1 Screening

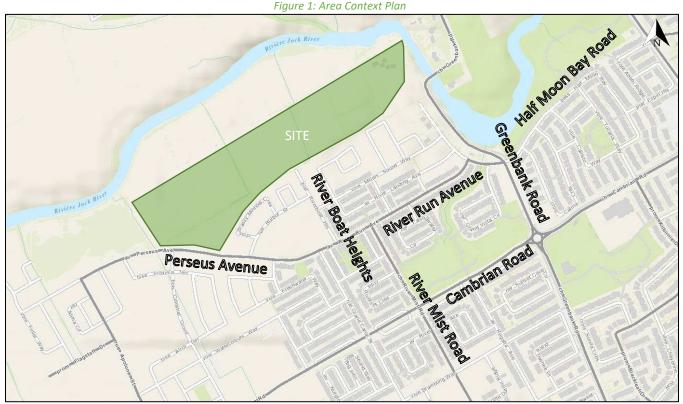

This study has been prepared according to the City of Ottawa's 2017 Transportation Impact Assessment (TIA) Guidelines. Accordingly, a Step 1 Screening Form has been prepared and is included in Appendix A, along with the Certification Form for TIA Study PM. As shown in the Screening Form, a TIA is required including the Design Review and Network Impact Component.

2 Existing and Planned Conditions

2.1 Proposed Development

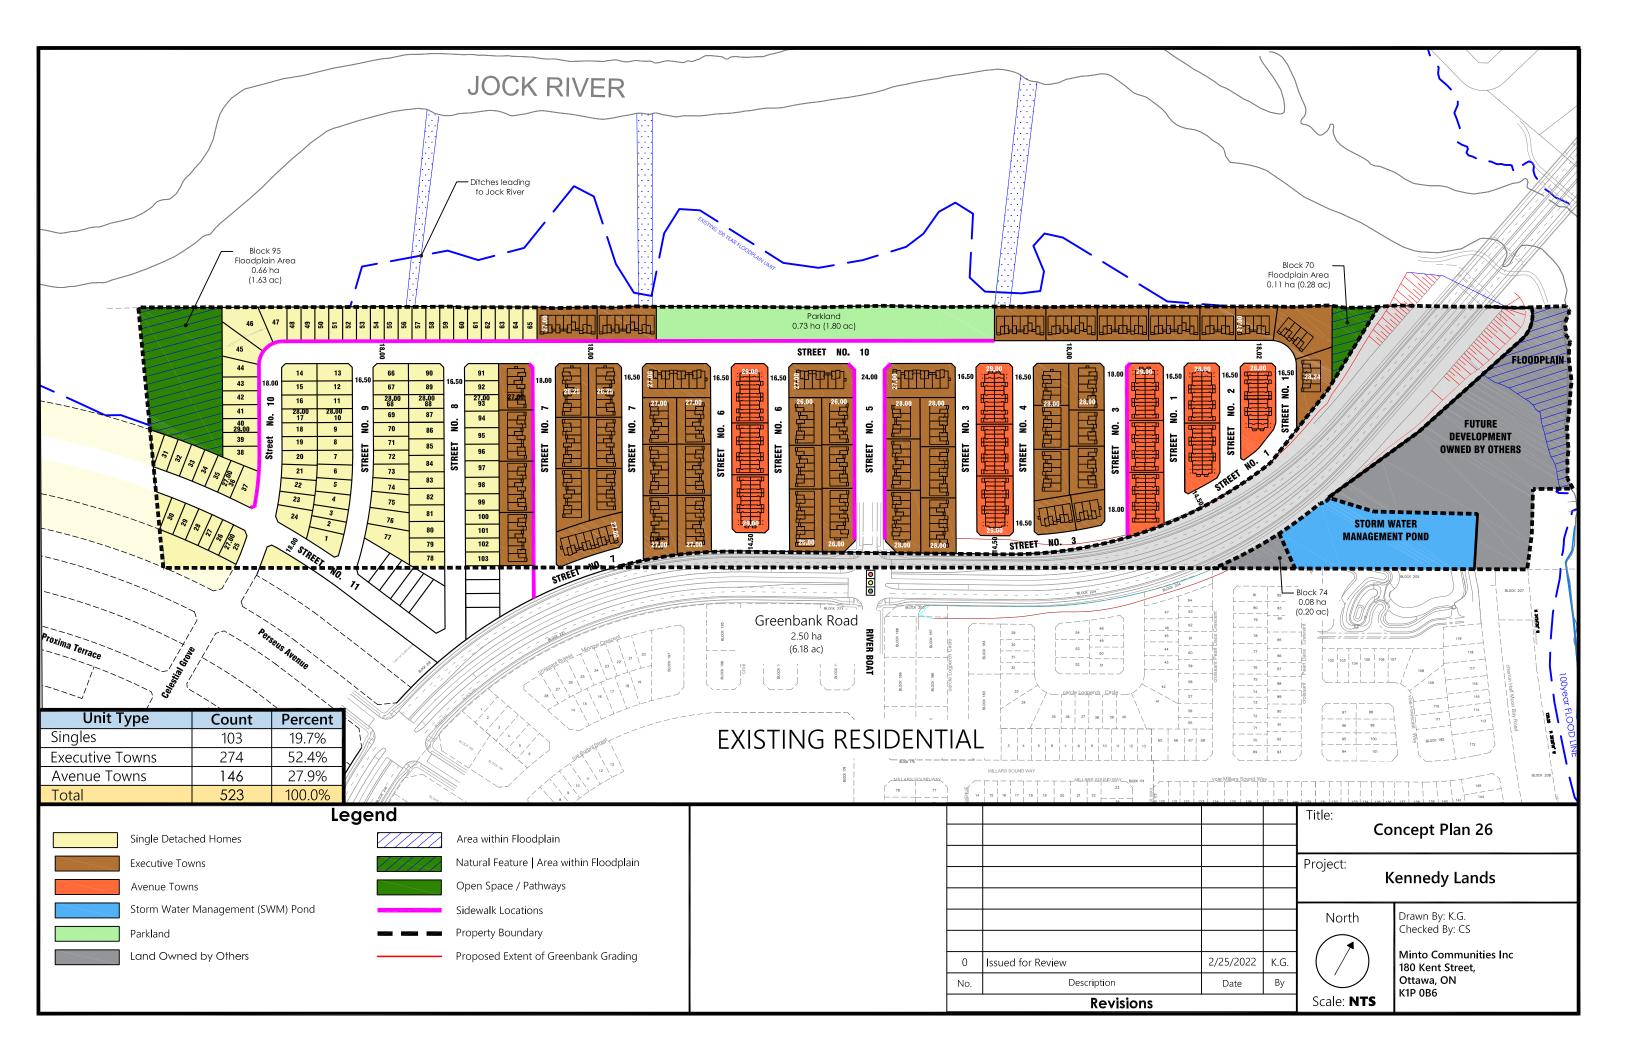

The subject property, located at 3432 Greenbank Road, is currently zoned as Development Reserve Zone [DR] and is undeveloped. The proposed development consists of 523 units, including 103 single family homes, 274 executive townhomes, and 146 avenue townhomes.

Access to the site will primarily be accommodated via River Boat Heights. A secondary access will be provided via Perseus Avenue at Celestial Grove, which will be extended north through the adjacent landowners property. The anticipated full build-out and occupancy horizon is 2024. Figure 1 illustrates the study area context. Figure 2 illustrates the proposed concept plan.

Source: http://maps.ottawa.ca/geoOttawa/ Accessed: July 28, 2021

2.2 Existing Conditions

2.2.1 Area Road Network

Cambrian Road

Cambrian Road is a City of Ottawa arterial road with a two-lane cross-section and a posted speed limit of 50 km/h. Curbs, gutters, parking lanes, and boulevard separated sidewalks are present on both sides of the road. The Ottawa Official Plan reserves a 37.5 metre right-of-way for this road.

River Mist Road

River Mist Road is a City of Ottawa collector road with a two-lane urban cross-section including gutters, parking lanes and sidewalks on both sides of the road. The unposted speed limit is assumed to be 50 km/h. The measured right-of-way is approximately 24 metres.

Greenbank Road

Greenbank Road is a City of Ottawa arterial road with a two-lane cross-section and a suggested speed limit of 30 km/h in the vicinity of the subject development. South of Half Moon Bay Road, curbs and boulevard-separated sidewalks are present on both sides of the road. North of Half Moon Bay Road, paved shoulders are present on the west-side of the road and a sidewalk separated by a curb and bollards with reflective stripes is present on the east side of the road. The measured right-of-way is approximately 24 metres.

Perseus Avenue / River Run Avenue

Perseus Avenue / River Run Avenue is a City of Ottawa collector road with a two-lane cross-section including curbs and gutters. Sidewalks are present on both sides of the road. Perseus Avenue / River Run Avenue has an unposted speed limit of 50 km/h to the east of King's Creek Lane, and 40 km/h west of King's Creek Lane. West of King's Creek Lane, the road is part of a school zone. The measured right-of-way is approximately 24 metres.

Half Moon Bay Road

Half Moon Bay is a City of Ottawa local road west of River Run Avenue and east of Greenbank Road and is a collector road between River Run Avenue and Greenbank Road. Half Moon Bay has a two-lane cross-section including curbs, gutters and a sidewalk on the south side of the road. A cycling path is present on the north side of the road, east of Greenbank Road. The unposted speed limit is assumed to be 50 km/h. The measured right-of-way is approximately 14.5 metres.

River Boat Heights

River Boat Heights is a City of Ottawa local road with a two-lane cross-section including curbs and gutters. Sidewalks are present on both sides of the road. The unposted speed limit is assumed to be 40 km/h given its proximity to Half Moon Bay Public School. School drop-off areas are located on the west side of the road, south of Millars Sound Way. The measured right-of-way is approximately 24 metres.

2.2.2 Existing Intersections

A description and accompanying aerial photograph of the existing intersections within the study area can be found below.

River Mist Road at Cambrian Road

The intersection of River Mist Road and Cambrian Road is an all-way stop-controlled intersection with a shared left-turn / through / right-turn lane on all approaches. No turn restrictions were noted.

Half Moon Bay Road at Greenbank Road

The intersection of Half Moon Bay Road at Greenbank Road is a single-lane roundabout intersection. Each roundabout approach consists of a single lane. Aerial Photo is unavailable. Photos of the roundabout is provided in Appendix B.

Greenbank Road at Cambrian Road

Greenbank Road at Cambrian Road is a single-lane roundabout intersection. Each roundabout approach consists of a single lane.

2.2.3 Existing Driveways

There are no existing driveways within 200 metres of the proposed site accesses.

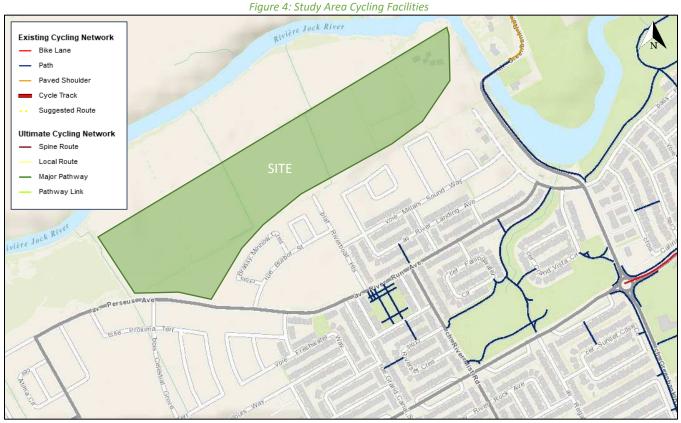

2.2.4 Cycling and Pedestrian Facilities

Pedestrian infrastructure is provided along one or both sides of developed communities in the vicinity of the proposed development. As the area builds out, it is expected that pedestrian connections will be provided through all of the neighboring communities, leading to arterial and collector roads. The cycling network consists of bike paths in Half Moon Bay Park and along Jock River near Greenbank Road. Figure 3 illustrates the pedestrian facilities in the study area and Figure 4 illustrates the cycling facilities.

Source: http://maps.ottawa.ca/geoOttawa/ Accessed: July 28, 2021

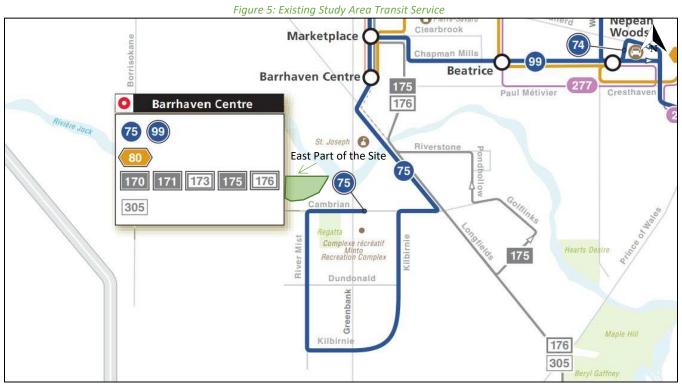

Source: http://maps.ottawa.ca/geoOttawa/ Accessed: July 28, 2021

2.2.5 Existing Transit

There is no existing transit service along the subject development boundary, and no transit service within 400 metres of the proposed development. South of the subject site, approximately 600 metres from the site, Route 75 runs along Cambrian Road. The existing study area transit service is presented in Figure 5. In this Figure, the map legend partially covers the location of the subject development. The transit stops in the study area are approximately 750 metres walking distance from the edge of the subject development (representing the shortest walking distance) to the transit stop, as shown in Figure 6. While all transit stops in the area are shown, the highlighted stops appear to not be in use. Both figures are excerpts from the OC Transpo Network Map. The frequency of Route 75 within proximity of the proposed site currently is:

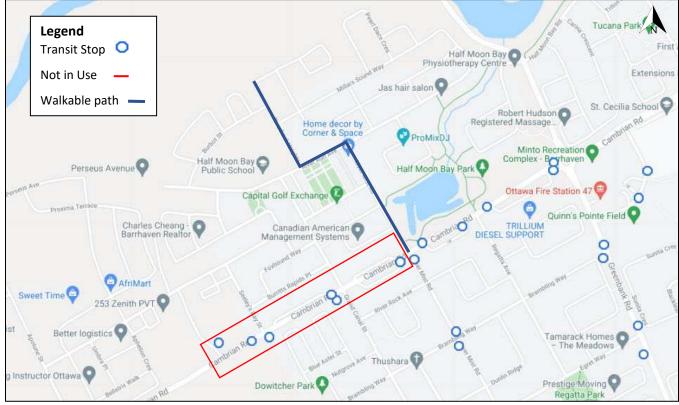

• Route # 75 – every 15 minutes during AM and PM weekday peak hours and every 30 during all other times.

Source: http://www.octranspo.com/ Accessed: July 28, 2021

Source: http://plan.octranspo.com/plan Accessed: July 28, 2021

2.2.6 Existing Area Traffic Management Measures

Within the study area, traffic management measures are present on River Mist Road, River Run Avenue and Greenbank Road. On River Mist Road, there is a radar feedback sign indicating drivers traveling north to slow down and reduced speed limit applies on River Run Avenue and Greenbank Road.

2.2.7 Existing Peak Hour Travel Demand

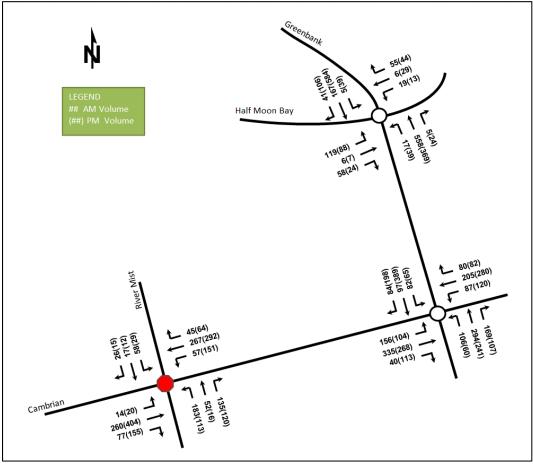

Existing turning movement counts were acquired from the City of Ottawa for the existing study area intersections. Table 1 summarizes the intersection count dates and data source.

. . .

Table 1: Intersection Count Date					
Intersection	Count Date				
River Mist Road at Cambrian Road	Wednesday, October 23, 2019				
Greenbank Road at Half Moon Bay Road	Tuesday, June 19, 2018				
Greenbank Road at Cambrian Road	Wednesday, September 13, 2017				

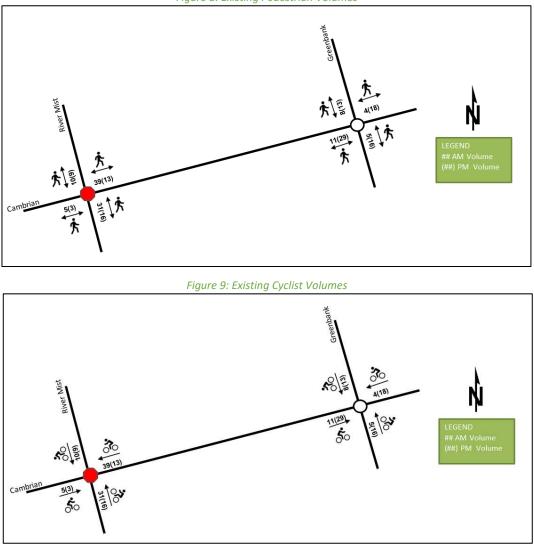

Figure 7 illustrates the 2021 existing horizon traffic volumes. To reflect a constant horizon, a 2% background growth rate has been used. This growth rate is consistent with surrounding development Traffic Impact Assessments such as 3285 Borrisokane Road Commercial Development Transportation Impact Study (Parsons, 2018), 3640 Greenbank Road Transportation Impact Assessment (CGH Transportation, 2018 Half Moon Bay North Apartment Block Transportation Impact Assessment (Stantec, 2018), The Meadows Phase 5 Transportation Impact Assessment Report (IBI Group 2018), and Quinn's Pointe 2 Transportation Impact Assessment (Stantec, 2018). Detailed turning movement count data is included in Appendix C.

Additionally, the collected intersection counts also provided existing pedestrian and cyclist demands at the Cambrian Road and River Mist Road intersection, as well as Cambrian Road and Greenbank Road intersection for both AM and PM peak periods. The pedestrian and cyclist peak hour volumes at Greenbank Road and Half Moon Bay Road are not available. Figure 8 illustrates the existing pedestrian volumes and Figure 9 illustrates the existing cyclist volumes at Cambrian Road and River Mist Road intersection.

2.2.8 Collision Analysis

Collision data have been acquired from the City of Ottawa open data website (data.ottawa.ca) for five years prior to the commencement of this TIA for the surrounding study area road network. Table 2 illustrates the collisions at the intersections and road segments within the study area, Figure 10 illustrates the intersections and segments analyzed, and Table 3 summarizes the collision types and conditions of the 18 collisions recorded in the study area. Collision data is included in Appendix D.

Intersection / Segment	Number	%
	18	100%
Cambrian Road at River Mist Road	2	11%
Greenbank Road at Half Moon Bay Road	6	33%
Cambrian Road at Greenbank Road	10	56%

Table 2. Summary of Collision Locations

Figure 10: Study Area Representation of Collision Locations

Source: https://maps.bikeottawa.ca/collisions/ Accessed: September 16, 2021

Table 3: Collision	Summary
--------------------	---------

		Number	%
То	tal Collisions	18	100%
	Fatality	0	0%
Classification	Non-Fatal Injury	1	6%
	Property Damage Only	17	94%
	Angle	5	28%
Initial Impact	Rear end	6	33%
Туре	Turning Movement	2	11%
	SMV Other	5	28%
	Dry	10	56%
Dood Curfooo	Wet	1	6%
Road Surface Condition	Loose Snow	2	11%
Condition	Slush	3	17%
	Loose Sand or Gravel	2	11%
Pedestrian Involved		0	0%
Cyclists Involved		0	0%

The study area intersections had a total of 18 collisions during the 2015-2019 time period, with 17 involving property damage only and one having non-fatal injuries. The collision types are most represented by the rear end with six collisions and angled with five collisions. Weather/road conditions are a contributing factor for 44% of the collisions in this area. There were no cyclist collisions and pedestrian collisions in the study area. Currently, no intersection has been noted to require an in-depth collision analysis.

2.3 Planned Conditions

2.3.1 Changes to the Area Transportation Network

The subject development is within the Barrhaven South Community Design Plan (CDP) Area. As such, it is subject to the planning polices outlined in the CDP. The CDP provides target population and employment densities in the four Sub-Planning Areas along with the plans for infrastructure to support the community growth. As part of this plan, the right-of-way along the following roads has been protected to accommodate an expansion to a four-lane arterial:

- Realigned Greenbank Road rapid transit corridor north and south of Cambrian Road with a protected right-of-way of 41.5 metres
- Cambrian Road between Borrisokane Road and Jockvale Road with a protected right-of-way of 37.5 metres. As part of this project, the intersection of Cambrian Road and River Mist Road will be signalized

Realigned Greenbank Road will be located on the south side of the proposed development. While listed within the Transportation Master Plan Affordable Network, it is unknown if Realigned Greenbank Road will be completed to Cambrian Road by 2031. It is assumed that the temporary connection of Realigned Greenbank Road between River Boat Heights and Cambrian Road will be completed by 2029 and will be included in 2029 future horizons. The proposed cross-section of Realigned Greenbank Road is a divided 4-lane cross-section including sidewalks, cycletracks, and centre median bus lanes.

Further, as the adjacent communities build out in the next five years, the local road network will expand and provide vehicular, and pedestrian connections to nearby communities, collector roads, and arterial roads. The City of Ottawa Ultimate Cycling Network also indicates that Perseus Avenue and Riverboat Heights are a proposed pathway link, and a local cycling route, respectively. These routes will provide cyclist connections to arterial roads and communities to the south, as well as connect to a proposed major cycling pathway along Jock River to the north beyond this study horizon.

2.3.2 Other Study Area Developments

Several development applications were available for the adjacent properties as listed on the City's Development Application Search tool:

Half Moon Bay West Community

Half Moon Bay West Community is a proposed five-phase residential development located on a 57.4-hectare area west of the subject site. According to the 2016 Community Transportation Study (CTS), this site was planned to include 552 single family homes, 464 townhouses and a 5.3-acre commercial land. The projected trip generation is 589 and 725 two-way auto trips during the AM and PM peak hours, respectively. The community full build-out year is 2024.

In the 2019 update, the plan was revised to include 154 back-to-back townhouse dwellings, 300 wide lot townhouse dwellings, 447 detached dwellings, and 72 apartment units. The anticipated trip generation from the new plan is 536 and 659 two-way auto trips during the AM and PM peak hours, respectively. The revised plan does not include traffic distribution, however, since the updated plan results in a decrease in community-generated

traffic volume, the original site traffic volume diagrams will be used. This will create a conservative estimate of the future background traffic volumes. The generated traffic volume from this community for AM and PM peak periods can be seen in Figure 11 and Figure 12 respectively and are excerpt from the Half Moon Bay West Community Transportation Study by Stantec.

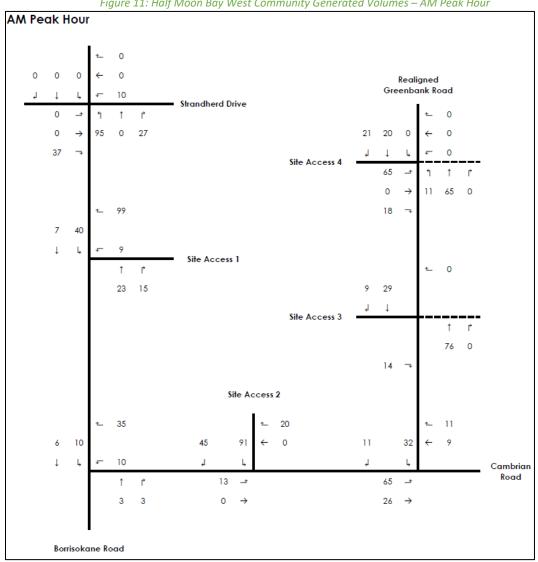

Figure 11: Half Moon Bay West Community Generated Volumes – AM Peak Hour

Source: Half Moon Bay West Community Transportation Study (Stantec, 2016)

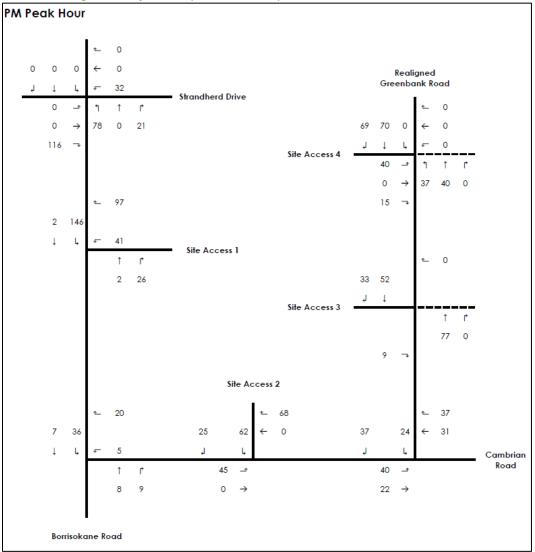

Figure 12: Half Moon Bay West Community Generated Volumes – PM Peak Hour

Source: Half Moon Bay West Community Transportation Study (Stantec, 2016)

2444 Watercolours Way

2444 Watercolours Way (Half Moon Bay North Phase 9) is a proposed residential development consisting of 60 stacked house units. This development was completed in 2019. However, this development is not captured in the available TMCs and therefore it has been accounted for explicitly herein. 2444 Watercolours Way is located south of the subject site and is expected to generate 74 and 80 two-way auto trips during the AM and PM peak hours, respectively. The anticipated trip generation from this site can be seen in Figure 13 and Figure 14 respectively and are excerpt from the Half Moon Bay North Apartment Block Transportation Impact Assessment by Stantec.

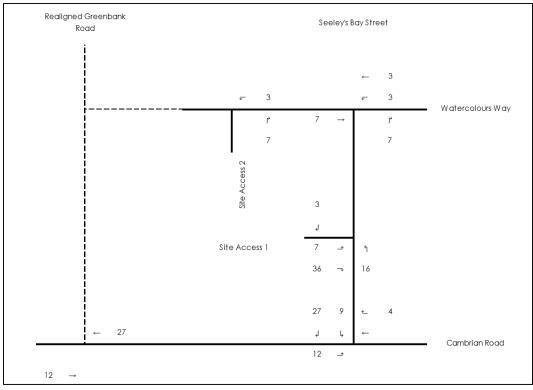

Figure 13: 2444 Watercolours Way Site Generated Traffic Volumes – AM Peak Hour

Source: Half Moon Bay North Apartment Block Transportation Impact Assessment (Stantec, 2018)

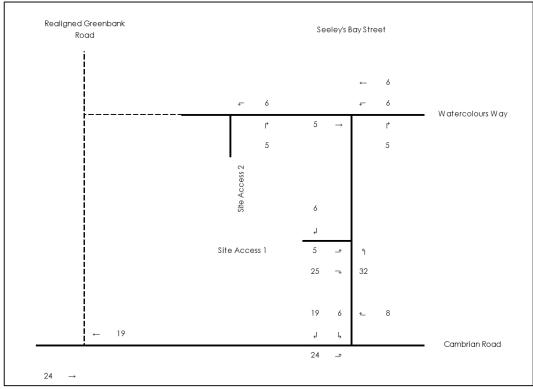

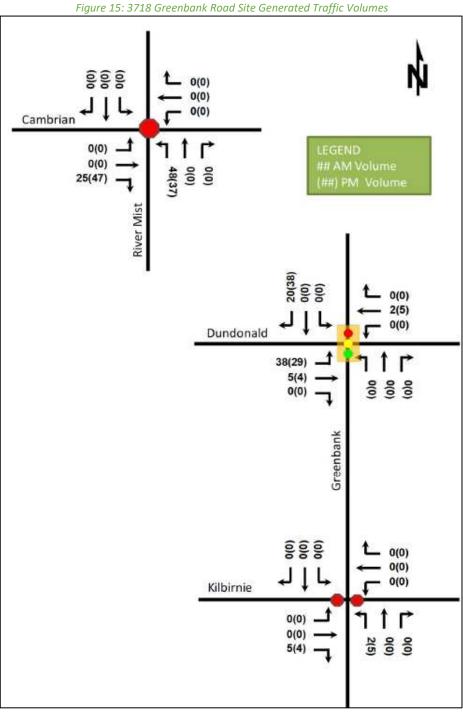

Figure 14: 2444 Watercolours Way Site Generated Traffic Volumes - PM Peak Hour

Source: Half Moon Bay North Apartment Block Transportation Impact Assessment (Stantec, 2018)

3718 Greenbank Road

3718 Greenbank Road is Phase 5 of Mattamy Half Moon Bay South, and it is located south of the subject site. The development will consist of 67 single detached home units and 97 townhouse units. This development is expected to produce 144 two-way AM peak period auto trips and 165 two-way PM peak period auto trips. The anticipated trip generation from this site can be seen Figure 15 and is an excerpt from the 3718 Greenbank Road – Half Moon Bay South – Phase 5 Transportation Impact Assessment by CGH Transportation.

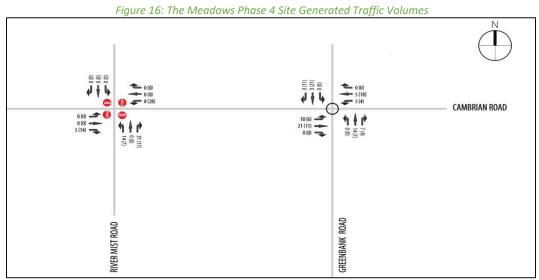

Source: 3718 Greenbank Road – Half Moon Bay South – Phase 5 Transportation Impact Assessment (CGH, 2019)

The Meadows Phase 4

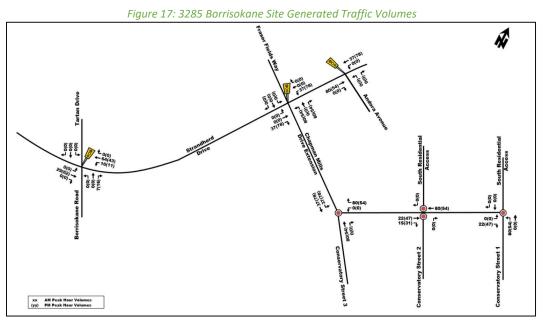

The Meadows Phase 4 is a residential development located south of the subject site and was built out in 2019. This development includes 136 townhouse units and 50 single family units. This development is expected to produce 86 two-way AM peak period auto trips and 107 two-way PM peak period auto trips. The anticipated trip generation from this site can be seen Figure 16 and is excerpt from the Meadows Phase 4 TIA Report by IBI.

Source: The Meadows Phase 4 TIA Report (IBI, 2018)

3285 Borrisokane Road

3285 Borrisokane Road is a proposed residential development located northwest of the subject site and is expected to be built-out in 2020. This development will include 125 single family homes and 75 townhouses. This development is expected to produce 129 two-way AM peak period auto trips and 146 two-way PM peak period auto trips. The anticipated trip generation from this site can be seen Figure 17 and is an excerpt from the 3285 Borrisokane Road Phase 1 Transportation Impact Study by Parsons.

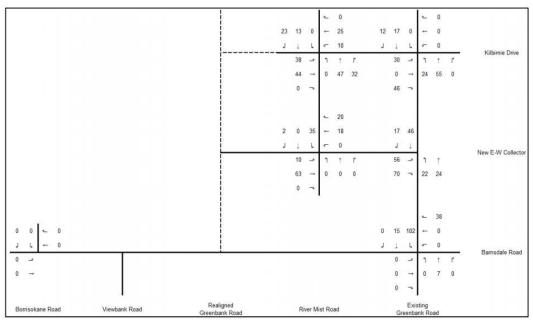

Source: 3285 Borrisokane Road Phase 1 Transportation Impact Study (Parsons, 2018)

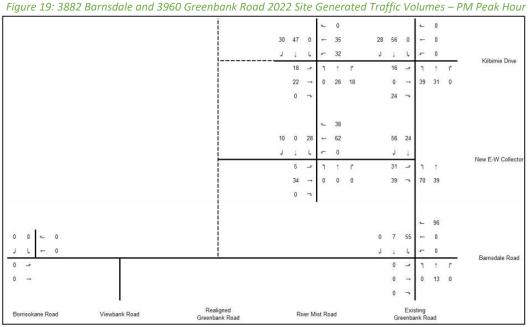

3882 Barnsdale Road and 3960 Greenbank Road

3882 Barnsdale Road and 3960 Greenbank Road (Quinn's Pointe 2) is a proposed two-phase residential development that will include 536 single-family dwelling units, 493 townhomes, 100 apartment units, and two elementary schools. A total of 749 two-way AM peak period auto trips and 813 two-way PM peak period auto trips are expected from this development upon full build-out. The anticipated trip generation from this site for Phase 1 (2022) can be seen in Figure 18 and Figure 19 are excerpts from Quinn's Pointe 2 Transportation Impact Assessment prepared by Stantec.

Source: Quinn's Pointe 2 Transportation Impact Assessment (Stantec, 2018)

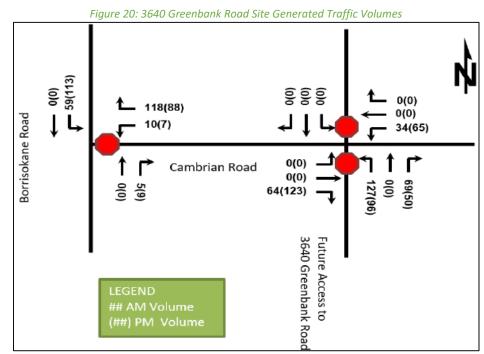

Source: 3718 Greenbank Road – Half Moon Bay South – Phase 5 Transportation Impact Assessment (CGH, 2019)

3640 Greenbank Road

3640 Greenbank Road (Meadow's Phase 5) is a proposed two-phase residential development located southwest of the subject site. The concept plan considers a total of approximately 350 units, split between townhouse and detached units (221 townhouses and 125 detached homes). The anticipated full build-out and occupancy horizon is 2022. The development is anticipated to produce 294 two-way AM peak period auto trips and 334 two-way PM peak period auto trips. The anticipated trip generation from this site can be seen in Figure 20 and is an excerpt from the 3640 Greenbank Road Transportation Impact Assessment by CGH Transportation.

Source: 3640 Greenbank Road Transportation Impact Assessment (CGH, 2018)

3713 Borrisokane Road – Residential Component

3713 Borrisokane Road is a proposed residential development located southwest of the subject site and is expected to be built-out during 2024. This development will include 141 detached homes and 439 townhouses. 3713 Borrisokane Road will include a connection to 3809 Borrisokane Road and both developments will share an access to Borrisokane Road. This development is expected to produce 364 two-way AM peak period auto trips and 423 two-way PM peak period auto trips. The anticipated trip generation from this site can be seen in Figure 21 and is an excerpt from the 3713 Borrisokane Road Transportation Impact Assessment by CGH Transportation.

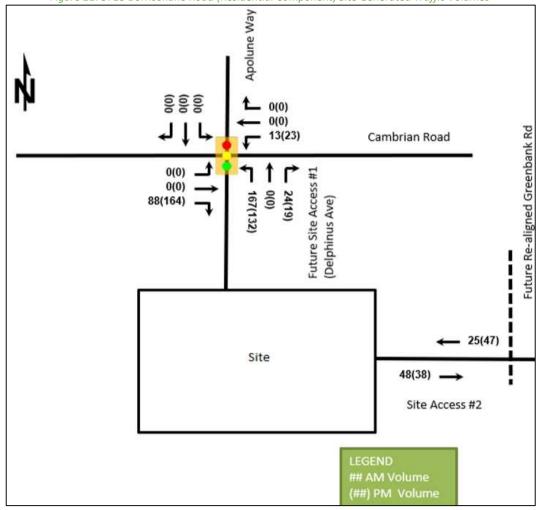

Figure 21: 3713 Borrisokane Road (Residential Component) Site Generated Traffic Volumes

Source: 3713 Borrisokane Road Transportation Impact Assessment (CGH, 2020)

3713 Borrisokane Road-Industrial Component

The industrial component of 3713 Borrisokane Road will be built-out in 2 phases, Phase 1 in 2022 and Phase 2 in 2027. The development will include approximately 3,250 square metres of general office space and 9,385 square metres of industrial buildings. This development is expected to produce 112 two-way AM peak period auto trips and-117 two-way PM peak period auto trips. The anticipated trip generation from this site after the completion of Phase 1 and Phase 2 can be seen in Figure 22 and Figure 23 respectively and are excerpts from the 3713 Borrisokane Road – ABIC Manufacturing Facility Transportation Impact Assessment by CGH Transportation.

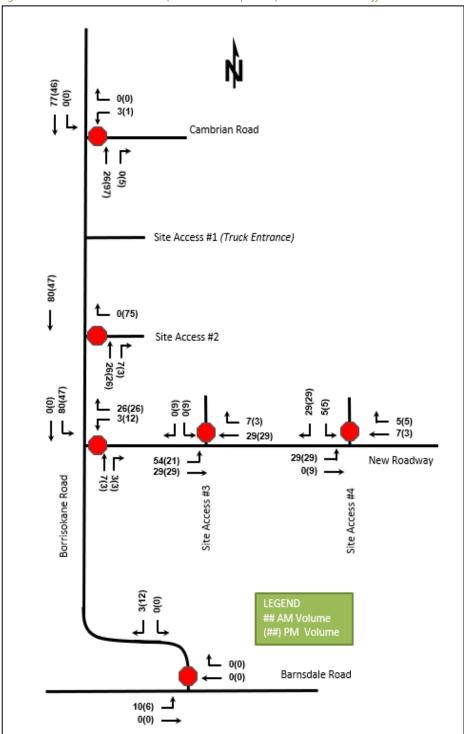

Figure 22: 3713 Borrisokane Road (Industrial Component) Site Generated Traffic Volumes – 2022

Source: 3713 Borrisokane Road – ABIC Manufacturing Facility Transportation Impact Assessment (CGH, 2020)

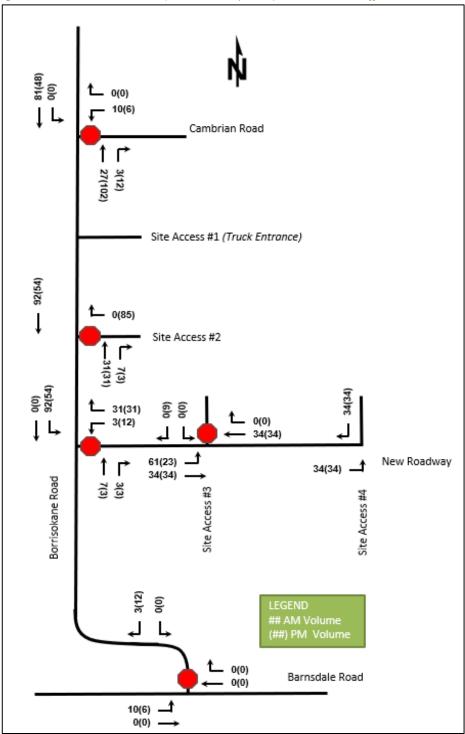

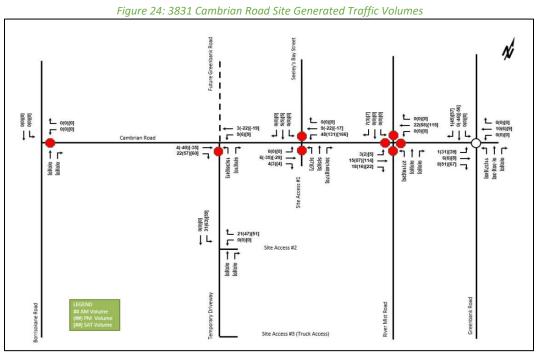

Figure 23: 3713 Borrisokane Road (Industrial Component) Site Generated Traffic Volumes – 2027

Source: 3713 Borrisokane Road – ABIC Manufacturing Facility Transportation Impact Assessment (CGH, 2020)

3831 Cambrian Road

The proposed development at 3831 Cambrian Road consists of a 4,024 square metre supermarket and an attached 929 square metre retail store. This development is anticipated to be built-out in 2023 and generate 134 new two-way AM peak hour, 88 new two-way PM peak hour, and 119 Saturday peak hour auto trips. The anticipated trip generation from this site can be seen in Figure 24 and is an excerpt from the 3831 Cambrian Road Transportation Impact Assessment by CGH Transportation.

Source: 3831 Cambrian Road Transportation Impact Assessment (CGH, 2021)

3809 Borrisokane Road

3809 Borrisokane Road is a proposed residential development, which is located southwest of the subject site and is expected to be built-out in 2025. This development will include approximately 590 residential units, split between townhouse units and detached home units. The eastern parcel of 3713 Borrisokane Road will include a connection to 3809 Borrisokane Road and both developments will share an access to Borrisokane Road as part of an interim phase only. Approximately 300 units will use this connection prior to the full build-out in 2025 at which time the connection to Borrisokane Road will be closed. This development is expected to produce 401 two-way AM peak period auto trips and 457 two-way PM peak period auto trips. Based on the City of Ottawa comments, the TIA report for this devilment is being revised and is currently underway. The most recent update to the 2023 and 2025 3809 Borrisokane Road generated volumes is included in Appendix E.

3 Study Area and Time Periods

3.1 Study Area

The study area will include the following intersections:

- River Mist Road at Cambrian Road
- Greenbank Road at Cambrian Road
- Half Moon Bay Road at Greenbank Road
- Realigned Greenbank at Cambrian Road (2029 Future horizons)

3.2 Time Periods

As the proposed development is composed entirely of residential developments, the AM, and PM peak hours will be examined.

3.3 Horizon Years

The anticipated build-out year is 2024. As a result, the full build-out plus five years horizon year is 2029.

4 Exemption Review

Table 4 summarizes the exemptions for this TIA.

Table 4: Exemption Review					
Module	Element	Explanation	Exempt/Required		
Design Review Compo	nent				
4.1 Development Design	4.1.2 Circulation and Access	Only required for site plans	Exempt		
	4.1.3 New Street Networks	Only required for plans of subdivision	Required		
4.2 Parking	4.2.1 Parking Supply	Only required for site plans	Exempt		
	4.2.2 Spillover Parking	Only required for site plans where parking supply is 15% below unconstrained demand	Exempt		
Network Impact Comp	onent				
4.5 Transportation Demand Management	All Elements	Not required for site plans expected to have fewer than 60 employees and/or students on location at any given time	Required		
4.6 Neighbourhood Traffic Management	4.6.1 Adjacent Neighbourhoods	Only required when the development relies on local or collector streets for access and total volumes exceed ATM capacity thresholds	Required		
4.8 Network Concept		Only required when proposed development generates more than 200 person-trips during the peak hour in excess of equivalent volume permitted by established zoning	Exempt		

5 Development-Generated Travel Demand

5.1 Mode Shares

Examining the mode shares presented in the TRANS Trip Generation Manual (2020) for the district derived from the most recent National Capital Region Origin-Destination survey (OD Survey), the existing mode shares by land use and peak period for South Nepean have been summarized in.

Travel Mode	Single-Detached Dwellings		Multi-Unit (Low-Rise)	
	AM	PM	AM	PM
Auto Driver	51%	53%	51%	53%
Auto Passenger	14%	19%	14%	19%
Transit	25%	18%	25%	18%
Cycling	1%	1%	1%	1%
Walking	9%	10%	9%	10%
Total	100%	100%	100%	100%

Table 5: TRAN	S Trip Generation	Manual	Recommended	Mode Shares –	South Nepean
					000000000000000000000000000000000000000

5.2 Trip Generation

This TIA has been prepared using the vehicle and person trip rates for the residential dwellings using the TRANS Trip Generation Manual (2020). Table 6 summarizes the person trip rates for the proposed residential land uses for each peak period.

Table 6: Trip Generation Person Trip Rates by Peak Period							
Land Use	Land Use Code	Peak Period	Person Trip Rates				
Single-Detached	210 (TRANS)	AM	2.05				
Dwellings		PM	2.48				
Multi-Unit (Low-Rise)	221 & 222	AM	1.35				
	(TRANS)	PM	1.58				

Table 6: Trip Generation Person Trip Rates by Peak Period

Using the above person trip rates, the total person trip generation has been estimated. Table 7 summarizes the total person trip generation for the residential land uses.

Table 7: Total Person Trip Generation by Peak Period								
Land Use	Units	AN	1 Peak Per	iod	PM Peak Period			
		In	Out	Total	In	Out	Total	
Single-Detached Dwellings	103	63	148	211	158	97	255	
Multi-Unit (Low-Rise)	420	170	397	567	372	292	664	

Table 7: Total Person Trip Generation by Peak Period

There are no major transit upgrades (i.e. BRT, transit priority measures, etc.) within the study area that are planned to be in place by the study horizons that will be examined in this study. Therefore, the existing mode shares will be carried forward.

Using the above mode shares and the person trip rates, the person trips by mode have been projected. Table 8 summarizes the trip generation by mode and peak hour using the residential peak hour adjustment factor.

		ble 8: Trip Generation by Mode M Peak Hour			PM Peak Hour				
Travel Mode		Mode Share	In	Out	Total	Mode Share	In	Out	Total
Single-Detached Dwellings	Auto Driver	51%	15	36	51	53%	37	22	59
	Auto Passenger	14%	4	10	14	19%	13	8	21
	Transit	25%	9	20	29	18%	13	8	21
	Cycling	1%	0	1	1	1%	1	0	1
	Walking	9%	3	8	11	10%	8	5	14
	Total	100%	32	74	106	100%	70	43	112
Multi-Unit (Low-Rise)	Auto Driver	49%	40	93	133	49%	80	63	143
	Auto Passenger	13%	11	25	36	13%	21	17	38

	Total	-	117	273	390	-	234	171	404

Table 8: Trip Generation by Mode

As shown above, 184 AM and 202 PM new peak hour two-way vehicle trips are projected as a result of the proposed development.

5.3 Trip Distribution

To understand the travel patterns of the subject development, the OD survey has been reviewed to determine the existing travel patterns that will be applied to the new vehicle trips. Table 9 below summarizes the distribution for South Nepean.

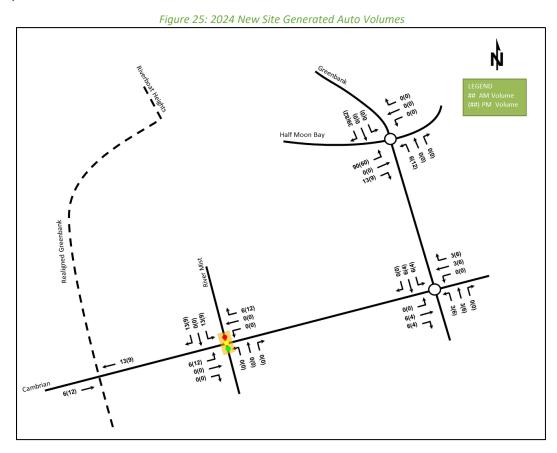

To/From	% of Trips
North	75%
South	10%
East	10%
West	5%
Total	100%

Table 0. OD Survey	Evicting	Directional	Split South	Nonoan
Table 9: OD Survey	EXISTING	Directional	spin south	wepeun

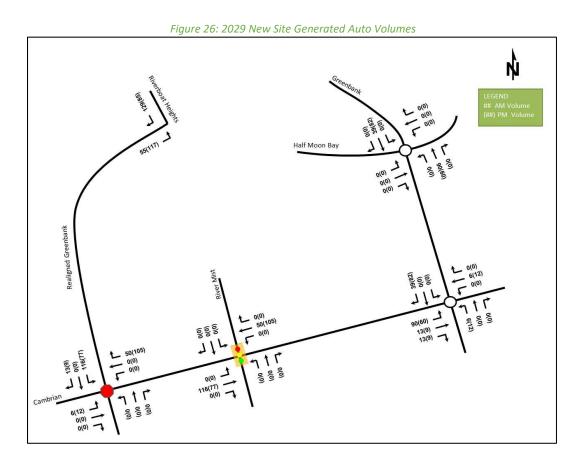

5.4 Trip Assignment

Using the distribution outlined above, turning movement splits, and access to major transportation infrastructure, the trips generated by the site have been assigned to the study area road network. The 2029 new site generation auto volumes have been re-assigned due to the network changes associated with the temporary connection of Realigned Greenbank Road. Figure 25 and Figure 26 illustrate the 2024 and 2029 new site generated volumes, respectively.

6 Background Network Travel Demands

6.1 Transportation Network Plans

The transportation network plans were discussed in Section 2.3.1. The additional capacity provided by these plans will improve the level of service in the study area road network, but these changes are not part of the 10-year affordable network. To support the proposed development and minimize the impact on the adjacent developments to the east, a temporary connection from the site access at River Boat Heights will be extended down to Cambrian Road. This road connection will be built along the Realigned Greenbank Road corridor. No access from the east side would be provided in order to prevent traffic from the proposed development cutting through the existing developments. This work should be coordinated with the ongoing Realigned Greenbank Road detail design to minimize throwaway. The 2029 Future background volume at the intersection of realigned Greenbank Road and Cambrian Road were acquired from the adjacent Half Moon Bay West Community development TIA (Stantec, 2016).

6.2 Background Growth and Other Developments

Surrounding development Traffic Impact Assessments have used a 2% traffic growth within the study area of this report. As such, an annual background growth of 2% will be used in order to remain consistent with these studies.

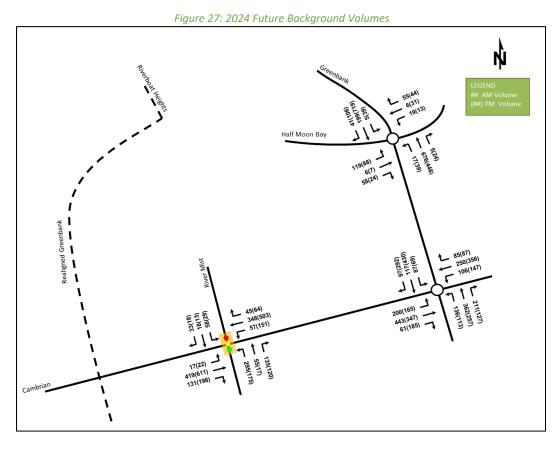

The background developments explicitly considered in the background conditions include:

- Half Moon Bay West Community
- 2444 Watercolours Way
- 3831 Cambrian Road

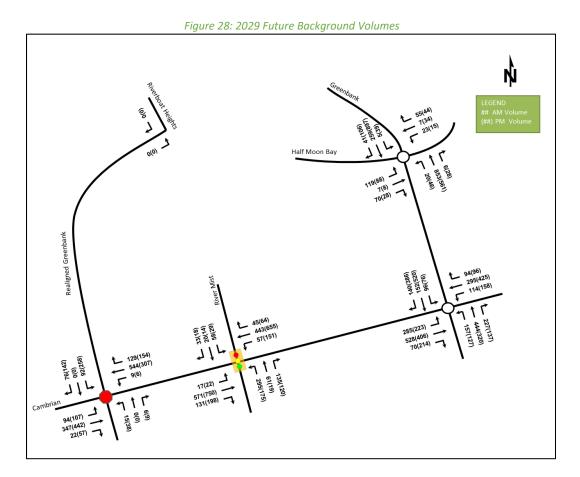

- 3718 Greenbank Road
- The Meadows Phase 4
- 3882 Barnsdale Road and 3960 Greenbank Road
- 3285 Borrisokane Road
- 3640 Greenbank Road
- 3713 Borrisokane Road Residential Component
- 3713 Borrisokane Road Industrial Component
- 3809 Borrisokane Road

All of these developments are discussed in Section 2.3.2. Figure 27 and Figure 28 illustrate the 2024 and 2029 future background volumes, respectively.

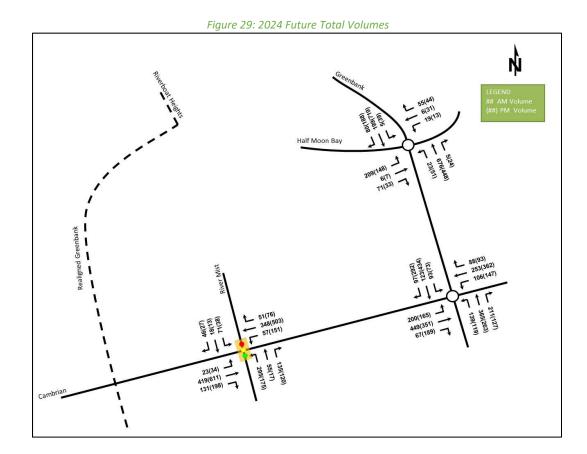

7 Demand Rationalization

7.1 2024 Future Background Operations

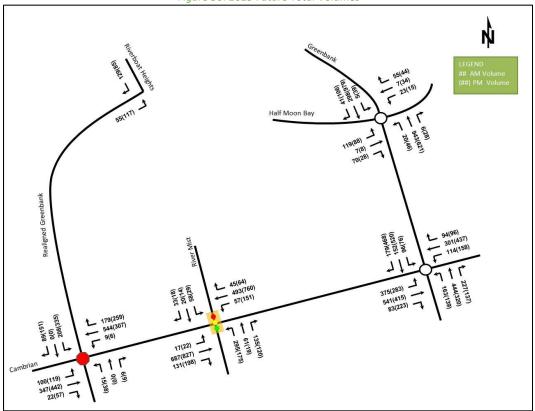

Based on the Synchro and Sidra analysis in Section 2.2.7 and the CGH's experience with other nearby developments, Greenbank Road at Cambrian Road intersection is anticipated to experience capacity constraints in the near future. It has also been noted that River Mist Road at Cambrian Road intersection is experiencing capacity constraints and high delays. As multiple residential communities are anticipated to be built in the study area within next three years, the demand generated by these developments will outgrow the capacity that the current road configuration can provide. Taking into account this, the existing poor LOS, and a lack of alternative routes, the demand determined in the previous sections of this report should be carried forward into the next step of this TIA to highlight the need for the infrastructure upgrades outlined in the city's Transportation Master Plan. The future total 2024 volumes are illustrated in Figure 29, and future total 2029 volumes are illustrated in Figure 30.

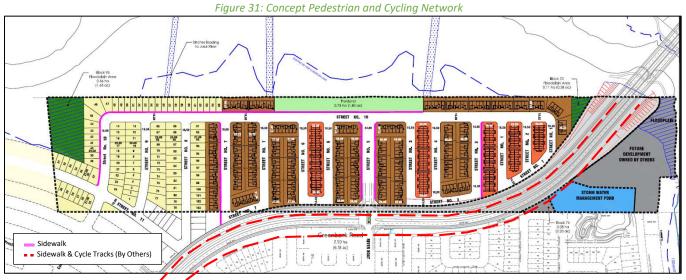

8 Development Design

8.1 Design for Sustainable Modes

The proposed development is a residential subdivision and therefore auto and bicycle parking areas will be within each resident's home. Figure 31 illustrates the concept active mode network. The plan incorporates the adjacent developments, and planned routes on geoOttawa. Additionally, pedestrian connection will be provided between window streets and the future realigned Greenbank Road. The existing transit service does not meet the council approved 400 metre minimum walking distance to transit. Therefore, as the study area builds out, and houses in this area become occupied, it is anticipated that OC Transpo will re-evaluate demand and ensure that more transit routes will be provided closer to the site. Additionally, beyond this study's horizons the proposed Greenbank Road BRT will run along the southern frontage of this site, providing excellent transit service to this community in the fullness of time.

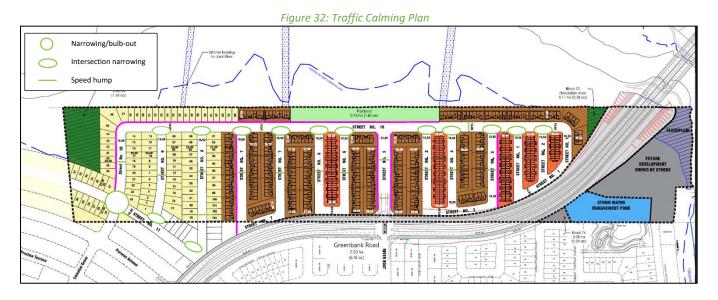

8.2 New Street Networks

The planned street network will include 14.5 metre window roads, 16.5 metre local roads, 18 metre local roadways, and 24.0 metre collector roadways. The local and collector roads will provide parking on one side of the roadway. The local roads are proposed to be posted as 30 km/h and the collector roads are proposed to be posted as 50 km/h. The pedestrian and cycling network are provided in Section 8.1.

To support the pedestrian and cycling connectivity within the subdivision, Figure 32 illustrates the concept traffic calming plan. The plan reduces crossing distances for the pedestrian and cyclists, as well as limits the speed of vehicles entering and exiting the local roads from the collector roads. The location of speed humps is subject to minor changes and will need to be refined as part of the detailed engineering submission once the locations of driveway, stormwater flows, surface ponding, and servicing elements, such as utilities and fire hydrants, have been established.

The internal road intersections are recommended to be stop-controlled on the minor approaches of all intersections.

9 Boundary Street Design

The Realigned Greenbank Road corridor will be a future boundary road to the proposed development however its construction is anticipated to occur outside of the future horizons of this TIA. Any MMLOS analysis will be completed as part of the detailed design of the corridor and is beyond the scope of this study.

10 Access Intersections Design

10.1 Location and Design of Access

Access to the development lands will be accommodated via River Boat Heights and Perseus Avenue at Celestial Grove, which will be extended north through the adjacent landowners property.

The intersections of River Mist Road and Cambrian Road, Half Moon Bay and Greenbank Road, and Greenbank Road and Cambrian Road, and future Realigned Greenbank Road at Cambrian Road are considered as study area intersections and are not the access intersections.

10.2 Access Intersection Control

No intersections are currently located at the site boundaries and access is provided through collector roadways. Assessment of the network intersections is provided in Section 15.

10.3 Access Intersection Design

No access intersections are considered in this TIA.

11 Transportation Demand Management

11.1 Context for TDM

The mode shares used within the TIA represent this area of the City and have not been altered. The subject site is within 200 metres of a future Rapid Transit Station along the proposed Greenbank Road BRT corridor. However, as the timing of this improvement is unknown, and to remain conservative, the existing transit mode share was carried forward in the analysis.

11.2 Need and Opportunity

The subject site has been assumed to rely predominately on auto travel and those assumptions have been carried through the analysis. If the low transit or non-auto mode shares are further reduced, this will result in higher volumes along Cambrian Road. Little opportunity is available to shift these modes until major infrastructure projects, such as the Realigned Greenbank Road corridor, are complete to increase the transit connectivity between South Barrhaven and the rest of the City.

11.3 TDM Program

As discussed above, any "suite of post-occupancy TDM measures" are limited in their applicability. It is anticipated that this development will rely predominantly on auto travel and those assumptions have been carried through the analysis. The TDM Checklist has been provided in Appendix F. The key TDM measures recommended include:

- Provide a multimodal travel option information package to new residents
- Inclusion of a 1-year Presto card for first time new townhome purchase, with a set time frame for this offer (e.g. 6-months) from the initial opening of the site.

12 Neighbourhood Traffic Management

In this section, the Neighborhood Traffic Management along Half Moon Bay Road / River Run Avenue and River Mist Road will be discussed. The TIA Guidelines propose a threshold of 2,500 vehicles per day (AADT), or 300 vehicles per peak hour for the classification of collector roads, equivalent to five cars per minute, which per City guidance is to be interpreted as two-way volumes.

The existing volumes on Half Moon Bay Road west of Greenbank Road are 247 two-way vehicles in the AM peak hour and 293 two-way vehicles in the PM peak hour. The site is anticipated to add approximately 148 and 163 two-way vehicle trips during the AM and PM peak hours in 2024 horizon, respectively, and it is anticipated to add no vehicle trips during both peak hours in 2029 horizon, due to the proposed temporary road along the Realigned Greenbank Road corridor.

The site traffic will account for approximately 35-38% of the total traffic on Half Moon Bay Road west of Greenbank Road in 2024 horizon. While over the prescribed theoretical local road capacity, it is expected that no trips to or from the proposed development would travel along Half Moon Bay Road / River Run Avenue in 2029 horizon. Additionally, site traffic will be redirected once the future Realigned Greenbank Road is built beyond this study's horizons.

The existing volumes on River Mist Road North of Cambrian Road are 212 two-way vehicles in the AM peak hour and 156 two-way vehicles in the PM peak hour. The site is anticipated to add approximately 38 and 42 two-way vehicle trips during the AM and PM peak hours in 2024 horizon, respectively, and it is anticipated to add no vehicle trip during both peak hours in 2029 horizon. These volumes are below the threshold of 300 vehicles per peak hour for the classification of collector roads from the TIA guidelines.

13 Transit

13.1 Route Capacity

In Section 5.1, the trip generation by mode was estimated, including an estimate of the number of transit trips that will be generated by the proposed development. Table 10 summarizes the transit trip generation.

Troval Mada	Mada Chara		AM		PM			
Travel Mode	Mode Share	In	Out	Total	In	Out	Total	
Transit	Varies	33	77	110	55	41	96	

Table 10: Trip Generation by Transit Mode

The proposed development is anticipated to generate an additional 110 AM peak hour transit trips and 96 PM peak hour transit trips. Of these trips, 77 outbound AM trips and 55 inbound PM trips are anticipated.

From the trip distribution found in Section 5.3, these values can be further broken down. Site-generated outbound AM trips break down to 58 trips to the north, eight each to the south and east, and three trips to the west. Site-generated inbound PM trips break down to 41 trips from the north, six trips each from the south and east, and two trips from the west.

Overall, the forecasted new transit trips would result in approximately one bus capacity equivalent (single bus, 55-person capacity) in the peak direction to accommodate the transit trips generated from the subject site. As the study area builds out, it is anticipated that OC Transpo will re-evaluate demand and ensure that adequate capacity is provided on Transit Route 75. Beyond this study's horizon, the transit trips generated by the subject site will be serviced by the proposed Greenbank Road BRT.

13.2 Transit Priority

The site-generated volumes at River Mist Road and Cambrian Road intersection do not impact the westbound left and the northbound right movements of transit route #75. Additionally, the operations of River Mist Road and Cambrian Road improve with signalization which is warranted in 2024 future background horizon. Therefore, no transit priority measures are required in the study area.

14 Review of Network Concept

Cambrian Road may potentially approach or exceed a single lane capacity in the peak direction by the 2024 background and total future conditions. For example, in the PM peak period the west approach volume at Cambrian Road and River Mist Road intersection is 579 during Existing horizon, and 831 in the 2024 future background horizon. These volume projections are a result of surrounding development growth being realized, Realigned Greenbank Road being constructed beyond this study's horizon, and on growth proceeding at the same rate. The likely impact of the interim condition is extended queues along Cambrian Road, between Borrisokane Road and Greenbank Road.

The network concept, as identified within the City of Ottawa's Transportation Master Plan Map 10, illustrates extensive improvements within Barrhaven South:

- New Realigned Greenbank Road, from Chapman Mills Drive to Cambrian Road
- Realigned Greenbank Road extension south of Cambrian Road
- Widening of Cambrian Road from the Realigned Greenbank Road to the existing Greenbank Road

These planned improvements are expected to address the high volumes experienced along Cambrian Road, and the existing Greenbank Road therefore no changes to the network concept are required.

15 Network Intersection Design

15.1 Network Intersection Control

Signal warrant analysis were performed for the intersection of Cambrian Road and River Mist Road for the 2024 and 2029 future background and future total horizons and Realigned Greenbank Road at Cambrian Road for the 2029 future background and future total horizons using the OTM Book 12 Justification 7 criteria and estimated average hourly volumes (AHV). Using these criteria, it was found that a signal is warranted at the Cambrian Road and River Mist Road intersection during the 2024 future background horizon. This is in line within the Cambrian Road Widening EA, where signals are the proposed intersection control method at the subject intersection. Appendix G includes the signal warrant calculation sheets.

The intersection of Cambrian Road at River Mist Road was also evaluated using the roundabout feasibility screening tool and the results indicate that a roundabout is not feasible at this location due to spatial limitations. Appendix H includes the roundabout screening forms.

The intersection method of control for Cambrian Road at Greenbank Road will remain consistent with existing methods of control at all future horizons.

Since the intersection of Realigned Greenbank Road at Cambrian Road is not warranted, it is assumed to be an All-Way stop controlled intersection.

15.2 Auxiliary Turn Lane Warrants

The Ministry of Transportation Ontario (MTO) Geometric Design Standards for Ontario Highways (GDSOH) has been reviewed to determine the need for left turns at the unsignalized intersection of Realigned Greenbank Road at Cambrian Road. Using the GDSOH methodology and appropriate design speeds, it was found that left-turn lane will be warranted on the eastbound and westbound legs in the 2029 background and future horizons.

Left turn lane warrant analysis sheets have been included in Appendix I. Required storage lengths for the eastbound and westbound left-turn lane were calculated using the Geometric Design Guide for Canadian Roads (TAC, 2017) equation 9.14.1. Table 11 summarizes the storage length calculations for each horizon and peak hour.

		Storage Length Required						
Intersection	Movement	2029 Future	Background	2029 Future Total				
		AM	PM	AM	PM			
Realigned Greenbank	Eastbound Left	21.9 m	25.0 m	23.3 m	27.8 m			
Road at Cambrian Road	Westbound Left	2.1 m	1.4 m	2.1 m	1.4 m			

Table 11: Storage Length Requirements for Turn Lanes

As summarized above, a storage length of 30.0 metres on the eastbound left-turn movement will be modeled in 2029 future horizons. And a storage length of 15.0 metres, which is the minimum recommended storage per section 9.17.4.3 of the Geometric Design Guide for Canadian Roads (TAC, 2017), will be modeled on the westbound left-turn movement in 2029 future horizons.

15.3 Network Intersection Design

To understand the intersection design, an MMLOS analysis of existing, 2024 future background, 2029 future background, 2024 future total, and 2029 future total horizon demands is required. The following sections will discuss the vehicle LOS at study area intersections which is based on the HCM criteria for average delay at unsignalized intersections and roundabouts. At signalized intersections, the level of service is based on the V/C ratio as required by the City of Ottawa. This will be followed by a discussion of the intersection MMLOS for other modes.

Synchro (Version 11) and Sidra (Version 8.0) were used to model the study area intersections. The Heavy Vehicle percentage (HV %) has been calculated for each turning movement at the study area intersection. All Heavy Vehicle percentages calculated to be less than 2% were entered into the Synchro model as 2% in order to produce a conservative analysis. These calculations are shown in Appendix J. All parameters have been coded using the City of Ottawa's TIA Guidelines and default parameters.

15.3.1 Existing Conditions

The existing intersection volumes have been analyzed to establish a baseline condition and determine the impact of the subject development as well as the surrounding background developments on the study area road network. Table 12 summarizes the operational analysis of the 2021 existing conditions. Appendix K contains the 2021 Existing Conditions Synchro and Sidra sheets.

Table 12: Existing Intersection Operations

Notes:

Queue is measured in metres Peak Hour Factor = 0.90 # = volume for the 95th %ile cycle exceeds capacity

As a result of high eastbound and westbound volumes at the intersection of River Mist Road and Cambrian Road, the east and west approaches are performing at LOS F during the PM peak hour. Using the OTM Book 5 methodology, the warrant for an all-way stop-controlled intersection (AWSC) has been reviewed. It has been found that an AWSC is not warranted, using existing volumes. The traffic signal warrant is also not met using the existing traffic volumes according to OTM Book 12 Justification 7 and is shown in Appendix H. Traffic signals are included in the Cambrian Road widening EA plan, however Cambrian Road widening is not part of the Transportation Master Plan 2031 Affordable Network. Synchro scenario with two-way stop control at River Mist Road and Cambrian Road intersection has been modeled for comparison. A two-way stop control improves the operational performance of heavier movements but decreases the LOS of the southbound and northbound

approaches. The summary of this analysis can be seen in Table 2 and the complete calculations are shown in Appendix K.

The northbound and southbound approaches at the intersection of Greenbank Road and Cambrian Road are also experiencing poor LOS, with the northbound and southbound approaches performing at LOS F during the AM and PM peak hour, respectively. The low performance of this intersection in the north and south directions is expected and can be explained by the location of the Ottawa CBD relative to the study area. The vehicle trips originating in the study area are directed towards the CBD (north) during the AM peak hour and back towards the residential communities in the study area (south) during the PM peak hour. However, the future realigned Greenbank Road will relieve the pressures from the current Greenbank Road and improve the north and southbound LOS at the intersection of Greenbank Road at Cambrian Road.

15.3.2 2024 Future Background Operations

The 2024 future background intersection volumes and other development traffic have been analyzed to allow a comparison between the future volumes with and without the proposed development. As previously mentioned, a signal warrant was met at Cambrian Road and River Mist Road intersection in 2024 future background horizon. The TIA for 3831 Cambrian Road prepared by CGH Transportation in 2021 has also illustrated Cambrian Road and River Mist Road intersection. Thus, the same intersection configuration assumptions as in 3831 Cambrian Road TIA have been used to model Cambrian Road and River Mist Road intersection within this study. Table 13 summarizes the operational analysis of 2024 future background conditions. Appendix L contains the 2024 future background Synchro sheets.

Notes:

Queue is measured in metres Peak Hour Factor = 1.00 # = volume for the 95th %ile cycle exceeds capacity

It has been noted that the 95th percentile cycle exceeds capacity at several approaches and time periods at Cambrian Road and River Mist Road intersection during the PM peak period. However, as the V/C ratio for these movements is less than one, it can be assumed that the 95th percentile queue will rarely be exceeded.

Cambrian Road and River Mist Road was signalized as traffic signals were found to be warranted at this intersection in 2024 future background horizon. As a result, the operations of this intersection improve when compared to the Existing 2021 horizon. All movements operate predominantly well, with eastbound through lane having the highest V/C ratio during both AM and PM peak periods, which is expected due to high volume demands along this road.

The eastbound approach at Greenbank Road and Cambrian Road roundabout has failed during the PM peak hour as a result of background growth and future developments. The southbound and northbound approaches have remained at LOS F during the PM and AM peak hours, respectively. As high north-south volumes at this roundabout are primarily driven by the location of Ottawa CBD relative to the study area, the LOS at these approaches will improve when the realigned Greenbank Road is built. The eastbound and westbound LOS at this roundabout will improve beyond our study horizon as a result of Cambrian Road widening.

15.3.3 2029 Future Background Operations

The 2029 future background intersection volumes and other development traffic have been analyzed to allow a comparison between the future volumes with and without the proposed development. As previously mentioned, a signal warrant was met at the Cambrian Road and River Mist Road intersection in the 2029 future background horizon. The TIA for 3831 Cambrian Road prepared by CGH Transportation in 2021 has also illustrated Cambrian Road and River Mist Road intersection as signalized in 2029 future background horizon. Thus, the same intersection configuration assumptions as in 3831 Cambrian Road TIA have been used to model Cambrian Road and River Mist Road intersection within this study. Also, the TIA for Half Moon Bay West Community by Stantec in 2016 has illustrated the volumes at realigned Greenbank Road and Cambrian Road intersection in 2029 Future horizon. The same volumes are assumed and used to model Greenbank Road and Cambrian Road intersection within this study. Table 14 summarizes the operational analysis of 2029 future background conditions. Appendix M contains the 2029 future background Synchro sheets.

Table 14: 2029 Future Background Intersection Operations

The intersection of Greenbank Road and Half Moon Bay Road at the 2029 future background horizon is anticipated to operate similarly to the 2024 future background conditions.

At the intersection of River Mist Road and Cambrian Road, eastbound through movement during AM peak hour and westbound left movement during PM peak hour may exhibit extended queuing. During PM peak hour, the eastbound through movement is over theoretical capacity and may be subject to high delays and extended queues and capacity issues.

The intersection of Greenbank Road and Cambrian Road eastbound and northbound movements during AM peak hour and eastbound, westbound, and southbound movements during PM peak hour are over theoretical capacity and may be subject to high delays and extended queues capacity issues.

The intersection of Realigned Greenbank Road and Cambrian Road westbound shared through/right-turn movements during AM peak hour and eastbound and westbound shared through/right-turn movements during PM peak hour are over theoretical capacity and may be subject to high delays and extended queues.

15.3.4 2024 Future Total Operations

The 2024 total future intersection volumes, including the site generated traffic and other development traffic, have been analyzed to understand the impact of the subject development on the study area intersections. Table 15 summarizes the operational analysis of the 2024 total future conditions. Appendix N contains the 2024 future total Synchro Sheets.

= volume for the 95th %ile cycle exceeds capacity

It has been noted that the 95th percentile cycle exceeds capacity at several approaches and time periods at Cambrian Road and River Mist Road intersection. However, as the V/C ratio for these movements is less than one, it can be assumed that the 95th percentile queue will rarely be exceeded.

With the addition of the site generated traffic, the intersections of River Mist Road and Cambrian Road and Greenbank Road and Half Moon Bay Road operate similarly to the 2024 future background horizon.

The operations of Greenbank Road at Cambrian Road further deteriorate. This is because in the previous horizon many movements of this intersection operate at a V/C ratio above 1.0 and no residual capacity is available for any additional traffic being introduced into the road network. However, the poor operational performance at this intersection is expected to be temporary as the traffic demands along this road will be significantly reduced once the realigned Greenbank Road is constructed beyond this study's horizons.

15.3.5 2029 Future Total Operations

Peak Hour Factor = 1.00

The 2029 total future intersection volumes, including the site generated traffic and other development traffic, have been analyzed to understand the impact of the subject development on the study area intersections. Table

16 summarizes the operational analysis of the 2029 total future conditions. Appendix O contains the 2029 future total Synchro Sheets.

Notes:

Queue is measured in metres Peak Hour Factor = 1.00

m = metered queue # = volume for the 95th %ile cycle exceeds capacity

At the River Mist Road and Cambrian Road intersection, the eastbound through movements are over the theoretical capacity during peak hours and may be subject to high delays and extended queues. Extended queues are projected on the westbound left-turn and through movements during AM peak hour and westbound left-turn movement during PM peak hour.

Similar to 2029 future background conditions, the roundabout intersection of Half Moon Bay Way at Greenbank Road is projected to operate with a good level of service on all approaches.

The roundabout intersection of Greenbank Road and Cambrian Road is projected to operate with similar constraints to those projected in the 2029 Future Background conditions, though some movements experience worse LOS and higher delays due to the addition of site traffic from the proposed development. Beyond this study's horizons the City plans to realign Greenbank Road, reducing the traffic volumes at this roundabout and improving the LOS.

Based on the signal, left-turn warrants, and storage length requirements, Realigned Greenbank Road and Cambrian Road is assumed to be All-Way stop control with auxiliary left-turn lanes on westbound and eastbound movements. However, it is noted that the westbound movements during peak hours and eastbound and westbound shared through/right-turn movements and southbound movements during PM peak hour are over theoretical capacity and may be subject to high delays and extended queues in 2029 future total horizon. Beyond the study horizon years, and after the completion of Realigned Greenbank Road, this intersection will become a signalized intersection, accommodating vehicular and bus traffic. The design of the temporary intersection should be coordinated with the Realigned Greenbank Road detail design team to minimize throwaway and ensure coordination between the future construction and the interim temporary road.

15.3.6 Network Intersection MMLOS

Intersection MMLOS is only undertaken at signalized intersections. The two signalized intersections considered in this study are Cambrian Road at River Mist Road and future Realigned Greenbank Road at Cambrian Road. The intersection of Cambrian Road at River Mist Road is currently stop-controlled and has been signalized in 2024 and 2029 future background and future total Synchro analyses. As such, several conservative assumptions about the intersection configuration were made to evaluate the intersection MMLOS and can be seen in MMLOS worksheets in Appendix P. Table 17 summarizes the MMLOS analysis for these intersections in the Study Area for the future background condition and future total horizons. The analysis is based on the general urban area targets.

Interrection	Horizon	Pedest	rian LOS	Bicyc	e LOS	Trans	it LOS	Truc	k LOS	Auto	LOS
Intersection	HOLIZON	PLOS	Target	BLOS	Target	TLOS	Target	TrLOS	Target	ALOS	Target
Cambrian	2024 FB									В	
Road &	2029 FB		C	D	D	N/A	N/A N/A	N/A	N/A	С	
River Mist	2024 FT	D	L							В	D
Road	2029 FT									D	

Table 17: Study Area Intersection MMLOS Analysis

Based on the new intersection configuration assumptions, the pedestrian LOS target is not met at Cambrian Road and River Mist Road intersection as a result of the future crossing distances at the east and west legs of the intersection.

As City of Ottawa's MMLOS Guidelines do not provide Transit LOS targets for roadways that are not a Rapid Transit Corridor or a Transit Priority Corridor, a target LOS for Transit Priority Corridor with isolated measures was used as a conservative target for Cambrian Road. This target is met in all background horizons.

General urban area targets should inform the future design process for Cambrian Road and River Mist Road intersection to ensure that these intersections operate safely and efficiently for various types of travel modes in the future.

16 Conclusions

- A. The proposed development, located at 3432 Greenbank Road, is a proposed subdivision consisting of 103 single family houses, 274 executive townhomes, and 146 avenue townhouses.
- B. Access to the site will be accommodated via River Boat heights and Perseus Avenue at Celestial Grove, which will be extended north through the adjacent landowner's property.

- C. The development area is not currently served by transit as the nearest bus stop is approximately 750 metres walking distance from the subject development, greater than the council approved minimum of 400 metres. Therefore, it is recommended that OC Transpo look at future transit route adjustments to better serve the proposed development. Beyond this study's horizons the subject development would be served by the future Realigned Greenbank BRT.
- D. The previous five years of collision history at the existing study area intersections has been reviewed. No patterns emerged that indicated that mitigation measures or further monitoring was required.
- E. The trip generation rates were identified using TRANS Trip Generation Manual (2020). The South Nepean mode shares were used to determine the trip generation by mode.
- F. It was found that the proposed development can be anticipated to generate 184 new AM and 202 new PM peak hour two-way vehicle trips.
- G. In the existing conditions operational analysis, major approaches at the All-Way Stop Controlled intersections of River Mist Road at Cambrian Road operate at LOS F. During this horizon traffic signals were not found to be warranted. For comparison, a scenario with Two-Way Stop Controls at the intersection has been modeled. This improved the operations of major approaches; however, the operations of minor movements have deteriorated as a result.
- H. Signals were projected to be warranted at Cambrian Road and River Mist Road in the 2024 future background and 2029 future background horizon.
- I. Realigned Greenbank Road at Cambrian Road will be included in the 2029 future background and future total horizons, and it is assumed to be All-Way stop control with auxiliary left-turn lanes on westbound and eastbound movements based on the requirements and warrants.
- J. The north and southbound approaches at the intersection of Greenbank Road and Cambrian Road are also experiencing LOS F during the peak hours. This can be explained by the location of Ottawa Centre relative to the study area with originating traffic directed towards the downtown core (north) in the AM peak hour and back towards the residential communities (south) in the PM peak hour. However, the future realigned Greenbank Road will relieve the pressures from the current Greenbank Road and improve the north and southbound LOS at the intersection of Greenbank Road at Cambrian Road.
- K. In the 2024 future background horizon, traffic signals were warranted at River Mist Road and Cambrian Road intersection, which improved operations of this intersection relative to the 2021 Existing horizon. At Greenbank Road and Cambrian Road intersection, the eastbound approach fails in the PM peak hour during the 2024 future background horizon. The operational performance of the previously failing northbound and southbound movements further deteriorates, which is expected as no residual capacity is available at these movement starting from the Existing 2021 horizon.
- L. With the addition of the site generated traffic, the intersection of River Mist Road and Cambrian Road and Greenbank Road and Half Moon Bay Road operate similarly to the 2029 future background horizon. The operations of Greenbank Road at Cambrian Road further deteriorate, however, the poor operational performance at this intersection is expected to be temporary as the traffic demands along this road will be significantly reduced once the realigned Greenbank Road is constructed, beyond this study's horizons.
- M. The PLOS, BLOS, TLOS, and TkLOS were evaluated at Cambrian Road and River Mist Road intersection. No intersection alterations or mitigation measures are suggested as it is expected that general urban area MMLOS targets will inform the design of Cambrian Road at River Mist Road.

From a transportation perspective this development is recommended to proceed for rezoning and draft plan submission.

TIA Screening Form and PM Certification Form

City of Ottawa 2017 TIA Guidelines Step 1 - Screening Form Date: Project Number: Project Reference: 20-Sep-21 2020-59 Minto Kennedy Lands

1.1 Description of Proposed Development	
Municipal Address	3432 Greenbank Road
	Located in Barrhaven South in the area bounded by
Description of Location	the Jock River, the realigned Greenbank Road, and
	the future Proxima Terrace
Land Use Classification	DR
Development Size	598 Units
A	One access at Perseus Avenue and one access at
Accesses	Riverboat Heights
Phase of Development	Assumed 1 Phase for TIA
Buildout Year	~2024
TIA Requirement	Full TIA Required

1.2 Trip Generation Trigger	
Land Use Type	Townhomes or apartments
Development Size	598 Units
Trip Generation Trigger	Yes

1.3 Location Triggers							
Does the development propose a new driveway to a boundary street that is							
designated as part of the City's Transit Priority, Rapid Transit or Spine	No						
Bicycle Networks?							
Is the development in a Design Priority Area (DPA) or Transit-oriented	No						
Development (TOD) zone?	No						
Location Trigger	No						

1.4. Safety Triggers	
Are posted speed limits on a boundary street 80 km/hr or greater?	No
Are there any horizontal/vertical curvatures on a boundary street limits	Νο
sight lines at a proposed driveway?	NO
Is the proposed driveway within the area of influence of an adjacent traffic	
signal or roundabout (i.e. within 300 m of intersection in rural conditions,	No
or within 150 m of intersection in urban/ suburban conditions)?	
Is the proposed driveway within auxiliary lanes of an intersection?	No
Does the proposed driveway make use of an existing median break that	No
serves an existing site?	No
Is there is a documented history of traffic operations or safety concerns on	Ne
the boundary streets within 500 m of the development?	No
Does the development include a drive-thru facility?	No
Safety Trigger	No

TIA Plan Reports

On 14 June 2017, the Council of the City of Ottawa adopted new Transportation Impact Assessment (TIA) Guidelines. In adopting the guidelines, Council established a requirement for those preparing and delivering transportation impact assessments and reports to sign a letter of certification.

Individuals submitting TIA reports will be responsible for all aspects of development-related transportation assessment and reporting, and undertaking such work, in accordance and compliance with the City of Ottawa's Official Plan, the Transportation Master Plan and the Transportation Impact Assessment (2017) Guidelines.

By submitting the attached TIA report (and any associated documents) and signing this document, the individual acknowledges that s/he meets the four criteria listed below.

CERTIFICATION

- 1. I have reviewed and have a sound understanding of the objectives, needs and requirements of the City of Ottawa's Official Plan, Transportation Master Plan and the Transportation Impact Assessment (2017) Guidelines;
- 2. I have a sound knowledge of industry standard practice with respect to the preparation of transportation impact assessment reports, including multi modal level of service review;
- 3. I have substantial experience (more than 5 years) in undertaking and delivering transportation impact studies (analysis, reporting and geometric design) with strong background knowledge in transportation planning, engineering or traffic operations; and
- 4. I am either a licensed¹ or registered² professional in good standing, whose field of expertise [check $\sqrt{}$ appropriate field(s)] is either transportation engineering $\sqrt{}$ or transportation planning \Box .

^{1,2} License of registration body that oversees the profession is required to have a code of conduct and ethics guidelines that will ensure appropriate conduct and representation for transportation planning and/or transportation engineering works.

TDM Checklist

TDM Measures Checklist:

Residential Developments (multi-family, condominium or subdivision)

C The measure is generally feasible and effective, and in most cases would benefit the development and its users

BETTER The measure could maximize support for users of sustainable modes, and optimize development performance

The measure is one of the most dependably effective tools to encourage the use of sustainable modes

	TDM	measures: Residential developments	Check if proposed & add descriptions
	1.	TDM PROGRAM MANAGEMENT	
	1.1	Program coordinator	
BASIC ★	1.1.1	Designate an internal coordinator, or contract with an external coordinator	
	1.2	Travel surveys	
BETTER	1.2.1	Conduct periodic surveys to identify travel-related behaviours, attitudes, challenges and solutions, and to track progress	
	2.	WALKING AND CYCLING	
	2.1	Information on walking/cycling routes & des	tinations
BASIC	2.1.1	Display local area maps with walking/cycling access routes and key destinations at major entrances (multi-family, condominium)	
	2.2	Bicycle skills training	
BETTER	2.2.1	Offer on-site cycling courses for residents, or subsidize off-site courses	

	TDM	measures: Residential developments	Check if proposed & add descriptions
	3.	TRANSIT	
	3.1	Transit information	
BASIC	3.1.1	Display relevant transit schedules and route maps at entrances (multi-family, condominium)	
BETTER	3.1.2	Provide real-time arrival information display at entrances (multi-family, condominium)	
	3.2	Transit fare incentives	
BASIC ★	3.2.1	Offer PRESTO cards preloaded with one monthly transit pass on residence purchase/move-in, to encourage residents to use transit	\checkmark
BETTER	3.2.2	Offer at least one year of free monthly transit passes on residence purchase/move-in	\checkmark
	3.3	Enhanced public transit service	
BETTER ★	3.3.1	Contract with OC Transpo to provide early transit services until regular services are warranted by occupancy levels <i>(subdivision)</i>	
	3.4 Private transit service		
BETTER	3.4.1	Provide shuttle service for seniors homes or lifestyle communities (e.g. scheduled mall or supermarket runs)	
	4.	CARSHARING & BIKESHARING	
	4.1	Bikeshare stations & memberships	
BETTER	4.1.1	Contract with provider to install on-site bikeshare station (<i>multi-family</i>)	
BETTER	4.1.2	Provide residents with bikeshare memberships, either free or subsidized <i>(multi-family)</i>	
	4.2	Carshare vehicles & memberships	
BETTER	4.2.1	Contract with provider to install on-site carshare vehicles and promote their use by residents	
BETTER	4.2.2	Provide residents with carshare memberships, either free or subsidized	
	5.	PARKING	
	5.1	Priced parking	
BASIC ★	5.1.1	Unbundle parking cost from purchase price (condominium)	
BASIC 🛨	5.1.2	Unbundle parking cost from monthly rent (multi-family)	

	TDM	measures: Residential developments	Check if proposed & add descriptions
	6.	TDM MARKETING & COMMUNICATIONS	
	6.1	Multimodal travel information	
BASIC ★	6.1.1	Provide a multimodal travel option information package to new residents	\checkmark
	6.2	Personalized trip planning	
BETTER ★	6.2.1	Offer personalized trip planning to new residents

Roundabout Screening Forms

3. Roundabout Implementation Policy

The following sections describe a roundabout implementation policy developed for the City of Ottawa, in consultation with a Project Working Group, that is consistent with existing Ottawa City Council policy.

3.1 Background

There are a number of roundabout implementation policies in place in certain Canadian provinces, U.S. states, and other jurisdictions. The most common type is a policy that simply states a roundabout should be "considered" when a new road or highway is built or an existing facility is widening or reconstructed. It is usually left to the service provider to determine in what manner a roundabout is considered.

Another is a "roundabouts first" policy, where a roundabout is deemed preferred unless it can be demonstrated that another alternative is preferred because it will operate better or be significantly less costly. This type of policy is in place in the provinces of British Columbia and Alberta, and in several U.S. states.

Another type is a policy that has been approved by Council in the Region of Waterloo, where roundabouts are considered under the following conditions:

- At any new Regional Road intersection.
- Where traffic signals are warranted.
- Where capacity or safety problems are being experienced.

If one or more of the conditions is met then the location is subjected to an initial screening. Should a roundabout pass the initial screening then an Intersection Control Study (ICS) is undertaken that compares a roundabout and one or more alternatives in terms of several economic and non-economic criteria. The economic criteria comprise construction costs and study period costs (which include maintenance costs and the human capital costs of motor vehicle collisions). The non-economic criteria may include peak hour traffic operations, speed control, access management, conditions for pedestrians and cyclists, impacts to transit services, environmental benefits, etc. After comparing the economic and non-economic evaluation the technically preferred alternative is recommended for implementation.

Similar Intersection Control Studies have been undertaken elsewhere, although they may not necessarily be a requirement of the road authority.

In consultation with the Project Working Group it was decided that a roundabout policy similar to the one in the Region of Waterloo would be most appropriate for the City of Ottawa.

3.2 The Roundabout Screening Tool

Similar to the Region of Waterloo, an initial screening tool was developed for the City. The intent of the tool is to provide a relatively quick assessment of the feasibility of a roundabout at a particular intersection in comparison to other appropriate forms of traffic control or road modifications. The intended outcome is to provide enough information to assist City staff in deciding whether or not to proceed with an ICS to investigate the feasibility of a roundabout in more detail.

The Roundabout Initial Feasibility Screening Tool asks some questions about the intersection, what traditional modifications are being proposed (i.e. installation of traffic signals, addition of auxiliary lanes, etc.), the type of roundabout that would be implemented, and why a roundabout is being considered. It then asks a series of questions related to suitability factors and contra-indications for roundabouts to aid in the decision-making process.

The suitability factor questions are:

- Does the intersection currently experience an average collision frequency of more than 1.5 injury crashes per year, or a collision rate in excess of 1 injury crash per 1 million vehicles entering (MVE)?
- Has there been a fatal crash at the intersection in the last 10 years?
- Are capacity problems currently being experienced, or expected in the future?
- Are traffic signals warranted, or expected to be warranted in the future?
- Does the intersection have more than 4 legs, or unusual geometry?
- Will planned modifications to the intersection require that nearby structures be widened (i.e. to accommodate left-turn lanes)?
- Is the intersection located at a transition between rural and urban environments (i.e. an urban boundary) such that a roundabout could act as a means of speed transition?

If "Yes" is indicated for two or more of the suitability factors, then the tool states that a roundabout should be technically feasible at the subject intersection.

The contra-indication questions are:

- Is there insufficient property at the intersection (i.e. less than 44 metres diameter if considering a single-lane roundabout, and less than 60 metres if considering a two-lane roundabout) or property constraints that would require demolition of adjacent structures?
- Are there any instances where stopping sight distance (SSD) of a roundabout yield line may not be attainable (i.e. the intersection is on a crest vertical curve)?
- Is there an existing uncontrolled approach with a grade in excess of 4 percent?
- Is the intersection located within a coordinated signal system?
- Is there a closely-spaced traffic signal or railway crossing that could not be controlled with a nearby roundabout?
- Are significant differences in directional flows or any situations of sudden high demand expected?
- Are there known visually-impaired pedestrians that cross this intersection?

If "Yes" is indicated for one or more of the contra-indications, then the tool states that a roundabout may be problematic at the subject intersection. That is not to say that a roundabout is not possible, just that there may be difficulties or high costs.

At its conclusion the tool asks for a recommendation whether to proceed with an ICS. An example of the City of Ottawa Roundabout Initial Feasibility Screening Tool, as of May 14, 2013, is provided in **Appendix A**.

3.3 Intersection Control Studies

3.3.1 The Decision Matrix

The means of conducting an Intersection Control Study in the City of Ottawa was discussed with the Project Working Group. It was decided to go with a matrix style approach that would compare economic and non-economic criteria, and be responsive to the needs of individual locations. The rationale for this was brought forward in a memo dated May 16, 2013, which is included in **Appendix B**.

The criteria to be examined should be relevant to the general environment, although additional criteria relevant to the specific location could be incorporated. The base criteria for rural, semiurban/suburban and urban intersections are listed in **Table 1**.

Rural Intersections	Semi-Urban/Suburban Intersections	Urban Intersections
Construction Cost	Construction Cost	Construction Cost
Safety	Safety	Safety
Capacity	Capacity	Capacity
	Pedestrians and Cyclists	Pedestrians and Cyclists
	Environmental	Environmental
	Property Impacts	Access Management
		Transit
		Property Impacts

Table 1 Roundabout Evaluation Criteria

It was decided that each criteria would be assigned a weight from 1 to 4 based on its subjective importance to the particular location (with 1 being "important enough that the criteria must be considered", and 4 being "very important for intersection control selection"). The weights would be established by a project team at the start of the ICS. Then, during the course of the ICS each criteria would be assigned a score from 1 to 5, such that the score for both alternatives would have to add to 6.

An example of this evaluation for an urban intersection is seen in Table 2.

Criteria	Weight	Signalized Intersection	Roundabout
Construction Cost	2	5	1
Safety	4	3	3
Capacity	3	2	4
Pedestrians and Cyclists	4	4	2
Environmental	1	2	4
Access Management	2	2	4
Transit	2	4	2
Property Impacts	4	5	1
Total		78	54

Table 2 Roundabout Evaluation Matrix - Example Urban Intersection

3.3.2 Evaluating the Criteria

Some of the criteria, namely Construction Cost, Property Impacts and Capacity, can be evaluated objectively using cost estimation techniques and intersection capacity analysis software.

The Safety criterion should be evaluated using models to predict the frequency and severity of collisions that would occur at the intersection during a specified study period following implementation of the alternatives. A score between 1 and 5 would be assigned based on their performance relative to each other. It is suggested that the scores be based on "fatal+injury" collisions only, or be weighted to account for injury severity. The collision predictions could be further weighted by assigning human capital costs to motor vehicle collisions, as is done by the MTO and some other agencies.

The Environmental criterion could be evaluated subjectively, although reasons for assigning collective scores for components of the criterion (such as vehicle noise, fuel consumption and emissions, quantity of impermeable pavement, and area available for landscaping) should be documented.

The Pedestrians & Cyclists criterion would also need to be evaluated subjectively. Collisions involving pedestrians and cyclists are infrequent, as is information regarding statistical levels of safety at roundabouts. Perceived level of safety would be difficult to incorporate into a comparison. Therefore this criterion should be scored based on the "quality" of the facilities for pedestrians and cyclists proposed for each alternative. Quality should be considered a combination of convenience and accessibility. Again, reasons for assigning scores should be documented.

In urban locations the criteria of Access Management and Transit could be evaluated subjectively based on locations of existing or proposed driveways, corridor operating speeds, the type and frequency of transit service, locations for bus stops, and whether there is or are plans for transit priority.

3.3.3 The Roundabout Implementation Process

Similar to the Region of Waterloo, a roundabout should be considered in the City of Ottawa under the following conditions:

- At any new City intersection.
- Where traffic signals are warranted.
- At intersections where capacity or safety problems are being experienced.

If any of these conditions are met then screening for the possibility of a roundabout should be undertaken using the Roundabout Initial Feasibility Screening Tool. If the tool indicates that the feasibility of a roundabout should be investigated in more detail, City staff should proceed with an Intersection Control Study (ICS) to determine whether a roundabout or another alternative is preferred at the subject intersection.

City of Ottawa Roundabout Initial Feasibility Screening Tool

The intent of this screening tool is to provide a relatively quick assessment of the feasibility of a roundabout at a particular intersection in comparison to other appropriate forms of traffic control or road modifications including all-way stop control, traffic signals, auxiliary lanes, etc. The intended outcome of this tool is to provide enough information to assist staff in deciding whether or not to proceed with an Intersection Control Study to investigate the feasibility of a roundabout in more detail.

1	Project Name:	2020-59 Minto Kennedy Lands
2	Intersection:	Cambrian Road at River Mist Road
3	Location and Description of Intersection: Lane configuration, total or approach AADT, distance to nearby intersection(s), etc. Attach or sketch a diagram and include existing and/or horizon-year turning movements. If an existing intersection then indicate type of control.	The intersection of Cambrian Road and River Mist Road is an all-way stop-controlled intersection with shared movement lanes on all approaches. No turn restrictions were noted.
4	What traditional modifications are proposed? All-way stop control, traffic signals, auxiliary lanes, etc. Attach or sketch a diagram if necessary.	Traffic signals (refer to Cambrian Road Widening EA in Appendix J)
5	What size of roundabout is being considered? Describe, and attach a Roundabout Traffic Flow Worksheet.	While a proponent isn't considering a roundabout for this intersection, conceptually, 2 two-lane roundabout would ultimately need to be considered to align with the planned Cambrian Road widening
6	Why is a roundahout hair a	
6	Why is a roundabout being considered?	This intersection is being considered as signalized in the future and the roundabout screening form is completed as per TIA requirements

7 Are there contra-indications for a roundabout?

If "Yes" is indicated for one or more of the contra-indications then a roundabout may be problematic at the subject intersection. That is not to say that a roundabout is not possible, just that there may be difficulties or high costs.

No.	Contra-Indication	Outcome
1	Is there insufficient property at the intersection (i.e. less than 44 metres diameter if considering a single-lane roundabout, and less than 60 metres if considering a two-lane roundabout) or property constraints that would require demolition of adjacent structures?	Yes 🖌 No
2	Are there any instances where stopping sight distance (SSD) of a roundabout yield line may not be attainable (i.e. the intersection is on a crest vertical curve)?	Yes No
3	Is there an existing uncontrolled approach with a grade in excess of 4 percent?	Yes No
4	Is the intersection located within a coordinated signal system?	Yes No
5	Is there a closely-spaced traffic signal or railway crossing that could not be controlled with a nearby roundabout?	Yes No
6	Are significant differences in directional flows or any situations of sudden high demand expected?	Yes 🖌 No
7	Are there known visually-impaired pedestrians that cross this intersection?	Yes No

8 Are there suitability factors for a roundabout?

If "Yes" is indicated for two or more of the suitability factors then a roundabout should be technically feasible at the subject intersection.

No.	Suitability Factor	Outcome
1	Does the intersection currently experience an average collision frequency of more than 1.5 injury crashes per year, or a collision rate in excess of 1 injury crash per 1 million vehicles entering (MVE)?	Yes No 🖌
2	Has there been a fatal crash at the intersection in the last 10 years?	Yes No
3	Are capacity problems currently being experienced, or expected in the future?	Yes 🖌 No
4	Are traffic signals warranted, or expected to be warranted in the future?	Yes 🖌 No
5	Does the intersection have more than 4 legs, or unusual geometry?	Yes No 🖌
6	Will planned modifications to the intersection require that nearby structures be widened (i.e. to accommodate left-turn lanes)?	Yes No
7	Is the intersection located at a transition between rural and urban environments (i.e. an urban boundary) such that a roundabout could act as a means of speed transition?	Yes No

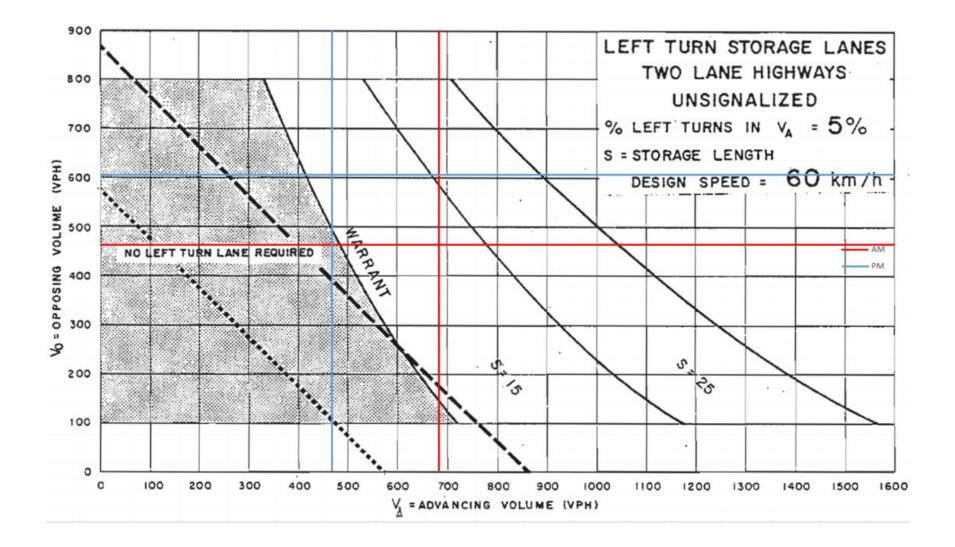

9 Conclusions/recommendation whether to proceed with an Intersection Control Study:

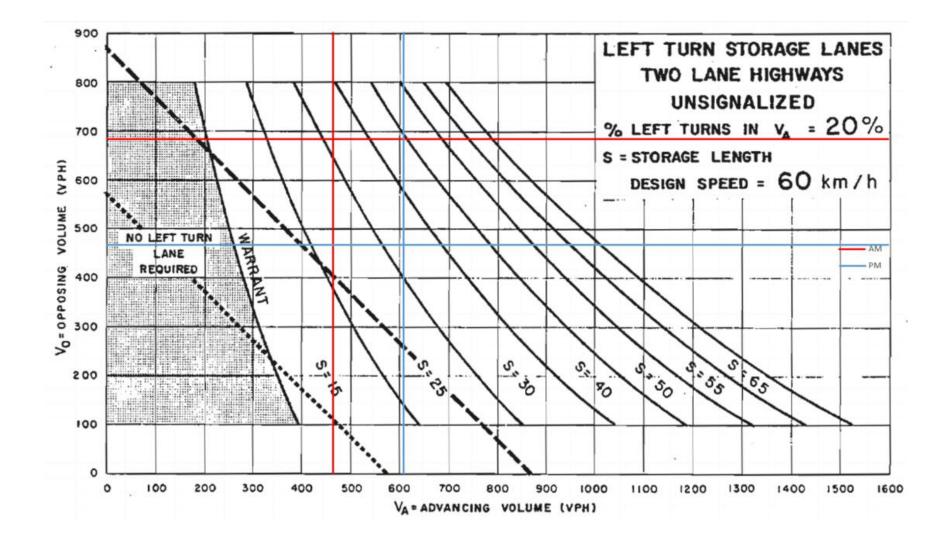

Due to spatial limitations, which prevent a roundabout from accommodating a future four-lane configuration of Cambrian Road, and per Cambrian Road widening EA, signalization of the subject intersection is recommended

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Parameter Settings dialog (Site tab). Roundabout LOS Method: SIDRA Roundabout LOS.

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Roundabout Capacity Model: SIDRA Standard.

SIDRA Standard Delay Model is used. Control Delay includes Geometric Delay.

Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Parameter Settings dialog (Site tab). Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Roundabout Capacity Model: US HCM 2010.

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies. Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Parameter Settings dialog (Site tab). Roundabout LOS Method: SIDRA Roundabout LOS.

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Roundabout Capacity Model: SIDRA Standard.

SIDRA Standard Delay Model is used. Control Delay includes Geometric Delay.

Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Parameter Settings dialog (Site tab). Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Roundabout Capacity Model: US HCM 2010.

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies. Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Parameter Settings dialog (Site tab). Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Roundabout Capacity Model: US HCM 2010.

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies. Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Parameter Settings dialog (Site tab). Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Roundabout Capacity Model: US HCM 2010.

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies. Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Parameter Settings dialog (Site tab). Roundabout LOS Method: SIDRA Roundabout LOS.

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Roundabout Capacity Model: SIDRA Standard.

SIDRA Standard Delay Model is used. Control Delay includes Geometric Delay.

Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Parameter Settings dialog (Site tab). Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Roundabout Capacity Model: US HCM 2010.

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies. Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Parameter Settings dialog (Site tab). Roundabout LOS Method: SIDRA Roundabout LOS.

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Roundabout Capacity Model: SIDRA Standard.

SIDRA Standard Delay Model is used. Control Delay includes Geometric Delay.

Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Parameter Settings dialog (Site tab). Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Roundabout Capacity Model: US HCM 2010.

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies. Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.
