impacts of foreseeable public and private developments were considered. The study recommended the implementation of a series of restoration measures in four locations and Pond #3 is upstream of two of these locations, Sites #12 and #13, which are approximately 475 m in length.

The implementation plan for the restoration includes establishing an approach to funding/cost sharing for the natural inventories, design, construction and post-construction monitoring activities. The major funding partners will include the City, land developers and the National

Capital Commission. As urbanization of lands tributary to some of the erosion works occur, the Draft Condition that will be formulated by the City should reference the mechanism that they have, or will, established to cost share the length of erosion works that the subject site will contribute while accounting the site's imperviousness.

4.2 Storm Criteria

4.2.1 Design Criteria

This Functional Servicing Report and associated high-level drawings have been prepared based on the discussions held during the pre-consultation meeting (Appendix A) and subsequent E-Mail correspondences. The storm design criteria used in this high-level functional level servicing is based on the items described in As shown in Figure 3, the total drainage area of the development consists of the following:

1) The internal tributary drainage area is ±5.295 ha. Which is the total site area of ±5.36 ha with a small area of ±0.069 ha removed that will sheet flows uncontrolled to Navan Road. The internal tributary drainage area is ±5.295 ha

2) In addition to the internal drainage area, the area from existing abutting properties on Navan Road (0.7ha) and Pagé Road (1.14ha) which currently drain towards the proposed development and will be captured via the proposed stormwater system within this new development. This external tributary drainage area is therefore an additional area of ±1.84 ha.

By considering the catchment areas noted above, the total drainage area for the site storm servicing is ±7.13 ha. Multiplying this area by the controlled release rate of 85 L/s/ha (as directed by the EUC ISSU), the allowable release rate calculated for the development is ±606 L/s.

Table 4-1.

4.2.2 Boundary Condition

The boundary condition of the storm sewer on Navan Road is set as the 1:100 year HGL specified for the Trunk Storm Sewer on Renaud Road in the EUC ISSU. The elevation specified at MH603 is estimated from the report at 77.5 m. It should be noted that this elevation is below the outlet from the subject parcels and therefore does not have significant impact on the site servicing.

4.2.3 Allowable Release Rate

The method to determine the allowable peak flow is based on multiplying the total drainage area tributary to the proposed development by the controlled release rate of 85 L/s/ha (as directed by the EUC ISSU). As shown in Figure 3, the total drainage area of the development consists of the following:

3) The internal tributary drainage area is ±5.295 ha. Which is the total site area of ±5.36 ha with a small area of ±0.069 ha removed that will sheet flows uncontrolled to Navan Road. The internal tributary drainage area is ±5.295 ha

4) In addition to the internal drainage area, the area from existing abutting properties on Navan Road (0.7ha) and Pagé Road (1.14ha) which currently drain towards the proposed development and will be captured via the proposed stormwater system within this new development. This external tributary drainage area is therefore an additional area of ±1.84 ha.

By considering the catchment areas noted above, the total drainage area for the site storm servicing is ±7.13 ha. Multiplying this area by the controlled release rate of 85 L/s/ha (as directed by the EUC ISSU), the allowable release rate calculated for the development is ±606 L/s.

Table 4-1: Storm Servicing Design Criteria

General Design Criteria
Proposed storm sewers to be sized to capture the 1:2-year peak flows, and the 1:10 year peak flows on Navan Road, to be estimated with the Rational Method based on the City of Ottawa Intensity-Duration-Frequency (IDF) curves.
Peak flows estimated based on an inlet time of ten (10) minutes, as per the Technical Bulletin ISDTB-2012-4.
Calculated peak flows to be estimated based on calculated Runoff-Coefficients. The weighted C-Factors have been calculated based on 0.90 for all hard surfaces and 0.60 for all landscaped areas.
Peak flow rate from the site to be controlled to 85 L/s/ha.
Proposed storm sewer systems on each of the individual Site Plans are to capture the 1:2-year design flow and have no surface ponding.
The stormwater management system on each of the individual Site Plans is to detain the 1:100-year flows while releasing at a peak flow rate equivalent to 85 L/s/ha therefore underground or rooftop storage will be required within the site plan parcels.
The 1:100-year peak flows to be detained by means of on-site retention measures including street sag storage and a dry pond facility.
Quality control will be accommodated by Pond #3 to meet an MECP Enhanced Level of Protection (80% TSS removal).
Inlet control devices (ICDs) will be sized at detailed design to capture a peak flow rate of 85 L/s/ha and ensure a freeboard in the sewer network to the underside of footing (USF) of 300 mm during the 1:100-year storm
Comparisons of the ICD captured flow rates to the rational method flow rates will be provided at detailed design.
Maximum street ponding depth of 350 mm (static and dynamic) as per the Design Guidelines and maximum depth of rear yard flow to be 300 mm. During the Climate Change event, the street ponding is not to reach the lowest building opening while the storm HGL must remain at or below the USF. The product of the velocity and depth of major system flows on streets during the 1:100-year design storm event is not to exceed 0.60 m²/s.
• Minimum roadway profile grades at 0.5%. • Roadway cross-fall of 3% was used for all streets. • Minimum roadway slope of 0.1% from crest-to-crest for overland flow route. • Minimum vertical clearance of 0.15 m between the spill elevation on the street and the finished grade (garage elevation). • Minimum vertical clearance of 0.30 m between the rear yard spill elevation and the ground elevation at the building in the rear yards.
Provide measures to ensure that site preparation and construction is in accordance with the current Best Management Practices for Erosion and Sediment Control.

4.2.4 Runoff Coefficients (C-Factors)

Functional runoff coefficients (C-Factors) were calculated based on the weighted product between the percentage of the pervious area and the percentage of the impervious area. At the direction of the City, sample runoff coefficient were calculated based on zoning setbacks and maximum driveway widths. To better reflect the differences in impervious surfaces within the subdivision, the overall C-Factor was broken down by assigning a higher C-Factor to the front areas that includes the roadways and driveways and a lesser C-Factor to the rear yard areas. On this basis, functional C-Factors used in the Rational Method calculations have been summarized in **Error! Not a valid bookmark self-reference.** below (refer to Appendix F2 for the Functional Runoff Coefficient calculations). Runoff coefficients for the remaining drainage areas were obtained from the EUC ISSU (Stantec, 2005). Refer to Appendix F1 for the EUC ISSU Storm Drainage Area Plan and Design Sheet.

Table 4-2: Functional Design Runoff Coefficients

Scenario	Functional Runoff Coefficient
Rear Yards – Townhouse Units Only	0.61
Front Yards and ROW	0.66

Commercial Site Plan (Block 16)	0.90
Park Block (Block 7)	0.40
Dry Pond Block (Block 13)	0.83
Abutting Properties on Navan Road and Pagé Road	0.30

4.3 Storm Servicing Strategy

The proposed storm servicing strategy within the subject properties consists of a conventional storm sewer system on the municipal right-of-way (ROW). The storm sewers will be designed with capacity for the 1:2 year event with capture of a peak flow rate of 85 L/s/ha. The proposed sewers have been designed to accommodate any catchment areas identified within the EUC ISSU Report (Stantec, 2005) as well as the future Navan Road widening. Refer to Drawing FDST for the Functional Storm Drainage Plan and Appendix F3 for the Functional Storm Design Sheets.

The storm sewer system will connect to new public sewers on Navan Road (refer to Drawing FSTM for Functional Stormwater Servicing), which are to be designed to convey the 1:10 year event from Navan Road as well as the 1:2 year event from the remainder of the catchment area.

Major overland flow on the ROW within the subject properties, in excess of the 85 L/s/ha minor system capture, will be directed via a series of sags to a dry pond facility. The dry pond facility will detain runoff from up to the 1:100 year event. The dry pond will have a controlled release into the downstream storm sewer system.

Blocks 14, 15 and 17, and the gas station block (Block 16) will detain on site the 1:100 year event and will discharge at a flow rate equivalent to 85 L/s/ha into the storm sewers in the ROW upstream of the control structure.

The 2690 Pagé Road parcel, which is directly on Pagé Road, will discharge into the site's conventional storm sewer network with capture at 85 L/s/ha. Major overland flow will be detained in the street sag in up to the 1:100 year event.

4.4 Assessment of Storm Servicing Strategy

Note that when assessing reported results and areas there may be minor differences in results presented due to:

- Rounding in GIS areas – if ten catchments are rounded up by 0.001 or up to 0.004, this can have a difference across the ten catchments of between 0.01 and 0.04 ha.

- Reporting timestep verses calculation time step – the SWMM engine provides graphing of the results using the reporting timestep set by the modeler, which is different from the simulation calculation timestep. Results in the report below are extracted from PCSWMM in a way that extracts the result from the calculation timestep and may differ from results graphed in PCSWMM.

4.4.1 On-Site Storage Volume Requirements

Storage volume requirements were evaluated using the PCSWMM software platform (Refer to Appendix F5 for PCSWMM Schematic). A functional level dual drainage model was developed; the minor system spanned from the upstream end of the system within the future Site Plans, through the municipal right-of-way (ROW) included Draft Plan of Subdivision, along Navan Road until the connection point with the Renaud Road 1350 mm diameter trunk storm sewer.

The model includes street sags with preliminary grading with control release into the minor system at 85 L/s/ha, underground storage (represented with storage nodes) on the future Site Plans, and a dry pond near the entrance of the site. The release rate of the dry pond has been set at the equivalent of 85 L/s/ha from the upslope lands draining via overland flow to the dry pond. Storage requirements for the site were identified as shown in Table 4-3.

Table 4-3: Main Site Storage Volume Requirements and Release Rates (Navan Road)

Block	Area (ha)	Release Rate	Storage Required (m^3)	Storage Required (m^3/ha)
Block 14	0.57	49 L/s (85 L/s/ha)	194	338
Block 15	0.54	46 L/s (85 L/s/ha)	184	341
Block 16	0.74	63 L/s (85 L/s/ha)	244	330
Block 17	0.56	48 L/s (86 L/s/ha)	190	339
TOTAL SITE	7.13	607 L/s (85 L/s/ha)	309	43

On site plan blocks, storage will be provided in the future with the opportunity to utilise underground storage as well as parking lot sag storage, roof top storage, and/or a combination of these. The design storage requirements and configuration will be optimized at the detailed design stage of each of he respective sites.

4.4.2 Dry Pond Operation

The dry pond will receive major overland flow on site and detain it to release it at a controlled rate to the minor system storage. Pond side slopes will be 3:1 and have been simulated using a stage-storage curve developed from the proposed grading surface. The pond has been preliminarily sized to meet the OSDG requirements.

A geotechnical report entitled "Geotechnical Investigation of the Proposed Residential Development 2983, 3053, and 3079 Navan Road Ottawa, Ontario" was prepared by EXP. The borehole data provided in this report specifies that the groundwater table at the proposed dry pond block (Block 13) is at an elevation of 80.46 meters. As shown in Figure 4, the bottom of the pond is 1.00 metres above the groundwater table at an elevation of 81.46 metres.

The operation of the dry pond in the modelling simulation is provided in Table 4-4 for the 3-hour Chicago storm distribution and Table 4-5 for the 12-hour SCS storm distribution.

Table 4-4: Dry Pond Operation (3-hour Chicago Storm)

Event	Max HGL (m)	Max Depth (m)	Total Inflow (L/s)	Peak Release Rate (L/s)	Max Storage Volume (m³)
1:2 year	81.57	0.11	16	14	3
1:5 year	81.68	0.22	67	41	25
1:10 year	81.76	0.29	126	62	54
1:25 year	81.88	0.42	206	83	123
1:50 year	81.98	0.52	309	96	192
1:100 year	82.14	0.67	425	113	309

Table 4-5: Dry Pond Operation (12-hour SCS Storm)

Event	Max HGL (m)	Max Depth (m)	Total Inflow (L/s)	Peak Release Rate (L/s)	Max Storage Volume (m³)
1:2 year	81.59	0.12	21	18	5
1:5 year	81.70	0.23	82	46	30
1:10 year	81.78	0.31	142	65	63
1:25 year	81.89	0.42	214	83	125
1:50 year	81.97	0.51	299	94	182
1:100 year	82.05	0.59	382	104	243

The modelling results show that the pond contains flow in the 1:2 year event. The frequent event flows are from the immediate catchment runoff, rear yard swale and overflow from the street. The maximum water level in the pond is 82.14 m, which provides 470 mm freeboard to the surrounding area. Maximum pond depth is 670 mm which is less than 1.5m.

4.4.3 Major System Ponding

Due to the capture rate of 85 L/s/ha being less than the 1:2 year rainfall event, there is ponding in the street sags in the 1:2 year event of up to 90 mm depth. The street ponding lasts for 19 minutes at the deepest location in the 1:2 year event and for 1.12 hours in the 1:100 year event. Table 4-7 shows the street ponding depths and capture rates compared to the 1:2 year rational flow as well as the 85 L/s/ha rate. Each low point has ICDs that combined capture a flow rate greater than the 85 L/s/ha flow rate to the low point.

Error! Reference source not found. shows the ponding depth values for the 3-hour Chicago storm, which is the critical storm event for the major system flows.

Table 4-6: Major System Ponding Analysis

Low Point	1:2 year Max Ponding Depth (mm)	1:100 year Max Ponding Depth (mm)	1:2 year Rational Method Flow (L/s)	85 L/s/ha Rate Flow (L/s)	Combined Low Point ICD Capture Rate (L/s)

4.4.4 Minor System Freeboard

As discussed in Section 1.4, a Functional Grading Plan (Drawing FG) has been developed with high-level centreline grades and USF for townhouse units. Table 4-7 below shows the HGLs of the minor system for both the 3-hour Chicago and 12-hour SCS 1:100 year storm events compared to the road centreline elevations. Basement underside of footings are typically 1.8 metres below the road centreline.

525_(P-Stm)	84.95	81.71	3.24	81.71	3.24
526_(P-Stm)	85.78	82.06	3.72	82.06	3.72
527_(P-Stm)	85.67	82.55	3.12	82.55	3.12

The results show that in the majority of manholes the available freeboard to the road centreline is greater than 2.2 metres. There is one location where the freeboard is less than 2.1 metres (assuming a 1.8 metre depth to the USF and 300 mm freeboard), which is in the Gas Bar site (Block 16) with no basement and therefore sufficient freeboard is provided to the surface.

4.5 Water Quality Assessment

The subject properties are within the catchment of Pond #3 in the East Urban Community, which provides water quality control for the receiving runoff. As outlined in the EUC Stormwater Management Facility #3 Design Brief Update (Stantec 2005), the Pond was sized to provide 70% TSS removal water quality treatment for 180.66 ha of land at a weighted percentage imperviousness of 45.3%.

The level of imperviousness of the proposed development increases the weighted percentage of imperviousness of the overall catchment to the pond from 45.3% to 47.0%. The sizing implications of such a change are compared in Table 4-8 below.

Table 4-8: Water Quality Volumes Comparison

Parameter	Value from 2005 Design Brief	Value incorporating new developments
Total Contributing Area (ha)	180.66 ha	180.66 ha
Imperviousness of Contributing Area (%)	45.3%	47.0%
Unit Area Storage Volume Requirements as per SWMPD	100.3 m³/ha	102.0 m³/ha
Required Total Water Quality Volume	18,113 m³	18,440 m³

Parameter	Value from 2005 Design Brief	Value incorporating new developments
Required Permanent Pool Volume	10,887 m³	11,210 m³
Permanent Pool Volume Provided (Total above sediment)	18,986 m³	18,986 m³
Required Extended Detention Volume (40m³/ha)	7,226 m³	7,226 m³
Extended Detention Volume Provided	22,873 m³	22,873 m³

From the analysis in Table 4-8, the pond facility still has sufficient permanent pool volume capacity to provide water quality treatment for the level of development proposed. The increase in volume required, 1,323 m³, is 4% of the residual capacity of the pond. Therefore water quality control is provided.

4.6 Storm and Stormwater Management Conclusions

The release rate from the site is set by the East Urban Community Infrastructure Servicing Study Update (EUC ISSU, Stantec 2005). The site contributes to the Navan Road storm system, which, under the 2005 EUC ISSU, has quality control provided by a downstream stormwater management pond, Pond #3. The 2005 EUC ISSU sized the downstream pond and storm sewer system to accept a flow of 85 L/s/ha from the site, which has been provided for through ICDs and a dry pond on site to capture the major system flows.

5.0 Erosion and Sediment Control

Erosion and sediment control measures, as outlined in the Ontario Ministry of Natural Resources (MNR) Guidelines on Erosion and Sediment Control for Urban Construction Sites, will be implemented to trap sediment on site. The following erosion and sediment control measures could be implemented during construction:

- Supply and installation of a silt fence barrier, as per OPSD 219.110.
- Supply and installation of siltsack or sentinel CB inserts between the frame and cover of catch basins and maintenance holes adjacent to the project area during construction, to prevent sediment from entering the sewer system.
- Stockpiling of material during construction is to be located along flat areas away from drainage paths. For material placed on sloped areas, stockpiles are to be enclosed with a silt fence to protect watercourses.
- All catch basins are to be equipped with sumps, inspected frequently, and cleaned as required.
- Temporary ICDs are to be placed blocking part of the sewer pipe in the connecting storm maintenance holes to eliminate construction debris from entering the existing storm sewer system. The ICDs are to be removed after the proposed storm sewers have been fully cleaned.
- A mud mat is to be built at each of the site entranceways to prevent the transport of sediment onto paved surfaces. The mud mat shall be:
  - Minimum of 20 m in length for the full width of the entrance way (10 m wide minimum).
  - Minimum of 400 mm thick underlain with a geotextile (or graded aggregate filter); and

- Constructed with 50 mm diameter clear stone for the first 10 m (extending from the paved street) and the remainder of the length with 150 mm diameter clear stone.

The proposed removal and reinstatement measures as well as the erosion control measures shall conform to the following documents:

- "Guidelines on Erosion and Sediment Control for Urban Construction Sites" published by Ontario Ministries of Natural Resources, Environment, Municipal Affairs, and Transportation & Communication, Association of Construction Authorities of Ontario and Urban Development Institute, Ontario, May 1987.

3. "MTO Drainage Manual", Chapter F: "Erosion of Materials and Sediment Control", Ministry of Transportation & Communications, 1985.

- "Erosion and Sediment Control" Training Manual by Ministry of Environment, Spring 1998.

4. Applicable Regulations and Guidelines of the Ministry of Natural Resources.

Subject: Re: Navan Road - Second Pre-Application

Gabrielle,

1. Site Plans for this file are to be a C of .5. Subdivision is to be calculated as per the SDG. Your permitted with a 5-year pipe design and store up to the 100-year for both subdivision and Site Plan.
2. If you discharge to a pipe that discharges to a City SWM facility, then no additional quality controls are required. However, you are required to confirm with the Conservation Authority.
3. No, but the City does confirm it is the responsibility of the proponent to demonstrate the site is serviceable for water, storm and sanitary and that the receiving sewers have capacity. The Functional Servicing Report provides the ultimate servicing solution for watermain storm and sanitary.
4. Unknown currently. Who owns 2973...apparently the City. Depends if they sell it or what? More ideal if it was within a City Block or City ROW but not an easement.
5. No. No occupancy unless it is serviced properly.
6. You may discharge to the **ditch and not the 750mm Ø storm** along Navan Road if that is to be your determined outlet. Quality Controls are provided by the Conservation Authority. 5-year Pre to post with a tc of 20 minutes Pre and a tc of 10 minutes with a 0.5 C, store up to the 100-year.
7. You are permitted to use infiltration designs anywhere within the city but they must demonstrate functionality and have supporting documentation.
8. You must demonstrate, not assume the 750 mm Ø storm pipe was designed to include your entire site. The road-side ditch primarily runs towards Page Road. This will require further investigation. The City will not support any municipal owned infrastructure within the proposed Gas Station parcel. 2973 is City Owned.

Any info you may require is available from the Info Centre "ISD Information Centre / Centre Information" informationcentre@ottawa.ca

The City reserves the right to change any decisions provided herein should new information warrant it.

Subject: RE: Navan Road - Second Pre-Application

Hi Steve and Will,

Leading up to the second pre-application meeting for 2983, 3053 and 3079 Navan Road, I wanted to forward you some questions regarding servicing:

Question 1: The City to confirm that the quantity control criterion from the EUC ISU prevails; The 1:100 year post-development peak flows for the overall subdivision be limited to the 1:5 year peak flows calculated based on a C-Factor of 0.60.
Question 2: The City to confirm that the quality control criterion from the EUC ISU prevails; Given that 2983 Navan Road is tributary to Pond #3 which was sized to meet the enhanced protection level, there is no be any additional water quality control requirements for the subdivision.
Question 3: The City to confirm that the ultimate servicing solution for storm & sanitary hinges on proposed storm and sanitary sewers along Navan Road, from 3053 Navan Road to Renaud Road.

Question 4: Given that water servicing to support the subdivision requires looping, can an easement be granted within 2973 Navan Road to facilitate water servicing as this future watermain connection would be the supply for both the subdivision and future gas station? The second watermain connection would be within 3053 Navan Road.
Question 5: To support the gas station under interim condition, would the City entertain that wastewater flows be captured by a holding tank assuming that the car wash would not be commissioned.
Question 6: Given that the lands for the future gas station currently sheet flows to the open ditch system & CB/DICB and 750 mm diameter storm sewer along Navan Road, its is assumed that storm servicing for the gas station can be developed to maintain the same drainage pattern. As such, the City to confirm the quantity control criterion for the gas station. The 1:100 year post-development peak flows from the gas station be limited to pre-development levels (C-Factor of 0.20). Prior to outlet into the 750 mm diameter storm sewer, a proposed OGS would be sized to achieve the enhanced protection level (TSS 80%).
Question 7: To minimize runoff volume discharged to the 750 mm diameter storm sewer, rooftop flows from the building and car wash could be captured and infiltrated. Although infiltration for this type of usage is generally not recommended, the City to confirm whether infiltration of the rooftop flows would be permitted.
Question 8: In support of servicing for the overall subdivision and gas station, would the City be favorable of an easement within the 2973 Navan Road to facilitate water and storm servicing (connection to the existing 750 mm diameter storm sewer)? As alternate, would the City entertain selling the eastern part of 2973 Navan Road?

Also, would it be possible to get information on the following for Brian Coburn Blvd:

- Built infrastructure for lanes (i.e. turning lanes, bike lanes etc.);
- Traffic signals;

- Infrastructure underground.

Thanks in advance and have a great weekend,

Hi Steve,

Please find the revised concept plan attached. Note that the only changes made were removing a row of townhouses and replacing them with another 3-storey condo building along the southeast corner.

Can you please confirm that the meeting on the 18th is still on? If it is, can Raad and Carmine be sent invites? Their emails are:
rakrawi@groupeheafey.com
carmine@zayoungroup.com

Should you have any questions, please feel free to reach out.

Thanks again,

Hi Steve,

Quick update, the client might provide us with an updated concept plan tomorrow that would include minor changes only however there is a chance that the concept plan I provided earlier will be the final draft to be discussed at the pre-consult meeting. If we receive an updated concept plan from them, I will be sure to promptly send it your way.

Thanks,

Gabrielle

Gabrielle,

I am reluctant to set up a meeting until I know that your group has prepared some kind of concept plan. This will is my last week before the Christmas Holidays and therefore very busy. If you have some material to share I will make a meeting for Thursday afternoon.

Regarding the parkland dedication, There is no plan for a park in the secondary plan. However, it will be up to the parks planner to make this call. I would imagine it will also depend on the number of units that you are proposing. I have spoken with them any they have indicated that they will get back to me.

Subject: Navan Road - Second Pre-Application

Hi Steve,

I hope this email finds you well.

I am reaching out to request a second pre-application meeting as it relates to the proposed Navan Road development. As mentioned during the last meeting, the client was able to acquire abutting properties (2983 Navan Road, 3053 Navan Road) in addition to 3079 Navan road. Since a number of additional development plans and considerations have changed as a result, we are looking to have a second meeting.

We are aiming to get you the site plan, pre-application meeting form and additional materials by early next week. With this in mind, do you think it would be possible to schedule the pre-application meeting end of week next week or sometime early the week after?

Also, would you be able to confirm that cash in lieu of parkland would be accepted for this development?

Thanks in advance,

Gabrielle

From:	Curry, William
To:	Gabrielle Snow
Cc:	Belan, Steve; Tim F. Chadder; Lucie Dalrymple; Guy Forget
Subject:	Navan Road Site
Date:	Tuesday, January 19, 2021 11:10:35 AM

Gabrielle,

I have already provided my Submission list to Steve for distribution.

I can offer these other items at this time.

I reviewed the report prepared by IBI and they followed the parameters of the Stantec EUC to demonstrate the site was serviceable for zoning purposes only. Historically I can tell you IBI tends to take their own liberties in what they deem we the City should accept.

There were several documents submitted for zoning and I don't know if Taggart is making those available to the applicant.

I will require a FSR for this file for Draft Plan of Subdivision, regardless of what was submitted.

Info only
I looked at the existing topographical plan of survey and it will require more existing elevations to be considered acceptable.
The Storm and Sanitary **pipe(s)** Outlets are as per the EUC and are to be on Navan Road and connected to Renaud Road. Design to City Standards may be another issue if you read IBI's report.
This site is lower than all the surrounding roads. Preloading would be ideal for this site. Note that the attempts to sometimes retain trees and preload areas is a conflict and some trees can't be saved.

The watermain option out to Page; you should consider or attempt to go through the City owned parcel between the proposed Townhouses and Brian Coburn. Also the easement location within that private parcel is critical as we accept nothing else within the easement other than asphalt and curbs. Maybe it is best to go in a straight line and loose some trees.
It is hard to believe you need a Dry Pond for this site with all the green spaces. I know this is just concept currently. Private Bio-swales could be considered

elsewhere...etc. Water table here is a concern.

Let me know if I can assist further.

Thanks

Will Curry, C.E.T.

Subject: Pre-con Follow-up - 3079 Navan Road

CC: Will Curry, Mark Young, Phil Castro, Mike Giampa

Hello Gabrielle,

I apologize for the delay on getting these out. Please refer to the below and/or attached notes, regarding the Pre-Application Consultation (pre-con) Meeting held on January 18, and March 25, for the property at 3079 Navan Road for ZBLA and subdivision in order to allow the development of in fill subdivision with low-rise apartments, town house unit and a commercial block at the corner of Brian Coburn and Navan. I have also attached the required Plans & Study List for application submission. During the Covid-19 pandemic the City will not be requiring any paper copies as listed in the attached list.

Below or attached, are staff's preliminary comments based on the information available at the time of pre-con meeting:

Planning

- A severance application may be required depending on how the owner wishes to proceed with the creating the commercial block at the intersection
- We need to discuss the order of applications. There are pros and cons to moving forward with a severance of the commercial blocks to address ownership issues.
- We support the move to low-rise buildings along Brain Coburn Blvd.
- Lynda Mongeon would be able to facilitate the transfer of surplus City lands as needed
- Contributions to the Mud Creek restoration will need to be determine.
- The Applicant must now provide a proposed strategy for public consultation as directed by Bill 73

Urban Design

1. PRUD appreciates and supports the desire to retain trees on-site. The arrangement and viability of this should be reviewed in depth by our Planning Forester.
2. The size and locations of the commercial block is supported. It would be worth exploring the possibility of obtaining additional city lands at the intersection of Brian Coburn and Navan Road to complete the block and allow for possible built form at this gateway location.

3. The current drive through configuration/location adjacent to this community entrance is a significant concern. Please re-consider the layout of the commercial site.
4. Please review the proposal in conjunction with the EUC Phase 1 CDP.
5. PRUD would support the inclusion of a park block to serve the new residents. Consider a location that allows for tree retention, and connectivity to the community to the east.
6. Access to Page Road should be discouraged. If this is planned to become a cul-de sac at Navan Road this should also be considered.
7. 18.0 m public r.o.w as proposed is supported.
8. Please ensure that rear yards with a minimum depth of 7.5 m for townhomes are provided abutting existing residential uses.
9. The 3 townhomes on Page Road should be re-considered. This typology is not common on Page Road.
10. A design brief will be required in support of your applications. Please see attached terms of reference.

Engineering

The attached “Pre-application consultation servicing memo” summarizes engineering design considerations as per our discussion. [Ensure the memo addresses all relevant engineering issues.]

Required for both Site Plan and Subdivision:

Water Boundary condition requests must include the location of the service and the expected loads required by the proposed development. Please provide the following information:

Location of service connections (MAP)

Type of development and the amount of fire flow required (as per FUS).

Average daily demand: ___ l/s.

Maximum daily demand: ___l/s.

Maximum hourly daily demand: ___ l/s.

Design Criteria

Storm Pre to post, C of .5, Pre tc 20; post tc 10

5-year pipe minimum and store up to 100-year on site. No 2-year ponding on site.

Permissible ponding of 350mm for 100-year

At 100-year ponding elevation you must spill to City ROW

100-year Spill elevation must be 300mm lower than any building opening

Minimum Drawing and File Requirements- All Plans

Plans are to be submitted on standard **A1 size** (594mm x 841mm) sheets, utilizing an appropriate Metric scale (1:200, 1:250, 1:300, 1:400, or 1:500).

With all submitted hard copies provide individual PDF of the DWGs and for reports please provide one PDF file of the reports. **All PDF documents are to be unlocked and flattened.**

1. Site Plans for this file are to be a C of .5. Subdivision is to be calculated as per the SDG. Your permitted with a 5-year pipe design and store up to the 100-year for both subdivision and Site Plan.
2. If you discharge to a pipe that discharges to a City SWM facility, then no additional quality controls are required. However, you are required to confirm with the Conservation Authority.
3. No, but the City does confirm it is the responsibility of the proponent to demonstrate the site is serviceable for water, storm and sanitary and that the receiving sewers have capacity. The Functional Servicing Report provides the ultimate servicing solution for watermain storm and sanitary.
4. Unknown currently. Who owns 2973...apparently the City. Depends if they sell it or what? More ideal if it was within a City Block or City ROW but not an easement.
5. No. No occupancy unless it is serviced properly.
6. You may discharge to the **ditch and not the 750mm Ø storm** along Navan Road if that is to be your determined outlet. Quality Controls are provided by the Conservation Authority. 5-year Pre to post with a tc of 20 minutes Pre and a tc of 10 minutes with a 0.5 C, store up to the 100-year.
7. You are permitted to use infiltration designs anywhere within the city but they must demonstrate functionality and have supporting documentation.
8. You must demonstrate, not assume the 750 mm Ø storm pipe was designed to include your entire site. The road-side ditch primarily runs towards Page Road. This will require further investigation. The City will not support any municipal owned infrastructure within the proposed Gas Station parcel. 2973 is City Owned.

Any info you may require is available from the Info Centre "ISD Information Centre / Centre Information" informationcentre@ottawa.ca

The City reserves the right to change any decisions provided herein should new information warrant it.

Feel free to contact the Infrastructure Project Manager, Will Curry, at Will.Curry@ottawa.ca for follow-up questions.

Transportation

A TIA is warranted, please proceed to scoping.

The application will not be deemed complete until the submission of the draft step 2-4, including the functional draft RMA package (if applicable) and/or monitoring report (if applicable).

Although a full review of the TIA Strategy report (Step 4) is not required prior to an application, it is strongly recommended.

Synchro files are required at Step 4.

ROW protection on Navan is 44.5m.

Corner sight triangle: 5m x 5m

A stationary Noise Impact Study is required if there is noise sensitive use within 100m.

Clear throat requirements on Navan as per TAC guidelines

On site plan:

Show all details of the roads abutting the site up to and including the opposite curb; include such items as pavement markings, accesses and/or sidewalks.

Turning templates will be required for all accesses showing the largest vehicle to access the site; required for internal movements and at all access (entering and exiting and going in both directions).

Show all curb radii measurements; ensure that all curb radii are reduced as much as possible

Show lane/aisle widths.

As built plans for Brian Coburn should be available through our Drawing Center; the applicant should contact: ISD Information Centre / Centre Information informationcentre@ottawa.ca.

There may be a fee.

A Noise Study will be required for traffic noise impacts and any newly created stationary noise sources.

Feel free to contact the Transportation Project Manager, Mike Giampa, at Mike.Giampa@ottawa.ca, for follow-up questions.

Environmental

- Environmental impact statements shall be submitted to identify any Species at risk
- A TCR will be required for these applications.
- A permit is required prior to any tree removal on site which can be made available at site plan approval. Please contact the planner associated with the file or Mark Richardson (mark.richardson@ottawa.ca) when the permit is required or for additional information.
- There may be adjacent or co-owned trees on or near the property line. Please ensure that all trees with a Critical Root Zone extending from adjoining sites onto the development site are addressed in the TCR.
- Please identify any City-owned trees – Forestry Services will need to provide permission for their removal.
- Please be aware of the City's Bird-Safe Design Guidelines

Parkland

- These lands have not been consider for any previous Parkland dedication /Cash-in-lieu of parkland
- Parkland requirements would be based on proposed unit counts.
- It would be preferred that the park is located in the interior of the site. However, we will consider a location with frontage on Brian Coburn and Page next to, but not including the pedestrian/service access to Page Road.

Conservation Authority

- The Conservation Authority will make comments concerning:
  - Stormwater runoff quality criteria
  - Area specific stormwater runoff criteria

Other

- [Insert other concerns or notes]
- You are encouraged to contact the Ward Councillor, Councillor Dudas, at Laura.Dudas@ottawa.ca about the proposal.

Please refer to the links to Guide to preparing studies and plans and fees for further information. Additional information is available related to building permits, development charges, and the Accessibility Design Standards. Be aware that other fees and permits may be required, outside of the development review process. You may obtain background drawings by contacting informationcentre@ottawa.ca.

These pre-con comments are valid for one year. If you submit a development application(s) after this time, you may be required to meet for another pre-consultation meeting and/or the submission requirements may change. You are as well encouraged to contact us for a follow-up meeting if the plan/concept will be further refined.

Please do not hesitate to contact me if you have any questions.

Regards,
Steve Belan

12714001 Canada Inc – 2983, 3053 and 3079 Navan Road & 2690 Pagé Road

DEVELOPMENT SERVICING STUDY CHECKLIST

REFERENCED STUDIES AND REPORTS	REFERENCE
Functional Servicing Report for 12714001 Canada Inc, 2983, 3053 and 3079 Navan Road & 2690 Pagé Road (J.L. Richards & Associates Limited, April 12, 2022)	FSR

4.1	GENERAL CONTENT	REFERENCE
☐	Executive Summary (for larger reports only).	N/A
☒	Date and revision number of the report.	FSR (Title Page)
☒	Location map and plan showing municipal address, boundary, and layout of proposed development.	FSR (Figure 1 & 2) All Drawings
☒	Plan showing the site and location of all existing services.	Functional Overall Servicing (FOS)
☒	Development statistics, land use, density, adherence to zoning and official plan, and reference to applicable subwatershed and watershed plans that provide context to which individual developments must adhere.	FSR (Section 1)
☒	Summary of Pre-consultation Meetings with City and other approval agencies.	FSR (Appendix 'A')
☒	Reference and confirm conformance to higher level studies and reports (Master Servicing Studies, Environmental Assessments, Community Design Plans), or in the case where it is not in conformance, the proponent must provide justification and develop a defendable design criteria.	Reference made to Stantec 2005 EUC ISSU
☒	Statement of objectives and servicing criteria.	FSR (Section 1.0, 2.0, 3.0, 4.0, 5.0)
☒	Identification of existing and proposed infrastructure available in the immediate area.	FSR (Section 1.0, 2.0, 3.0, 4.0) Functional Overall Servicing (FOS)
☐	Identification of Environmentally Significant Areas, watercourses and Municipal Drains potentially impacted by the proposed development (Reference can be made to the Natural Heritage Studies, if available).	N/A
☒	Concept level master grading plan to confirm existing and proposed grades in the development. This is required to confirm the feasibility of proposed stormwater management and drainage, soil removal and fill constraints, and potential impacts to neighbouring properties. This is also required to confirm that the proposed grading will not impede existing major system flow paths.	Functional Grading Plan (FG)

☐	Identification of potential impacts of proposed piped services on private services (such as wells and septic fields on adjacent lands) and mitigation required to address potential impacts.	N/A
☐	Proposed phasing of the development, if applicable.	N/A
☐	Reference to geotechnical studies and recommendations concerning servicing.	To be confirmed
☒	All preliminary and formal site plan submissions should have the following information: ▪ Metric scale ▪ North arrow (including construction North) ▪ Key plan ▪ Name and contact information of applicant and property owner ▪ Property limits, including bearings and dimensions ▪ Existing and proposed structures and parking areas ▪ Easements, road widening and rights-of-way ▪ Adjacent street names	All Drawings

4.2	DEVELOPMENT SERVICING REPORT: WATER	REFERENCE
☐	Confirm consistency with Master Servicing Study, if available.	N/A
☒	Availability of public infrastructure to service proposed development.	SSR (Section 1.0, 2.0) Functional Overall Servicing (FOG)
☒	Identification of system constraints.	FSR (Section 2.0)
☒	Identify boundary conditions.	FSR (Section 2.0, Appendix 'D3')
☒	Confirmation of adequate domestic supply and pressure.	FSR (Section 2.0)
☒	Confirmation of adequate fire flow protection and confirmation that fire flow is calculated as per the Fire Underwriter's Survey. Output should show available fire flow at locations throughout the development.	FSR (Section 2.0, Appendix 'D1' & 'D5')
☒	Provide a check of high pressures. If pressure is found to be high, an assessment is required to confirm the application of pressure reducing valves.	FSR (Section 2.0)
☐	Definition of phasing constraints. Hydraulic modelling is required to confirm servicing for all defined phases of the project, including the ultimate design.	N/A
☒	Address reliability requirements, such as appropriate location of shutoff valves.	FSR (Section 2.0)
☐	Check on the necessity of a pressure zone boundary modification.	N/A

☒	Reference to water supply analysis to show that major infrastructure is capable of delivering sufficient water for the proposed land use. This includes data that shows that the expected demands under average day, peak hour and fire flow conditions provide water within the required pressure range.	FSR (Section 2.0, Appendix D1 to D6)
☒	Description of the proposed water distribution network, including locations of proposed connections to the existing system, provisions for necessary looping, and appurtenances (valves, pressure reducing valves, valve chambers, and fire hydrants), including special metering provisions.	FSR (Section 2.0) Functional Watermain Servicing (FWM)
☐	Description of off-site required feedermains, booster pumping stations, and other water infrastructure that will be ultimately required to service proposed development, including financing, interim facilities, and timing of implementation.	N/A
☒	Confirmation that water demands are calculated based on the City of Ottawa Design Guidelines.	FSR (Section 2.0)
☒	Provision of a model schematic showing the boundary conditions locations, streets, parcels, and building locations for reference.	FSR (Appendix 'D2')

4.3	DEVELOPMENT SERVICING REPORT: WASTEWATER	REFERENCE
☒	Summary of proposed design criteria (Note: Wet weather flow criteria should not deviate from the City of Ottawa Sewer Design Guidelines. Monitored flow data from relatively new infrastructure cannot be used to justify capacity requirements for proposed infrastructure).	FSR (Section 3.0, Appendix 'E1' & 'E2')
☐	Confirm consistency with Master Servicing Study and/or justifications for deviations.	Stantec 2005 EUC ISSU
☐	Consideration of local conditions that may contribute to extraneous flows that are higher than the recommended flows in the Guidelines. This includes groundwater and soil conditions, and age and condition of sewers.	N/A
☒	Description of existing sanitary sewer available for discharge of wastewater from proposed development.	FSR (Section 1.0, 3.0) Functional Sanitary Servicing (FSAN)
☒	Verify available capacity in downstream sanitary sewer and/or identification of upgrades necessary to service the proposed development. (Reference can be made to previously completed Master Servicing Study if applicable.)	FSR (Section 3.0, Appendix 'E1' & 'E2')
☒	Calculations related to dry weather and wet weather flow rates from the development in standard MOE sanitary sewer design table (Appendix 'C') format.	FSR (Appendix 'E1', 'E2')
☒	Description of proposed sewer network, including sewers, pumping stations and forcemains.	FSR (Section 3.0) Functional Sanitary Servicing (FSAN)

☐	Discussion of previously identified environmental constraints and impact on servicing (environmental constraints are related to limitations imposed on the development in order to preserve the physical condition of watercourses, vegetation, soil cover, as well as protecting against water quantity and quality).	N/A
☐	Pumping stations: impacts of proposed development on existing pumping stations or requirements for new pumping station to service development.	N/A
☐	Forcemain capacity in terms of operational redundancy, surge pressure and maximum flow velocity.	N/A
☐	Identification and implementation of the emergency overflow from sanitary pumping stations in relation to the hydraulic grade line to protect against basement flooding.	N/A
☐	Special considerations, such as contamination, corrosive environment, etc.	N/A

4.4	DEVELOPMENT SERVICING REPORT: STORMWATER	REFERENCE
☒	Description of drainage outlets and downstream constraints, including legality of outlets (i.e., municipal drain, right-of-way, watercourse, or private property).	FSR (Section 1.0, 4.0)
☒	Analysis of available capacity in existing public infrastructure.	FSR (Section 4.0)
☒	A drawing showing the subject lands, its surroundings, the receiving watercourse, existing drainage patterns, and proposed drainage pattern.	Drawings FSTM, FDST, FSMW
☒	Water quantity control objective (e.g. controlling post-development peak flows to pre-development level for storm events ranging from the 2 or 5 year event (dependent on the receiving sewer design) to 100 year return period); if other objectives are being applied, a rationale must be included with reference to hydrologic analyses of the potentially affected subwatersheds, taking into account long-term cumulative effects.	FSR (Section 4.0)
☒	Water Quality control objective (basic, normal or enhanced level of protection based on the sensitivities of the receiving watercourse) and storage requirements.	FSR (Section 4.0)
☒	Description of the stormwater management concept with facility locations and descriptions with references and supporting information.	FSR (Section 4.0) Drawings FDST, FSMW
☐	Setback from private sewage disposal systems.	N/A
☐	Watercourse and hazard lands setbacks.	N/A
☒	Record of pre-consultation with the Ontario Ministry of Environment and the Conservation Authority that has jurisdiction on the affected watershed.	FSR (Appendix 'A')

☐	Confirm consistency with subwatershed and Master Servicing Study, if applicable study exists.	Stantec 2005 EUC ISSU
☒	Storage requirements (complete with calculations) and conveyance capacity for minor events (1:2 year return period) and major events (1:100 year return period).	FSR (Section 4.0)
☐	Identification of watercourses within the proposed development and how watercourses will be protected, or, if necessary, altered by the proposed development with applicable approvals.	N/A
☒	Calculate pre- and post-development peak flow rates, including a description of existing site conditions and proposed impervious areas and drainage catchments in comparison to existing conditions.	FSR (Section 4.0)
☒	Any proposed diversion of drainage catchment areas from one outlet to another.	FSR (Section 4.0)
☒	Proposed minor and major systems, including locations and sizes of stormwater trunk sewers, and stormwater management facilities.	Drawings FOS, FSTM, FDST, FSMW
☐	If quantity control is not proposed, demonstration that downstream system has adequate capacity for the post-development flows up to and including the 100-year return period storm event.	Quantity control proposed per FSR (Section 4.0)
☐	Identification of potential impacts to receiving watercourses.	N/A
☐	Identification of municipal drains and related approval requirements.	N/A
☒	Description of how the conveyance and storage capacity will be achieved for the development.	FSR (Section 4.0)
☒	100 year flood levels and major flow routing to protect proposed development from flooding for establishing minimum building elevations (MBE) and overall grading.	SSR (Section 4.0) Drawings FOS, FSTM, FDST, FSMW
☒	Inclusion of hydraulic analysis, including hydraulic grade line elevations.	FSR (Section 4.0)
☒	Description of approach to erosion and sediment control during construction for the protection of receiving watercourse or drainage corridors.	SSR (Section 5.0)
☐	Identification of floodplains – proponent to obtain relevant floodplain information from the appropriate Conservation Authority. The proponent may be required to delineate floodplain elevations to the satisfaction of the Conservation Authority if such information is not available or if information does not match current conditions.	N/A
☐	Identification of fill constraints related to floodplain and geotechnical investigation.	N/A

4.5	APPROVAL AND PERMIT REQUIREMENTS	REFERENCE
The Servicing Study shall provide a list of applicable permits and regulatory approvals necessary for the proposed development, as well as the relevant issues affecting such approval. The approval and permitting shall include but not be limited to the following:		
☒	Conservation Authority as the designated approval agency for modification of floodplain, potential impact on fish habitat, proposed works in or adjacent to a watercourse, cut/fill permits and Approval under Lakes and Rivers Improvement Act. The Conservation Authority is not the approval authority for the Lakes and Rivers Improvement Act. Where there are Conservation Authority regulations in place, approval under the Lakes and Rivers Improvement Act is not required, except in cases of dams, as defined in the Act.	N/A
☐	Application for Environmental Compliance Approval (ECA) under the Ontario Water Resources Act.	As part of future submission
☐	Changes to Municipal Drains.	N/A
☐	Other permits (National Capital Commission, Parks Canada, Public Works and Government Services Canada, Ministry of Transportation, etc.).	N/A

4.6	CONCLUSION CHECKLIST	REFERENCE
☒	Clearly stated conclusions and recommendations.	FSR (Section 2.7, 3.6, 4.7)
☒	Comments received from review agencies, including the City of Ottawa and information on how the comments were addressed. Final sign-off from the responsible reviewing agency.	Comment Response Letter to City of Ottawa
☒	All draft and final reports shall be signed and stamped by a Professional Engineer registered in Ontario.	FSR All Drawings

ONTARIO LAND SURVEYOR

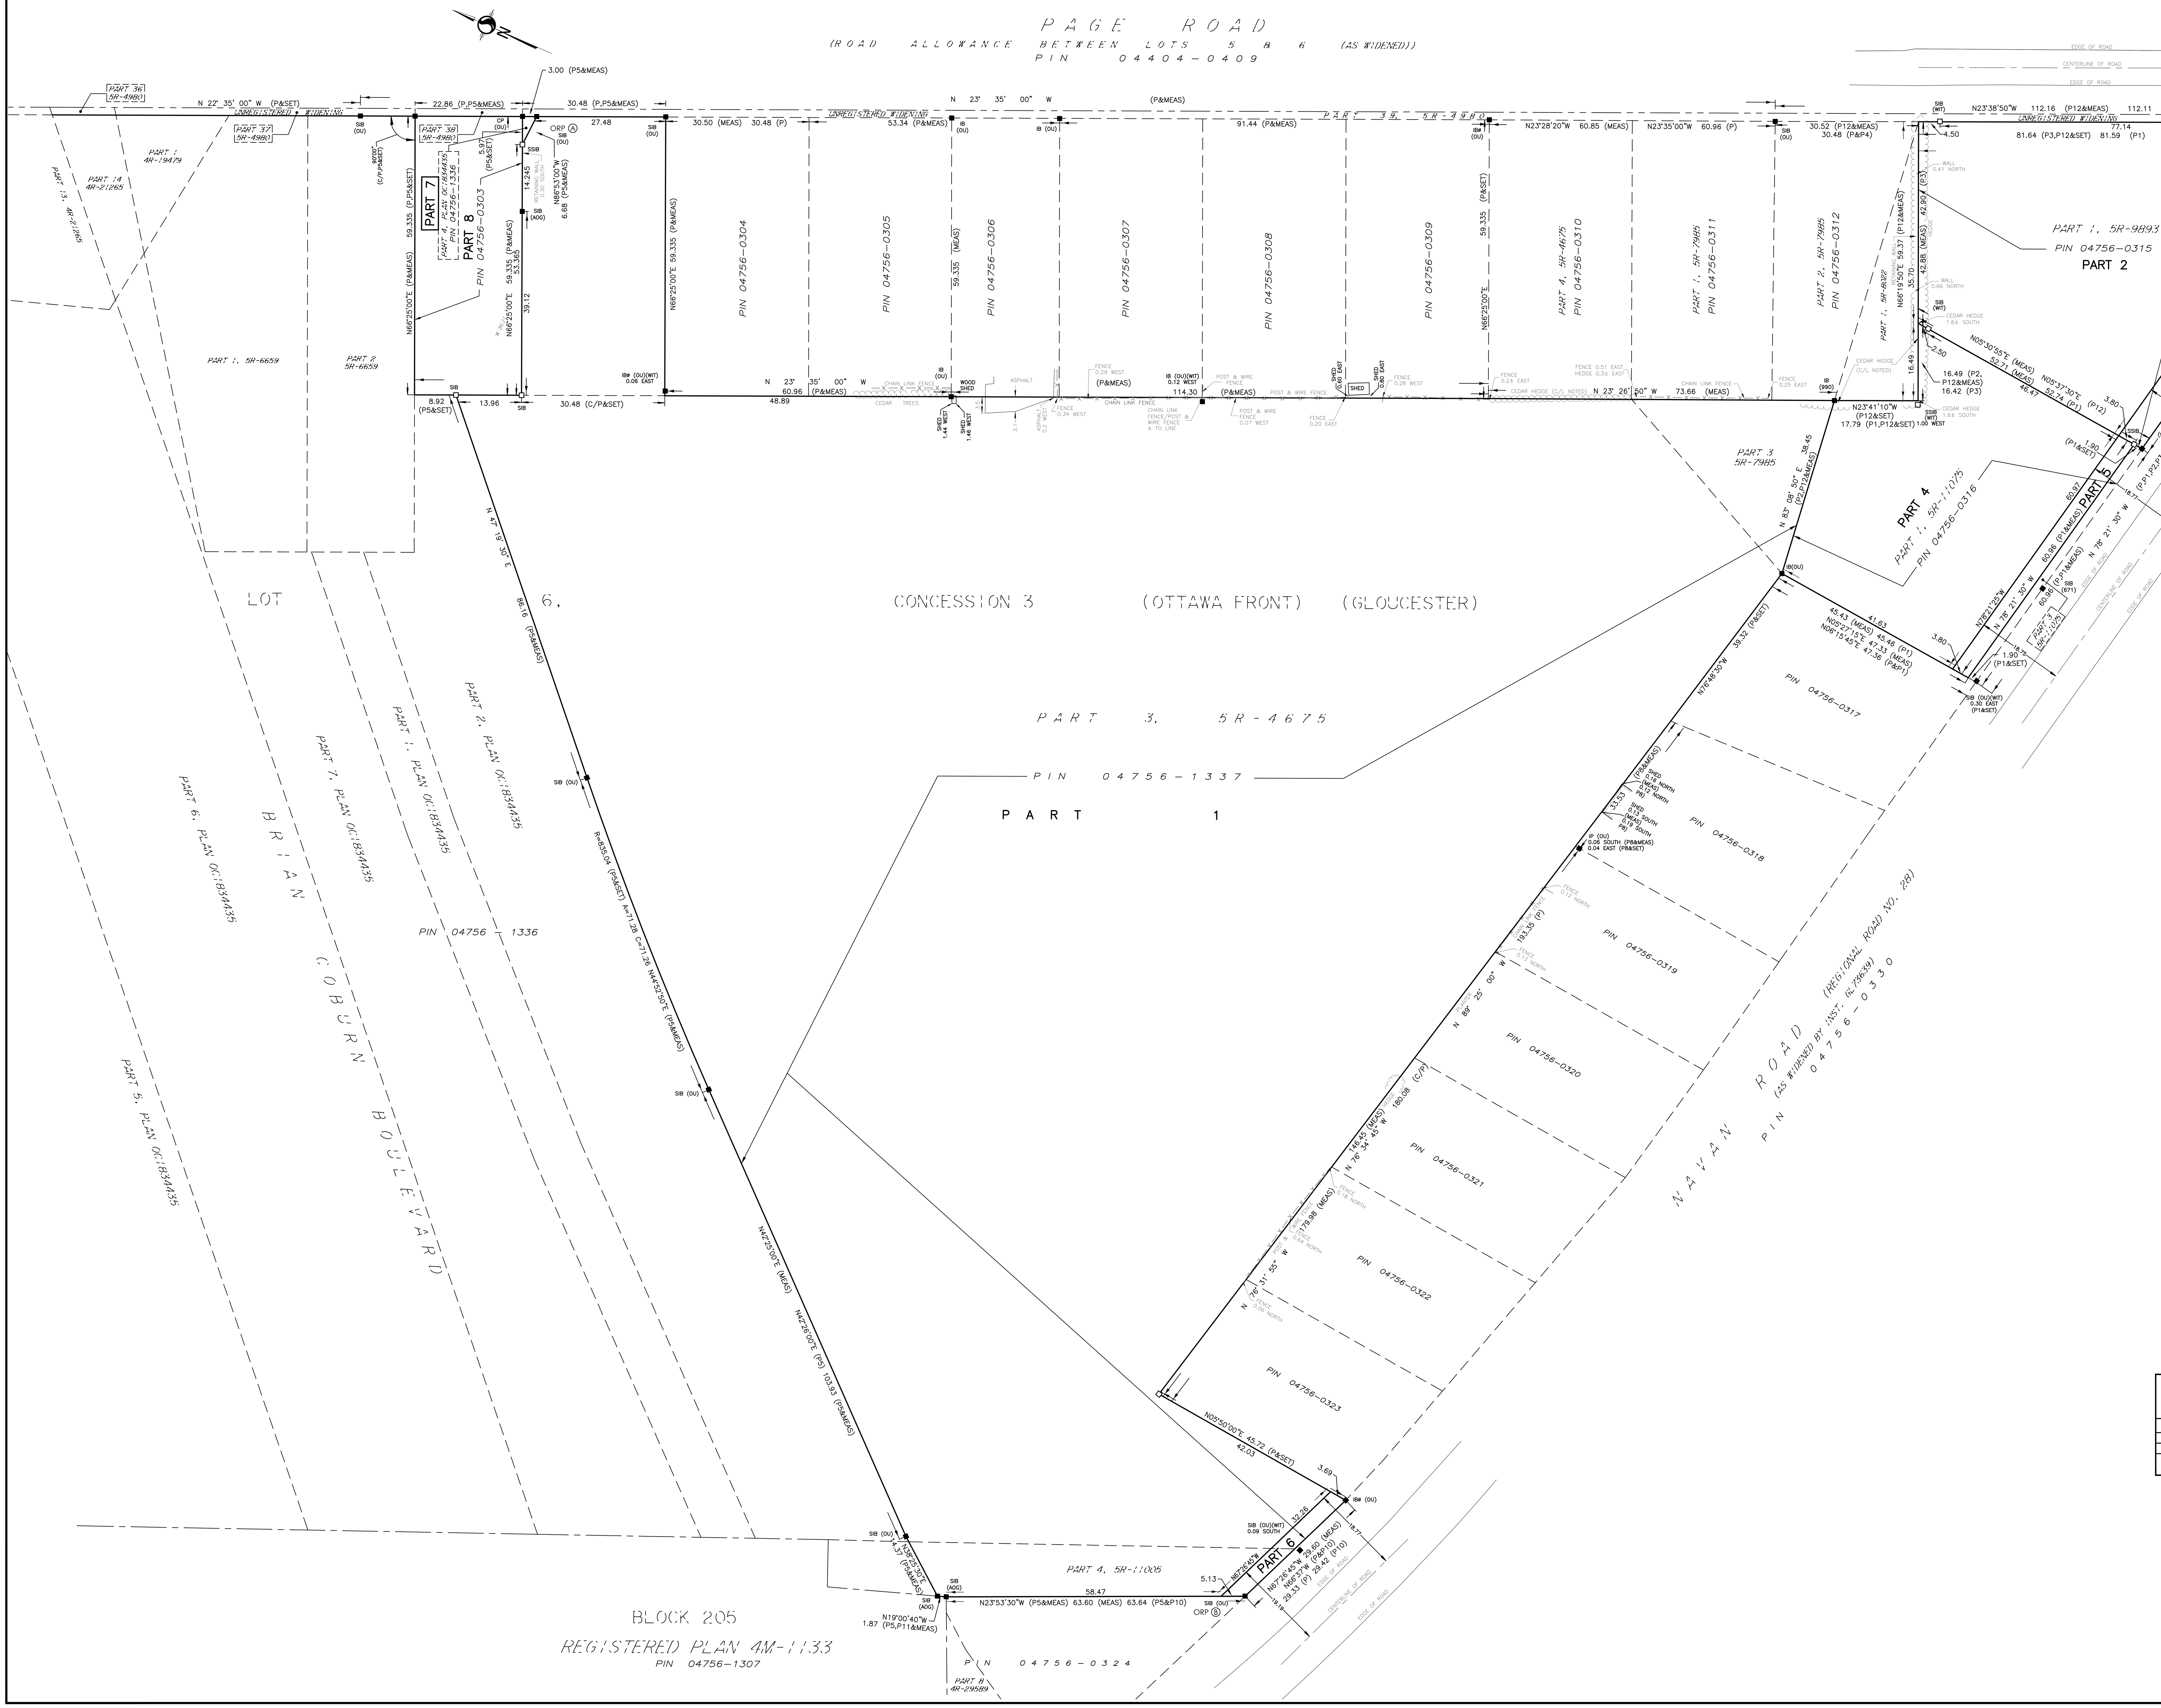
PLAN 4R-________

RECEIVED AND DEPOSITED

DATE: ____________________

REPRESENTATIVE FOR THE LAND REGISTRAR FOR THE LAND TITLES DIVISION OF OTTAWA-CARLETON No. 4



DRAFT PLAN OF SURVEY OF

PART OF LOT 6
CONCESSION 3 (OTTAWA FRONT)

(GEOGRAPHIC TOWNSHIP OF GLOUCESTER)

CITY OF OTTAWA

Scale 1:500

10 0 10 20 30 METRES

METRIC CONVERSION

DISTANCES AND COORDINATES SHOWN ON THIS PLAN ARE IN METRES AND CAN BE CONVERTED TO FEET BY DIVIDING BY 0.3048

GRID SCALE CONVERSION

DISTANCES ARE GROUND AND CAN BE CONVERTED TO GRID BY MULTIPLYING BY THE COMBINED SCALE FACTOR OF 0.999964

BEARING NOTE

BEARINGS ARE GRID, DERIVED FROM CAN-NET VRS NETWORK GPS OBSERVATIONS ON NCC HORIZONTAL CONTROL MONUMENTS 19773035 AND 19680191, CENTRAL MERIDIAN, 76° 30' WEST LONGITUDE MTM ZONE 9, NAD83 (ORIGINAL).

FOR BEARING COMPARISONS, BEARINGS ON PLANS P, P1, P2 & P3 HAVE BEEN ROTATED 0°41'30" COUNTERCLOCKWISE.

PART OF LOT 6
CONCESSION 3 (OTTAWA FRONT)

(GEOGRAPHIC TOWNSHIP OF GLOUCESTER)

CITY OF OTTAWA

Scale 1:500

10 0 10 20 30 METRES

METRIC CONVERSION

DISTANCES AND COORDINATES SHOWN ON THIS PLAN ARE IN METRES AND CAN BE CONVERTED TO FEET BY DIVIDING BY 0.3048

GRID SCALE CONVERSION

DISTANCES ARE GROUND AND CAN BE CONVERTED TO GRID BY MULTIPLYING BY THE COMBINED SCALE FACTOR OF 0.999964

BEARING NOTE

BEARINGS ARE ASTRONOMIC AND ARE REFERRED TO THE WESTERLY LIMIT OF PAGE ROAD, AS SHOWN ON PLAN 5R-4980, HAVING A BEARING OF N22°53'30"W.

A BEARING ROTATION CLOCKWISE OF 0°41'20" HAVE BEEN APPLIED TO BEARINGS SHOWN ON P5, P6, AND P7.

ELEVATION NOTE

ELEVATIONS SHOWN HEREON ARE GEODETIC (CGVD-1928:1978) AND ARE DERIVED FROM THE CAN-NET VRS NETWORK.

Notes

1. ALL MATERIALS AND CONSTRUCTION METHODS TO BE IN ACCORDANCE WITH OPS AND CITY OF OTTAWA STANDARD SPECIFICATIONS AND DRAWINGS AND OPSD SUPPLEMENT, ONTARIO PROVINCIAL STANDARDS WILL APPLY WHERE NO CITY STANDARDS ARE AVAILABLE.
2. THE CONTRACTOR IS RESPONSIBLE FOR OBTAINING ALL PERMITS REQUIRED AND BEAR COST OF SAME INCLUDING WATER PERMIT AND ASSOCIATED COSTS.
3. SERVICE AND UTILITY LOCATIONS ARE APPROXIMATE, CONTRACTOR TO VERIFY LOCATION AND ELEVATION OF EXISTING SERVICES AND UTILITIES PRIOR TO ANY CONSTRUCTION. CONTRACTOR SHALL BE RESPONSIBLE FOR OBTAINING LOCATES FROM ALL UTILITY COMPANIES TO LOCATE EXISTING UTILITIES PRIOR TO EXCAVATION. THE CONTRACTOR IS RESPONSIBLE FOR PROTECTION AND REINSTATEMENT.
4. ALL DISTURBED AREAS SHALL BE REINSTATED TO EQUAL OR BETTER CONDITION TO THE SATISFACTION OF THE ENGINEER & THE CITY. PAVEMENT REINSTATEMENT FOR SERVICE AND UTILITY CUTS SHALL BE IN ACCORDANCE WITH OPSD 509.010 AND OPSS 310.
5. STORM SEWERS 375mm DIA. OR SMALLER SHALL BE PVC SDR 35. STORM SEWERS LARGER THAN 375mm DIA. SHALL BE CONCRETE CSA A 257 CLASS 100 D.
6. STORM MANHOLES SIZE SHALL BE AS INDICATED ON THE PROFILES IN ACCORDANCE WITH OPSD c/w FRAME AND COVER AS PER CITY OF OTTAWA S24.1 AND S25.
7. STREET CBs SHALL BE CURB INLET TYPE AS PER CITY STANDARD S3. FRAME AND COVER AS PER CITY STANDARD S22 AND S23, AND PROVIDED WITH 150mmø SPACERS. ALL CBs SHALL HAVE 600mmø SUMPS. CB LEADS SHALL BE 200mmø (MIN.) PVC SDR35 AT 1.0% MIN. ALL STREET CBs WILL BE INTERCONNECTED WITH ICDs. SEE SCHEDULE ON DWG. OSD-1.
8. THE CONTRACTOR SHALL IMPLEMENT BEST MANAGEMENT PRACTICES TO PROVIDE PROTECTION FOR RECEIVING STORM SEWERS OR DRAINAGE DURING CONSTRUCTION ACTIVITIES. (ie: FILTER CLOTH ON CATCH BASINS, STRAW BALE CHECK DAMS AND SEDIMENT CONTROLS AROUND ALL DISTURBED AREAS). DEWATERING SHALL BE PUMPED INTO SEDIMENT TRAPS. (SEE EROSION CONTROL PLAN).
9. GRANULAR "A" SHALL BE PLACED TO A MINIMUM THICKNESS OF 300 mm AROUND ALL STRUCTURES WITHIN PAVEMENT AREA
10. SEWER TRENCH SHALL CONSIST OF A CLASS "B" BEDDING AS PER CITY OF OTTAWA STANDARDS S6 AND S7. COMPACTION SHALL BE A MINIMUM OF 98% STANDARD PROCTOR DENSITY.
11. ALL GRANULAR FOR ROADS SHALL BE COMPACTED TO A MINIMUM OF 98% STANDARD PROCTOR DENSITY.
12. ALL NECESSARY CLEARING AND GRUBBING SHALL BE COMPLETED BY THE CONTRACTOR. REVIEWED BY THE CITY OF OTTAWA PRIOR TO TREE CUTTING.
13. CONTRACTOR SHALL PERFORM VIDEO INSPECTION OF ALL STORM SEWERS. A COPY OF THE VIDEO AND INSPECTION REPORT SHALL BE SUBMITTED TO THE CONSULTANT FOR REVIEW.
14. ASPHALT WEAR COURSE SHALL NOT BE PLACED UNTIL THE VIDEO INSPECTION OF SEWERS & NECESSARY REPAIRS HAVE BEEN CARRIED OUT TO THE SATISFACTION OF THE CONSULTANT.
15. SUB-EXCAVATE SOFT AREAS & FILL WITH GRANULAR 'B' COMPACTED IN 0.15m LAYERS.
16. CONCRETE CURBS SHALL BE CONSTRUCTED AS PER CITY STANDARD SC1.1
17. ALL DIMENSIONS ARE IN METRES UNLESS OTHERWISE STATED.
18. RECONNECT EXISTING SANITARY SERVICE LATERALS FROM EXISTING RESIDENTAL UNITS AS REQUIRED AS PER CITY STANDARD S11.
19. STORM SERVICE LATERALS TO BE INSTALL FOR THE EXISTING RESIDENTS ALONG RENAUD ROAD TO PROPERTY LINE AS REQUIRED AS PER CITY STANDARD S11. CONNECTION LOCATION AND INV. TO BE DETERMINED IN FIELD. (INVERT AT PROPERTY LINE SHALL BE A MINIMUM OF 3.0m BELOW TOP OF FOUNDATION WALL.)
20. 150mmø SUBDRAIN TO BE INSTALLED 300mm BELOW SUBGRADE LEVEL CONTINUOUS ALONG BOTH SIDES OF PAVEMENT, CONNECTED TO CATCHBASINS.
21. REFER TO GEOTECHNICAL REPORT BY PATERSONGROUP DATED NOVEMBER 17, 2008 FOR TEST PIT INFORMATION AND GEOTECHNICAL RECOMMENDATIONS.

Hi Annie,

No, they are not. I was reading your last e-mail and I think I have mis explained myself. The 4-story building will be built of **COMBUSTIBLE** construction. Same as the towns. Regular wood construction.

Thanks,

PMA ARCHITECTES

Hi Pascal,

Are the 4-storey condominium buildings considered to be fire-resistive construction? If so, will the vertical openings be protected or unprotected?

Thank you,
Annie

Subject: RE: Navan Road Project - Building Aspects

Hi Pascal,

Thank you very much for the call today. I made the following notes from our discussion, please notify me of any errors.

- 48-unit 4-storey condominium buildings – Can we assume these to be similar to apartment units? Will the buildings be of non-combustible construction with windows on all 4 sides? Will they include a sprinkler system and if so, will it be automatic fully supervised?
  Similar to apartment units, non-combustible windows all 4 sides, yes sprinkler system (can assume automatic fully supervised – 'best case'). Noted that mech. engineer will have to submit a certified letter to City stating that sprinkler system is automatic fully supervised.

- Row Townhouses – Will any of the blocks have a 2-hr firewall (per OBC Div. B 3.1.10)? If so, where are they located? We note there are 9 units in the middle which are separated by less than 3m so there is likely a firewall required here. We are assuming wood frame construction for the row townhouses.
  OBC does not require any firewalls, gypsum composition wall. Considering making 3m separation between the 2 blocks. 7 units should be ok without firewall. 8 units would need firewall. 7 units together footprint is <600 m2 (it is 554 m2). Wood frame construction. Firewalls can be added as needed to meet fire flow requirements.

- Commercial Portion – Will the drive-thru/gas retail and car wash be of wood frame construction? Any fire protection?
  Steel construction (non-combustible), no sprinkler unless required.

As we discussed, you are shifting the center townhouses to provide a 3m separation between the 7-unit block and the 6-unit block and you will send us the updated Site Plan once ready. I will send email confirmation once we have determined whether a firewall is required within the 6-unit block backing towards Page Road.

Also just copying the note from Karla below about the updated grading relationships in case this item is still outstanding.

Thank you,
Annie

Subject: RE: Navan Road Project - Building Aspects

Pascal,

Any chance you can coordinate with Annie right away to get the information she needs so that we can submit the Watermain Boundary Condition request to the City. The City usually takes a couple weeks to respond and this will delay the water modelling if we can't get this information into the City in a timely manner.

Also, could you give us an update on when we can expect the updated grading relationships discussed at our meeting earlier this week.

Thanks

Karla

Hi Pascal,

Following my voicemail, I've attached the updated site plan. Please let me know your answers to the questions below as we require this information to submit our request for boundary coniditions to the City, which we need for our design.

Feel free to give me a call to discuss.

Thank you,
Annie

Subject: Navan Road Project - Building Aspects

Good morning Pascal,

We are working on the Navan Road Development Project and wanted to clarify a few items about the buildings in support of our hydraulic water analysis:

- 48-unit 4-storey condominium buildings – Can we assume these to be similar to apartment units? Will the buildings be of non-combustible construction with windows on all 4 sides? Will they include a sprinkler system and if so, will it be automatic fully supervised?

- Row Townhouses – Will any of the blocks have a 2-hr firewall (per OBC Div. B 3.1.10)? If so, where are they located? We note there are 9 units in the middle which are separated by less than 3m so there is likely a firewall required here. We are assuming wood frame construction for the row townhouses.

- Commercial Portion – Will the drive-thru/gas retail and car wash be of wood frame construction? Any fire protection?

Thank you,
Annie

Objet : 3079 Navan Road - Firewall Requirement for Townhouse Blocks

Hi Raad, Pascal,

It is our understanding of the Ontario Building Code that townhouse blocks may require a 2hr firewall if the total footprint exceeds either 7 units or 600 sq-m. There appears to be two blocks which exceed this limit (see below).

As we are finalizing our water servicing, we will need to understand if firewalls are required (as per OBC) and if so, where they will be placed.

Thanks
Mahad

Disclaimer

The boundary condition information is based on current operation of the city water distribution system. The computer model simulation is based on the best information available at the time. The operation of the water distribution system can change on a regular basis, resulting in a variation in boundary conditions. The physical properties of watermains deteriorate over time, as such must be assumed in the absence of actual field test data. The variation in physical watermain properties can therefore alter the results of the computer model simulation. Fire Flow analysis is a reflection of available flow in the watermain; there may be additional restrictions that occur between the watermain and the hydrant that the model cannot take into account.

DESIGN PARAMETERS

Residential Flow =	350 Lpcd	Industrial Peak Factor =	as per MOE Graph	Low Density (LD)/Existing =	3.2 ppu
Commerical/Institutional Flow =	50000 L/ha/d	Extraneous Flow =	0.28 L/s/ha	Low/Medium Density (LMD) =	3.2 ppu
Industrial Flow =	35000 L/ha/d	Minimum Velocity =	0.76 m/s	Medium Density (MD) =	2.4 ppu
Maximum Residential Peak Factor =	4.00	Mannings n =	0.013	High Density (HD) =	1.9 ppu
Minimum Residential Peak Factor =	2.00	Harmon Peak Factor =	1+14/(4+(P/1000)^1/2)*K, where K= 1	MUC =	1.9 ppu
Commerical/Institutional Peak Factor =	1.50			GUA =	3.1 ppu

Sample Functional Runoff Coefficients

2022-12-01
Our File: 29899-000

Runoff Coefficient
2983, 3053, and 3079 Navan Road & 2690 Page Road

The proposed development is comprised of four (4) subject properties under (1) Draft Plan of Subdivision and four (4) Site Plan Applications. In total there are 67 row townhouse units, six (6) condominium units and a gas station and retail establishment.

1. ROW TOWNHOUSE BLOCK:

An average run-off coefficient was calculated for front yard and rear yard of the smallest block (Block 4) which contains five (5) townhouse units. The runoff coefficients are based on zoning setbacks and a maximum driveway width of 50% of the area of the front yard as stated in Section 107 (2) in the City of Ottawa Zoning By-Laws. Since this scenario has the highest ratio of house area to greenspace, the resulting run-off coefficient would be the highest of any scenario for a townhouse block.

Unit Information

Unit Width	5.80	m
Block Depth	29.9	m
Unit Area	97	m^2
Total Number of Units	5	units
Number of Interior Units	4	units
Number of End Units	1	units
Corner Unit Width	6.25	m
Min. Corner Yard Setback	3	m
Min. Rear Yard Setback	7.5	m
Min. Front Yard Setback	3	m

Block Area

Total Block Area = (5.80 x 4 + 9.25 x 1) x 29.9 = 970.26 m^2 **(A_T)**
Zoning Footprint (Internal Unit) = (29.9 - 7.5 – 3) m x 5.80m = 112.52 m^2 **(B_T)**
Zoning Footprint (End Unit) = (29.9 - 7.5 - 3) x 6.25 = 121.25 m^2 **(C_T)**
Unit Driveway Area (50% of Front Yard Area) = 8.7 m^2 **(D_T)**

Assuming each lot has a highpoint at the centre, the unit and lot areas could be divided equally between the front and rear yards.

Rear Area:

Block Rear Area = $\frac{AT}{2} = \frac{970.26}{2}$ = 485.13 m^2 **(E_T)**

By: MM

Number of Internal Units: 4
Number of End Units: 1
Rear Impervious (House) Footprint: $\frac{4(BT)+1(CT)}{2} = \frac{4(112.52)+1(121.25)}{2}$ = 285.67 m^2 **(F_T)**

Front Area:
Block Front Area = Block Rear Area = 485.13 m^2 **(G_T)**
Number of Internal Units: 4
Number of End Units: 1
Front Impervious (House/Driveway) Footprint: $F_T + 6D_T = 285.67 + 5(8.7)$ = 329.17 m^2 **(I_T)**

Using a run-off coefficient of 0.2 for grassed areas and 0.9 for impervious areas (houses and driveways) the following weighted averages are calculated:

Run-off Coefficient:
Rear Coefficient = $\frac{0.2(E_T-F_T)+0.9F_T}{E_T} = \frac{0.2(485.13-285.67)+0.9(285.67)}{485.13}$ = **0.61** **(C_{RT})**
Front Coefficient = $\frac{0.2(G_T-I_T)+0.9(I_T)}{G_T} = \frac{0.2(485.13-329.17)+0.9(329.17)}{485.13}$ = **0.67** **(C_{FT})**

Summary: The rear yard runoff coefficient used for design is **0.61**

2. 18m ROW Road

A similar approach was used for the ROWs, a weighted average was calculated using the total 18m ROW Road.

Asphalt Road and Sidewalk (C=0.9)
There is approximately 585 m of 8.5 m asphalt road and 630 m of 1.8 m sidewalk. These lengths were measured directly from the Concept Plan in Appendix B1 of the Functional Servicing Report.
The total area of asphalt road is 585 x 8.5 = 4972.50 m^2 **(J_T)**
The total area of sidewalk is 630 x 1.8 = 1134.00 m^2 **(K_T)**

Driveways (C=0.9)
Within the boulevard there are 27 units which have driveways that do not overlap with sidewalks. For these cases the driveways have a width of 4.75 m within the boulevard span a distance of 2.9 m (50% of unit width).

The total area of driveways not fronting sidewalks can be taken as 27 x 4.75 x 2.9 = 371.93 m^2 **(L_T)**

By: MM

Within the boulevard there are 42 units which have driveways that do overlap sidewalks. For these cases the sidewalk width must be subtracted from the driveway boulevard width since it was already considered in **(K_T).** Hence, these driveways span 4.75m - 1.8m = 2.95m within the boulevard and span a distance of 2.9m (50% of unit width).

The total area of driveways fronting sidewalks can be taken as 42 x 2.95 x 2.9 = 359.31 m^2 **(M_T)**

Grassed Area (C=0.2)

The total area of grass is equal to the total ROW Area subtracted by area of asphalt road, sidewalks, and driveways. I.e., Grassed Area = (18 x 585m – (4972.50 + 1134.00 + 371.93 + 359.31 = 3692.26 m^2 **(N_T)**

Table 1 summarizes the total areas within the 18m ROW and their respective c-factors.

Table 1: ROW C-factor breakdown

Description	**Area (m^2)**	**C-Factor**
Asphalt Road	4972.50	0.9
Sidewalk	1134.00	0.9
Driveways not fronting sidewalk (26 units)	371.93	0.9
Driveways fronting sidewalk (41 units)	359.31	0.9
Grass boulevard not fronting sidewalk	3692.26	0.2

3. FRONT YARD AND ROW C-FACTOR

The front yard and ROWs of the subdivision were grouped into one weighted front yard runoff coefficient. The weighted average is derived from the results front yard co-efficient calculated for the ROW townhouse block and from the results in Table 1 for the 18 m ROW.

$$= \frac{(J_T\ x\ 0.9)+(K_T\ x\ 0.9)+(L_T\ x\ 0.9)+(M_T\ x\ 0.9)+(N_T\ x\ 0.2)+\ (69\ x\ 97)\ x\ C_{FT}\ )}{(J_T)+(K_T)+(L_T)+(M_T)+(N_T)+(69\ x(97))}$$

$$= \frac{(4972.50\ x\ 0.9)+(1134x0.9)+(371.93x0.9)+(359.31x0.9)+(3692.26x0.2)+((67\ x(97)\ x\ \mathbf{0.67})}{(\ 4972.50)+(1134)+(371.93)+(359.3)+(3692.26)+(67\ x(97)\ )}$$

= 0.66

By: MM

4. Residential and Commercial Site Plans (Block 14, 15 and 17)

A runoff coefficient was calculated for the residential site plans on Blocks 14, 15 and 17. Block 14 was used for the sample calculations since this block generates the highest ratio of impervious surfaces to grass.

A minimum zoned amenity space of 10% was assumed for the residential site plans. This is more conservative than the City of Ottawa By-Law requirement of 6m^2 per dwelling unit for low-rise apartment dwellings.

Block 14 Information

Total Block Area	0.575	ha
Zoning Limit Area	0.494	ha
Zoning Amenity Area (10% Zoning Limit Area)	0.049	ha **(O_T)**
Zoning Impervious Area (90% Zoning Limit Area)	0.445	ha **(P_T)**

The remaining area of the site plan (outside of the zoning area) is 0.069 ha of grass **(Q_T)** and 0.012 ha of impervious surfaces **(R_T)**.

Given that these are private site plans, a run-off coefficient of 0.25 was used for grassed areas and 0.9 for impervious areas. The following weighted averages are calculated:

$$= \frac{(\mathbf{0.25}\ (O_T+Q_T))+\mathbf{0.9}(P_T+R_T)}{(O_T+Q_T)+(P_T+R_T\ )}$$

$$= \frac{(\mathbf{0.25}\ (0.049+0.0688))+\mathbf{0.9}(0.445+0.0123)}{(0.049+0.0688\ )+(0.455+0.012\ )}$$

$$= \mathbf{0.77}$$

5. Commercial Site Plan (Gas Bar on Block 16)

Since there is minimal grass and amenity space within the industrial site plan a C-factor of **0.9** was assumed for all of Block 16.

6. Dry Pond (Block 13)

A C-factor of 0.83 was assumed for the Dry Pond because the water surface from large storm events would be considered 90% impermeable.

7. Park (Block 7)

A C-factor of 0.40 was assumed for the park given that this area is mainly grassed with minimal infrastructure.

8. **Abutting Existing Units on Navan and Page that drain into 3079 Navan Road**

The C-factor breakdowns based on actual impervious cover within the existing catchment areas are summarized in Table 2 and Table 3. A weighted average was calculated for impervious (C=0.9) and grassed (C=0.2).

Table 2: Existing Units on Navan Road C-factor breakdown

Description	**Area (m^2)**	**C-Factor**
Impervious	0.169	0.9
Grassed	0.971	0.2
Total	1.14	0.3

Table 3: Existing Units on Page Road C-factor breakdown

Description	**Area (m^2)**	**C-Factor**
Impervious	0.096	0.9
Grassed	0.598	0.2
Total	0.694	0.3

Table 4 below presents a summary of run-off coefficients to be used for functional design.

Table 4: Functional Design Run-off Coefficients

Scenario	**Runoff Coefficient (C)**
Rear Yards – Townhouse Units Only	**0.61**
Front Yards and ROW	**0.66**
Residential Site Plan	**0.77**
Industrial Site Plan (Gas Bar)	**0.90**
Abutting Properties on Navan and Page	**0.30**
Park	**0.40**
Dry Pond	**0.83**
