      FileTitle= File comment: [Based onvarious calibration exercises in Onta
                 THE FOLLOWING PARAMETERS ARE USED IN THE DESIGN STANDHYD COM
      Horton's infiltration equation parameters:
      [Fo= 76.20 mm/hr] [Fc=13.20 mm/hr] [DCAY= 4.14 /hr] [F=  .00 mm]
      Parameters for PERVIOUS surfaces in STANDHYD:
      [IAper=   4.67 mm] [LGP=50.00 m] [MNP= .250]
      Parameters for IMPERVIOUS surfaces in STANDHYD:
      [IAimp=   1.57 mm] [CLI= 1.50]   [MNI= .013]
      Parameters used in NASHYD:
      [Ia=   4.67 mm] [N= 3.00]
      Average monthly Pan Evaporation data in    (mm)
   JAN   FEB   MAR   APR   MAY   JUN   JUL   AUG   SEP   OCT   NOV   DEC

# Insertion of a reservoir to simulate the effects of the Richmond Fen.
# Storage area and volumes were estimated from available topo maps.
# Release rate from fen was assumed to be controlled by the downstream
# river cross-section for summer conditions.  It is was assumed that for up to
# 0.75 m of water, the main channel of the river provided the storage.  Above
# this depth, the wetland starts to signigicantly store water.

# Insertion of a reservoir to simulate the effects of the Richmond Fen.
# Storage area and volumes were estimated from available topo maps.
# Release rate from fen was assumed to be controlled by the downstream
# river cross-section for summer conditions.  It is was assumed that for up to
# 0.75 m of water, the main channel of the river provided the storage.  Above
# this depth, the wetland starts to signigicantly store water.

#***************************************************************************
#    Catchment OKEEFE
#    - To O'Keefe drain (north of the Jock)
#    - Developed with assumed 43% imp.
#    - 2020-12-01 add Okeefe model (Area 513.02 HA) instead of current Okeefe (Area 513.02 HA)
#    - 2020-11-20 Okeefe detailed model was added as per the NOVATECH SWMHYMO model (Citi-Gate 2014).

# Insertion of a reservoir to simulate the effects of the Richmond Fen.
# Storage area and volumes were estimated from available topo maps.
# Release rate from fen was assumed to be controlled by the downstream
# river cross-section for summer conditions.  It is was assumed that for up to
# 0.75 m of water, the main channel of the river provided the storage.  Above
# this depth, the wetland starts to signigicantly store water.

# Insertion of a reservoir to simulate the effects of the Richmond Fen.
# Storage area and volumes were estimated from available topo maps.
# Release rate from fen was assumed to be controlled by the downstream
# river cross-section for summer conditions.  It is was assumed that for up to
# 0.75 m of water, the main channel of the river provided the storage.  Above
# this depth, the wetland starts to signigicantly store water.

# Insertion of a reservoir to simulate the effects of the Richmond Fen.
# Storage area and volumes were estimated from available topo maps.
# Release rate from fen was assumed to be controlled by the downstream
# river cross-section for summer conditions.  It is was assumed that for up to
# 0.75 m of water, the main channel of the river provided the storage.  Above
# this depth, the wetland starts to signigicantly store water.

#    - To Foster ditch (north of the Jock)
#    - Partially developed (medium density); remaining agricultural
#    - 2020-12-01 JFSA Foster area is 332 as per Foster SWMF Environmental Study Report, CH2MHILL, Aug 2013.
#    - 2020-12-01 decrease Foster drainage area from (373 HA) to (307.98 HA) after increasing Okeefe drainage area to (5
#    - 2021-02-12  update Foster area to 325.44 ha as measured from QGIS

S-1 Total Area (ha)			197.6															
FRASER Total Area (ha)			35.26															

(1) N_CE is NHYDout from ROUTE CHANNEL at Channel X-Section obtained from RVCA Hydraulic Model - Station 6016 (Hydrograph from Node Foster routed to Node at Cedarview Road)

(2) "MS_P2" and "P2-OVF" are the outflow and the overflow from ROUTE RESERVOIR of the Clarke sub-catchment

(3) "KB-Pond3" =Total Flows at KB third pond

(4 & 5 & 6 & 7) "FC-01-S" & "FC-02-S" & "FC-03-S" & "FC-04-S" = Existing / Proposed Subcatchments To Fraser Clarke Drain as per NOVATECH Report June, 2020

(8 & 9) "JR-01-S" & "JR-02-S" = Proposed Subcatchments To Jock River as per NOVATECH Report June, 2020

*A1 is named as A1-Corrig in SWMHYMO Model to avoid name duplication. A1 was not developed in 2008 so it was NASHYD in Corrigan Report, IBI Group, 2008. After checking A1 from geoOttawa (https://maps.ottawa.ca/geoottawa/)in Jan. 2021, A1 is developed. Because of the lack of information, A1 parameters were taken as A2 parameters because A2 is the nearest sub-catchment to A1. Major and Minor systems go to MH101 because lacking information about where the major system should go.

**B6 was not developed in 2008 so it was NASHYD in Corrigan Report, IBI Group, 2008. After checking B6 from geoOttawa (https://maps.ottawa.ca/geoottawa/)in Jan. 2021, B6 is developed. Because of the lack of information, B6 parameters were taken as B7 parameters because B7 is the nearest sub-catchment to B6. Major and Minor systems go to MH106A because lacking information about where the major system should go.

*** 'Corr Pond Block' is added, Jan. 2021, because it was not included in Corrigan Report, IBI Group, 2008. TIMP calculation was based on the impervious area in 'Corr Pond Block'. TIMP = XIMP = 0.415. 'Corr Pond Block' drains to "Corrigan" just before Corrigan ROUTE RESERVOIR which is just before draining Corrigan sub-catchment to Jock River.

**** MH104=["A6-MN"+"103-104"+"TODD_MJn"(Minor of the Todd Major System goes to Corrigan)], TODD_MJ=30.230 ha, ROUTE RESERVOIR(OUTFLOW = 3.314 cms, STORAGE = 0.0001 ha-m, NHYDout=["TODD_MJn"] ,NHYDin=["TODD_MJ"], NHYDovf=["TODD_MJj"])

1. O'KEEFE MUNICIPAL DRAIN – APPOINTMENT OF ENGINEER

DRAIN MUNICIPAL O'KEEFE– NOMINATION D'UN INGÉNIEUR

COMMITTEE RECOMMENDATION

That Council appoint Mr. Andy Robinson, P. Eng of Robinson Consultants Inc. as the Engineer of record to prepare a report under Section 78 (1) of the *Drainage Act* to inform Council on the current status of the O'Keefe Municipal Drain and whether one or more of the projects listed under Section 78 (1.1) is required for the better use, maintenance or repair of the drainage works or lands or roads.

RECOMMANDATION DU COMITÉ

Que le Conseil nomme M. Andy Robinson, ing., de la firme Robinson Consultants Inc., comme ingénieur chargé de rédiger un rapport aux termes du paragraphe78(1) de la *Loi sur le drainage* afin de renseigner le Conseil sur l'état actuel du drain municipal O'Keefe et de lui indiquer si un ou plusieurs des projets énumérés au paragraphe 78(1.1) sont nécessaires pour faciliter l'utilisation, l'entretien ou la remise en état des installations de drainage, des terrains ou des routes.

SUBJECT: O'Keefe Municipal Drain – Appointment of Engineer

OBJET: Drain municipal O'Keefe– Nomination d'un ingénieur

REPORT RECOMMENDATIONS

That the Agriculture and Rural Affairs Committee recommend that Council appoint Mr. Andy Robinson, P. Eng of Robinson Consultants Inc. as the Engineer of record to prepare a report under Section 78 (1) of the Drainage Act to inform

Council on the current status of the O’Keefe Municipal Drain and whether one or more of the projects listed under Section 78 (1.1) is required for the better use, maintenance or repair of the drainage works or lands or roads.

RECOMMANDATIONS DU RAPPORT

Que le Comité de l’agriculture et des affaires rurales recommande au Conseil de nommer M. Andy Robinson, ing., de la firme Robinson Consultants Inc., comme ingénieur chargé de rédiger un rapport aux termes du paragraphe78(1) de la *Loi sur le drainage* afin de renseigner le Conseil sur l’état actuel du drain municipal O’Keefe et de lui indiquer si un ou plusieurs des projets énumérés au paragraphe 78(1.1) sont nécessaires pour faciliter l’utilisation, l’entretien ou la remise en état des installations de drainage, des terrains ou des routes.

BACKGROUND

Development is proposed on multiple parcels of land within the existing watershed of the O’Keefe Municipal Drain which may result in changes in the land use, surface, subsurface and storm water flows from the existing parcels of land. The proposed developments are located in Part of Lots 14 and 15, Concession 4 former Township of Nepean, Barrhaven Ward.

A Drainage Engineer will be required to examine the proposed development within Part of Lots 14 and 15, Concession 4 former Township of Nepean, Barrhaven Ward, to determine the proposed changes to the extent and nature of use within the watershed of the O’Keefe Municipal Drain. An engineer’s report will be required in order to address any work required due to the potential improvements required to address the developer’s proposed changes.

The original O’Keefe Municipal Drain is located in Part Lots 14 to 20, Concession 4, former Township of Nepean, Barrhaven Ward and was first constructed in 1967 by the former Township of Nepean under the engineer’s report prepared by Graham, Berman and Associates Ltd. dated October 10, 1967 By-law 17-68. Modifications to the existing O’Keefe Municipal Drain by Robinson Consultants Inc. were adopted under engineer’s reports, the first modification dated March 2006 and By-law No. 2006-389, the second modification dated March 2015 and By-law No. 2016-149 and the third modification dated November 2018 and By-law No. 2019-281.

DISCUSSION

The O'Keefe Municipal Drain is a private communal drainage system which has legal status under the provincial *Drainage Act*, RSO 1990 c.17. As such, any changes to the drainage works requires the approval of Council based on the report of a qualified Drainage Engineer, pursuant to Section 78 of the *Act*. The City's Drainage Superintendent is recommending the appointment of Andy Robinson, P.Eng., a qualified Drainage Engineer from Robinson Consultants Inc., as the engineer of record as he has experience with similar *Drainage Act* projects, a specialized field of engineering in Ontario. He was also involved in the 2006, 2015 and 2018 Engineer's Reports on this drainage works.

This report has no tax or budget implications. All costs associated with the engineer's report will be initially paid by the Parks, Forestry and Stormwater Services Branch of the Public Works and Environmental Services Department but eventually recovered from the owners of land as determined by the Engineers' Report. The Engineers' Report will include an updated assessment for each parcel of land within the existing watershed of the O'Keefe Municipal Drain for a proportion of the costs of any drainage works projects that the drainage engineer determines is required under subsection 78 (1.1).

Under the *Drainage Act*, all lands that will benefit from the drainage works are assigned an assessment by the engineer. "Benefit" is defined under the *Drainage Act* as the advantages to any lands from the construction, improvement, repair or maintenance of a drainage works such as will result in a higher market value or increased crop production or improved appearance or better control of surface or subsurface water, or any other advantages relating to the betterment of the lands.

As such, the lands that benefit the most from improved drainage as a result of a Subsection 78 (1.1) project will be assessed a greater proportion of the costs of the project.

The estimated initial engineering cost of the report is $100,000. Until the costs are recovered from the owners of the assessed lands, all costs associated with the preparation of the engineer's report, engineering, administration, implementation and regulatory documentation required to complete any improvements recommended by the engineer and approved by Council, will be paid from the 2021 approved capital budget for the Municipal Drains Program for the cost of the engineer's report.

The *Drainage Act* prescribes the process and timelines to be followed for any variations in assessments within the Engineer's Report of an existing Petition Drain.

This report places the request for an Engineer's Report on the current status of the O'Keefe Municipal Drain and whether one or more of the projects listed under Section 78 (1.1) is required for the better use, maintenance or repair of the drainage works or lands or roads before the Agriculture and Rural Affairs Committee and Council as required under Section 78(1) of the *Drainage Act*.

RURAL IMPLICATIONS

The proposed development will benefit from this undertaking through the provision of legal and sufficient outlet, improved drainage and reduced risk of flooding.

CONSULTATION

Consultation with the Ward Councillor and City staff is ongoing.

COMMENTS BY THE WARD COUNCILLOR(S)

The Councillor is aware of this report.

LEGAL IMPLICATIONS

There are no legal impediments to Committee and Council's approval of the recommendation of this report.

RISK MANAGEMENT IMPLICATIONS

There are no risk implications associated with this report.

FINANCIAL IMPLICATIONS

This report has no tax or budget implications. The estimated initial cost of $100,000 for the Engineer's Report will be initially paid by the City of Ottawa, Parks, Forestry and Stormwater Services of the Public Works and Environmental Services Department and recovered, as per the assessment schedule included in the final Engineer's Report. Funds are available in the 2021 approved Capital Budget - Municipal Drainage Program.

ACCESSIBILITY IMPACTS

There are no accessibility impacts associated with this report.

ENVIRONMENTAL IMPLICATIONS

The modifications to the O'Keefe Municipal Drain are associated with proposed development. Any proposed works will require compliance with City, provincial and federal policies, standards, regulations and legislation.

TERM OF COUNCIL PRIORITIES

The recommendations of this report align with the current Strategic Priority as part of the sustainable environmental services strategic priority by supporting an environmentally sustainable Ottawa.

SUPPORTING DOCUMENTATION

DOCUMENT 1 – Location Plan

DISPOSITION

Once approved by Council, a separate new internal order will be created for this specific drain and all necessary funding will be transferred accordingly.

Subject: **BCD Phase 3 (Conservancy West) – Preliminary Water Balance**

Introduction

Phase 3 (Conservancy West) of the Barrhaven Conservancy Development is located in Barrhaven, Ontario, north of the Jock River, east of Highway 416 and west of the Foster Creek. The proposed development is approximately 35.6 ha that will primarily comprise of single and townhouse residential lots along with a 3.54 ha of parks. The following memo outlines how the proposed development will match/exceed the existing water budget through the use of LIDs.

Water Balance Overview

A pre-and post-development water balance has been completed for the site based on continuous hydrologic model simulations. As such a SWMHYMO model was developed that reflects the hydrologic conditions of these lands under pre-development, post-development without LIDs and post-development with LIDs conditions. These models were run using 36 years of hourly rainfall data from the Ottawa International Airport from 1967 to 2003 (excluding 2001 - missing rainfall data), the average annual runoff volumes from the subject site were computed and compared. Table A1 in Attachment A outlines the continuous modelling parameters for both pre and post-development conditions. The following section outlines the modelling approach for each scenario and the results of this analysis.

Pre-Development

Based on the Soil Survey Complex mapping from the Ontario Ministry of Agriculture, Food, and Rural Affairs (OMAFRA) the site primarily consists of Carsonby - Silt (Type C) and Brandon -Silty Clay- (Type D) Soils. This was confirmed by Paterson Groups through onsite field investigations and boreholes which also reported Silt and Silty Clays through the majority of the site.

Based on the Southern Ontario Land Resource Information System (SOLRIS) the site consists primarily of tilled lands and hedgerows. Based on the underlying Land Use Type and Soil Classification at each location within a subcatchment, a Curve Number (CN) was calculated, based on applicable values outlined in Tables A2 and A3 in the SWMHYMO Manual. Each Curve Number was then weighted based on the total area within the subcatchment to determine the weighted CN for that subcatchment. The CN value calculated was then converted to CN*, as CN* values have been shown to correlate well with measured flows and perform well in continuous SWMHYMO modelling (as discussed in the July 1989 INTERHYMO / OTTHYMO 89 Manual), when compared to conventional CN. Full details of the derivation of CN under existing conditions have been outlined in Table A2 and Figures A1 & A2 in Attachment A.

For this area, the time to peak has been calculated based on existing topography. Flow paths have been discretized based on the topographic data using GIS tools and the longest major flow path within the subcatchment identified; refer to Figure A3 in Attachment A for the flow paths discretized for these lands. The upstream and downstream topographic elevations and flow lengths were identified for this subcatchment and used in the calculations. For these lands, the Federal Aviation Administration (FFA) method was determined to be the most appropriate method to calculate the Time to Peak. Full details of these calculations have been provided in Table A3 in Attachment A, along with other time to peak values using alternative tp calculation methods. This site under pre-development conditions has been represented in SWMHYMO using a CONTINUOUS NASHYD command, with all continuous parameters outlined in Table A1 of Attachment A.

Post-Development – Without LIDs

Under post-development conditions, the site will have 4 individual storm sewer outlets, as such the development lands have been broken into these 4 discrete areas (with a total drainage area of 35.6 ha, matching existing conditions). Based on the development conceptual plan, the 35.6 ha site will have a total imperviousness of 64%, see figure A4 in Attachment A for an overview of the proposed development plan. These developed lands have been represented using CONTINUOUS STANDHYD commands in SWMHYMO, with City default Horton infiltration parameters for urban developments of F_o=76.2 mm/hr, F_c=13.2 mm/hr, DCAY=4.14 /hr, F=0 mm applied. This scenario has been provided to quantify the average annual reduction in infiltration volume throughout the site due to the increase in impervious area.

Post-Development – With LIDs

As mentioned above the proposed development will have LIDs implemented throughout the site to offset any deficit in annual infiltration volume produced by the increase in the impervious area due to the development. For this analysis, it is assumed that the development will have infiltration LIDs implemented at the road catch basins. Runoff captured by the road catch basins will be directed to an infiltration trench, where it can infiltrate before discharging to the storm sewer system (see *Figure 5* in DSEL *Figures & Drawings* package for more details about the proposed LID configuration). A conceptual design of these LIDs systems has been completed but will be refined at detailed design when detailed grading is available, to yield optimal benefit from this LID approach. Table 1 below outlines the parameters of these conceptual LIDs based on the current development plan. Each of the LID clusters have been represented in the model as single lumped ROUTE RESERVOIR commands, with the outflow of each command reflective of the soil infiltration rate and the volume reflective of the storage volume within each LID.

Soil Infiltration & Draw Down Time

Based on the Paterson Groups geotechnical Investigation, the site consists of soil that typically has infiltration rates in the range of 9 mm/hr - 25 mm/hr. As such it has been assumed that this site will have an infiltration rate of 9mm/hr with a safety factor of 2.5 (3.6 mm/hr). based on a trench height of 0.4m (with a void ratio of 0.4) these trenches will have a draw downtime of approximately 45 hours. Note that in this analysis it is assumed that only the bottom of the trench can infiltrate, which is a conservative assumption.

Table 1: Proposed LID Summary

Parameter	OGS W1	OGS W2	OGS W3	OGS W4
Area (ha)	8.92	8.22	9.9	8.6
Runoff Coefficient	0.65	0.65	0.65	0.65
Pipe Length (m)	1991	1896	1693	1693
Pipe Dia (mm)	250	250	250	250
Perf. Pipe Length (m)	1500	1440	1320	1320
Pipe Vol. (m^3)	73.6	70.7	64.8	64.8
Trench Width (m)	1.25	1.25	1.25	1.25
Trench Height (m)	0.4	0.4	0.4	0.4
Trench Length (m)	30	30	30	30
Void Ratio	0.4	0.4	0.4	0.4
Trench Vol. (m^3)	270.55	259.73	238.08	238.08
Total Vol. (m^3)	344	330	303	303
Area of Trench (m^2)	1875	1800	1650	1650
# of CB's	50	48	44	44
Soil Infiltration Rate (mm/hr)	9	9	9	9
Safety Factor	2.5	2.5	2.5	2.5
Reduced Rate (mm/hr)	3.6	3.6	3.6	3.6
Infiltration rate (m^3/hr)	0.001875	0.0018	0.00165	0.00165

Water Budget Scenario Summary

The models were run for 36 years using hourly rainfall data from the Ottawa Airport, and the annual evaporation, infiltration and runoff volumes calculated for each scenario. Tables 2-4 summarize the annual average water balance under existing conditions and post-development conditions for the proposed development lands with and without LID measures in place, as m³/year, mm/year and % of total annual rainfall.

Table 2:Pre-Development Water Balance

Drainage Area (ha)		35.64	Imperviousness:	7%
Annual Average Volume	Precipitation	Evapotranspira-tion	Runoff	Infiltration
m^3	212,328	121,651	14,501	76,176
mm	596	341	41	214
%	100%	57.3%	6.8%	35.9%

Table 3:Post Development Water Balance – Without LIDs

Drainage Area (ha)		35.64	Imperviousness:	64%
Annual Average Volume	Precipitation	Evapotranspira-tion	Runoff	Infiltration
m^3	212,328	77,264	88,035	47,029
mm	596	217	247	132
%	100.0%	36.4%	41.5%	22.1%

Table 4:Post Development Water Balance – With LIDs

Drainage Area (ha)		35.64	Imperviousness:	64%
Annual Average Volume	Precipitation	Evapotranspira-tion	Runoff	Infiltration
m^3	212,328	77,264	43,497	91,567
mm	596	217	122	257
%	100%	36.4%	20.5%	43.1%

Based on this analysis of pre-development conditions this site will evaporate 57.3%, runoff 6.8% and infiltrate 35.9% of all annual rainfall. Under Post-development conditions without LIDs, this site will evaporate 36.4%, runoff 41.5% and infiltrate 22.1% of all annual rainfall, resulting in a deficit of 82 mm/year infiltrated from pre-development conditions. Under post-development conditions with LIDs, this site will evaporate 36.4%, runoff 20.5% and infiltrate 43.1% and of all annual rainfall, resulting in an excess of 43 mm/year, exceeding existing pre-development infiltration rates. Full annual breakdowns of the three conditions have been provided in Attachment B, tables B1-B3. An average annual summary of the infiltration volume for each of the proposed LID measures is outlined in Table B4, which shows that the LIDs alone provide a total average annual infiltration volume of 125 mm/year.

Conclusion

A preliminary water balance analysis of the existing site was completed to determine pre-development infiltration rates, based on continuous hydrologic model simulations. A post-development analysis for the site, where no LIDs were implemented, showed that the volume of annual rainfall infiltrated would decrease by 82 mm/yr. (-38% from existing). Implementing LIDs in the way of infiltration trenches connected to the catchbasins would offset this deficit and exceed pre-development conditions by 43mm/year (+20% from existing). Based on the above it has been shown that Phase 3 of the Barrhaven Conservancy Development will be able to meet pre-development infiltration rates under post-development conditions through the use of LIDs.

Yours truly,
J.F Sabourin and Associates Inc.

Table A1: Continuous Simulation Parameters

Parameter(s) & Value(s)	Description
APII=[50], APIK=[0.90]/day	Used to compute the Antecedent Precipitation Index during the continuous simulation. Without model calibration, these are the default values.
IAimp = [1.57](mm), IAper=[4.67](mm)	Default Initial Abstraction (IA) values per the City of Ottawa Design Guidelines
IaREC=[6](hrs);	The time that it takes for the Initial Abstraction over pervious areas to recover during a dry period in undeveloped areas.
SMIN=[-1], SMAX=[-1](mm)	The negative values indicate that the storage volume in the SCS procedure will vary between the "S" determined for AMC I and AMC III conditions of the entered CN value in undeveloped and urban areas.
SK=[0.03]/(mm);	A calibration coefficient that can typically vary from 0.01 to 0.3 for undeveloped and urban areas. The higher the value, the more runoff generated. To set the baseline for existing conditions, it was decided to take a value in the low range.
InitGWResVol=[10](mm), GWResK=[0.9](mm/day/mm), VhydCond=[1](mm/hr);	Parameters that are used to simulate both the groundwater storage and discharge to surface watercourses from undeveloped areas. Without adequate field measurements, these parameters were selected based on previous continuous modelling experience.
IaRECper=[6](hrs);	The time that it takes for the Initial Abstraction over pervious areas to recover during a dry period in urban areas.
IaRECimp=[1.5](hrs);	The time that it takes for the Initial Abstraction over impervious areas to recover during a dry period in urban areas.
InterEventTime=[12](hrs)	The continuous dry time is required to reset the parameters in the SCS procedure to their initial values.

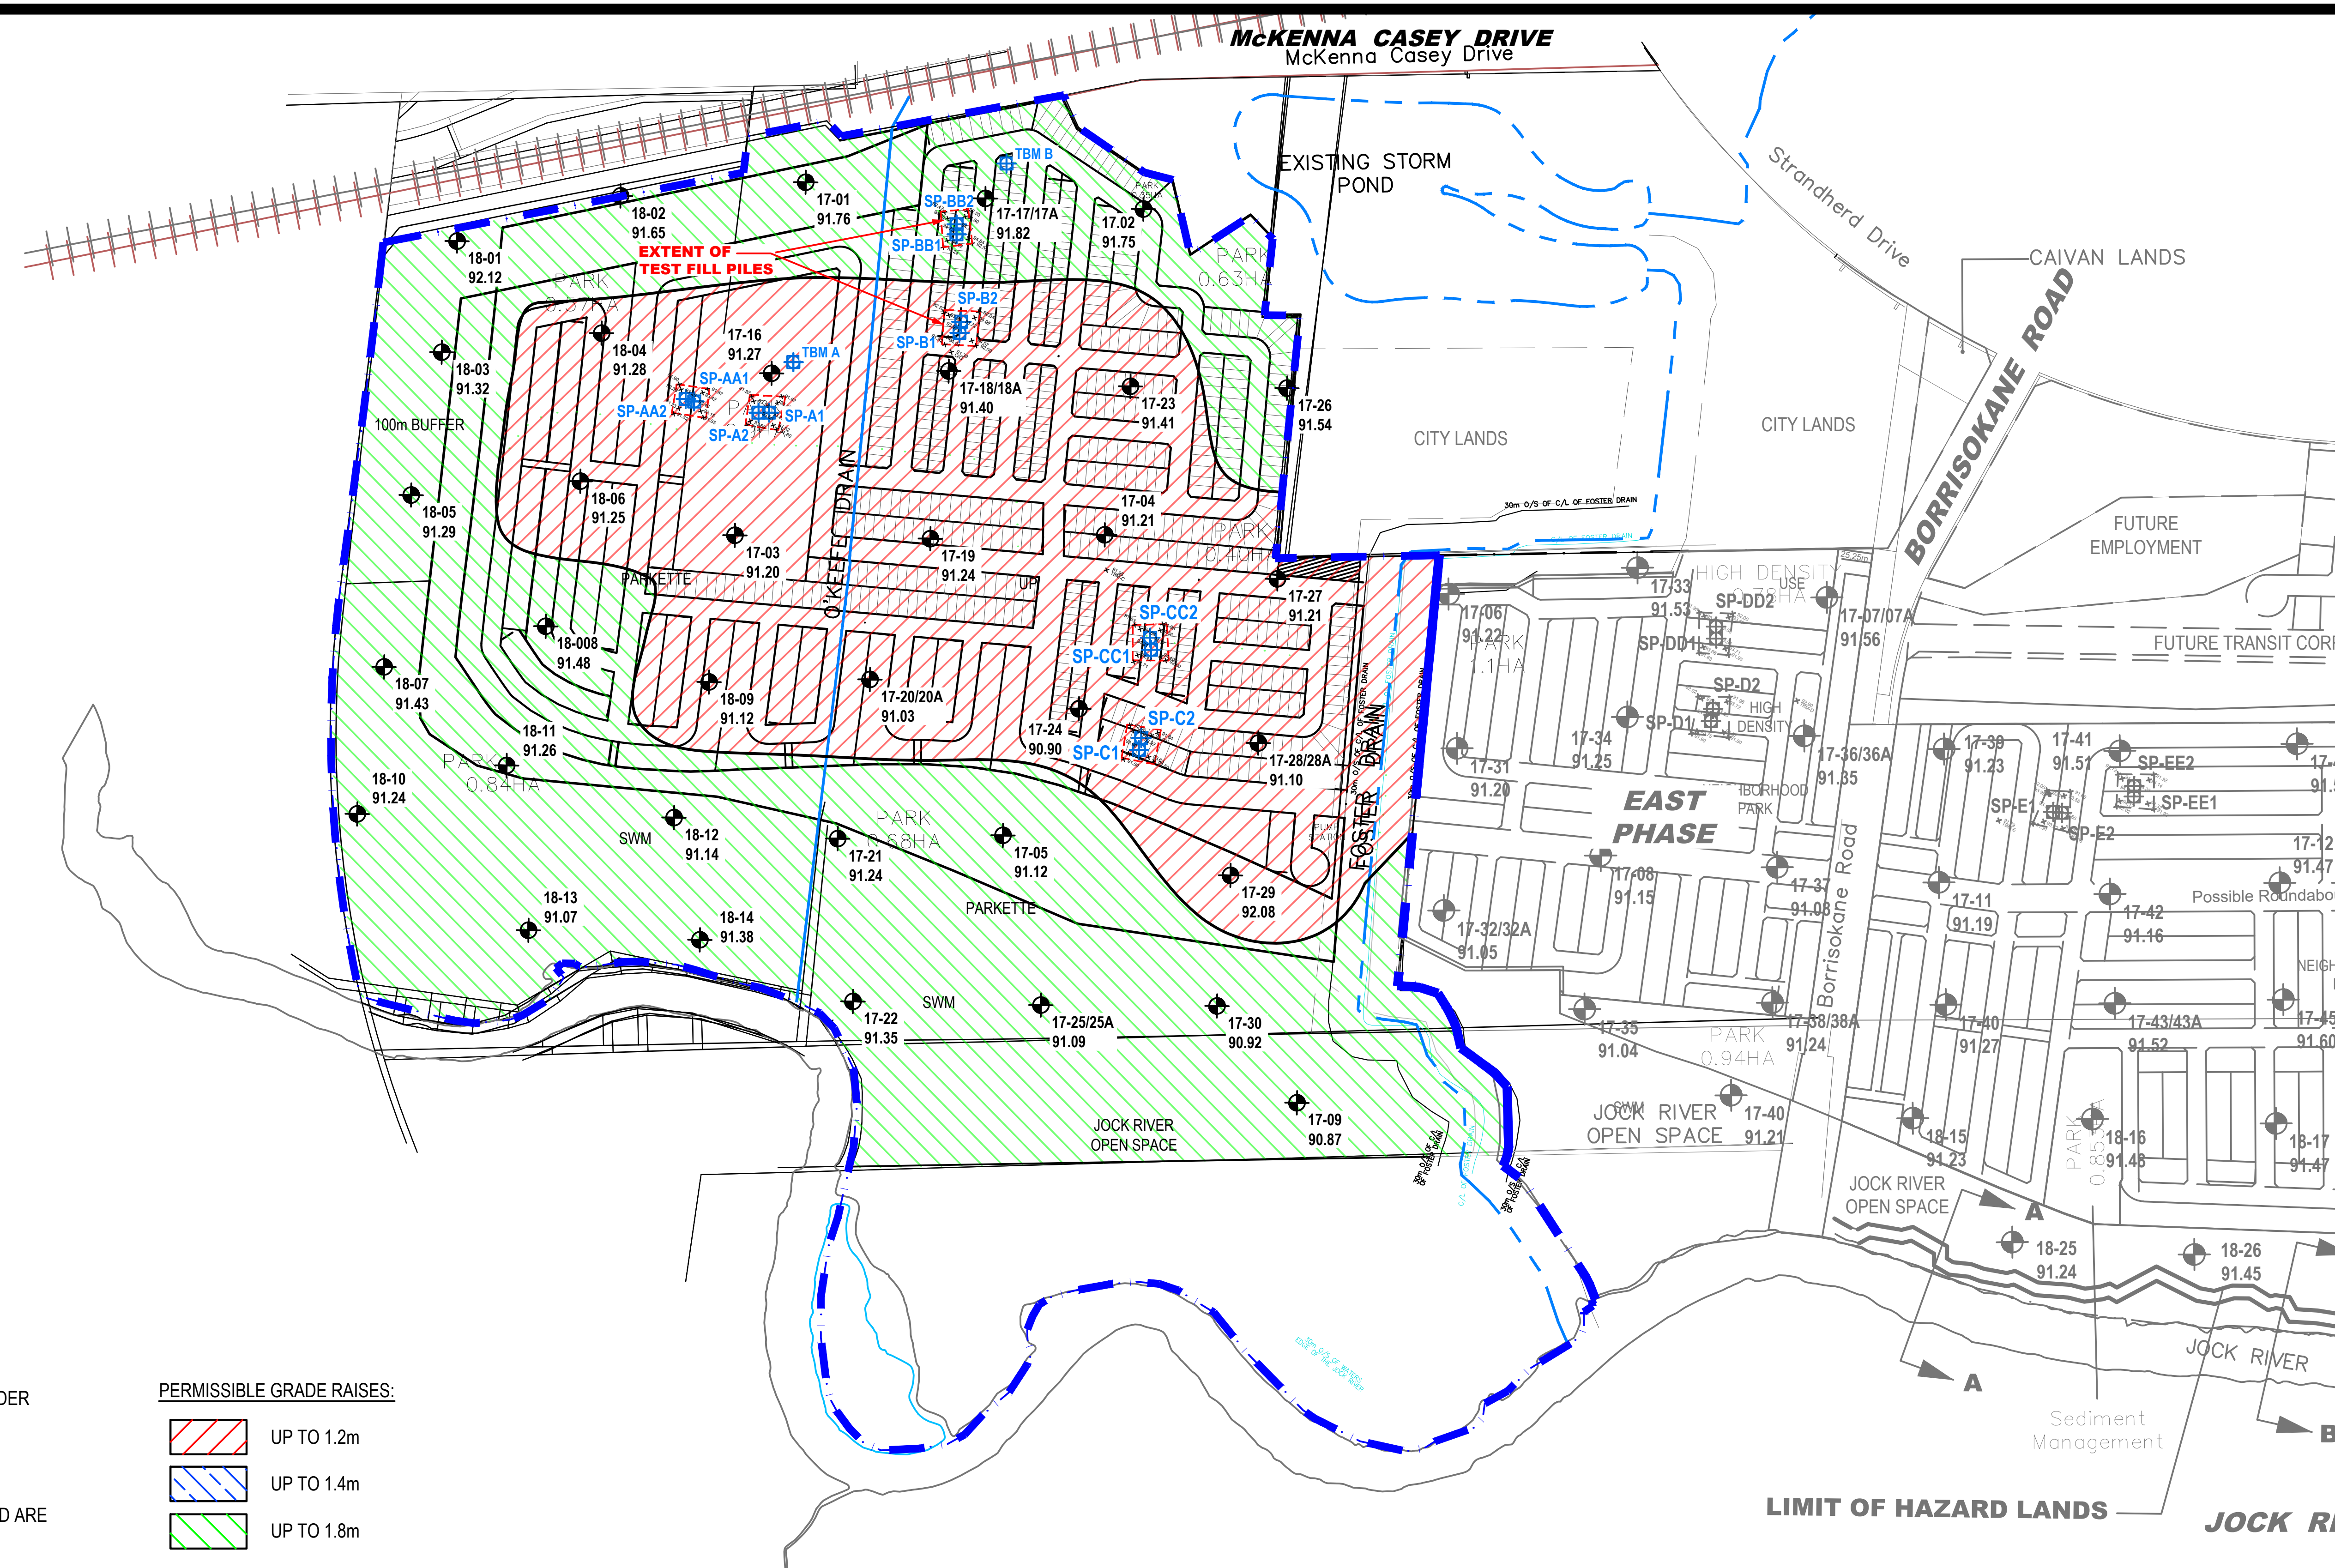
Table B4- LID Infiltration Summary

LID	Area (ha)	Average Annual Infiltration Volume (m^3/Yr)	Average Annual Infiltration Volume (mm/Yr)
W1	8.92	11,749	132
W2	8.22	11,093	135
W3	9.9	11,080	112
W4	8.6	10,620	123
Total/Average	**35.64**	**44,543**	**125.5**

APPENDIX E

GEOTECHNICAL



LEGEND:

APPROXIMATE BOREHOLE LOCATION (GOLDER ASSOCIATES, 04/2019)

91.07 GROUND SURFACE ELEVATION (m)

BOREHOLE LOCATIONS WERE SURVEYED BY OTHERS AND ARE REFERENCED TO A GEODETIC DATUM.

PERMISSIBLE GRADE RAISES:

- UP TO 1.2m
- UP TO 1.4m
- UP TO 1.8m
