

# TECHNICAL NOTE

**RECIPIENT:** Ryan MacDougall, Uniform Urban Developments Ltd.

**SENDER:** Casey Little, Biologist, **CIMA+**

**DATE:** December 7, 2022

**SUBJECT:** Tree Conservation Report – 4386 Rideau Valley Drive, Ottawa, ON K4M 0E2  
**CIMA+** file number: A001244C

---

## 1. Introduction

### 1.1 Objective

**CIMA+** has been retained by Uniform Urban Developments Ltd. to prepare a Tree Conservation Report (TCR) for the planned development located at 4386 Rideau Valley Drive, Ottawa, ON K4M 0E2. This report follows the *City of Ottawa Tree Conservation Report Guidelines* (City of Ottawa, 2021). The field work was completed by Casey Little who has an Ecosystems Management Diploma and has 16 years of experience completing natural environment assessments, including tree inventories. Ms. Little is also a certified Butternut Health Assessor (#530) and is trained and certified in Ecological Land Classification (ELC) for Southern Ontario, and Ontario Wetland Evaluation System (OWES). **CIMA+** was also retained to complete an Environmental Impact Statement (EIS) for this project and this memo will form part of that report. The EIS was completed by Michelle Lavictoire who has a M.Sc. in Natural Resource Sciences, a B.Sc. in Wildlife Biology and over 25 years of experience in completing natural environment assessments.

Uniform Urban Developments Ltd. is proposing to build a residential subdivision at the corner of Rideau Valley Drive and Bankfield Road. The subdivision would be bordered by Mud Creek, Wilson Cowan Municipal Drain, Rideau Valley Drive and Bankfield Road. The EIS being completed by CIMA+ for this project will confirm the appropriate setback from the two watercourse features and address any other natural heritage features (including species at risk). The proposed subdivision will consist of a combination of single, semi and town units and it will be fully serviced.

The intention of this TCR is to determine what woody vegetation should be retained and protected on the site. In the paragraphs below, we have outlined the background and project description, field methodology and findings and recommendations. With respect to natural elements, these will be included solely within the EIS (i.e., Rural Natural Features, Significant Woodlands, Species at Risk and their Habitat). Any mitigation measures included herein are specifically with respect to individual trees to be retained and or injured, and these will also be included in the main body of the EIS.

## 2. Limitations

The assessment presented in this report has been made using accepted standard arboriculture techniques as outlined in the Council of Tree and Landscape Appraisers Guide for Plant Appraisal, 10th Edition, Second Printing (2019). These techniques include visual examination of above-ground parts of each tree or trees in each group. The trees observed were not climbed, cored, or dissected, and excavation for detailed root crown inspection was not performed. Since some symptoms may only be present seasonally, the extent of observations that can be made may be limited by the time of year in which the inspection took place.

Since trees are living organisms, their health and vigour continually change over time due to seasonal variations, changes in site conditions, and other factors. For this reason, the assessment presented in this report is valid at the time of inspection, and no guarantee is made about the continued health of trees that are deemed to be in good condition. It is recommended that the trees be reassessed periodically to identify changes in condition. While every standing tree has the potential for failure and therefore poses some risk, a tree assessment is a good indication of present health and potential problems that could arise in the future.

**CIMA+** has prepared this report for the sole use of the client. Any use of this report by a third party, as any decision based on this report, is the singular responsibility of the third party. **CIMA+** will not be held responsible for eventual damages towards a third party resulting from decisions taken, or based, on this report.

## 3. Methodology

The tree inventory was undertaken on June 8, and August 18, 2022. Trees were numbered, identified, measured, and assessed for condition. Information collected on the individual trees included:

- Their location (GPS coordinates, NAD83);
- Identified to species for native specimens;
- Diameter at breast height (DBH);
- Height; and
- Health.

The assessment methodology is outlined in the sections below. The tree inventory tables containing this information are included in **Appendix A** along with the locations of the individual trees are shown on Maps 1 and 2.

Nomenclature used in this report follows the Southern Ontario Plant List (Bradley, 2007) for both common and scientific names which are based on Newmaster et al. (1998). Authorities for scientific names are given in Newmaster et al. (1998).

### 3.1 Tree Size

Size refers to trunk diameter at breast height (DBH or caliper) measured in centimetres at 1.4 m above the ground. Where trees had more than one trunk from the base, the size of each trunk

was recorded. Where trees forked to codominant trunks, each trunk was measured, or the diameter was measured at the narrowest point below the fork.

### 3.2 Observations

Several structural defects and health problems are included in the Tree Inventory and Assessment Table (**Appendix A**). The following is an explanation of the short forms used in the table:

- DB Dieback
- SMD Small dead branches
- CA Cavity
- FC Frost cracking
- EXR Exposed surface roots
- GR Girdling roots
- EAB Emerald Ash Borer
- MEC Mechanical Damage
- SUP Suppressed trees

These observations as well as other notable observations are defined in **Appendix B**.

### 3.3 Tree Condition

Each tree was given a subjective rating for trunk integrity, canopy structure, crown vigour, and an overall health condition rating of: Excellent, Good, Fair, Poor, or Dead. The following is a summary of how the ratings are determined:

- EXCELLENT (E): no apparent health problems; good structural form
- GOOD (G): minor problems with health and/or structural form
- FAIR(F): more serious problems with health and/or structural form
- POOR (P): major problems with health and structural form
- DEAD (D): dead

### 3.4 Tree Protection

The minimum Critical Root Zone (CRZ) was determined using the *City of Ottawa's Tree Conservation Report Guidelines*. The CRZ is established as being 10 centimetres from the trunk of a tree for every centimetre of trunk DBH measured in a radius around the tree. The CRZ is calculated as DBH x 10 cm.

Tree Impact (retain, injury, or removal) has been determined and is included in the Tree Inventory and Assessment Table in **Appendix A**.

## 4. Results

The dates, timing, and environmental conditions at the time of the assessments are presented below in **Table 1**.

*Table 1: Site Investigation Details*

Date	Start/End Time	Field Surveys	Weather Conditions
2022/06/08	1330 ~ 1800hrs	Visual assessment of all trees ≥10 cm dbh on-site	Temperature: 20°C Cloud cover / Precip: mixed sun/clouds, moderate wind.
2022/08/18	0900 ~ 1530hrs		Temperature: 21°C Cloud cover / Precip: overcast, moderate wind.

The approximate 30-acre site is currently comprised mostly of cropland (planted with corn) with a residential property, including three (3) barns, situated at the southeastern extent of the site. Mature trees surround the residential property and line the margins of the corn field to the west, north and portions east of the site. The Wilson Cowen Municipal Drain flows along the western edge of the site conveying flow into Mud Creek. A mature deciduous swamp is located north of the site where the Wilson Cowen Municipal Drain connects with Mud Creek and continues to flow eastwards into the West Branch Rideau River, east of the site. An oxbow of Mud Creek borders the site along its eastern edge for approximately 150 m and flows east under Rideau Valley Drive where it drains into the Rideau River. South of the oxbow is a small parcel of land which contains the Manotick Wastewater Pumping Station where a cedar hedge borders the building to the south. A 1.82-acre parcel of parkland east of Rideau Valley Drive is also included in the site boundaries which is comprised mainly of a mixed meadow with a riparian strip containing mature deciduous trees along the margins of the Rideau River. The overall topography of the residential property and the cropland is flat. The adjacent lands to the west and to the south are fully developed (residential), with naturalized, undeveloped lands to the north and east. Most of the trees were situated in the southeast corner of the site within the private residential lands, with scattered trees along the margins of the cropland.

A total of 409 trees were assessed as part of this inventory within the site boundaries. There were 229 individual trees assessed on the main site with a DBH of 10 cm or greater. Of these, 176 were alive, and 53 were dead. The most common species were White Elm (*Ulmus americana*), Green Ash (*Fraxinus pennsylvanica*), Manitoba Maple (*Acer negundo*), and American Basswood (*Tilia americana*). There were 180 individual trees assessed on the parkland adjacent to the river, with a DBH of 10 cm or greater. Of these, 131 were alive, and 49 were dead. The most common species were White Elm, Green Ash, and Manitoba Maple.

A summary of the trees surveyed on the main site and the parkland is provided in **Table 2** and **Table 3** respectively.

Table 2: Summary of Tree Inventory within the Main Site

Species	Count	Size Range (DBH cm)	Height Range (m)	Crown Spread (m)
American Basswood	6	16-63	4-20	2-9
Bur Oak	10	12-126	8-21+	2-11
Green Ash	29	10-21	4-15	1-5
Manitoba Maple	22	11-68	4-21+	2-18
Eastern White Cedar	16	10-41	4-15	2-20
Willow Species	1	123	21+	11
Siberian Elm	1	13	4-7	1
Sugar Maple	4	13-62	8-20	2-5
White Elm	65	10-57	4-21+	1-6
White Spruce	16	12-42	4-20	2-4
Deciduous	6	10-58	4-11	2-5
<b>Total</b>	<b>176</b>	<b>10-126</b>	<b>4-21+</b>	<b>1-20</b>

Table 3: Summary of Tree Inventory within the Parkland

Species	Count	Size Range (DBH cm)	Height Range (m)	Crown Spread (m)
American Basswood	31	11-68	4-21+	3-14
Bur Oak	9	9-52	4-20	2-9
Green Ash	42	10-47	4-20	1-6
Manitoba Maple	17	13-42	4-20	3-14
Norway Maple	5	16-33	8-15	5-8
Eastern White Cedar	1	12	8-11	3
Black Cherry	3	38-43	16-21+	7-11
Black Walnut	2	10-11	4-11	4-5
Sugar Maple	5	18-46	8-20	6-10
White Elm	9	10-34	4-20	2-7
Butternut	5	17-37	4-20	2-5
Scots Pine	2	33-42	16-20	4-7
<b>Total</b>	<b>131</b>	<b>9-68</b>	<b>4-21+</b>	<b>1-14</b>

## 5. Impact Assessment

An impact assessment was undertaken to determine impacts to the trees within the site because of the proposed project construction. Trees recommended for removal include trees within or outside the limit of work that would not be able to withstand construction-related impacts. Trees identified as being injured require work within the minimum CRZ; however, impacts to these trees are anticipated to be minor and it is likely that these trees will survive post construction. Trees identified as being retained are expected to be minimally damaged by the project and are proposed to be protected through mitigation measures outlined below.

The results of the impact assessment are summarized below in **Table 4**. These details are also included in the Tree Inventory and Assessment Table and Figure 2 included in **Appendix A**.

Trees to be Removed	Trees to be Injured	Trees to be Retained
Main Site		
40	3	133
Parkland		
0	0	180

## 6. Mitigation Measures and Construction Management

### 6.1 Tree Protection Measures

As noted above, avoidance and mitigation measures associated with other natural heritage features including the birds and SAR are in the EIS. The EIS must be referred to when planning the timing of tree removal.

The most typical construction damage to trees is a root damage from compaction and severance. While the drip line of a tree's canopy is typically thought to be associated with the root area, the root zones can extend significantly beyond the drip line of the tree, sometimes up to 2 or 3 times the height of the tree. Some of the trees inventoried are growing close to the edge of the proposed construction and will be at risk of contact with, and damage from, heavy equipment. Generally, to protect trees, grade changes and construction activities that could cause soil compaction should be kept away from trees as much as possible.

In order to successfully preserve trees that are recommended for on-site retention, as well as those identified as being impacted, the following series of mitigation measures is recommended. These recommended measures largely center on the minimum CRZ of trees, as defined by the City's Tree Conservation Report Guidelines. The following measures are being recommended to protect the CRZ of all trees slated for retention and/or impact:

- Delineation of the disturbance limits within work areas will be clearly defined on drawings and on the site prior to construction.
- Install Tree Protection Fencing prior to commencement of construction activities, and retain fencing until construction activities have been completed, as per City of Ottawa's Tree Protection (By-law No. 2020-340), Part VI:
  - Tree protection fencing shall be at least 1.2 metres in height and installed in such a way that the fence cannot be altered.
- Do not place any material or equipment within the CRZ of a tree.
- Do not raise or lower the existing grade within the CRZ of a tree.

- Do not extend any hard surface or significantly change landscaping.
- If the construction will have to encroach into a tree's minimum CRZ, installing a temporary layer of 150 mm deep partially composed wood chips mulch over the root zone can help to protect roots from compaction damage, and conserve soil moisture levels.
- Equipment and materials should not be stored near trees
- Ensure that exhaust fumes from all equipment are not directed towards any tree's canopy.
- Do not attach any signs, notices, or posters to trees.
- Ensure that site clearing is carried out only in areas where it is specifically required, and that the areas to be cleared are carefully and clearly delineated.

## 6.2 Tree and Root Pruning

- Do not damage the root system, trunk, or branches of any tree; if any roots are encountered during excavation while working outside the CRZ, they should be cut off cleanly with sharp pruning tools rather than allow them to be torn by large equipment; clean cuts will help to minimize decay and entry points for disease.
- All exposed roots of trees to be retained should be covered in a minimum of 5 cm of firm soil within 24 hours of exposure.
- If root pruning is implemented, the crown of the tree should be reduced proportionately under the direction of a Certified Arborist or Registered Forester, to decrease wind sail. Pruning should be kept to thinning cuts (no major limb removal), and crowns should be monitored, and maintenance carried out for two (2) years after root pruning to remove any dieback under the direction of a Certified Arborist or Registered Forester.
- If branches are likely to hang in the way of passing equipment, the branches should be pruned by a Certified Arborist or Registered Forester to avoid tearing and undue injury to the tree.
- All pruning work must be performed under the supervision and guidance of a qualified tree professional in accordance with the latest ANSI A300 Pruning Standards and best management practices identified by the International Society of Arboriculture.

## 7. Permits and Approvals

The City of Ottawa's Tree Protection By-law No. 2020-340 describes the rules that govern tree ownership in Ottawa and the responsibility of tree maintenance, including administration and enforcement. As per Part IV: Sections 42 – 44 Prohibition, No person shall injure or destroy a tree without a permit. Sections 45 to 48 - Application for tree permit stipulates the process to apply for a permit under this by-law.

Therefore, it is recommended that consultation should be undertaken with the City prior to construction to confirm the requirements for tree removal permits associated with the municipal tree protection by-law. Where required, tree removal permits must be obtained from the City prior to the start of construction.

No other tree by-laws to protect trees on private properties are available from the City.

## **8. Certification and Closure**

We certify that all the statements of fact in this assessment are true, complete, and correct to the best of our knowledge and belief, and that they are made in good faith.

## Appendix B Structural Defect Definitions

## **Definitions of Structural Defects and Tree Health Problems**

Structural defects are often insignificant when a tree is small but can pose problems when the tree grows larger, and the weight of branches put added stress on defects that can cause weakness. Larger trees also have the potential to cause more damage should they fail. The following is an explanation of some of the observations included in the inventory and assessment table, and how they can affect trees over time.

### **Crown Defects**

BNL - Broken / No Leader occurs if the central leader is broken, damaged or very weak, or has a dead terminal bud

CRB - Crossing branches are often associated with narrow branch angles. Branches that cross over each other often rub, causing damage and therefore weakness to one or both branches, and crossing branches can eventually girdle each other.

DB - Dieback refers to the ends of branches dying, which is often associated with root problems.

HSS - Heavy seed set, or an abundance of seed production, can be the result of a stressed tree putting energy reserves into seed production in an effort to reproduce while it is still able.

HP - Hydro-Pruning occurs when the Hydro companies undertake pruning of trees away from hydro wires to prevent contact between the trees and wires which could result in power outages. Pruning in these situations is often not in the best interest of the tree.

LC - Leaf chlorosis is yellowing of interveinal leaf tissue that can be caused by nutrient deficiencies, pH imbalance, poor drainage, or root damage.

LT - Lion-tailing refers to branches that have a tuft of foliage at the end like a lion's tail, due to pruning of the inner branches. Branches that have been pruned in this way are end-heavy and more likely to fail.

LLCR - Low live crown ratio is the ratio of the live crown to the overall height of the tree. A low live crown ratio can develop when trees are growing close together in stands or can be created by pruning or dieback. Low live crown ratio is associated with increased likelihood of failure, depending on the cause and site factors.

MBR - When a tree has multiple branches from the same point of attachment, the branches usually have characteristics of weakly attached branches.

NA - Narrow branch angles, especially where there is included bark, can be a problem as trees grow larger because the inner wood is poorly attached.

SMD - Small dead branches are an indicator of crown dieback and can be an early sign of stress.

SE - Staghorn effect refers to dead branches protruding through the crown of a tree, and often indicates a state of significant decline.

SBR - Sunken areas under scaffold branches is often an indication of internal decay.

T - Topping is the cutting of branches to reduce canopy size, leaving stubs that cannot assume the terminal role. Topping leads to trees being stressed, disfigured, and susceptible to decay. Structural issues caused by topping typically require corrective pruning and can lead to unacceptable risk.

UC - Unbalanced Crown is a tree's crown that is much more extensive in one direction than another, often due to competition from the crown of a nearby tree or exposure

### **Trunk Defects**

ADV - Adventitious shoots are vigorous growth of shoots from pruning cuts, inner branches, or along the trunk that usually occur in response to stress.

AD - Apical dominance refers to a tree maintaining a strong central leader with upright growth (excurrent form). When lateral shoots outgrow the original terminal shoot (leader), the tree's form becomes rounded, or decurrent, which in some cases can make a tree more likely to have weak branching that can limit longevity potential.

AT - An asymmetrical trunk cross-section can indicate internal decay.

CA - Cavities are often the result of an injury followed by decay. Decay can begin by injury to the trunk, the loss of a large limb, topping or improper pruning. The inner dead wood begins to decay but living wood is protected by a barrier zone that compartmentalizes damage

COD - Codominant leaders (2 trunks or branches of approximately equal size) often have narrow branch angles and are associated with weak branch attachment. Strong branch attachments occur between 2 limbs of unequal size with enough space for branch enlargement and formation of a branch bark ridge.

FC - Frost cracking is a winter injury caused by temperature fluctuations on bark and inner wood when the sun warms a tree trunk and then temperatures drop quickly, causing splitting of the bark that can extend into the wood below. Frost cracking can be associated with snow reflection and southwest-facing trunk exposures, and particularly affects young trees and species with thin bark.

RB - Ring-Barking, is the complete removal of the bark (consisting of cork cambium or "phellogen", phloem, cambium and sometimes going into the xylem) from around the entire circumference of either a branch or trunk of a woody plant. Girdling results in the death of the area above the girdle over time.

INC - Included bark is bark that has become embedded in a crotch where limbs join and causes weakened branch attachments. As the trunk and branch increase in diameter, the bark of each stem in the tight crotch begin to push apart, increasing the likelihood of failure.

LE - A tree with a lean can be more susceptible to windthrow and soil failure. Self-correcting lean refers to a natural correction of the lean by development of new growth that counteracts the lean of the trunk to provide a more balanced form.

RAS - Ribs and seams are often associated with included bark but can also indicate internal defects or decay that cause irregular growth.

### **Root Defects**

BS - Basal Shoots are the growth of branches and leaves found growing at the bottom or base of a dead tree, or the stump from a tree that has been cut down. This may indicate that the tree is stressed.

BRF - Bulging root flare can occur on trees growing in soils with poor drainage.

EXR - Exposed surface roots can be a result of erosion and soil compaction combined with increasing root diameter. It is important to protect exposed roots from pedestrian and vehicular traffic, and lawn mowers. Damage to roots can cause stress and can result in canopy dieback.

GR - Girdling roots are roots that cross over each other or around the trunk of the tree. As these roots grow larger, they can restrict the uptake of nutrients and water, and inhibit structural anchorage.

NRF - No root flare refers to the base of the trunk where it widens as it transitions to the root system.

### **Insects / Disease / Damage**

BLK - Blackknot is a fungal disease of Prunus species (Cherry, Plum, Chokecherry) that causes swelling and discolouration of branches, resulting in girdling and dieback, and sometimes death of the tree.

BU - A burl is a localized area of swelling on the trunk or branches made up of deformed growth, generally not considered a defect.

C - A canker is an area of dead tissue, often shrunken and discoloured.

CAT - Some Caterpillars, such as the European Gypsy Moth, may cause considerable damage to a tree while others are more of a nuisance than a treat to overall tree health.

DPR - Decay at pruning wounds can occur when pruning (or other bark-penetrating abrasions) expose a tree's heartwood, which can then be affected by a rot-causing fungi. The decay can lead to cavities and internal decay, and potentially affect the structural integrity of the tree.

DED - Dutch Elm Disease. The leaves on the elm tree begin to wilt, curl, shrivel and turn brown on one or more branches. The foliage throughout the entire crown wilts and the tree dies.

EAB - Emerald Ash Borer refers to a species of beetle native to East Asia that feeds on all species ash trees (Fraxinus spp.) during its larval stage. Typical symptoms of infection include heavy seed set, dieback, splitting bark, and adventitious shoots. Almost all infected ash trees will die within a few years of infection.

FRA - Frass is the excrement of insect larvae, with an appearance similar to sawdust or small wood chips that can be seen at the base of a tree where wood boring insects are feeding. Frass can be an indicator of internal decay.

FB - Fruiting bodies are often recognized as mushrooms or conks on trees. Presence of fruiting bodies is a positive indicator of wood decay, but depending on the species of the fruiting body,

the decay can be of little significance or an indicator of imminent failure. It is important to observe decay fungi during the season in which it is growing to accurately identify the species and consider the potential associated indications of the extent of decay.

MEC - Mechanical Damage is a generalized term to describe damage to vegetation from using equipment and from weather related events. Damage to vegetation from equipment can be simple carelessness or incorrect use of the equipment.

PM - Powdery Mildew is a fungal leaf disease where white powdery spots or patches may cover the entire leaf surface. Leaves that are heavily infected may become chlorotic and senesce early. Although unsightly, the disease does not cause serious damage to established trees.

SAH - Sapsucker holes refers to holes in the trunk or branches made by birds in search of insects. This damage is a sign of insects in the tree and can make trees more susceptible to other infection.

ST - Staking can provide support to newly planted, but if left in place too long can actually damaged trees and is not always necessary. Stem attachment materials should be wide and flexible to prevent damage to the tree.

SUP - Suppressed trees are growing under the canopies of neighbouring trees, which can diminish vigour and affect structural form.

TS - Tar spot is a fungal disease also known as *rhytisma acerinum*, does not usually have an adverse effect on trees and is generally a cosmetic problem.

WBE - Witches' broom effect is a dense proliferation of shoots with short internodes, and the resulting growth appears stunted. Witches' broom can have several different causes, including fungi such as powdery mildew, insect infestation, genetic mutation, and adverse environmental conditions.

W - Woundwood is the thickened tissue growing around the edges of a wound. The rate of its development can be a sign of the tree's vigour.

### **Understorey Species of Concern**

BUC - Buckthorn is a thorny, invasive exotic shrub species that out-competes native vegetation.

CUV - Cucumber vine, grapevines and dog-strangling vine growing over the canopy of trees suppress vigour and eventually kill trees by blocking sunlight and restricting growth. They also add weight that can make trees more susceptible to breakage during storms.

GM - Garlic mustard is an invasive exotic vegetative species.

JKN - Japanese knotweed is a non-native semi-woody perennial plant with aggressive growth. It out-competes native vegetation, degrades wildlife habitat, and its roots can damage pavements and underground structures.
