Executive Summary

EXP Services Inc. (EXP) was retained by the City of Ottawa to complete a Phase Two Environmental Site Assessment (ESA) of the property located at 1770 Heatherington Road in Ottawa, Ontario, (hereinafter referred to as the 'Phase Two Property'). The Phase Two Property is currently designated as industrial land use, as it forms a portion of a former municipal works yard. The intention is to change to a mix of residential and parkland land use.

The objective of the Phase Two ESA was to assess the areas of potential environmental concern (APECs) identified in EXP's (2024) Phase One ESA and to obtain soil and groundwater data to further characterize the Phase Two Property to support the filing of a Record of Site Condition (RSC) on the Ontario Ministry of the Environment, Conservation and Parks (MECP) Brownfields Environmental Site Registry. The need to file an RSC is to support a change in land use from industrial to residential and parkland.

This Phase Two ESA was conducted in accordance with the Phase Two ESA standard defined by Ontario Regulation 153/04, as amended (O.Reg.153/04); and in accordance with generally accepted professional practices. Subject to this standard of care, EXP makes no express or implied warranties regarding its services and no third-party beneficiaries are intended. Limitation of liability, scope of report and third-party reliance are outlined in Section 8 of this report.

The Phase Two Property is located on the west side of Heatherington Road, at 1770 Heatherington Road, Ottawa in an area of mixed residential and commercial land use (Figure 1 and 2). The Phase Two property is an irregular shaped parcel of land with an area of approximately 2.7 hectares (6.7 acres) and has a generally flat topography with a gentle north to south grade. The Site was most recently used as a works yard by the City of Ottawa (City) and has been used for such purposes since around the mid-1960s. There are and were no built structures on the Phase Two Property. North-south and east-west trending soil berms, designed as a noise and visual barrier, were previously present on the east and south sides of the Phase Two Property, but have since been relocated to the west part of the property.

For assessment purposes, EXP selected the MOE (2011) Table 3: Full Depth Generic Site Condition Standards in a Non-Potable Ground Water Condition for Community Property Use and medium-to-fine textured soil. Additionally, given the minimum depth to groundwater identified in the overburden groundwater unit at the Site (i.e., 1.54 m bgs) volatile groundwater impacts were also assessed against the MECP (2011a) Table 7 Full Depth Generic SCS for Shallow Soils in a Non-Potable Groundwater Condition, all types of land use and medium/fine textured soil.

The following potentially contaminating activities (PCA) were identified on-site and within the Phase One Study Area, as per Schedule D of O. Reg 153/04, and are thought to contribute to an area of potential environmental concern (APEC):

Table EX-1: Potentially Contaminating Activities					
PCA Identifier	Address	Location of Activity (in Relation to Site)	Potentially Contaminating Activity (PCA)	Approximate Timeline That PCA Occurred	Contribution to APEC at the Site
PCA 1: Former On-Site Garage	1770 Heatherington Road	On-site (northeast corner)	#27: Garages and Maintenance and Repair of Railcars, Marine Vehicles	The site had operated as a public works yard and garage since approximately the 1960s. A three-door garage was used for the light maintenance and storage of City of	Yes - PCA is located on-site

Table EX-1: Potentially Contaminating Activities					
PCA Identifier	Address	Location of Activity (in Relation to Site)	Potentially Contaminating Activity (PCA)	Approximate Timeline That PCA Occurred	Contribution to APEC at the Site
(Location of Remedial Pit No. 1)			and Aviation Vehicles	<p>Ottawa public works vehicles and equipment. Based on a reviewed Phase I ESA (JWEL, 2008a), completed during the operation of the Site garage, various light chemicals (cleaners, motor oils, antifreeze, etc..) were stored in sealed containers within the garage. A catch basin was connected to a former dry-well east adjacent to the former garage. Based on reviewed City of Ottawa building plans from 1960 a fuel oil powdered heating system was present in the north portion of the garage. The heating system was powered by a 500-gallon fuel oil storage tank (identified as PCA 2 and described below).</p> <p>Soil and groundwater within the footprint of the former garage was remediated in 2012 - 2014. The impacts included petroleum hydrocarbons, metals and volatile organic compounds.</p>	
PCA 2: Former On-Site UST (Location of Remedial Pit No. 1)	1770 Heatherington Road	On-site (northeast corner)	#28: Gasoline and Associated Products Storage in Fixed Tanks	<p>At the time of the 2012 remedial investigation, the former UST had already been removed from the Site. The date of removal is unknown, however based on a review of City of Ottawa Site plans from 1960 the UST was identified to a 500-gallon buried, steel wall fuel oil tank.</p> <p>The tank was identified to service the heating system in the former garage structure (PCA 1, outlined above). The UST was constructed of steel and was situated on top of a subgrade concrete foundation. The UST was located north adjacent to the former garage structure.</p>	Yes – PCA is located on-site

Table EX-1: Potentially Contaminating Activities					
PCA Identifier	Address	Location of Activity (in Relation to Site)	Potentially Contaminating Activity (PCA)	Approximate Timeline That PCA Occurred	Contribution to APEC at the Site
<p>PCA 3: Surficial granular fill material of unknown quality present across the Site</p> <p>Former excavation (Pit 2) – located in central portion of the Site</p> <p>Former excavation (Pit 3) – located in southeast portion of the Site</p> <p>Former excavation (Pit 4) – located in southwest portion of the Site</p>	1770 Heatherington Road	On-site (across the entire Site)	#30: Importation of Fill Material of Unknown Quality	<p>Based on review of aerial photographs and prior ESA reports, fill materials are present across the entirety of the Site. The Site has used soil from public works operations to re-grade the property and for stockpiling at the former public works yard. Fill of unknown quality and street sweepings were stored on-Site, street sweepings were reportedly disposed of at off-Site landfill facilities each year while soil stockpiles were stored and reused for ongoing public work projects (JWEL, 2008a).</p> <p>Based on review of historical aerial photographs between 1958 and present day, fill piles and soil berms change locations during operation of the Site. Evidence of fill materials being re-worked and stored across the majority of the Site is evident from review of the historical aerial photographs. In addition, it is assumed that fill materials of unknown quality were also used to regrade the property to accommodate new structures built during the course of Site operations.</p> <p>As such, given that fill materials have been located across the majority of the Site during operations and that it is suspected that the majority of the Site has been graded with fill materials of unknown quality, PCA 3 has been identified to be associated with the entire Site. Several remedial excavations were completed to address exceedances suspected to be associated with the fill materials present at the Site:</p>	Yes – PCA is located on-site

Table EX-1: Potentially Contaminating Activities					
PCA Identifier	Address	Location of Activity (in Relation to Site)	Potentially Contaminating Activity (PCA)	Approximate Timeline That PCA Occurred	Contribution to APEC at the Site
				<p>Impacts at Pit 2 included PAH and PHC.</p> <p>Impacts at Pit 3 included V and Co.</p> <p>Impacts at Pit 3 included PAH.</p>	
PCA 4: Historical salt related exceedances, Former salt dome, salt use and salt storage	1770 Heatherington Road	On-site (across the entire Site)	#48: Salt Manufacturing, Processing and Bulk Storage	<p>The site had operated as a works yard since the 1960s, including the use and storage of de-icing salts.</p> <p>During the operation of the Site as a municipal public works yard for the City of Ottawa, de-icing related infrastructure was formerly present at the Site and de-icing salts were applied to the Site across paved regions during winter months. A former Quonset hut, salt storage dome and calcium chloride AST were all located within the northwestern portion of the Site. Salts were stored on-Site, within these structures, and were loaded into vehicles for application on municipal streets during winter months.</p> <p>In addition, based on review of historical ESA reports (JWEL, 2008b) salt-related impacts have been identified across the majority of the Site in surficial soils and overburden groundwater. As such, the entire Site was identified to be related to PCA 4.</p>	Yes – PCA is located on-site
PCA 5: Former Dry Cleaner	1574 Walkley Road	Off-Site (north adjacent property)	#37: Operation of Dry Cleaning Equipment (where chemicals are used)	<p>Betty's Brite Cleaners (formerly located at 1574 Walkley Road) operated between approximately 1980 and 1990 based on the reviewed City Directories and ERIS report, provided with the Phase One ESA (EXP, 2016a).</p> <p>Based on the proximity to the Site, duration of operations and suspected presence of halogenated solvents, the</p>	<p>Yes, however this APEC was previously assessed by JWEL in 2008b and EXP in 2016b.</p> <p>The results of the prior investigations indicated VOCs in all groundwater samples collected along the northern property line</p>

Table EX-1: Potentially Contaminating Activities					
PCA Identifier	Address	Location of Activity (in Relation to Site)	Potentially Contaminating Activity (PCA)	Approximate Timeline That PCA Occurred	Contribution to APEC at the Site
				property at 1574 Walkley Road was identified as a PCA. No information on the location of former infrastructure or other operations occurring at the property were identified. The approximate location PCA is identified to be the entire building at 1574 Walkley Road.	were less than the applicable SCS.
PCA 6: Former Retail Fuel Outlet and UST	1594 Walkley Road	Off-Site (north adjacent property)	#28: Gasoline and Associated Products Storage in Fixed Tanks	A former retail fuel outlet was present along the northern property boundary at 1594 Walkley Road as identified in the ERIS report, the City Directories and prior environmental investigations completed at the Site (JWEL, 2008a). This PCA occurred at 1594 Walkley Road between the 1960s - 1990s. Locations of storage tanks or other associated infrastructure related to the retail fuel outlet are unknown. However, the approximate location of the former retail fuel outlet is provided on Figure 4.	Yes, however previously assessed by JWEL in 2008b and EXP in 2016b. The results of the prior investigations indicated metals, PAH, PHC and VOC in groundwater samples collected along the northern property line were less than the applicable SCS.
PCA 7: Former remediation contractor	1606 Walkley Road	off-Site (north adjacent property)	#28: Gasoline and Associated Products Storage in Fixed Tanks	Triangle Pump was formerly located at 1606 Walkley Road, north adjacent to the Site. Triangle Pump is an environmental contractor with services that include solid and liquid waste removal, tank removals, and Site remediations. It is unknown if any former infrastructure or operations occurred on the property at 1606 Walkley Road. This PCA occurred between the 1960s - 1980s. Based on review of the JWEL (2008a) Phase One ESA an approximate location of the	Yes, however, previously assessed by JWEL in 2008b and EXP in 2016b. The results of the prior investigations indicated metals, PAH, PHC and VOC in groundwater samples collected along the northern property line were less than the applicable SCS.

Table EX-1: Potentially Contaminating Activities					
PCA Identifier	Address	Location of Activity (in Relation to Site)	Potentially Contaminating Activity (PCA)	Approximate Timeline That PCA Occurred	Contribution to APEC at the Site
				former building is shown on Figure 4.	
PCA 8: Former Automotive Sales and Services	1620 Walkley Road	off-Site (north adjacent property)	#27: Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles	A Nissan dealership was formerly located at the intersection of Walkley Road and Heatherington Road at 1620 Walkley Road. This PCA occurred between the 1960s - 1980s. No information on the location of historical infrastructure, storage tanks or other operations were identified.	Yes, however, previously assessed by JWEL in 2008b and by EXP in 2016b. The results of the prior investigations indicated metals, PAH, PHC and VOC in groundwater samples collected along the northern property line were less than the applicable SCS.
PCA 9: Reported Spill (Motor Oil)	1620 Walkley Road	off-Site (north adjacent property)	#Other: Spill	Based on the reviewed ERIS report a historical spill of 150 L of motor oil was identified at the property located at 1620 Walkley Road. This PCA occurred in 1988. Given the proximity of the PCA to the Sites northern boundary, the spill of motor oil was identified as a PCA.	Yes, however, previously assessed by JWEL in 2008b and by EXP in 2016b. The results of the prior investigations indicated metals, PAH, PHC and VOC in groundwater samples collected along the northern property line were less than the applicable SCS.

Ontario Regulation 153/04 defines an area of potential environmental concern (APEC) as an area on a property where one or more contaminants are potentially present. The following APEC were identified on the Phase One property.

I. Table EX-2: Areas of Potential Environmental Concern

Area of Potential Environmental Concern (APEC)	Location of APEC on Site	PCA Identifier & (Potentially Contaminating Activity)	Location of PCA (on-site or off-site)	Contaminants of Potential Concern (CPOC)	Media Potentially Impacted (Groundwater, Soil and/or Sediment)
APEC 1: Former garage in the northeast corner of the Phase One Property. All impacted soils and overburden groundwater were removed during various remediation programs (Pit 1).	Northeast Corner	PCA 1 (PCA #27: Garages and Maintenance and Repairs of railcars, Marine Vehicles, and Aviation Vehicles)	On-site	PHCs, VOCs, PAHs, metals	Soil and groundwater
APEC 2: Former UST. All impacted soils and overburden groundwater were removed during various remediation programs (Pit 1).	Northeast Corner	PCA 2 (PCA #28: Gasoline and Associated Products Storage in Fixed Tanks)	On-site	PHCs, VOCs, PAHs, metals	Soil and groundwater
APEC 3: Placement of surficial granular fill of unknown quality across the entire Site.	Across the Site	PCA 3 (PCA #30: Importation of Fill Material of Unknown Quality)	On-site	Metals, PAH, PHC	Soil
APEC 4: Salt Dome and Use on-site. Previous Phase Two ESAs by both EXP and others identified salt impacts in the shallow soil across much of the site.	Across the Site	PCA 4 (PCA #48: Salt Manufacturing, Processing and Bulk Storage)	On-site	Soil (SAR and Electrical Conductivity), Groundwater (Na, Cl-)	Soil and groundwater
APEC 5: Former off-site dry cleaner.	Northwest corner of site	PCA 5 (#37: Operation of Dry Cleaning Equipment where chemicals are used)	Off-Site	VOC	Groundwater
APEC 6: Former off-site retail fuel outlet and UST.	North central portion of site	PCA 6 (#28: Gasoline and Associated Products Storage in Fixed Tanks)	Off-Site	BTEX, PHC	Groundwater
APEC 7: Former fuel dispenser and remediation contractor.	North central portion of site	PCA 7 (#28: Gasoline and Associated Products Storage in Fixed Tanks)	Off-Site	BTEX, PHC	Groundwater

I. Table EX-2: Areas of Potential Environmental Concern					
Area of Potential Environmental Concern (APEC)	Location of APEC on Site	PCA Identifier & (Potentially Contaminating Activity)	Location of PCA (on-site or off-site)	Contaminants of Potential Concern (CPOC)	Media Potentially Impacted (Groundwater, Soil and/or Sediment)
APEC 8: Former automotive sales and services	Northeast portion of site	PCA 8 (#27: Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles)	Off-Site	PHC, PAH, metals, VOCs	Groundwater
APEC 9: Former reported motor oil spill	Northeast portion of site	PCA 9 (#Other: Spill)	Off-site	PHC, PAH	Groundwater

The Site investigative activities consisted of numerous investigations over several year and included the following:

- Test pit and surface sample advancement to facilitate the collection of soil samples for geologic characterization and/or chemical analysis.
- Borehole drilling to facilitate the collection of soil and bedrock samples for geologic characterization and/or chemical analysis; and,
- Monitoring well installation for hydrogeologic property characterization and the collection of groundwater samples for chemical analysis.

Summary of Results

The results and findings of the Phase Two ESA conducted at the Phase Two Property are summarized as follows:

1. The investigations included the advancement of 74 test pits into the sub-grade; 41 test pits into the soil berm, 53 boreholes (up to a maximum depth of approximately 18.6 m below grade) of which 47 were completed as monitoring wells and 16 surface soil samples.
2. Below the asphalt, topsoil layer, or sand and gravel granular sub-based, a layer of native silty clay was encountered across the Phase Two Property. The silty clay was approximately 1 m to 4 m thick. Below the silty clay layer was the silty clay till layer, which became progressively coarser with sand and gravel at depth. The final stratigraphic layer encountered on the Phase Two Property was the Carlsbad Formation, which is composed of shale bedrock. The bedrock was encountered at approximately 6.2 metres below grade.
3. Based on the field and analytical testing, much of the soil across the Phase Two Property was found to be impacted with SAR and EC. The source of this impact is attributed to the former storage and handling of road salt within the former works yard.
4. The intention is to address the soil impacts through a Risk Assessment

5. Overburden groundwater was detected between 1.54 m and 2.82 m bgs. Static elevations for bedrock groundwater ranged between 1.59 m bgs and 11.79 m bgs. Direction of groundwater flow was measured as southeast in the overburden and south in the bedrock.
6. Based on the field and analytical testing, salt impacts exist in both the overburden and bedrock horizons across the majority of the site extending from the source (northwest corner), and continuing downgradient to the southeast corner of the site.
7. Based on analytical testing one (1) volatile parameter was identified to exceed the Table 7 SCS in groundwater at the Site, cis-1,2-dichloroethylene. Cis-1,2-dichloroethylene was only identified to exceed the Table 7 SCS at one (1) monitoring well location, MW14-7, during the post-remedial sampling events. MW14-7 is screened within the native silty clay till soil at a depth of 1.3 – 4.3 m bgs and is located in the northeastern portion of the Site.
8. The intention is to address the groundwater impacts through a Risk Assessment

Current Site Conditions

Contaminants of concern that exist on-site include those related to salt storage and handling on the Phase Two Property and the former maintenance garage. For soil, specific contaminants of concern include SAR and EC whereas in groundwater, the contaminants of concern include Na and Cl⁻ and cis-1,2-DCE for Table 7 SCS.

With respect to receptor exposure to salt impacted soil, Table 3 generic standards are driven by ecotoxicity models as opposed to human health models. There are no human health standards for SAR and EC and consequently, there are no human health concerns associated with these parameters.

With respect to the receptor exposure salt impacted groundwater, Table 3 generic standards are driven by drinking water standards. The Phase Two Property and surrounding properties, however, rely on the municipal water supply for drinking water as opposed to local groundwater. Consequently, the exposure pathway for those parameters are incomplete.

With respect to the cis-1,2-DCE impacted groundwater, it is noted that vinyl chloride was not identified at a measured concentration at this monitoring well or any others. This indicates that anaerobic degradation is not occurring at an appreciable rate. Furthermore, the concentrations of cis-1,2-DCE at MW14-7 appear to be decreasing since the post-remedial Site maximum identified in 2019 and all post remediation groundwater sampling events met the Table 3 SCS for all VOCs analyzed.

As previously indicated, it is proposed that the Phase Two Property may be redeveloped, for parkland/residential land use, which will include some landscaping areas. The potential on-Site ecological receptors that may be present on-Site comprise terrestrial vegetation, soil invertebrates, birds and mammals.

The potential on-Site exposure pathways for terrestrial vegetation are via root uptake of soil or groundwater, and stem and foliar uptake of vapour. The potential on-Site exposure pathways for soil invertebrates are via soil dermal contact, soil ingestion, groundwater dermal contact, groundwater ingestion and inhalation of vapour. The potential on-Site exposure pathways for birds and mammals are via soil dermal contact, soil ingestion.

It is noted that the EC/SAR impacts in soil and the Na/Cl and cis-1,2-DCE impacts in groundwater remain on the Phase Two Property and will be managed as a part of the Tier III risk assessment.

Soil Management

The aforementioned RA provides risk management measures, including capping specifications, associated with managing soil in place.

It is noted that the linear soil berms previously located on the east side of the Phase Two Property has been relocated to the west portion of the 1770 Heatherington Road property and are suitable for use as fill, provided it meets geotechnical requirements.

It is recommended that any excess soil that is generated during the redevelopment of the site be managed in accordance with the MECP document entitled *Rules for Soil Management and Excess Soil Quality Standards* with particular reference to the conditions related to salt-impacted excess soil (Section D 1, (3)).

The Qualified Person can confirm that the Phase Two Environmental Site Assessment was conducted per the requirements of Ontario Regulation 153/04, as amended, and in accordance with generally accepted professional practices.

This executive summary is a brief synopsis of the report and should not be read in lieu of reading the report in its entirety

1 Introduction

EXP Services Inc. (EXP) was retained by the City of Ottawa to complete a Phase Two Environmental Site Assessment (ESA) of the property located at 1770 Heatherington Road in Ottawa, Ontario, (hereinafter referred to as the 'Phase Two Property'). The Phase Two Property is currently designated as industrial land use, as it forms a portion of a former municipal works yard. The intention is to change to residential and parkland.

The objective of the Phase Two ESA was to assess the areas of potential environmental concern (APECs) identified in EXP's (2024) Phase One ESA and to obtain soil and groundwater data to further characterize the Phase Two Property to support the filing of a Record of Site Condition (RSC) on the Ontario Ministry of the Environment, Conservation and Parks (MECP) Brownfields Environmental Site Registry. The need to file an RSC is in support of the intended change in land use from industrial to residential and parkland.

This Phase Two ESA was conducted in accordance with the Phase Two ESA standard defined by Ontario Regulation 153/04, as amended (O.Reg.153/04); and in accordance with generally accepted professional practices. Subject to this standard of care, EXP makes no express or implied warranties regarding its services and no third-party beneficiaries are intended. Limitation of liability, scope of report and third-party reliance are outlined in Section 8 of this report.

The Site investigative activities, as incorporated into this Phase Two ESA, were conducted between 2005 and 2023.

1.1 Site Description

The Phase Two Property is located on the west side of Heatherington Road at 1770 Heatherington Road, Ottawa in an area of mixed residential and commercial land use (Figure 1 and 2). The Phase Two Property covers an area of approximately 2.7 hectares and consists of a vacant and undeveloped portion of a former City of Ottawa Works Yard as shown in Figure 3A. North-south and east-west trending soil berms, designed as a noise and visual barrier, were previously present on the east and south sides of the Phase Two Property, but have since been relocated to the west end of the site.

Former structures that previously existed on the site included a 3-bay maintenance garage, salt storage dome, storage shed, four office trailers, quonset hut, and an aboveground (liquid) calcium chloride storage tank as shown in Figure 3B. All these structures were located on the northern half of the property which included paved access and parking areas. The southern half of the site is gravel covered. All structures were removed from the site prior to remedial activities that commenced in 2012 and concluded in 2015. The site is currently vacant and is not being used for any purpose.

The Phase Two Property is currently bounded by commercial retail businesses to the north, a Boys and Girls Club community building followed by Heatherington Road and residential landuse to the east, followed by the Ministry of Transportation facility and residential landuse to the west and residential landuse to the south.

The approximate Universal Transverse Mercator (UTM) coordinates for the subject site centroid is NAD83, Zone 18, 449470 m E, 5024942 m N. The UTM coordinates were based on an estimate derived using Google Earth™. The accuracy of the centroid is estimated to range from 5 to 50 m.

1.2 Legal Description and Property Ownership

The legal description of the Phase Two Property is Part of Lot A, Concession 4 (Rideau Front), Geographic Township of Gloucester; Part 2 on Plan 4R-33717; Part of PIN 04741-0011 (LT) and is zoned IG1; General Industrial Zone. A survey plan for this is presented in Appendix D.

At the time of the investigation, the Phase Two Property was owned by:

Owner Contact: City of Ottawa
 110 Laurier Avenue West, 5th Floor
 Ottawa, Ontario K1P 1J1

1.3 Current and Proposed Future Uses

The Phase Two Property is currently designated as industrial land use, as it forms a former municipal works yard. The intention is to change to parkland and residential land use. The proposed layout is also presented in Appendix D.

1.4 Applicable Site Condition Standards

Analytical results obtained for Phase Two Property soil and groundwater samples were assessed against Site Condition Standards (SCS) as established under subsection 169.4(1) of the Environmental Protection Act, and presented in the document MOE "Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the *Environmental Protection Act*", ("SGWS" Standards), (MOE, 2011a). Tabulated background SCS (Table 1) applicable to environmentally sensitive properties and effects-based generic SCS (Tables 2 to 9) applicable to non-environmentally sensitive properties are provided in MOE (2011a). The effects-based SCS (Tables 2 to 9) are protective of human health and the environment for different groundwater conditions (potable and non-potable), land use scenarios (residential, parkland, institutional, commercial, industrial, community and agricultural/other), soil texture (coarse or medium/fine) and restoration depth (full or stratified).

Tables 1 to 9 of MOE (2011a) are summarized as follows:

- Table 1 – applicable to sites where background concentrations must be met (full depth), such as sensitive sites where site-specific criteria have not been derived;
- Table 2 – applicable to sites with potable groundwater and full depth restoration;
- Table 3 – applicable to sites with non-potable groundwater and full depth restoration;
- Table 4 – applicable to sites with potable groundwater and stratified restoration;
- Table 5 – applicable to sites with non-potable groundwater and stratified restoration;
- Table 6 – applicable to sites with potable groundwater and shallow soils;
- Table 7 – applicable to sites with non-potable groundwater and shallow soils;
- Table 8 – applicable to sites with potable groundwater and that are within 30 m of a water body; and,
- Table 9 – applicable to sites with non-potable groundwater and that are within 30 m of a water body.

Application of the generic or background SCS to a specific property is based on a consideration of conditions related to soil pH (*i.e.*, surface and subsurface soil), thickness and extent of overburden material (*i.e.*, shallow soil

conditions), and proximity to an area of environmental sensitivity or of natural significance. For some chemical constituents, consideration is also given to soil textural classification with SCS having been derived for both coarse and medium-fine textured soil conditions.

For assessment purposes, EXP selected the MOE (2011) Table 3: Full Depth Generic Site Condition Standards in a Non-Potable Ground Water Condition for Community Property Use and medium-to-fine textured soil. The selection of this category was based on the following factors:

- The Phase Two Property had an overburden thickness greater than 2 m. The Phase Two Property is not located within 30 m of a surface water body or an area of natural significance.
- Soil samples collected at the Phase Two Property have pH values inside of the acceptable range between 5 and 9 for surficial soils and, between 5 and 11 for subsurface soils.
- The property is not within an area of natural significance; does not include, nor is it adjacent to an area of natural significance, nor is it part of such an area; and, it does not include land that is within 30 m of an area of natural significance, nor is it part of such an area.
- The Phase Two Property and surrounding properties are supplied by the City of Ottawa municipal drinking water system, and no potable water wells are located on the Phase Two Property.
- The predominant soil type on the Phase Two Property was considered to be medium-to-fine textured (refer to Borehole Logs in Appendix F and grain size analysis results in Appendix H).
- There was no intention to carry out a stratified restoration at the Phase Two Property.

Additionally, given the minimum depth to groundwater identified in the overburden groundwater unit at the Site (i.e., 1.54 m bgs) volatile groundwater impacts were also assessed against the MECP (2011a) Table 7 Full Depth Generic SCS for Shallow Soils in a Non-Potable Groundwater Condition, all types of land use and medium/fine textured soil. It is also noted that the MECP Table 7 Generic SCS for Shallow soils in Non-Potable Ground Water Condition consider a scenario where biodegradation cannot be assured and where soil may not be present to provide attenuation to volatile migration towards the surface grade.

2 Background Information

2.1 Physical Setting

The following physiographic, geological and soil maps were reviewed as part of this Phase Two ESA:

1. *Bedrock Geology of Southern Ontario* – Ontario Geological Survey. Scale 1:50,000. Electronic resource Issued 2003.
2. *Surficial Geology of Southern Ontario*– Ontario Geological Survey. Scale 1:50,000. Electronic resource Issued 2003.
3. MOE Water Well Records and Ontario Geotechnical Boreholes. Electronic Resource.

Based on the review of the above maps, the following information was obtained:

- The review of the Bedrock Geology revealed that the bedrock in the general area of the Phase Two Property is part of a group belonging to the Carlsbad Formation consisting of shale and limestone.
- A review of the Surficial Geology revealed that the Phase Two Property and surrounding area are dominated by fine textured glaciomarine deposits of silt and clay.
- The review of the Physiographic Region Map revealed that the Phase Two Property and surrounding area is in the physiographic region known as “Till Plains (Drumlinized)”.
- The closest body of water is the McEwens Creek located 1.3 km south of the Phase Two Property. Based on topography and the direction of the Creek, the inferred groundwater flow direction was expected to be to the southeast direction.

The Ministry of Natural Resources (MNR) Natural Heritage website was reviewed to assess if the Phase Two Property was considered to be an Area of Natural and Scientific Interest (ANSI). Based on the review of the MNR website, there are no ANSI within proximity to the Phase Two Property.

2.2 Previous Environmental Reports

There have been numerous reports conducted at the Phase Two Property between 2008 and 2021. A summary of the previous reports is presented in Appendix A.

2.3 Previous Remedial Activities – Former Works Yard

Several environmental Site assessments have been completed since 2008. Figures depicting the extent and sampling results of the remedial excavations are provided on Figures 26 through 32. Again, it is noted that remedial Pit No. 6 was formerly located on-site, but due to revisions to the property boundary Pit No. 6 is now located off-site.

Site remediation activities were subsequently completed in two phases in 2012 and 2015, respectively. The remediation activities included: i) the excavation and disposal of impacted soil at licensed landfill facilities; and, ii) the pumping and disposal of impacted groundwater at licensed facilities.

In 2012, six (6) excavations (Pits 1 to 6) were advanced on the site to address soil impacted by various parameters at different locations across the site (Figure 6). A total of 7,130 tonnes of impacted soil was removed from the site and disposed of at the Tomlinson waste disposal facility at Rideau Road in Ottawa. Due to site limiting features, the

main excavation (Pit 1) could not be fully completed to the north and east. A total of 126,020 litres of impacted groundwater was removed from Pit 1 during the remediation work and disposed of at the Clean Water Works disposal facility at Bantree Street in Ottawa.

Following the 2012 excavation activities, eight (8) overburden monitoring wells were constructed in the Pit 1 excavation (MW12-1 to MW12-5, MW08-8, MW08-10 and MW12-11) (Figure 16). These wells were sampled on two or three occasions including July 2012 and/or October 2012, and April 2013. Exceedances were noted in MW08-19 for cis-1,2-dichloroethylene (cis-1,2-DCE and VC in all sampling rounds).

In 2014, the main excavation (Pit 1) was further excavated to the north and east to remove the remaining impacted soil which could not be removed during the 2012 works. An additional 2,040 tonnes of impacted soil were removed from these areas and disposed of at the City of Ottawa owned and operated Trail Road waste disposal facility. Several monitoring wells were also removed during the excavation activities. An additional 16,500 L of impacted groundwater was pumped from the Pit 1 excavation and disposed of at the Clean Water Works disposal facility at Bantree Street in Ottawa.

Analytical results from the 2012 and 2014 confirmatory soil sampling met the applicable Table 3 non-potable criteria indicating vertical and horizontal delineation was achieved at all excavation areas.

Following the 2014 excavation activities, eight additional overburden monitoring wells were installed in and around Pit 1. These wells, plus several of the 2012 monitoring wells, were sampled on two occasions (July 2014 and November 2014). During these rounds of sampling and analyses, no exceedances of the applicable Table 3 non-potable criteria were detected for VOC, PHC, or PAH.

The following are the significant conclusions resulting from the specific excavations advanced on-site. It should also be noted that the EC/SAR impacts in soil and the Na/Cl impacts in groundwater remain on the Site and will be managed as a part of the risk assessment.

Table 2.1: Summary of Previous Remedial Efforts

Location	Contaminants of Concern in Soil	Volume (Tonnage) of Soil Removed	Confirmatory Soil Analysis	Contaminants of Concern in Groundwater	Volume of Groundwater Removed (litres)	Confirmatory Groundwater Analysis
Pit 1	PHC, VOC, PAH, boron (HWS), lead	4,025 m ³ (8,480 T)	All samples submitted for confirmatory analysis (ie; VOC [16 samples], PHC [53 samples], PAH [2 samples], boron (HWS) and lead [3 samples] met the applicable criteria.	PHC, VOC, PAH	142,520	Post remediation groundwater monitoring met the applicable criteria (2014 x2, 2015, 2019, 2022)
Pit 2	PHC, PAH	222 m ³ (380 T)	All samples submitted for confirmatory analysis (i.e.; PHC [8 samples] and PAH [8 samples] met the applicable criteria	None	None	2015 groundwater monitoring met the applicable criteria

Location	Contaminants of Concern in Soil	Volume (Tonnage) of Soil Removed	Confirmatory Soil Analysis	Contaminants of Concern in Groundwater	Volume of Groundwater Removed (litres)	Confirmatory Groundwater Analysis
Pit 3	Cobalt, vanadium	54 m ³ (90 T)	All samples submitted for confirmatory analysis (i.e.; cobalt and vanadium) met the applicable criteria	None	None	2015 groundwater monitoring met the applicable criteria
Pit 4	PAH	42 m ³ (80 T)	All samples submitted for confirmatory met the applicable criteria	None	None	2015 groundwater monitoring met the applicable criteria
Pit 5	pH	36 m ³ (80 T)	All samples submitted for pH confirmatory analysis met the applicable criteria	None	None	Not applicable
Pit 6 ⁽¹⁾	pH	25 m ³ (60 T)	All samples submitted for pH confirmatory analysis met the applicable criteria	None	None	Not applicable

(1) Pit No. 6 is Located Off-Site (formerly located on-Site but due to property boundary revisions, Pit No. 6 is now located off-Site).

Brief summaries regarding the remedial efforts completed at the Site and on the adjacent and are summarized below under the sub-headings Pit 1 through Pit 6 Excavation details, below:

Pit 1 Excavation Details (On-Site, North-Eastern Portion of Site)

Between 2008 and 2012, exceedances of various PAHs, select metals (soil only), PHCs and VOCs (groundwater only) were identified in soil and groundwater were identified in samples collected from the vicinity of the former maintenance and storage garage located at the north portion of the Site.

Between 2012 and 2014 approximately, 8,480 tonnes of impacted soil that exceeded the MECP Table 3 SCS for Residential/Parkland/Institutional Property Use (medium - fine textured) was removed from this excavation and disposed of at a licensed landfill site. The final excavation for Pit No. 1 measured approximately 1,150 m² in total floor area.

Analytical results from the 2012 and 2014 confirmatory soil sampling met the applicable Table 3 SCS indicating vertical and horizontal delineation for soil impacts was achieved at all excavation areas. In brief the following confirmation samples were collected from Pit No. 1 to assess soil quality:

- North Wall – In 2012, nine (9) soil samples were collected from the north wall and analyzed for VOCs, PAHs, PHCs and/or select metals. Four (4) of the 2012 samples from the north wall failed to meet the applicable Table 3 SCS for PHCs F1-F2. No other exceedances were identified. As such, in 2014 the bounds of the north wall were extended, and an additional five (5) soil samples and one (1) duplicate were collected from the new bounds of the north wall and analyzed for PHCs. No exceedances were identified, and the north wall of the excavation had been determined to be appropriately delineated to the applicable SCS.
- South Wall – In 2012, three (3) soil samples were collected from the bounds of the south wall and were analyzed for VOCs and/or PHCs. No exceedances were identified in the soil samples collected from along the south wall. In 2014, two (2) additional soil samples were collected from the south wall and were analyzed for PHCs.
- East Wall – In 2012, five (5) soil samples and one (1) duplicate sample were collected from along the east wall and were analyzed for VOCs, PHCs and/or PAHs. Select exceedances of PHC F2 were identified in several soil samples collected from the east wall in 2012. As such, in 2014 the east wall was extended, and an additional five (5) soil samples and two (2) duplicates were collected from the new bounds of the east wall and analyzed for VOCs and/or PHCs. No exceedances of the applicable SCS were noted for the samples collected in 2014 from the east wall.
- West Wall – Between 2012 and 2014, seven (7) soil samples were collected from the west wall and were analyzed for VOCs, PHCs and/or select metals. One (1) exceedance was identified in a sample collected from the west wall in 2014 for PHC F3, the sampling location was subsequently removed, and additional confirmatory sampling indicated delineation of impacts had been archived.
- Floor – In 2012, eight (8) soil samples were collected from the floor of the remediation and were analyzed for PHCs, no exceedances of the applicable SCS were identified. In 2014 at the time of the north wall extension an additional ten (10) soil samples and three(3) duplicate samples were collected from the floor of the excavation and analyzed for VOCs and/or PHCs. No exceedances of the applicable SCS were identified for any of the 2012 or 2014 floor samples collected from Pit No. 1.

Throughout the excavating work at Pit 1, groundwater seeped into the base of the excavation and was pumped into a holding tank as needed. The holding tank was then emptied by Clean Water Works when filled. A total of 142,520 liters of groundwater from Pit No. 1 was hauled off-site by Clean Water Works. All groundwater was disposed of under provincial code description 251 L at the Clean Water Works disposal facility at Bantree Street in Ottawa.

Following the 2012 excavation activities, eight (8) overburden monitoring wells were constructed in the Pit 1 excavation (MW12-1 to MW12-5, MW08-8, MW08-10 and MW12-11). These wells were sampled on two (2) or three (3) occasions including July 2012 and/or October 2012, and April 2013.

Following the 2014 excavation and 2012-2013 groundwater sampling activities, eight (8) additional overburden monitoring wells were installed in and around Pit 1. These wells, plus several of the 2012 monitoring wells, were sampled on two occasions (July 2014 and November 2014). During these rounds of sampling and analyses, no exceedances of the applicable Table 3 non-potable criteria were detected for VOC, PHC, or PAH. As such it was deemed that the groundwater within the remedial Pit No. 1 footprint met the applicable Table 3 SCS.

Given that the final round of confirmatory sampling conducted in 2014 for Pit 1 yielded analytical results for soil and groundwater samples below the applicable Table 3 SCS, Pit No. 1 was not identified as a PCA for the Site and is considered to be remediated to the applicable Table 3 SCS as per the opinion of the QP_{ESA}.

Pit 2 Excavation Details (On-Site, Central Portion)

Between May 18 and May 22, 2012, Pit No. 2 was excavated on the central portion of the Site to address PHC (F1-F4) and PAH soil exceedances identified at test pit location, TP08-15. On the 30th of January 2008, a marginal exceedance of benzo(a)pyrene (0.36 ug/g) and an exceedance of PHC F2 (1,740 ug/g) were noted at this sampling location, TP08-15, at a sampling depth of 0.3 m bgs.

Approximately 380 tonnes of impacted soil were removed from the Pit 2 excavation. The excavation was advanced to a depth of 1.2 m below ground surface. Groundwater did not enter the excavation. The final excavation for Pit 2 measured approximately 185 m².

To confirm the removal of soil impacts identified at TP08-15, a total of five (5) composite wall samples (i.e., NW1-1, SW2-2, EW2-1, EW5-1 and WW3-1) were collected from the, north, south, east and west walls of the excavation. In addition, three (3) composite floor samples (i.e., F2, F7, and F12) were collected from the base of the excavation. All confirmatory samples collected from Pit 2 met the applicable Table 3 SCS for the Site, indicating impacts had been removed and delineation achieved. Furtherer more, following the completion of the Pit 2 excavation, a monitoring well was installed, denoted as MW15-4, at the approximate location of the former TP08-15. MW15-4 was screened at a depth of 3.0 – 6.0 m bgs and was subsequently sampled for PHCs and BTEX and PAH parameters on the 25th of August 2015. No exceedances of either PHCs and BTEX or PAHs were identified in the groundwater sampling conducted at MW15-4.

Given that all confirmatory sampling conducted at this location yielded analytical results for PHCs and BTEX and PAHs below the applicable Table 3 SCS, Pit No. 2 was not identified as a PCA for the Site and is considered to be remediated to the applicable Table 3 SCS as per the opinion of the QP_{ESA}.

Pit 3 Excavation Details (On-Site, Southeastern Portion)

On May 23, 2012, Pit No. 3 was excavated along the southern boundary of the Site, to address cobalt and vanadium soil exceedances identified at MW08-8 in a soil sample collected at a depth of 0.2 – 1.22 m bgs.

A total of approximately 90 tonnes of soil was excavated from the Pit 3 excavation. Initially the excavation was advanced to a depth of 1.2 m below ground surface and three (3) composite wall samples (i.e., WW1-1, EW1-1, and NW2-1) and two (2) composite floor samples (i.e., F3 and Fla) were collected for laboratory analysis of cobalt and vanadium. One (1) of the submitted floor samples exceeded the criteria for both cobalt and vanadium. As a result, on May 30, 2012, the western portion of the excavation was advanced to a depth of 1.5 m below ground surface and re-sampled, the additional confirmational soil sample was found to meet the applicable Table 3 criteria.

Groundwater did not enter the excavation. The final excavation for Pit 3 measured approximately 36 m² in total floor area. Following remedial activities, a monitoring well denoted as MW15-6, was advanced within the center of the former remedial pit with a screen depth of 3.0 – 6.0 m bgs. MW15-6 was sampled on August 25th, 2015, for metals and inorganics and no exceedances of the applicable Table 3 SCS were identified.

Given that the remedial Pit 3 is located at the downgradient portion of the Site, and that all confirmatory soil and groundwater sampling at this location yielded analytical results for cobalt and vanadium below the applicable Table 3 SCS, Pit No. 3 was not identified as a PCA for the Site and is considered to be remediated to the applicable Table 3 SCS as per the opinion of the QP_{ESA}.

Pit 4 Excavation Details (On-Site, South-Central Portion of Site)

On May 24, 2012, Pit No. 4 was excavated at the southern property boundary to address a PAH soil exceedance identified at TP08-1. Benzo(a)pyrene and fluoranthene were both identified as marginal exceedances of the applicable Table 3 SCS in a sample collected from a depth of 0.2 m bgs at TP08-1 in January 2008.

Approximately 80 tonnes (4 truckloads) of impacted soil were removed from the Pit 4 excavation. The excavation was advanced to a depth of 1 m below ground surface. Three (3) composite wall samples (i.e., NW2-1, EW3-1 and WW2-1) and two (2) composite floor samples (i.e., F1 and F4) were collected and submitted for laboratory analysis of PAH. All confirmatory samples collected from the remedial excavation yielded analytical results below the applicable Table 3 SCS.

Groundwater did not enter the excavation. The final excavation for Pit 4 measured approximately 42 m² in total floor area. Following remedial activities, a monitoring well denoted as MW15-9, was advanced within the center of the former remedial pit with a screen depth of 3.0 – 6.0 m bgs. MW15-9 was sampled on August 25, 2015, for PAHs and no exceedances of the applicable Table 3 SCS were identified.

Given that the remedial Pit No. 4 is located at downgradient boundary of the Site and that all confirmatory soil and groundwater sampling at this location yielded analytical results for PAHs below the applicable Table 3 SCS, Pit 4 was not identified as a PCA for the Site.

Pit 5 Excavation Details (On-Site, South-Central Portion of Site)

On May 31 2012, Pit 5 was excavated at the south-central portion of the Site to address pH exceedances identified in a soil sample collected from TP08-8 at a sampling depth of 0.6 m bgs on the 30th of January 2008.

Approximately 80 tonnes (4 truckloads) of impacted material were removed from the Pit 5 excavation and three (3) composite wall samples (i.e., WW1, EW1, and SW1) and two (2) composite floor samples (i.e., F1 and F2) were collected and sent for laboratory analysis of pH. All five (5) of the confirmatory pH samples were within the applicable Table 3 SCS pH range for surficial soils.

Groundwater did not enter the excavation. The final excavation for Pit 5 measured approximately 36 m².

Given that the remedial Pit 5 is located at the downgradient portion of the Site and that all confirmatory soil sampling at this location yielded analytical results for soil pH within the applicable Table 3 SCS, Pit 5 was not identified as a PCA for the Site and is considered to be remediated to the applicable Table 3 SCS as per the opinion of the QP_{ESA}.

Pit 6 Excavation Details (Off-Site – Located 15 m east of the Site)

On May 31, 2012, Pit 6 was excavated to the immediate east of the current Site boundaries to address a pH exceedance identified at a test pit in 2008. Based on revisions to the current Site boundary Pit No. 6 is now located off-Site, and analytical results for the remediation of Pit 6 are not presented in the current Phase two CSM or associated Figures. However, the approximate location and general details of the Pit 6 remediation are provided in the figures and below for transparency.

Approximately 60 tonnes (3 truckloads) of impacted surficial soil material was removed from the Pit 6 excavation up to a depth of 1.0 m bgs. Two (2) composite wall samples and three (3) composite floor samples including one (1) duplicate sample, for QA/QC purposes, were collected from Pit 6 and sent for the laboratory analysis of pH. On June 22, 2021, two (2) additional soil samples, S1 and S2, were collected from the bounds of the Pit 6 excavation, from the south and east walls of the former excavation, respectively. Soil samples S1 and S2 were collected at a depth of approximately 0.3 – 0.5 m bgs. All confirmational soil sampling for pH yielded results within the Table 3 SCS.

Groundwater was not encountered upon advancement of the excavation. The final excavation area for Pit 6 measured approximately 25 m². It is noted that no confirmatory groundwater sampling was conducted at Pit 6 given the nature of the initial soil exceedance identified (i.e., pH).

2.4 Soil Importation

In 2012, the backfill material used for re-instating all the excavations comprised of Granular B Type I and II material. The material was placed in 300 mm lifts and each lift was compacted. In-place density testing was conducted using a nuclear densometer on lifts to ensure that the specified degree of compaction has been achieved. The test results indicated that the granular fill was compacted to a minimum degree of compaction of 98 percent of the Standard Proctor Dry Density.

Backfilling activities for the excavation were carried out by Tomlinson using pit run and Granular B Type I and II material sourced from their commercial operations. A total of 4,370 m³ of material was imported to the Site in 2012. A total of four (4) soil samples were collected from the imported backfill material and submitted for laboratory analysis of PHC (F1-F4). The analytical results indicate all the imported backfill samples met the applicable criteria for PHC (F1-F4). It is noted that Granular B Type I and II materials do not meet the definition of 'soil' as per that provided in O.Reg. 153/04, as amended, and as such backfilling materials were not required to be tested prior to importation. As a conservative measure, EXP undertook testing on the granular backfill material for PHCs, the results of which are presented in table 7B below.

Table 2.2 Result of Confirmational Sampling of Backfill Materials Used at Site

Parameter	Detection Limit (µg/g)	MECP (2011) Table 3: Full Depth Generic SCS in a Non-Potable Groundwater Condition Industrial/Commercial/Community Land Use (medium/fine textured soil)	Imported B. Fill 1	Imported B. Fill 2	Imported B. Fill 3	Imported B. Fill 4
Sample Date (m/d/y)			(CoA No. 1223122-01)	(CoA No. 1223122-02)	(CoA No. 1223122-03)	(CoA No. 1223122-04)
			06/04/2012	06/04/2012	06/04/2012	06/04/2012

Please refer to Appendix G (USB) for a copy of the Laboratory Certificate of Analysis generated for the confirmational sampling of PHCs (F1-F4) in the granular backfill materials used at the Site.

In 2014, the backfill material used for re-instating the excavation comprised of Granular B Type II material sourced from Karson Aggregates. A total of 1,236 m³ of material was imported to the Site in 2014. Based on the texture and coarseness of the aggregate, the backfill material from the commercial quarry was not considered to be soil material, and thus did not require laboratory analysis.

In addition, the segregated stockpiled material that was deemed to be acceptable based on laboratory analysis was also used in the backfilling process. The material was placed in 300 mm lifts and each lift was compacted as best as possible. However, based on the extreme cold temperatures during backfilling, compaction testing could not be completed.

2.5 Phase One Conceptual Site Model

2.5.1 Site Description

This section provides a description of the Phase One conceptual site model (CSM).

The Phase Two Property is located on the west side of Heatherington Road, at 1770 Heatherington Road, Ottawa. The legal description of the Phase Two Property is Part of Lot A, Concession 4 (Rideau Front), Geographic Township of Gloucester; Part 2 on Plan 4R-33717; Part of PIN 04741-0011 (LT). The Phase Two Property consists of a 0.47-hectare parcel which consists of the east-central portion of a former City of Ottawa works yard that is currently vacant.

The approximate Universal Transverse Mercator (UTM) coordinates for the subject site centroid is NAD83, Zone 18, 449470 m E, 5024942 m N. The UTM coordinates were based on an estimate derived using Google Earth™. The accuracy of the centroid is estimated to range from 5 to 50 m.

Topographically, the Phase Two Property is generally flat, with a slight grade from north to south. Surface water drainage flows to catch basins and storm sewers located in the paved portion north of the Phase Two Property of the site or dissipates via surface infiltration. Standing water was noted around the soil berms on the southern portion of the property. Regional groundwater flow is inferred to be toward Sawmill Creek located approximately 1.3 km south of the Phase Two Property. Previous investigations by EXP at the Phase Two Property confirm groundwater flow direction is to the south - southwest. A municipal drainage ditch is located approximately 600 m southwest of the Phase Two property.

2.5.2 Potentially Contaminating Activities

The following potentially contaminating activities (PCA) were identified on-site and within the Phase One Study Area, as per Schedule D of O. Reg 153/04, and are thought to contribute to an area of potential environmental concern (APEC) (Figure 7).

Table 2.3: Summary of Potentially Contaminating Activities

PCA Identifier	Address	Location of Activity (in Relation to Site)	Potentially Contaminating Activity (PCA)	Approximate Timeline That PCA Occurred	Contribution to APEC at the Site
PCA 1: Former On-Site Garage (Location of Remedial Pit No. 1)	1770 Heatherington Road	On-site (northeast corner)	#27: Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles	The site had operated as a public works yard and garage since approximately the 1960s. A three-door garage was used for the light maintenance and storage of City of Ottawa public works vehicles and equipment. Based on a reviewed Phase I ESA (JWEL, 2008a), completed during the operation of	Yes - PCA is located on-site

PCA Identifier	Address	Location of Activity (in Relation to Site)	Potentially Contaminating Activity (PCA)	Approximate Timeline That PCA Occurred	Contribution to APEC at the Site
				<p>the Site garage, various light chemicals (cleaners, motor oils, antifreeze, etc..) were stored in sealed containers within the garage. A catch basin was connected to a former dry-well east adjacent to the former garage. Based on reviewed City of Ottawa building plans from 1960 a fuel oil powdered heating system was present in the north portion of the garage. The heating system was powered by a 500-gallon fuel oil storage tank (identified as PCA 2 and described below).</p> <p>Soil and groundwater within the footprint of the former garage was remediated in 2012 - 2014. The impacts included petroleum hydrocarbons, metals and volatile organic compounds.</p>	
<p>PCA 2: Former On-Site UST</p> <p>(Location of Remedial Pit No. 1)</p>	1770 Heatherington Road	On-site (northeast corner)	#28: Gasoline and Associated Products Storage in Fixed Tanks	<p>At the time of the 2012 remedial investigation, the former UST had already been removed from the Site. The date of removal is unknown, however based on a review of City of Ottawa Site plans from 1960 the UST was identified to a 500-gallon buried, steel wall fuel oil tank.</p> <p>The tank was identified to service the heating system in the former garage structure (PCA 1, outlined above). The UST was constructed of steel and was situated on top of a subgrade concrete foundation. The UST was located north adjacent to the former garage structure.</p>	Yes – PCA is located on-site
PCA 3: Surficial granular fill material of unknown quality	1770 Heatherington Road	On-site (across the entire Site)	#30: Importation of Fill Material of Unknown Quality	Based on review of aerial photographs and prior ESA reports, fill materials are present across the entirety of the Site. The Site has used soil from public works operations to re-grade the	Yes – PCA is located on-site

PCA Identifier	Address	Location of Activity (in Relation to Site)	Potentially Contaminating Activity (PCA)	Approximate Timeline That PCA Occurred	Contribution to APEC at the Site
<p>present across the Site</p> <p>Former excavation (Pit 2) – located in central portion of the Site</p> <p>Former excavation (Pit 3) – located in southeast portion of the Site</p> <p>Former excavation (Pit 4) – located in southwest portion of the Site</p>				<p>property and for stockpiling at the former public works yard. Fill of unknown quality and street sweepings were stored on-Site, street sweepings were reportedly disposed of at off-Site landfill facilities each year while soil stockpiles were stored and reused for ongoing public work projects (JWEL, 2008a).</p> <p>Based on review of historical aerial photographs between 1958 and present day, fill piles and soil berms change locations during operation of the Site. Evidence of fill materials being re-worked and stored across the majority of the Site is evident from review of the historical aerial photographs. In addition, it is assumed that fill materials of unknown quality were also used to regrade the property to accommodate new structures built during the course of Site operations.</p> <p>As such, given that fill materials have been located across the majority of the Site during operations and that it is suspected that the majority of the Site has been graded with fill materials of unknown quality, PCA 3 has been identified to be associated with the entire Site. Several remedial excavations were completed to address exceedances suspected to be associated with the fill materials present at the Site:</p> <p>Impacts at Pit 2 included PAH and PHC.</p> <p>Impacts at Pit 3 included V and Co.</p> <p>Impacts at Pit 3 included PAH.</p>	

PCA Identifier	Address	Location of Activity (in Relation to Site)	Potentially Contaminating Activity (PCA)	Approximate Timeline That PCA Occurred	Contribution to APEC at the Site
PCA 4: Historical salt related exceedances, Former salt dome, salt use and salt storage	1770 Heatherington Road	On-site (across the entire Site)	#48: Salt Manufacturing, Processing and Bulk Storage	<p>The site had operated as a works yard since the 1960s, including the use and storage of de-icing salts.</p> <p>During the operation of the Site as a municipal public works yard for the City of Ottawa, de-icing related infrastructure was formerly present at the Site and de-icing salts were applied to the Site across paved regions during winter months. A former Quonset hut, salt storage dome and calcium chloride AST were all located within the northwestern portion of the Site. Salts were stored on-Site, within these structures, and were loaded into vehicles for application on municipal streets during winter months.</p> <p>In addition, based on review of historical ESA reports (JWEL, 2008b) salt-related impacts have been identified across the majority of the Site in surficial soils and overburden groundwater. As such, the entire Site was identified to be related to PCA 4.</p>	Yes – PCA is located on-site
PCA 5: Former Dry Cleaner	1574 Walkley Road	Off-Site (north adjacent property)	#37: Operation of Dry Cleaning Equipment (where chemicals are used)	<p>Betty's Brite Cleaners (formerly located at 1574 Walkley Road) operated between approximately 1980 and 1990 based on the reviewed City Directories and ERIS report, provided with the Phase One ESA (EXP, 2016a).</p> <p>Based on the proximity to the Site, duration of operations and suspected presence of halogenated solvents, the property at 1574 Walkley Road was identified as a PCA. No information on the location of former infrastructure or other operations occurring at the property were identified. The approximate location PCA is</p>	<p>Yes, however this APEC was previously assessed by JWEL in 2008b and EXP in 2016b.</p> <p>The results of the prior investigations indicated VOCs in all groundwater samples collected along the northern property line were less than the applicable SCS.</p>

PCA Identifier	Address	Location of Activity (in Relation to Site)	Potentially Contaminating Activity (PCA)	Approximate Timeline That PCA Occurred	Contribution to APEC at the Site
				identified to be the entire building at 1574 Walkley Road.	
PCA 6: Former Retail Fuel Outlet and UST	1594 Walkley Road	Off-Site (north adjacent property)	#28: Gasoline and Associated Products Storage in Fixed Tanks	A former retail fuel outlet was present along the northern property boundary at 1594 Walkley Road as identified in the ERIS report, the City Directories and prior environmental investigations completed at the Site (JWEL, 2008a). This PCA occurred at 1594 Walkley Road between the 1960s - 1990s. Locations of storage tanks or other associated infrastructure related to the retail fuel outlet are unknown. However, the approximate location of the former retail fuel outlet is provided on Figure 4.	Yes, however previously assessed by JWEL in 2008b and EXP in 2016b. The results of the prior investigations indicated metals, PAH, PHC and VOC in groundwater samples collected along the northern property line were less than the applicable SCS.
PCA 7: Former remediation contractor	1606 Walkley Road	off-Site (north adjacent property)	#28: Gasoline and Associated Products Storage in Fixed Tanks	Triangle Pump was formerly located at 1606 Walkley Road, north adjacent to the Site. Triangle Pump is an environmental contractor with services that include solid and liquid waste removal, tank removals, and Site remediations. It is unknown if any former infrastructure or operations occurred on the property at 1606 Walkley Road. This PCA occurred between the 1960s - 1980s. Based on review of the JWEL (2008a) Phase One ESA an approximate location of the former building is shown on Figure 4.	Yes, however, previously assessed by JWEL in 2008b and EXP in 2016b. The results of the prior investigations indicated metals, PAH, PHC and VOC in groundwater samples collected along the northern property line were less than the applicable SCS.
PCA 8: Former Automotive Sales and Services	1620 Walkley Road	off-Site (north adjacent property)	#27: Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles	A Nissan dealership was formerly located at the intersection of Walkley Road and Heatherington Road at 1620 Walkley Road. This PCA occurred between the 1960s - 1980s. No information on the location of historical	Yes, however, previously assessed by JWEL in 2008b and by EXP in 2016b. The results of the prior investigations indicated metals, PAH,

PCA Identifier	Address	Location of Activity (in Relation to Site)	Potentially Contaminating Activity (PCA)	Approximate Timeline That PCA Occurred	Contribution to APEC at the Site
				infrastructure, storage tanks or other operations were identified.	PHC and VOC in groundwater samples collected along the northern property line were less than the applicable SCS.
PCA 9: Reported Spill (Motor Oil)	1620 Walkley Road	off-Site (north adjacent property)	#Other: Spill	Based on the reviewed ERIS report a historical spill of 150 L of motor oil was identified at the property located at 1620 Walkley Road. This PCA occurred in 1988. Given the proximity of the PCA to the Sites northern boundary, the spill of motor oil was identified as a PCA.	Yes, however, previously assessed by JWEL in 2008b and by EXP in 2016b. The results of the prior investigations indicated metals, PAH, PHC and VOC in groundwater samples collected along the northern property line were less than the applicable SCS.

2.5.3 Areas of Potential Environmental Concern

Ontario Regulation 153/04 defines an APEC as an area on a property where one or more contaminants are potentially present. The following APEC were identified on the Phase One property.

Table 2.4: Summary of Areas of Potential Environmental Concern

Area of Potential Environmental Concern (APEC)	Location of APEC on Site	PCA Identifier & (Potentially Contaminating Activity)	Location of PCA (on-site or off-site)	Contaminants of Potential Concern (CPOC)	Media Potentially Impacted (Groundwater, Soil and/or Sediment)
APEC 1: Former garage in the northeast corner of the Phase One Property. All impacted soils and overburden groundwater were removed during various remediation programs (Pit 1).	Northeast Corner	PCA 1 (PCA #27: Garages and Maintenance and Repairs of railcars, Marine Vehicles, and Aviation Vehicles)	On-site	PHCs, VOCs, PAHs, metals	Soil and groundwater

Area of Potential Environmental Concern (APEC)	Location of APEC on Site	PCA Identifier & (Potentially Contaminating Activity)	Location of PCA (on-site or off-site)	Contaminants of Potential Concern (CPOC)	Media Potentially Impacted (Groundwater, Soil and/or Sediment)
APEC 2: Former UST. All impacted soils and overburden groundwater were removed during various remediation programs (Pit 1).	Northeast Corner	PCA 2 (PCA #28: Gasoline and Associated Products Storage in Fixed Tanks)	On-site	PHCs, VOCs, PAHs, metals	Soil and groundwater
APEC 3: Placement of surficial granular fill of unknown quality across the entire Site.	Across the Site	PCA 3 (PCA #30: Importation of Fill Material of Unknown Quality)	On-site	Metals, PAH, PHC	Soil
APEC 4: Salt Dome and Use on-site. Previous Phase Two ESAs by both EXP and others identified salt impacts in the shallow soil across much of the site.	Across the Site	PCA 4 (PCA #48: Salt Manufacturing, Processing and Bulk Storage)	On-site	Soil (SAR and Electrical Conductivity), Groundwater (Na, Cl-)	Soil and groundwater
APEC 5: Former off-site dry cleaner.	Northwest corner of site	PCA 5 (#37: Operation of Dry Cleaning Equipment where chemicals are used)	Off-Site	VOC	Groundwater
APEC 6: Former off-site retail fuel outlet and UST.	North central portion of site	PCA 6 (#28: Gasoline and Associated Products Storage in Fixed Tanks)	Off-Site	BTEX, PHC	Groundwater
APEC 7: Former fuel dispenser and remediation contractor.	North central portion of site	PCA 7 (#28: Gasoline and Associated Products Storage in Fixed Tanks)	Off-Site	BTEX, PHC	Groundwater
APEC 8: Former automotive sales and services	Northeast portion of site	PCA 8 (#27: Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles)	Off-Site	PHC, PAH, metals, VOCs	Groundwater
APEC 9: Former reported motor oil spill	Northeast portion of site	PCA 9 (#Other: Spill)	Off-site	PHC, PAH	Groundwater

3 Scope of the Phase Two ESA

3.1 Overview of the Investigation

The objective of the Phase Two ESA was to assess the APECs identified in EXP's (2024) Phase One ESA Update; and, to obtain soil and groundwater data to characterize the Phase Two Property in support of the filing of an RSC on the MECP's Environmental Brownfield Site Registry.

The need to file an RSC is in support of the planned redevelopment of the Phase Two Property to the proposed parkland and residential land use. The Site investigation activities incorporated into this Phase Two ESA, were conducted between 2008 and 2023.

3.2 Scope of Work

The scope of work for the Phase Two ESA was as follows:

- Request local utility locating companies (e.g., cable, telephone, gas, hydro, water, sewer and storm water) to mark any underground utilities present at the Phase Two Property.
- Retain a private utility locating company to mark any underground utilities present in the vicinity of the borehole locations and to clear the individual borehole locations.
- In 2008, the following was completed by JWEL and Trow:
 - Advance a total of 39 test pits, up to a maximum depth of approximately 1.0 m bgs.
 - Collect 16 surface soil samples in between the testpits.
 - Advance 19 boreholes and complete as monitoring wells to a maximum depth of 6.9 m bgs (MW08-1 to MW08-19).
- In 2012, advance 11 boreholes/monitoring wells to a maximum depth of 6.1 m bgs (MW12-1 to MW12-11) and 29 delineation testpits to 1.5 metres.
- In 2014, advance 8 boreholes/monitoring wells to a maximum depth of 5.2 m bgs (MW14-1 to MW14-8).
- In 2015, advanced 12 boreholes, complete 9 as monitoring wells to a maximum depth of 18.3 m bgs (MW15-1 to MW15-12) including four bedrock monitoring wells.
- In 2019 and 2021, advance 17 testpits (TP21-01 to TP21-17) within the north-south trending soil berm and 24 testpits (TP21-18 to TP21-42) within the east-west trending berm.
- In 2022, advance 3 boreholes (BH22-1 to BH22-3) and 2 testpits (TP-30A and TP-30 B) to fill in sample gaps.
- In 2023, advance 4 additional testpits (TP23-01 to TP-23-04) within the east-west trending berm.
- Collect representative soil samples for laboratory chemical analysis, including grain size analysis.
- Develop the newly installed and existing groundwater monitoring wells prior to sampling.
- Collect groundwater samples from the installed monitoring wells and select previously existing monitoring wells for laboratory chemical analysis.

- Complete an elevation survey of all monitoring wells to determine the groundwater flow direction in the groundwater unit(s) identified beneath the Phase Two Property.
- Conduct slug testing on overburden groundwater monitoring wells to determine the hydraulic conductivity.
- Analyze the data and prepare a report of the findings, in accordance with O.Reg.153/04.

3.3 Media Investigated

The focus of this Phase Two ESA was on the environmental conditions of the overburden material and bedrock, and the groundwater beneath the Phase Two Property. As there was no surface water body on the Phase Two Property, no sediment or surface water sampling was required.

The rationale and adequacy of the investigation is presented in Appendix C.

3.4 Deviations from Sampling and Analysis Plan

The field investigative and sampling program was carried out following the requirements of the Site Sampling and Analysis Plan (SAAP), provided in Appendix C. No significant deviations from the Sampling and Analysis Plan were reported that would have affected the sampling and data quality objectives for the Phase Two Property.

3.5 Impediments

The entire Phase Two Property was accessible at the time of the investigation, and no physical impediments were encountered during the field investigation.

4 Investigation Method

4.1 General

The Site investigative activities consisted of the following:

- Test pit and surface sample advancement to facilitate the collection of soil samples for geologic characterization and/or chemical analysis.
- Borehole drilling to facilitate the collection of soil and bedrock samples for geologic characterization and/or chemical analysis; and,
- Monitoring well installation for hydrogeologic property characterization and the collection of groundwater samples for chemical analysis.

Test pits were advanced into the fill and overburden by licensed excavators, under the full-time supervision of EXP staff, as described in further detail below. Surface soil grab samples were collected by EXP staff utilizing a hand-auger advanced into the surficial material; or, using a licensed excavator under the full-time supervision of EXP staff, as described in further detail below.

Boreholes were advanced in the surficial fill, overburden soils, the fractured bedrock, and the competent bedrock by a licensed drilling company under the full-time supervision of EXP staff. The drilling equipment used to advance the boreholes is described below. No petroleum-based greases or solvents were used during drilling activities.

Monitoring wells were installed in select boreholes by a MECP licensed well contractor in accordance with Ontario Regulation 903/90, as amended (O.Reg.903) using manufactured well components (i.e., riser pipes and screens) and materials (i.e., sand pack and grout) from documented sources.

The approximate locations of the previously installed boreholes and monitoring wells are shown on Figure 5A, 5B, 7B, 8A and 8B, 9 and 11.

4.2 Underground Utilities

When in operation, utilities for the former works yard site were located approximately 40 m north of the Phase One Property. Considering that all services were removed during the soil excavation activities, these services are no longer considered conduits for contaminant migration.

Apart from a remnant storm sewer line located north of the site, there are no utilities on the Phase Two Property. The storm sewer is not considered a conduit for contaminant migration because groundwater monitoring has shown no evidence of groundwater flow modification.

4.3 Soil: Sampling

The soil sampling conducted during the completion of this Phase Two ESA was undertaken in accordance with the SAAP presented in Appendix C, to ensure that the APECs identified in the Phase One ESA were properly characterized, in accordance with O.Reg.153/04. A summary of the sampling rationale and details from current and previous investigations is also presented in Appendix C.

Typically, soil samples for geologic characterization and chemical analysis were collected on a discrete basis in the overburden materials using 5 cm diameter, 60 cm long, spilt spoon samplers or dedicated plastic liners advanced

into the subsurface using a truck- or track-mounted drill rig. The soil cores were extruded from the samplers upon retrieval by drilling personnel. Samples collected during testpit programs were retrieved directly from the excavator bucket. Geologic details of the recovered cores were logged by EXP field staff and samples were collected from selected cores for chemical analysis. The boreholes from EXP's current and previous investigations are also included in Appendix F.

Measures were taken in the field and during transport to preserve sample integrity prior to chemical analysis. Recommended volumes of soil samples selected for chemical analysis were collected from the recovered cores into pre-cleaned, laboratory-supplied glass sample jars/vials identified for the specified analytical test group. Samples intended for VOCs or PHC fractions F1 and F2 were collected using a laboratory-supplied soil core sampler, placed into the vials containing methanol for preservation purposes and sealed using Teflon lined septa lids.

All soil samples were placed in clean coolers containing ice prior to and during transportation to the subcontract laboratory, Paracel Laboratories Limited (Paracel) of Ottawa, Ontario.

The samples were transported/submitted following appropriate holding time requirements and Chain of Custody protocols for chemical analysis.

Decontamination and other protocols were followed during sample collection and handling to minimize the potential for sample cross-contamination. New disposable nitrile gloves were used for the handling and sampling of each retrieved soil core. The split-spoon samplers were decontaminated between sampling intervals by the drilling contractor using a water/phosphate-free detergent solution followed by rinses with de-ionized water. Wash and rinse waters were collected in sealed, labeled containers. Drill cuttings were placed in labeled, sealed drums upon completion of sampling. Boreholes that were not installed with monitoring wells were sealed with bentonite.

Soil samples submitted for specific chemical analysis were selected on the basis of visual inspection of the recovered cores, field screening measurements, sample location and/or depth interval.

Geologic details of the soil cores recovered from the boreholes advanced at the Phase Two Property are provided in boreholes logs presented in Appendix F.

Soil samples were also collected and submitted for grain size analysis (Appendix H).

Appropriate quality assurance/quality control (QA/QC) samples were collected during soil sampling, including field duplicate samples (Appendix C).

4.4 Soil: Field Screening Measurements

Where required for the characterization of volatile parameters, a portion of each soil core was placed in a sealed plastic bag and allowed to reach ambient temperature prior to field screening, using a RKI Eagle Gas Monitor calibrated with hexane gas. The measurements were made by inserting the instrument's probe into the plastic bag while manipulating the sample to ensure volatilization of the soil gases. These readings provide a real-time indication of the relative concentration of combustible vapours encountered in the subsurface during drilling, and are used to aid in the assessment of the vertical and horizontal extent of volatile parameter contamination and the selection of soil samples for analysis.

The field screening measurements, in parts per million (ppm) hexane equivalents, are presented on the borehole logs in Appendix F. It should be noted that field measurements are for screening purposes only and the presence/absence of contamination is determined by laboratory analysis.

Each sample was additionally examined for visual, textural and olfactory classification at the time of sampling.

4.5 Groundwater: Monitoring Well Installation

The purpose of the monitoring well installation program was to characterize the groundwater regimes within the various APECs. A summary of the sampling rationale and details from current and previous investigations is also presented in Appendix C.

The monitoring wells were installed in general accordance with the *Ontario Water Resources Act* - R.R.O. 1990, Regulation 903, as amended (O.Reg.903), and were installed by licensed well contractors. When the monitoring wells are no longer required, they must be decommissioned in accordance with the procedure outlined in the *Ontario Water Resources Act* - R.R.O. 1990, O.Reg.903.

The monitoring wells consisted of 1.52 m, or 3.05 m long, 50 mm diameter, PVC screen, and an appropriate length of PVC riser pipe. All pipe connections were factory machined threaded flush couplings. The annular space around the wells was backfilled with sand to an average height of 0.3 m above the top of the screen. A bentonite seal was added from the top of the sand pack to approximately 0.3 m below ground surface. The monitoring wells were completed with flush mount protective well casings at ground surface, or as stick-up pipes with protective stick-up steel casings.

EXP continuously monitored the well installation activities. Well installation details on the borehole logs provided in Appendix F.

Measures taken to minimize the potential for cross contamination or the introduction of contaminants during well construction included:

- The use of well pipe components (e.g., riser pipe and well screens) with factory machined threaded flush coupling joints;
- Construction of wells without the use of glues or adhesives;
- Removing the protective plastic wraps from well components until borehole insertion (to prevent contact with the ground and other surfaces);
- Cleaning of augers between sampling locations or the use of dedicated sampling liners (GeoProbe only); and,
- The use of hollow stem augers to prevent loose and potentially contaminated material in overlying layers from sloughing into the boreholes and coming into contact with groundwater.

4.6 Groundwater: Monitoring Well Development

Upon completion of monitoring well installation, the monitoring wells were developed to remove fine sediment particles from the sand pack and enhance hydraulic communication with the surrounding formation waters. The monitoring wells were developed using a dedicated sampling tubing or peristaltic pump and dedicated tubing to disturb the water column and recover groundwater containing dislodged sediment particles.

4.7 Groundwater: Purging and Field Measurement of Water Quality Parameters

At least 24 hours following the monitoring well development activities, the depth to groundwater at each monitoring well was measured utilizing an electronic water level meter. The water level measurements were recorded on log sheets or in a bound field book. The water level meter was decontaminated between monitoring well locations.

Prior to groundwater sampling, each monitoring well underwent water purging utilizing a low flow peristaltic pump obtained from Pine Environmental, until the purged water had chemically stabilized as indicated by field parameter measurements. The water quality was measured utilizing a YSI 550, Hydrolab® Quanta, or similar, multi probe water quality meter, obtained from Pine, that was connected to the low-flow peristaltic pump with dedicated tubing. Water quality readings were collected at regular intervals based on the flow rate established. Groundwater was considered to be chemically stable when the pH measurements of three (3) successive readings agreed to within ± 1 pH units, the specific conductance within $\pm 10\%$, and the temperature within $\pm 10\%$. The multi-meter electrodes were calibrated prior to receipt of the meter by Pine personnel using in-house reference standards.

All development and purge water were collected and stored on Phase Two Property in labeled, sealed containers, until properly managed or disposed off-Site.

Equipment used during groundwater monitoring were thoroughly cleaned and decontaminated between wells. Well purging details were recorded on log sheets or in a bound field book.

4.8 Groundwater: Sampling

The groundwater sampling programs were undertaken in accordance with the SAAP presented in Appendix C, to ensure that the APECs identified on the Phase Two Property were properly characterized, in accordance with O.Reg.153/04.

Upon completion of purging activities, groundwater samples were collected from monitoring wells. Recommended groundwater sample volumes were collected into pre-cleaned laboratory-supplied vials or bottles provided with analytical test group specific preservatives, as required. The samples were placed in an insulated cooler pre-chilled with ice immediately upon collection.

All groundwater samples were placed in clean coolers containing ice prior to and during transportation to the subcontract laboratory, Paracel. The samples were transported/submitted following appropriate holding time requirements following Chain of Custody protocols for chemical analysis.

Decontamination and other protocols were followed during sample collection and handling to minimize the potential for sample cross-contamination. New disposable nitrile gloves were used at each monitoring well location.

Groundwater samples submitted for specific chemical analysis were selected on the basis of sample location and/or depth interval. Appropriate QA/QC samples were collected during groundwater sampling, including field duplicate samples and trip blanks, where required.

4.9 Sediment: Sampling

As no surface water body was present at the Phase Two Property, sediment sampling was not part of the scope of work for the Phase Two ESA.

4.10 Analytical Testing

The contractual laboratories selected to perform the chemical analyses was Paracel, in Ottawa, Ontario. Paracel is accredited laboratories under the Standards Council of Canada/Canadian Association of Environmental Analytical Laboratories (Accredited Laboratory No. 97 and No. A3200, respectively) in accordance with ISO/IEC 17025:2005 – “General Requirements for the Competence of Testing and Calibration Laboratories”.

4.11 Residue Management Procedures

The residue materials produced during the Phase Two Property Phase Two ESA investigative activities comprised soil cuttings from drilling activities; decontamination fluids from equipment cleaning; and waters from well development and purging. All soil cuttings were labeled and drummed on-site.

4.12 Elevation Surveying

Elevation surveys were conducted during the various stages of the Site Phase Two ESA investigative activities. The top of pipe and ground surface elevations of each monitoring well was surveyed relative to a geodetic benchmark. The geodetic benchmark was initially a jersey barrier along the eastern property boundary. This jersey barrier no longer exists; however subsequent wells were surveyed relative to existing wells. The elevation surveys were completed using a self-leveling laser system.

4.13 Quality Assurance and Quality Control Measures

Quality Control/Quality Assurance measures, as set out in the Sampling and Analysis Plan, were implemented during sample collection, storage and transport, to provide accurate data representative of conditions in the overburden soils, bedrock material, and the water table. The QA/QC measures included decontamination procedures to minimize the potential for sample cross contamination; the execution of standard operating procedures to collect representative and unbiased samples; the collection of quality control samples to evaluate sample precision and accuracy; and, the implementation of measures to preserve sample integrity.

Decontamination protocols were followed during sample collection and handling to minimize the potential for cross-contamination. During the collection of soil and weathered bedrock samples, split-spoon samplers were scraped and decontaminated between sampling intervals by washing with a potable water/detergent solution followed by a rinse with potable water. New disposable nitrile gloves were used for the handling and collection of samples from each soil core and for sample collection from each borehole.

Soil samples selected for chemical analyses were collected from the retrieved soil cores and placed directly into pre-cleaned, laboratory-supplied glass jars or vials. Sample volumes were consistent with analytical test group requirements as specified by the receiving laboratory.

Groundwater samples were collected into pre-clean laboratory-supplied vials or bottles provided with analytical test group specific preservatives, as required. Recommended analytical test group specific sample volumes were collected as specified by the contractual laboratory.

Measures were followed to preserve sample integrity between collection and receipt by the contractual laboratory. All soil and groundwater samples were immediately placed in insulated coolers pre-chilled with ice for storage and transport to the contractual laboratory. Samples were received by the contractual laboratory within specific analytical test group holding time requirements.

Documentation procedures were followed to confirm sample identification and tracked sample movement. Each sample was assigned a unique identification ID number, which was recorded along with the date, time of sampling and requested analyses on labels affixed to the sampling containers, and in a bound field notebook. Chain of Custody protocols were followed to track sample handling and movement until receipt by the contractual laboratory.

Field QA/QC samples were collected during the soil and groundwater sampling. Duplicate samples were collected to evaluate sampling precision; trip blanks were included to evaluate the potential for sample cross-contamination

*The City of Ottawa.
Phase Two Environmental Site Assessment
1770 Heatherington Road, Ottawa, ON

April 25, 2024*

during handling and transport; and, trip spikes were included to assess the effects of the sampling process on the analytes, including holding time and storage temperature.

5 Review and Evaluation

5.1 Geology

5.1.1 Site Stratigraphy

The site stratigraphy has been characterized by the advancement of various boreholes and test pits into the overburden material and the underlying bedrock material, up to a maximum depth of approximately 18.3 m below grade.

The general stratigraphy at the Site, as observed in the boreholes and test pits, consists of a surficial sand and gravel fill and re-worked native material which overlies the native overburden consisting of silty clay and clay, over a gravelly silty till layer. Weathered limestone bedrock can be found beneath the native soils. The interpreted Site geology is shown on Figures 15A-15D and Figures 25A and 25B and Table 5.1.

Table 5.1: Site Stratigraphy

Stratigraphy	Details	Approximate Depth (m bgs)	Approximate Elevation (m RSD)
Surface	Asphalt	0 - 0.12	98.8 – 98.7
	Topsoil	0 – 0.19	98.8 – 98.6
	Reworked native/fill (sand and gravel, granular sub-base)	0 - 0.8	98.7 – 97.9
Native Overburden	Silty clay	0.7 – 3.3	98.0 – 94.7
	Clay	1.4 – 3.1	98.0 – 94.3
	Gravelly silty till	3.0 – 5.5	95.9 – 93.4
Bedrock	Limestone	> 5.2	< 92.7

m bgs - metres below ground surface

m GEO – metres relative to geodetic

5.1.2 Soil Texture

Based on the subsurface investigations completed at the Site, the site stratigraphy is generally described as consisting of a surficial sand and gravel fill and re-worked native material which overlies the native soil overburden consisting of native silty clay and clay, becoming sandier with depth over a gravelly silty clay till layer. Weathered shale bedrock can be found beneath the native soils. It should be noted that the stratigraphy and depth to bedrock at the site was only derived based on the boreholes/monitoring wells installed by EXP.

Two (2) historical grain size samples were collected from the Site by EXP in August of 2015, in support of the Phase Two ESA investigative activities. Sample BH/MW15-9 SS1 and BH/MW15-5 SS4 were collected from the footprints of remedial excavation Pit No. 4 and Pit No. 2, respectively.

A total of six (6) soil samples analyzed for grain size were collected from the Site during the field work conducted in May 2022. Based on the 75-micron sieve of representative soil, the soil texture of the analyzed samples was determined to be predominantly medium and fine textured (refer to the 75-micron sieve analysis in the Certificates

of Analysis – Appendix G USB). More than 50% by mass of five (5) of the eight (8) total samples analyzed for soil texture, consisted of particle sizes less than 75 µm in diameter. Based on the observations recorded in the borehole logs and the cumulative grain size results for the Site, the soil texture at the Site was determined to be predominately medium and fine textured.

Based on the observations made during previous drilling investigations and the results of the grain size analysis, as per Section 42 of O. Reg. 153/04, the QP_{ESA} has determined that more than 1/3 of the soil at the property, measured by volume, consists of medium and fine textured soil and hence standards for medium and fine textured soil at the property are applicable.

As per Section 42 of O. Reg. 153/04, coarse textured soil means soil that contains more than 50 percent by mass of particles that are 75 µm or larger in mean diameter and medium and fine textured soil means soil that contains 50 percent or more by mass of particles that are smaller than 75 µm in mean diameter.

Please refer to Table Q-1, below for a summary of grain size sample location, depth and sample description. Please refer to Figure 5B of Appendix H for a graphical depiction of the borehole locations sampled for grain size analysis at the Site.

Table 5.2: Grain Size Analyses

Sample ID	Sampling Interval	Sampling Interval (m bgs)	Soil Description	Classification
BH/MW15-9	SS1	0.0 - 0.76	Silty Clay, trace sand	Fine Grained
BH/MW15-5	SS4	2.29 - 2.9	Silty Clay, trace sand	Coarse Grained
BH22-1	G2	0.9 – 1.1	Sandy Silt & Clay	Fine Grained
BH22-1	G3	1.2 – 1.4	Silt & Clay	Fine Grained
BH22-2B	G1	0.5 - 0.9	Silty Sand	Coarse Grained
BH22-3	G2	0.7 – 0.9	Silty Sand	Coarse Grained
BH22-3	G3	1.0 – 1.4	Silt & Clay	Fine Grained
BH22-3	G4	2.0 – 2.5	Silt & Clay	Fine Grained

SS – Split Spoon
G – Grab Sample

5.2 Hydrogeology

The Site hydrogeological characteristics are summarized in Table 5 and groundwater flow directions and groundwater table elevations are depicted in Figures 8A and 8B, for the overburden and bedrock groundwater units, respectively. Groundwater elevations presented in Figures 8A and 8B were collected in July 2022, at the time of the most recent comprehensive groundwater elevation assessment.

Depths to groundwater have been measured at the Site between 2008 and 2022. Groundwater measurements collected from prior to the remedial activities in 2015 have not been relied upon. As such only groundwater depth measurements collected after 2015 are considered representative of current Site conditions. Groundwater levels collected at the time of the 2022 groundwater sampling event were considered unsuitable for Site characterization due to time elapsed since well development and the time to the prior groundwater monitoring events.

Table 5.3: Site Hydrogeological Characteristics

Descriptor	Overburden Groundwater (2015 – 2022)	Bedrock Groundwater (2015 – 2022)
Depth to Groundwater	1.54 to 2.82 (m bgs)	1.59 to 11.79 (m bgs)
Groundwater Elevation	84.44 to 85.91 m RSD	75.76 to 86.05 m RSD
Direction of Groundwater Flow	southeast	south
Hydraulic Conductivity	5.8×10^{-8} – 3.1×10^{-5} m/s	Not Determined
Average Hydraulic Conductivity	1.6×10^{-5} m/s	Not Determined
Horizontal Hydraulic Gradient	0.006 – 0.012 m/m	0.003 – 0.008 m/m
Average Horizontal Hydraulic Gradient	0.009 m/m	0.005 m/m
Vertical Hydraulic Gradient	-0.003 m/m (upward) in northwest and southeast part of site, and 0.061 m/m (downward) in central part of site	

5.2.1 Elevations and Flow Direction

Groundwater levels were measured in the wells in June 2022. The groundwater levels and relative elevations are summarized in Appendix I, and presented in the borehole logs provided in Appendix F.

Groundwater flow directions was estimated to be east to southeast in the overburden and east in the bedrock (Figure 8A and 8B).

5.2.2 Hydraulic Conductivity

Estimates of the saturated hydraulic conductivity in the water table unit were obtained from the analysis of single well response tests (SWRT) conducted at select monitoring wells screened in native overburden within the Phase One ESA Study Area in 2013 and 2015. Using Hvorslev's equation, the estimated hydraulic conductivity value was calculated. The hydraulic conductivity was measured to be 5.8×10^{-5} m/s (BH15-4) and 5.8×10^{-8} m/sec (MW08-19 previously located 30 m north of the Phase Two Property). An attempt was made to conduct an SWRT within a deep bedrock well, however, this well failed to recover in a reasonable time.

5.2.3 Hydraulic Gradients

Horizontal hydraulic gradients were estimated for the groundwater flow component identified in the overburden and bedrock water table regimes. The overburden hydraulic gradients were established based on the groundwater elevations obtained in 2015. The bedrock hydraulic gradients were established based on the groundwater elevations obtained in 2015.

The horizontal hydraulic gradient, between each monitoring well pair, is calculated using the following equation:

$$i_h = \Delta h / \Delta s$$

Where,

i_h = horizontal hydraulic gradient;

Δh (m) = groundwater elevation difference; and,

Δs (m) = separation distance.

The hydraulic gradients in the overburden groundwater regime ranged from approximately 0.010 m/m (between MW15-9 and MW15-11) to 0.012 m/m (between MW15-4 and MW15-6), and 0.006 m/m (between MW15-1 and MW15-6), with the geometric mean value of 0.009 m/m.

The hydraulic gradients in the bedrock groundwater regime ranged from approximately 0.008 m/m (between MW15-12 and MW15-5) to 0.003 m/m (between MW15-5 and MW15-7), with the geometric mean value of 0.005 m/m.

The vertical hydraulic gradient, between a monitoring well pair, is calculated using the following equation:

$$i_v = (h_2 - h_1) / (z_2 - z_1)$$

Where,

i_v = vertical hydraulic gradient;

h_p = elevation difference between groundwater and bottom of well;

z = elevation difference between bottom of well and bottom of groundwater regime; and,

h = sum of h_p and z .

The vertical gradient between the overburden and bedrock groundwater regimes was variable with 0.61 m/m (between MW15-4 and MW15-5) downwards in the centre of the Phase Two Property, but -0.003 m/m (between MW15-6 and MW15-7) and -0.002 (between MW15-11 and MW15-12) upwards in the southeast and northwest portions of the Phase Two Property respectively.

5.3 Soil Quality

In accordance with the scope of work, chemical analyses were performed on selected soil samples recovered from the boreholes. The selection of representative “worst case” soil samples was based on field screening, visual and/or olfactory evidence of impacts, and the presence of potential water bearing zones. Sampling rationale is presented in Appendix C.

A summary of the analytical results for the soil samples, including the locations and depths of each sample, a comparison of parameter concentrations against applicable SCS, and the identification of the potential contaminants of concern, are provided in Appendix E. Copies of the laboratory Certificates of Analysis for the analyzed soil samples are provided in Appendix G.

5.3.1 Soil Field Screening

Soil samples selected for VOCs and/or PHCs analysis were determined based on the vapour readings collected during subsurface drilling, using the Eagle GasTech to measure vapour concentrations, in ppm hexane equivalent. None of

the current soil samples were considered to have elevated vapour readings. The vapour readings, in ppm, are provided on the borehole logs in Appendix F.

All other soil samples were submitted for chemical analyses based on field observations, location and depth.

5.3.2 Analysis of Petroleum Hydrocarbons

Numerous soil samples have been analyzed as part of the previous and current Phase Two ESAs. A summary of the analytical results along with the Table 3 SCS are presented in Table E.1a (pre-excavation), E.1b (post-excavation) and E.1c (berm)(Appendix E). The laboratory Certificates of Analysis are presented in Appendix G.

Based on the analytical results obtained, the concentrations of petroleum hydrocarbons (PHC), benzene, toluene, ethylbenzene and xylenes (BTEX) collected from below grade and within the remedial excavation were less than the Table 3 SCS (E1.c and E.2b).

Based on the analytical results obtained, the concentrations of petroleum hydrocarbons (PHC), benzene, toluene, ethylbenzene and xylenes (BTEX) collected from the soil berm were less than the Table 3 SCS (Table EF.1c).

5.3.3 Analysis of Volatile Organic Compounds

Numerous soil samples have been analyzed as part of the previous and current Phase Two ESAs. A summary of the analytical results along with the Table 3 SCS are presented in Table E.2a (pre-excavation) and E.2b (post-excavation) (Appendix E). The laboratory Certificates of Analysis are presented in Appendix G.

Based on the analytical results obtained, the concentrations of VOC collected from below grade and within the remedial excavation were less than the Table 3 SCS (Table E1.b).

5.3.4 Analysis of Polycyclic Aromatic Hydrocarbons

Numerous soil samples have been analyzed as part of the previous and current Phase Two ESAs. A summary of the analytical results along with the Table 3 SCS are presented in Table E.3a (pre-excavation), E.3b (post-excavation) and E.3c (berm) (Appendix E). The laboratory Certificates of Analysis are presented in Appendix G.

Based on the analytical results obtained, the concentrations of PAH collected from below grade and within the remedial excavation were less than the Table 3 SCS (E3.b).

Based on the analytical results obtained, the concentrations of PAH collected from the soil berm were less than the Table 3 SCS (Table E3.c).

5.3.5 Analysis of Polychlorinated Biphenyls

Numerous soil samples have been analyzed as part of the previous Phase Two ESAs. A summary of the analytical results along with the Table 3 SCS are presented in Table E.4 (pre-excavation) (Appendix E). The laboratory Certificates of Analysis are presented in Appendix G.

Based on the analytical results obtained, the concentrations of PCBs collected from below grade were less than the Table 3 SCS (Table E.4).

5.3.6 Analysis of Metals and Inorganics

Numerous soil samples have been analyzed as part of the previous and current Phase II ESAs. A summary of the analytical results along with the Table 3 SCS are presented in Table E.5a (pre-excavation), E.5b (post-excavation) and E.5c (berm) (Appendix E). The laboratory Certificates of Analysis are presented in Appendix G.

Based on the analytical results obtained, the concentrations of metals and inorganics collected from below grade and within the remedial excavation were less than the Table 3 SCS (Table E.5b).

Based on the analytical results obtained, the concentrations of metals and inorganics collected from the soil berm were less than the Table 3 SCS (Table E.5c).

5.3.7 Analysis of Salt Related Parameters

Numerous soil samples have been analyzed as part of the previous and current Phase II ESAs. A summary of the analytical results along with the Table 3 SCS are presented in Table E.6a (pre and post excavation), E.6b (berm) (Appendix E). The laboratory Certificates of Analysis are presented in Appendix G.

Elevated SAR and EC were identified as exceeding the current MECP Table 3 SCS across the majority of the Site to the depth of bedrock. The impacts are believed to be related to the handling and storage of road salt on the Phase One Property as part of the historical Site operations while is use as a City of Ottawa Public Storage yard. EC and SAR impacts in soil at the Site extend to the Site boundaries and the horizontal delineation of salt related impacts was not feasible to achieve given that impacts were identified up to the property boundary in all directions.

In 2015, soil samples were submitted for SAR and EC analysis from boreholes MW/BH15-8, MW/BH15-10, and MW/BH15-11. Samples were collected from depths of 4.6 to 6.1 m below grade, just above the bedrock, to vertically delineate the salt impacts. EC and/or SAR exceedances of the Table 3 SCS were noted at BH15-10 and BH15-11, no exceedances were noted in the sample collected from BH15-8. The vertical delineation of EC and SAR in Site soil was not feasible or practical to achieve at the Site, as EC and SAR exceedances are assumed to extend to bedrock across the majority of the Site.

This indicates that for most of the soils at the site, the SAR and EC impact extend to the bedrock interface, except for the southern portion of the site, near MW/BH15-8. Based on these results, the SAR and EC has been vertically and laterally delineated as much as practicable at the Site. Please refer to Figure 15 for a plan view figure of the EC and SAR impacts and refer to Figures 15A through 15D for cross-sectional figures demonstrating the EC and SAR impacts identified in soil at the Site.

The intention is to address the salt related soil impacts through a Risk Assessment.

Table 5.4: Contaminants of Concern in Soil

Parameter Analyzed in Soil	Maximum Concentration	Site Condition Standard ¹	Maximum Concentration Above Applicable Standard?
Salts			
EC	12.7 mS/cm (TP08-42)	0.7 mS/cm	Yes
SAR	184 (TP1C)	5 (unitless)	Yes

¹ MECP Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the EPA, April 2011, *Table 3 - Non-Potable Groundwater (Fine Grained Soil) Community Land Use*

5.3.8 Chemical Transformation and Soil Contaminant Sources

Since the Phase Two Property is currently vacant and has been decommissioned and remediated, apart from the residual impacts from salt storage, there are no additional soil contaminant sources. Consequently, chemical transformation is not considered an issue.

5.4 Groundwater Quality

In accordance with the scope of work, chemical analyses were performed on groundwater samples recovered from select monitoring wells. A summary of the analytical results for the groundwater samples, including the locations of each sample, well screen interval depth, a comparison of parameter concentrations against applicable SCS, and the identification of the contaminants of concern are provided in Appendix E.

Certificates of Analysis for the recent analyzed groundwater samples are provided in Appendix G.

5.4.1 Analysis of Petroleum Hydrocarbons and BTEX/VOC

A summary of the PHC analytical results along with the Table 3 SCS are presented in Table E.7a (pre-excitation) and F.7b (post excavation) for PHC and Table E.8a (pre-excitation) and F.8b (post excavation) for VOC (Appendix E). The laboratory Certificates of Analysis are presented in Appendix G.

Based on the analytical results obtained, the post excavation concentrations of PHC, BTEX and VOC in groundwater were less than the Table 3 SCS (Table E.7b and Table E.8b).

One (1) volatile parameter was identified to exceed the Table 7 SCS in groundwater at the Site, cis-1,2-dichloroethylene. Cis-1,2-dichloroethylene was only identified to exceed the Table 7 SCS at one (1) monitoring well location, MW14-7, during the post-remedial sampling events. MW14-7 is screened within the native silty clay till soil at a depth of 1.3 – 4.3 m bgs and is located in the northeastern portion of the Site. It is noted that vinyl chloride was not identified at a measured concentration at this monitoring well or any others, indicating anaerobic degradation is not occurring at an appreciable rate. Concentrations of cis-1,2-DCE at MW14-7 appear to be decreasing since the post-remedial Site maximum identified in 2019.

The identified Table 7 exceedance of cis-1,2-dichloroethylene is likely associated with remnant impacts from the former garage located within the northeastern corner of the Site (APEC 1). It is noted that all post remediation groundwater sampling events met the Table 3 SCS for all VOCs analyzed.

The intention is to address cis-1,2-DCE Table 7 impact through a Risk Assessment.

5.4.2 Analysis of Polycyclic Aromatic Hydrocarbons

Numerous groundwater samples have been analyzed as part of the previous and current Phase Two ESAs. A summary of the analytical results along with the Table 3 SCS are presented in Table E.9a and E.2b (Appendix E). The laboratory Certificates of Analysis are presented in Appendix G.

Based on the analytical results obtained, post-remediation groundwater sampling for PAH meets the Table 3 SCS .

5.4.3 Analysis of Polychlorinated Biphenyls

Numerous soil samples have been analyzed as part of the previous Phase Two ESAs. A summary of the PCB analytical results along with the Table 3 SCS are presented in Table E.10 (pre-excavation) (Appendix E). The laboratory Certificates of Analysis are presented in Appendix G.

Based on the analytical results obtained, the concentrations of PCBs collected from below grade were less than the Table 3 SCS (Table E.10).

5.4.4 Analysis of Select Metals

A summary of the select metals and inorganics analytical results along with the Table 3 SCS are presented in Table E.11a (pre-excavation) and E.11b (post-excavation) (Appendix E). The laboratory Certificates of Analysis are presented in Appendix G.

Based on the analytical results obtained, the concentrations of metals in groundwater were less than the Table 3 SCS (Table E.11a and E.11 b).

Nitrite was analyzed in one (1) groundwater sample collected from MW08-9 in October 2009. The concentration of Nitrite was below the laboratory RDL. It is noted that the MECP does not currently endorse a SCS for nitrite concentrations in groundwater. Given that nitrite was not detected above the laboratory RDL, and no SCS is provided by the MECP, nitrite has not been retained as a COC for further assessment.

5.4.5 Analysis of Salt Related Parameters

A summary of the salt related groundwater analytical results (i.e., sodium and chloride) along with the Table 3 SCS are presented in Table E.12a (pre-excavation) and E.12b (post-excavation) (Appendix E). The laboratory Certificates of Analysis are presented in Appendix G.

As stated above, salt impacts (i.e., EC and SAR) were identified in most the overburden soils across the site exceeding the Table 3 SCS, extending all the way to bedrock across the majority of the Site. The salt impacts in both the overburden and bedrock groundwater (i.e., sodium and/or chloride) across the site required assessment for horizontal and vertical delineation. The primary source of the salt was suspected to be in the northwest corner (i.e., location of former Quonset hut) of the Site, which is also considered to be upgradient in terms of groundwater flow.

In January and February 2021, the time of most recent groundwater sampling for salt related parameters, MW15-1 (overburden), MW15-2 (bedrock), MW15-4 (overburden), MW15-5 (bedrock), MW15-6 (overburden), MW15-7 (bedrock), MW15-11 (overburden), and MW15-12 (bedrock) were sampled for sodium and chloride. All groundwater samples collected in 2021 exceeded for sodium and/or chloride in groundwater, with the exception of samples collected at MW15-12 (bedrock) and MW15-1 (overburden) exceeded the applicable Table 3 SCS. As multiple rounds of groundwater sampling have occurred at the Site for sodium and chloride across the prior environmental investigations, the most recent rounds of sampling (i.e., 2019 and 2021) are considered most representative of the current groundwater conditions at the Site in relation to the salt impacts. Based on review of all recent groundwater analytical data analyzed for sodium and chloride collected between 2019 and 2021, the highest concentrations of sodium and chloride were identified to be within the southeast portion of the Site at MW15-6.

Concentrations of sodium and chloride appear to be decreasing as a function of time since Site decommissioning and source removal and impacts in groundwater appear to be migrating with distance from the anticipated source of salt related impacts.

Based on the above, salt impacts exist in both the overburden and bedrock horizons across the majority of the site extending from the source (northwest corner), and continuing downgradient to the southeast corner of the site. For the horizontal delineation, refer to Figure 25. For the vertical delineation, refer to Figures 25A and 25B.

Table 5.5: Contaminants of Concern in Groundwater

Parameter Analyzed in Groundwater	Maximum Concentration	Site Condition Standard ¹	Maximum Concentration Above Applicable Standard?
Salts¹			
Na+	5,120 mg/L (MW15-6)	2,300 mg/L	Yes
Cl-	7,830 mg/L (MW15-6)	2,300 mg/L	Yes
VOC²			
Cis-1,2-DCE	6.9 (MW14-7)	1.6	Yes

¹ MECP Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the EPA, April 2011, *Table 3 - Non-Potable Groundwater (Fine Grained Soil) Community Land Use*

² MECP Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the EPA, April 2011, *Table 7 – Shallow Soil Condition and Non-Potable Groundwater (Fine Grained Soil) Residential Land Use*

It is acknowledged that the requirements of O. Reg. 153/04 stipulate that for each Contaminant of Concern, the contaminant must be “delineated laterally and vertically...in soil, ground water or sediment, on, in or under the phase two property”. However, it is the QP’s opinion that there is no practical reason or justification for drilling and installation of additional wells on-Site to achieve lateral and vertical delineation to the generic SCS for groundwater Na and Cl. Notwithstanding the risk associated with this additional drilling, information obtained will contribute negligibly to the RA or the development of appropriate Risk Management Measures.

It is QP’s opinion that additional vertical delineation will not lead to an improved the understanding of the distribution of Na and Cl in groundwater.

5.4.6 Evidence of Non-Aqueous Phase Liquid (NAPL)

Inspection of the purged groundwater retrieved from the monitoring wells did not indicate the presence of NAPL, staining, sheen, or odour.

5.4.7 Chemical Transformation and Contaminant Sources

The salt impacts in the shallow soils continue to contribute to salt related impacts in the groundwater. Since salt use and storage no longer exists at the Phase Two Property, these impacts should decrease with time.

5.5 Parameters in Soil and Groundwater Without Site Condition Standards

Six (6) parameters, sulphate, chloroethane, chloromethane, methyl butyl chloride, 1,3,5-trimethylbenzene, and benzo(b+k)fluoranthene, were analyzed in soil and/or groundwater samples for which there is no applicable MECP SCS available for assessment purposes. As such, due to the lack of applicable MECP SCS, each parameter is evaluated separately below for consideration as a COC in soil or groundwater to be retained for further evaluation within the RA.

Sulphate in Soil (Pre-Remediation):

As part of the of the pre-remedial sampling conducted at the Site, select soil samples were analyzed for sulphate. It is acknowledged that sulphate is not a regulated parameter under O.Reg. 153/04 and no applicable SCS is provided by the MECP for this parameter. However, sulphate has not been retained for further evaluation as the analytical results of this parameter were only collected in 2008 from pre-remedial soil samples. Further, sulphate was only analyzed in support of a prior geotechnical report and analytical results were not intended for use within the ESA or RA. In general, the inclusion of sulphate as a COC would have no material effect on the conclusions of the RA given the substances low toxicity and natural occurrence in soils at the Site. Health Canada recommends an aesthetic objective for sulphate compounds in drinking water of 500 mg/L (or 500,000 µg/L) (Health Canada, 1994). No soil quality guidelines for sulphate in Canadian soils were identified upon review of the applicable literature.

1,3,5-Trimethylbenzene:

1,3,5-Trimethylbenzene was analyzed in soil samples collected in Pit 1 (i.e., north wall, south wall, east wall, west wall and floor) as well as from MW12-5, MW12-8, MW12-10 and MW12-11 in soil samples taken post-remediation. It was not analyzed in any soil samples taken pre-remediation. However, all soil samples that were characterized for 1,3,5-trimethylbenzene were below detection limit (i.e., <0.05 µg/g) except for the sample taken from FS1 (i.e., Pit 1 floor sample) at a depth of 3.5 m bgs which was slightly above detection limit (i.e., 0.12 µg/g). Additionally, groundwater samples taken both pre- and post-remediation showed 1,3,5-trimethylbenzene to be below the detection limit. Therefore, for the current assessment, 1,3,5-Trimethylbenzene is not considered to be a COC. Although a concentration above detection limit was noted, samples taken in the vicinity of FS1 were below detection indicating that 1,3,5-trimethylbenzene has been sufficiently characterized at the Site. Additionally, as previously noted, no MECP SCS is provided for 1,3,5-trimethylbenzene for comparison purposes, however given the similarities in physiochemical properties to benzene, concentrations of 1,3,5-trimethylbenzene were also compared to the Table 3 SCS for benzene of 0.17 µg/g. Given that 1,3,5-trimethylbenzene was below the Table 3 SCS for benzene and was not detected at any other sampling locations in soil or groundwater, this parameter is not retained as a COC for further investigation in the RA.

Chloroethane:

Chloroethane was analyzed in soil and/or groundwater samples collected from both pre- and post remedial activities. Chloroethane has not been detected above the laboratory RDL in any soil or groundwater samples collected from the Site. Although the MECP does not provide soil or groundwater SCS for this parameter, upon review of the British Columbia Contaminated Sites Regulation (B.C. Reg. 375/96) a soil quality and drinking water quality standard for this parameter were identified of 30 µg/g and 46 µg/L, respectively. Given that chloroethane was not detected at a measured concentration in any soil or groundwater samples collected from the Site and that the RDL of this parameter is well below the identified soil and groundwater quality standards from other jurisdictions, chloroethane is not retained as a COC for further investigation in the RA.

Chloromethane:

Chloromethane was analyzed in soil and/or groundwater samples collected from both pre- and post remedial activities. Chloromethane has not been detected above the laboratory RDL in any soil or groundwater sample collected from the Site. Although the MECP does not provide soil or groundwater SCS for this parameter, upon review of the British Columbia Contaminated Sites Regulation (B.C. Reg. 375/96) a soil quality and drinking water quality standard for this parameter were identified of 26 µg/g and 52 µg/L, respectively. Given that chloromethane was not detected at a measured concentration in any soil or groundwater samples collected from the Site and that

the RDL of this parameter is well below the identified soil and groundwater quality standards from other jurisdictions, chloromethane is not retained as a COC for further investigation in the RA.

Methyl Butyl Ketone (2-Hexanone):

Methyl butyl ketone was analyzed in post remediation soil samples and groundwater samples collected from both pre- and post remedial activities. Methyl butyl ketone has not been detected above the laboratory RDL in any soil or groundwater sample collected from the Site. No applicable soil or groundwater quality standards from other jurisdictions were identified upon review. However, given that methyl butyl ketone has similarities in physiochemical properties to methyl ethyl ketone, concentrations of methyl butyl ketone were also compared to the Table 3 soil and Table 7 groundwater SCS for methyl ethyl ketone of 44 µg/g and 26 µg/L, respectively. Given that methyl butyl ketone was below the Table 3 soil and Table 7 groundwater SCS for methyl ethyl ketone and was not detected at any sampling locations in soil or groundwater, this parameter is not retained as a COC for further investigation in the RA.

Benzo(b+k)fluoranthene:

Benzo(b+k)fluoranthene was provided as an analyzed parameter for both soil and groundwater samples collected from the Site upon receipt of the certificates of analysis from the contractual laboratory. However, benzo(b+k)fluoranthene is not a regulated parameter under O.Reg. 153/04, and is assessed through the individual standards provided for benzo(b)fluoranthene and benzo(k)fluoranthene. As such, benzo (b+k) fluoranthene is not identified as a COC as both benzo(k)fluoranthene and benzo(b)fluoranthene were below the applicable SCS.

5.6 Sediment Quality

As no surface water body was present at the Phase Two Property, sediment sampling was not part of the scope of work for the Phase Two ESA.

5.7 Quality Assurance and Quality Control Results

Quality assurance and quality control measures were taken during the field activities to meet the objectives of the sampling and quality assurance plan to collect unbiased and representative samples to characterize existing conditions in the overburden and bedrock materials, and water table units at the Phase Two Property.

Review of field activity documentation indicated that recommended sample volumes were collected from soil and groundwater for each analytical test group into appropriate containers and preserved with proper chemical reagents in accordance with the protocols set out in the "Protocol for Analytical Methods used in the Assessment of Properties under Part XV.1 of the *Environmental Protection Act*" (MOE, 2004). Samples were preserved at the required temperatures in pre-chilled insulated coolers and met applicable holding time requirements, when relinquished to the receiving laboratory.

Field QA/QC samples were collected during soil and groundwater sampling. Duplicate samples were collected to evaluate sampling precision; and, trip blanks were included to evaluate the potential for sample cross-contamination during handling and transport. Refer to Tables 3 and 5 for a summary of the QA/QC samples collected and submitted for chemical analysis.

The field duplicate sample results were quantitatively evaluated by calculating the relative percent difference (RPD). The RPD for soil (inorganics) was an average of 4%. The RPD for sodium chloride in groundwater was 2.5%. The remaining parameters in groundwater (i.e., VOC, PHC, and PAH) were all less than laboratory detection limits and it was not possible to calculate an RPD. The overall assessment indicates that the soil and groundwater samples were

collected with an acceptable level of precision, and the data is acceptable quality for meeting the objectives of the Phase Two ESA.

The results of the trip blanks indicated that the chemical parameters were all non-detect, which shows that the groundwater samples were not cross contaminated during handling and transport.

The contractual laboratories selected to perform the chemical analyses was Paracel Laboratories (Paracel), of Ottawa, Ontario. Paracel is accredited laboratories under the Standards Council of Canada/Canadian Association of Environmental Analytical Laboratories (Accredited Laboratory No. 97 and No. A3200, respectively) in accordance with ISO/IEC 17025:2005 – “General Requirements for the Competence of Testing and Calibration Laboratories”.

Certificates of Analysis were received Paracel reporting the results of all the chemical analyses performed on the submitted soil, and groundwater samples. Copies of the Certificates of Analysis are provided in Appendix G. Review of the Certificates of Analysis, prepared by Paracel, indicates that they were in compliance with the requirements set out under subsection 47(3) of O.Reg.153/04.

The analytical program conducted by Paracel included analytical test group specific QA/QC measures to evaluate the accuracy and precision of the analytical results and the efficiency of analyte recovery during solute extraction procedures. The laboratory QA/QC program consisted of the preparation and analysis of laboratory duplicate samples to assess precision and sample homogeneity, method blanks to assess analytical bias, spiked blanks and QC standards to evaluate analyte recovery, matrix spikes to evaluate matrix interferences and surrogate compound recoveries (VOCs only) to evaluate extraction efficiency. The laboratory QA/QC results are presented in the Quality Assurance Report provided in the Certificate of Analysis prepared by Paracel. The QA/QC results are reported as percent recoveries for matrix spikes, spike blanks and QC standards, relative percent difference for laboratory duplicates and analyte concentrations for method blanks.

The QA/QC results were assessed against test group control limits in the case of spiked blanks, matrix spikes and surrogate recoveries and alert criteria in the case of method blanks and laboratory duplicates. Review of the laboratory QA/QC results reported by Paracel indicated that they were within acceptable control limits or below applicable alert criteria for the sampled media and analytical test groups.

Based on the assessment of the QA/QC, the analytical results reported are of acceptable quality and data qualifications are not required.

6 Phase Two Conceptual Model

6.1 Introduction

This section presents the Phase Two Conceptual Site Model (P2CSM) providing a narrative, graphical and tabulated description integrating information related to the Site geologic and hydrogeological conditions, areas of potential environmental concern/potential contaminating activities, the presence and distribution of potential contaminants of concern, contaminant fate and transport, and potential exposure pathways. The P2CSM was completed in accordance with Ontario Regulation 153/04, as amended (O.Reg.153/04), as defined by the Ontario Ministry of the Environment, Conservation and Parks (MECP).

The Site is currently designated as industrial land use, and the intention is to change to a residential land use. Therefore, a Record of Site Condition (RSC) is required.

This P2CSM is based on the results of sample analyses and stratigraphy from the following reports:

- Phase I and II ESA by Jacques Whitford (February and March, 2008)
- Supplemental Phase II ESA by Trow (September and December, 2008)
- Pre-remediation Soil Sampling by Trow (April, 2012)
- Soil Remediation by Trow (July, 2012)
- Phase One and Two ESAs and Updates by EXP (2016)
- Phase One ESA by EXP (2024)

All results were compared to the MECP (2011) Table 3: Full depth Generic Site condition Standards (SCS) in a Non-Potable Ground Water Condition for Industrial/Commercial/Community Property Use and medium/fine textured soil.

It is additionally noted that since completion of the relied upon reports noted above, revisions to the property boundary constituting the Risk Assessment (RA) lands have occurred. The relied upon reports were completed for the historical site boundaries, including a portion of land located in the eastern central portion of the property. As of 2021 a separate Risk assessment process was undertaken for the central eastern portion of the Site. All soil and groundwater analytical data collected from the eastern-central portion of the former RA property boundary has been omitted from the Phase Two and figure set

6.2 Physical Site Description

The site is located on the west side of Heatherington Road, at 1770 Heatherington Road, Ottawa in an area of mixed residential and commercial land use (Figure 1 and 2). Refer to Table 1 for the Site identification information.

The site consists of a 2.7-hectare - former City of Ottawa Works Yard that is currently vacant as shown in Figure 3A. The site was reportedly in operation between the mid-1960s and 2012. Former structures that previously existed on the site included a 3-bay maintenance garage, salt storage dome, storage shed, four office trailers, quonset hut, and an aboveground (liquid) calcium chloride storage tank as shown in Figure 3B. All these structures were located on the northern half of the property which includes paved access and parking areas. The southern half of the site is gravel covered. All structures were removed from the site prior to remedial activities that commenced in 2012 and concluded in 2015. The site is currently vacant and is not being used for any purpose.

The site is generally flat, with a slight grade from north to south. Surface water drainage flows to catch basins and storm sewers located in the paved portion of the site or dissipates via surface infiltration. Regional groundwater flow is inferred to be toward Sawmill Creek located approximately 600 m south or McEwen Creek located approximately 1.1 km south of the of the subject property. Although there are surface drainage ditches south, southeast and southwest of the site that drain into Sawmill and/or McEwen Creek, it is unlikely that groundwater is discharging to the drainage ditches since the depth to groundwater ranges between 1.5 and 2.82 m below grade surface (m bgs), in overburden monitoring wells at the Site. Bedrock groundwater levels were measured between 1.59 and 11.79 m bgs in bedrock monitoring wells at the Site.

A visual inspection of the adjacent properties and properties within 250 m of the Site was conducted from publicly accessible areas to identify the occupants and document the uses and sources of potential environmental concerns that may impact the site. Refer to Figure 2 for the adjacent land uses and previous surrounding land use (Figure 4).

- North: Various light commercial
- South: Residential
- East: Residential and Boys and Girls Club of Ottawa (i.e., community)
- West: Service Ontario (i.e., institutional), Residential

Based on the current visual inspection, no present-day sources of potential environmental concern that could impact the subject site were identified on the adjacent and surrounding properties (Figure 2). It is additionally noted that the off-Site operations noted to constitute Potentially Contaminating Activity (PCA) IDs 5 through 9, are based on historical activities that occurred between the 1960s and the 1990s along the north adjacent property boundary. Several prior environmental investigations have been conducted at the Site to address the off-Site PCAs and no soil or groundwater impacts have been identified in relation to the off-Site PCAs constituting on-Site Areas of Potential Environmental Concern (APECs). A figure depicting the location of test pits, monitoring wells and borehole locations utilized as part of the prior environmental investigations is provided as Figure 5A.

Table 6.1: Site Identification Information

Civic Address	1770 Heatherington Road, Ottawa, Ontario
Current Land Use	Industrial
Proposed Land Use	Residential and Parkland
Legal Description	Part of Lot A, Concession 4 (Rideau Front), Geographic Township of Gloucester; Part 2 on Plan 4R-33717; Part of PIN 04741-0011 (LT).
Property Identification Number (PIN)	Part of 04741-0011 (LT)
Universal Transverse Mercator (UTM) coordinates	NAD83, Zone 18, 449470 m E, 5024942 m N
Site Area	2.7 hectare
Property Owner	City of Ottawa
Owner Contact	Mr. Vahid Arasteh
Owner Address	10 Laurier Avenue West, Ottawa, Ontario
Assessment Roll Number (ARN)	061411650502200

6.3 Geological and Hydrogeological Setting

6.3.1 Geology

The site stratigraphy has been characterized by the advancement of various boreholes and test pits into the overburden material and the underlying bedrock material, up to a maximum depth of approximately 18.3 m below grade.

The general stratigraphy at the Site, as observed in the boreholes and test pits, consists of a surficial sand and gravel fill and re-worked native material which overlies the native overburden consisting of silty clay and clay, over a gravelly silty till layer. Weathered limestone bedrock can be found beneath the native soils. The interpreted Site geology is shown on Figures 15A-15D and Figures 25A and 25B and Table 5.1.

Table 6.2: Site Stratigraphy

Stratigraphy	Details	Approximate Depth (m bgs)	Approximate Elevation (m RSD)
Surface	Asphalt	0 - 0.12	98.8 – 98.7
	Topsoil	0 – 0.19	98.8 – 98.6
	Reworked native/fill (sand and gravel, granular sub-base)	0 - 0.8	98.7 – 97.9
Native Overburden	Silty clay	0.7 – 3.3	98.0 – 94.7
	Clay	1.4 – 3.1	98.0 – 94.3
	Gravelly silty till	3.0 – 5.5	95.9 – 93.4
Bedrock	Limestone	> 5.2	< 92.7

6.3.2 Hydrogeology

The Site hydrogeological characteristics are summarized in Table 5 and groundwater flow directions and groundwater table elevations are depicted in Figures 8A and 8B, for the overburden and bedrock groundwater units, respectively. Groundwater elevations presented in Figures 8A and 8B were collected in July 2020, at the time of the most recent comprehensive groundwater elevation assessment.

Depths to groundwater have been measured at the Site between 2008 and 2021. Groundwater measurements collected from prior to the remedial activities in 2015 have not been relied upon. As such only groundwater depth measurements collected after 2015 are considered representative of current Site conditions. Groundwater levels collected at the time of the 2022 groundwater sampling event were considered unsuitable for Site characterization due to time elapsed since well development and the time to the prior groundwater monitoring events.

Table 6.3: Site Hydrogeological Characteristics

Descriptor	Overburden Groundwater (2015 – 2022)	Bedrock Groundwater (2015 – 2022)
Depth to Groundwater	1.54 to 2.82 (m bgs)	1.59 to 11.79 (m bgs)
Groundwater Elevation	84.44 to 85.91 m RSD	75.76 to 86.05 m RSD
Direction of Groundwater Flow	southeast	south
Hydraulic Conductivity	5.8×10^{-8} – 3.1×10^{-5} m/s	Not Determined
Average Hydraulic Conductivity	1.6×10^{-5} m/s	Not Determined
Horizontal Hydraulic Gradient	0.006 – 0.012 m/m	0.003 – 0.008 m/m
Average Horizontal Hydraulic Gradient	0.009 m/m	0.005 m/m
Vertical Hydraulic Gradient	-0.003 m/m (upward) in northwest and southeast part of site, and 0.061 m/m (downward) in central part of site	

6.4 Site Sensitivity

The Site Sensitivity classification with respect to the conditions set out under Section 41 and 43.1 of O.Reg.153/04 were evaluated to determine if the Site is sensitive, as presented in Table 6.2.

Table 6.4: Site Sensitivity

Sensitivity	Classification	Does Sensitivity Apply to Site?
Section 41 Applies If	(i) property is within an area of natural significance	No
	(ii) property includes or is adjacent to an area of natural significance or part of such an area	No
	(iii) property includes land that is within 30 m of an area of natural significance or part of such an area	No
	(iv) soil at property has a pH value for surface soil less than 5 or greater than 9	No ¹
	(v) soil at property has a pH value for sub-surface soil less than 5 or greater than 11	No
	(vi) a qualified person is of the opinion that, given the characteristics of the property and the certifications the qualified person would be required to make in a record of site condition in relation to the property as specified in Schedule A, it is appropriate to apply this section to the property	No
Section 43.1 Applies If	(i) property is a shallow soil property	No
	(ii) property includes all or part of a water body or is adjacent to a water body or includes land that is within 30 m of a water body	No

¹Soil pH had been locally measured outside of the acceptable range at one (1) location on-Site, identified as TP08-8. Remedial excavation Pit No. 5 was completed at the location of the pH exceedance in surficial soil in order to remove the impacted soil. It is noted that Pit No. 6 was also completed to remediated soil pH due to a measured exceedance of the surficial pH range; however due to revisions to the Site boundary this location is now located off-Site

6.5 Potentially Contaminating Activities

The following potentially contaminating activities (PCA) were identified on-site and within the Phase One Study Area, as per Schedule D of O. Reg 153/04, and are thought to contribute to an APEC:

Table 6.5: Summary of Potentially Contaminating Activities

PCA Identifier	Address	Location of Activity (in Relation to Site)	Potentially Contaminating Activity (PCA)	Approximate Timeline That PCA Occurred	Contribution to APEC at the Site
PCA 1: Former On-Site Garage (Location of Remedial Pit No. 1)	1770 Heatherington Road	On-site (northeast corner)	#27: Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles	The site had operated as a public works yard and garage since approximately the 1960s. A three-door garage was used for the light maintenance and storage of City of Ottawa public works vehicles and equipment. Based on a reviewed Phase I ESA (JWEL, 2008a), completed during the operation of the Site garage, various light	Yes - PCA is located on-site

PCA Identifier	Address	Location of Activity (in Relation to Site)	Potentially Contaminating Activity (PCA)	Approximate Timeline That PCA Occurred	Contribution to APEC at the Site
				<p>chemicals (cleaners, motor oils, antifreeze, etc..) were stored in sealed containers within the garage. A catch basin was connected to a former dry-well east adjacent to the former garage. Based on reviewed City of Ottawa building plans from 1960 a fuel oil powdered heating system was present in the north portion of the garage. The heating system was powered by a 500-gallon fuel oil storage tank (identified as PCA 2 and described below).</p> <p>Soil and groundwater within the footprint of the former garage was remediated in 2012 - 2014. The impacts included petroleum hydrocarbons, metals and volatile organic compounds.</p>	
PCA 2: Former On-Site UST (Location of Remedial Pit No. 1)	1770 Heatherington Road	On-site (northeast corner)	#28: Gasoline and Associated Products Storage in Fixed Tanks	<p>At the time of the 2012 remedial investigation, the former UST had already been removed from the Site. The date of removal is unknown, however based on a review of City of Ottawa Site plans from 1960 the UST was identified to a 500-gallon buried, steel wall fuel oil tank.</p> <p>The tank was identified to service the heating system in the former garage structure (PCA 1, outlined above). The UST was constructed of steel and was situated on top of a subgrade concrete foundation. The UST was located north adjacent to the former garage structure.</p>	Yes – PCA is located on-site
PCA 3: Surficial granular fill material of unknown quality present across the Site	1770 Heatherington Road	On-site (across the entire Site)	#30: Importation of Fill Material of Unknown Quality	Based on review of aerial photographs and prior ESA reports, fill materials are present across the entirety of the Site. The Site has used soil from public works operations to re-grade the property and for stockpiling at the	Yes – PCA is located on-site

PCA Identifier	Address	Location of Activity (in Relation to Site)	Potentially Contaminating Activity (PCA)	Approximate Timeline That PCA Occurred	Contribution to APEC at the Site
<p>Former excavation (Pit 2) – located in central portion of the Site</p> <p>Former excavation (Pit 3) – located in southeast portion of the Site</p> <p>Former excavation (Pit 4) – located in southwest portion of the Site</p>				<p>former public works yard. Fill of unknown quality and street sweepings were stored on-Site, street sweepings were reportedly disposed of at off-Site landfill facilities each year while soil stockpiles were stored and reused for ongoing public work projects (JWEL, 2008a).</p> <p>Based on review of historical aerial photographs between 1958 and present day, fill piles and soil berms change locations during operation of the Site. Evidence of fill materials being re-worked and stored across the majority of the Site is evident from review of the historical aerial photographs. In addition, it is assumed that fill materials of unknown quality were also used to regrade the property to accommodate new structures built during the course of Site operations.</p> <p>As such, given that fill materials have been located across the majority of the Site during operations and that it is suspected that the majority of the Site has been graded with fill materials of unknown quality, PCA 3 has been identified to be associated with the entire Site. Several remedial excavations were completed to address exceedances suspected to be associated with the fill materials present at the Site:</p> <p>Impacts at Pit 2 included PAH and PHC.</p> <p>Impacts at Pit 3 included V and Co.</p> <p>Impacts at Pit 3 included PAH.</p>	

PCA Identifier	Address	Location of Activity (in Relation to Site)	Potentially Contaminating Activity (PCA)	Approximate Timeline That PCA Occurred	Contribution to APEC at the Site
PCA 4: Historical salt related exceedances, Former salt dome, salt use and salt storage	1770 Heatherington Road	On-site (across the entire Site)	#48: Salt Manufacturing, Processing and Bulk Storage	<p>The site had operated as a works yard since the 1960s, including the use and storage of de-icing salts.</p> <p>During the operation of the Site as a municipal public works yard for the City of Ottawa, de-icing related infrastructure was formerly present at the Site and de-icing salts were applied to the Site across paved regions during winter months. A former Quonset hut, salt storage dome and calcium chloride AST were all located within the northwestern portion of the Site. Salts were stored on-Site, within these structures, and were loaded into vehicles for application on municipal streets during winter months.</p> <p>In addition, based on review of historical ESA reports (JWEL, 2008b) salt-related impacts have been identified across the majority of the Site in surficial soils and overburden groundwater. As such, the entire Site was identified to be related to PCA 4.</p>	Yes – PCA is located on-site
PCA 5: Former Dry Cleaner	1574 Walkley Road	Off-Site (north adjacent property)	#37: Operation of Dry Cleaning Equipment (where chemicals are used)	<p>Betty's Brite Cleaners (formerly located at 1574 Walkley Road) operated between approximately 1980 and 1990 based on the reviewed City Directories and ERIS report, provided with the Phase One ESA (EXP, 2016a).</p> <p>Based on the proximity to the Site, duration of operations and suspected presence of halogenated solvents, the property at 1574 Walkley Road was identified as a PCA. No information on the location of former infrastructure or other operations occurring at the property were identified. The approximate location PCA is</p>	<p>Yes, however this APEC was previously assessed by JWEL in 2008b and EXP in 2016b.</p> <p>The results of the prior investigations indicated VOCs in all groundwater samples collected along the northern property line were less than the applicable SCS.</p>

PCA Identifier	Address	Location of Activity (in Relation to Site)	Potentially Contaminating Activity (PCA)	Approximate Timeline That PCA Occurred	Contribution to APEC at the Site
				identified to be the entire building at 1574 Walkley Road.	
PCA 6: Former Retail Fuel Outlet and UST	1594 Walkley Road	Off-Site (north adjacent property)	#28: Gasoline and Associated Products Storage in Fixed Tanks	A former retail fuel outlet was present along the northern property boundary at 1594 Walkley Road as identified in the ERIS report, the City Directories and prior environmental investigations completed at the Site (JWEL, 2008a). This PCA occurred at 1594 Walkley Road between the 1960s - 1990s. Locations of storage tanks or other associated infrastructure related to the retail fuel outlet are unknown. However, the approximate location of the former retail fuel outlet is provided on Figure 4.	Yes, however previously assessed by JWEL in 2008b and EXP in 2016b. The results of the prior investigations indicated metals, PAH, PHC and VOC in groundwater samples collected along the northern property line were less than the applicable SCS.
PCA 7: Former remediation contractor	1606 Walkley Road	off-Site (north adjacent property)	#28: Gasoline and Associated Products Storage in Fixed Tanks	Triangle Pump was formerly located at 1606 Walkley Road, north adjacent to the Site. Triangle Pump is an environmental contractor with services that include solid and liquid waste removal, tank removals, and Site remediations. It is unknown if any former infrastructure or operations occurred on the property at 1606 Walkley Road. This PCA occurred between the 1960s - 1980s. Based on review of the JWEL (2008a) Phase One ESA an approximate location of the former building is shown on Figure 4.	Yes, however, previously assessed by JWEL in 2008b and EXP in 2016b. The results of the prior investigations indicated metals, PAH, PHC and VOC in groundwater samples collected along the northern property line were less than the applicable SCS.
PCA 8: Former Automotive Sales and Services	1620 Walkley Road	off-Site (north adjacent property)	#27: Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles	A Nissan dealership was formerly located at the intersection of Walkley Road and Heatherington Road at 1620 Walkley Road. This PCA occurred between the 1960s - 1980s. No information on the location of historical	Yes, however, previously assessed by JWEL in 2008b and by EXP in 2016b. The results of the prior investigations indicated metals, PAH,

PCA Identifier	Address	Location of Activity (in Relation to Site)	Potentially Contaminating Activity (PCA)	Approximate Timeline That PCA Occurred	Contribution to APEC at the Site
				infrastructure, storage tanks or other operations were identified.	PHC and VOC in groundwater samples collected along the northern property line were less than the applicable SCS.
PCA 9: Reported Spill (Motor Oil)	1620 Walkley Road	off-Site (north adjacent property)	#Other: Spill	Based on the reviewed ERIS report a historical spill of 150 L of motor oil was identified at the property located at 1620 Walkley Road. This PCA occurred in 1988. Given the proximity of the PCA to the Sites northern boundary, the spill of motor oil was identified as a PCA.	Yes, however, previously assessed by JWEL in 2008b and by EXP in 2016b. The results of the prior investigations indicated metals, PAH, PHC and VOC in groundwater samples collected along the northern property line were less than the applicable SCS.

6.6 Areas of Potential Environmental Concern

Based on the evaluation of the PCAs located within the Phase One Study Area, two areas of potential environmental concern (APECs) were identified, as presented below.

Table 6.6: Summary of Areas of Potential Environmental Concern

Area of Potential Environmental Concern (APEC)	Location of APEC on Site	PCA Identifier & (Potentially Contaminating Activity)	Location of PCA (on-site or off-site)	Contaminants of Potential Concern (CPOC)	Media Potentially Impacted (Groundwater, Soil and/or Sediment)
APEC 1: Former garage in the northeast corner of the Phase One Property. All impacted soils and overburden groundwater were removed during various remediation programs (Pit 1).	Northeast Corner	PCA 1 (PCA #27: Garages and Maintenance and Repairs of railcars, Marine Vehicles, and Aviation Vehicles)	On-site	PHCs, VOCs, PAHs, metals	Soil and groundwater
APEC 2: Former UST. All impacted soils and overburden groundwater were removed during various remediation programs (Pit 1).	Northeast Corner	PCA 2 (PCA #28: Gasoline and Associated Products Storage in Fixed Tanks)	On-site	PHCs, VOCs, PAHs, metals	Soil and groundwater
APEC 3: Placement of surficial granular fill of unknown quality across the entire Site.	Across the Site	PCA 3 (PCA #30: Importation of Fill Material of Unknown Quality)	On-site	Metals, PAH, PHC	Soil
APEC 4: Salt Dome and Use on-site. Previous Phase Two ESAs by both EXP and others identified salt impacts in the shallow soil across much of the site.	Across the Site	PCA 4 (PCA #48: Salt Manufacturing, Processing and Bulk Storage)	On-site	Soil (SAR and Electrical Conductivity), Groundwater (Na, Cl-)	Soil and groundwater
APEC 5: Former off-site dry cleaner.	Northwest corner of site	PCA 5 (#37: Operation of Dry Cleaning Equipment where chemicals are used)	Off-Site	VOC	Groundwater
APEC 6: Former off-site retail fuel outlet and UST.	North central portion of site	PCA 6 (#28: Gasoline and Associated Products Storage in Fixed Tanks)	Off-Site	BTEX, PHC	Groundwater
APEC 7: Former fuel dispenser and remediation contractor.	North central portion of site	PCA 7 (#28: Gasoline and Associated Products Storage in Fixed Tanks)	Off-Site	BTEX, PHC	Groundwater

Area of Potential Environmental Concern (APEC)	Location of APEC on Site	PCA Identifier & (Potentially Contaminating Activity)	Location of PCA (on-site or off-site)	Contaminants of Potential Concern (CPOC)	Media Potentially Impacted (Groundwater, Soil and/or Sediment)
APEC 8: Former automotive sales and services	Northeast portion of site	PCA 8 (#27: Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles)	Off-Site	PHC, PAH, metals, VOCs	Groundwater
APEC 9: Former reported motor oil spill	Northeast portion of site	PCA 9 (#Other: Spill)	Off-site	PHC, PAH	Groundwater

Notes:

- 1) SAR - sodium adsorption ratio, EC – electrical conductivity, PAH – polycyclic aromatic hydrocarbons, PHC – petroleum hydrocarbons
- 2) Area of Potential Environmental Concern means the area on, in or under a phase one study area where one or more contaminants are potentially present, as determined through the P One ESA, including through (a) identification of post or present uses on, in or under the phase one property, and (b) identification of potentially contaminating activities.
- 3) Potentially contaminating activity means a use or activity set out in Column A of Table 2 of Schedule D (O.Reg.153/04, as amended) that is occurring or has occurred in a phase one Study area.

6.7 Selection of Site Condition Standards and Contaminants of Concern

The MECP (2011a) Table 3: Full Depth Generic Site Condition Standards (SCS) in a Non-Potable Ground Water Condition for Community Property Use and medium/fine textured soils were considered applicable for determining contaminants of concern (COCs), based on the reasons presented in Table 6.7.

Table 6.7: Site Condition Standards

Descriptor	Site-Specific Condition
Section 41 Site Sensitivity	<p>Not applicable</p> <p>The soil at the Site has pH values between 5 and 9 for surficial soil; and, between 5 and 11 for subsurface soil. Soil pH had been locally measured outside of the acceptable range at one location (TP-22); however, this area was remediated.</p> <p>The Site is not located near an area of natural significance or an environmentally sensitive area.</p>
Section 43.1 Site Sensitivity	<p>Not applicable</p> <p>The Site is not considered a shallow soil property, based on the recovered soil cores, which indicated that more than two-thirds of the Site has an overburden thickness more than 2 m; and,</p> <p>The Site is not located within 30 m of a surface water body; the nearest surface water body, Sawmill Creek is located approximately 600 m south of the Site and McEwen Creek is located approximately 1.1 km south.</p>
Ground Water	<p>Non-Potable</p> <ul style="list-style-type: none"> • The Site and surrounding properties within 250 m of the Site are supplied by the City of Ottawa municipal drinking water system. No potable water wells are located on the Site or within 250 m of the Site. An initial Notification Letter to apply non-potable standards was sent by exp on behalf of the Owner to the City of Ottawa on September 6, 2016. A subsequent non-potable notification was issued to the City of Ottawa on November 2, 2020.
Land Use	<p>Residential/Parkland/Institutional</p> <ul style="list-style-type: none"> • The proposed future use of the Site is to change to residential / parkland.
Soil Texture	<p>Fine-textured</p> <ul style="list-style-type: none"> • The predominant texture of soils at the Site is fine-textured, based on soil characteristics identified in the borehole logs and grain size analysis. Please refer to Section 5.1.2 for a full rationale of grain size selection.

Additionally, given the minimum depth to groundwater identified in the overburden groundwater unit at the Site (i.e., 1.54 m bgs) volatile groundwater impacts were also assessed against the MECP (2011a) Table 7 Full Depth Generic SCS for Shallow Soils in a Non-Potable Groundwater Condition, all types of land use and medium/fine textured soil. It is also noted that the MECP Table 7 Generic SCS for Shallow soils in Non-Potable Ground Water Condition consider a scenario where biodegradation cannot be assured and where soil may not be present to provide attenuation to volatile migration towards the surface grade.

Based on the results of the prior Phase Two ESA reports, remediation programs and confirmatory sampling programs all historical soil and groundwater exceedances have been addressed at the Site, with the exception of the following parameters:

- Soil:
 - o Electrical Conductivity (EC) (associated with APEC 4); and,

- o Sodium Adsorption Ratio (SAR) (associated with APEC 4).
- Groundwater (Table 3 SCS):
 - o Sodium (Na+) (associated with APEC 4); and,
 - o Chloride (Cl-) (associated with APEC 4).
- Groundwater (Table 7 SCS):
 - o Cis-1,2-dichloroethylene (associated with APEC 1).

6.8 Soil Exceedances

Elevated SAR and EC were identified as exceeding the current MECP Table 3 SCS across the majority of the Site to the depth of bedrock. The impacts are believed to be related to the handling and storage of road salt on the Phase One Property as part of the historical Site operations while its use as a City of Ottawa Public Storage yard (i.e., APEC 4). EC and SAR impacts in soil at the Site extend to the Site boundaries and the horizontal delineation of salt related impacts was not feasible to achieve given that impacts were identified up to the property boundary in all directions.

In 2015, soil samples were submitted for SAR and EC analysis from boreholes MW/BH15-8, MW/BH15-10, and MW/BH15-11. Samples were collected from depths of 4.6 to 6.1 m below grade, just above the bedrock, to vertically delineate the salt impacts. EC and/or SAR exceedances of the Table 3 SCS were noted at BH15-10 and BH15-11, no exceedances were noted in the sample collected from BH15-8. The vertical delineation of EC and SAR in Site soil was not feasible or practical to achieve at the Site, as EC and SAR exceedances are assumed to extend to bedrock across the majority of the Site.

The soil samples from MW/BH15-10 and MW/BH15-11 exceeded MECP Table 3 SCS for SAR and/or EC. The soil sample from MW/BH15-8 was less than the MECP criteria for SAR and EC, whereas, the soil sample from MW/BH15-10 was less than MECP criteria for SAR.

This indicates that for most of the soils at the site, the SAR and EC impact extend to the bedrock interface, except for the southern portion of the site, near MW/BH15-8. Based on these results, the SAR and EC has been vertically and laterally delineated as much as practicable at the Site. Please refer to Figure 15 for a plan view figure of the EC and SAR impacts and refer to Figures 15A through 15D for cross-sectional figures demonstrating the EC and SAR impacts identified in soil at the Site.

The intention is to address the salt related soil impacts through a Risk Assessment.

6.9 Groundwater Exceedances

As stated above, salt impacts (i.e., EC and SAR) were identified in most the overburden soils across the site exceeding the Table 3 SCS, extending all the way to bedrock across the majority of the Site. The salt impacts in both the overburden and bedrock groundwater (i.e., sodium and/or chloride) across the site required assessment for horizontal and vertical delineation. The primary source of the salt was suspected to be in the northwest corner (i.e., location of former Quonset hut) of the Site, which is also considered to be upgradient in terms of groundwater flow.

In January and February 2021, the time of most recent groundwater sampling for salt related parameters, MW15-1 (overburden), MW15-2 (bedrock), MW15-4 (overburden), MW15-5 (bedrock), MW15-6 (overburden), MW15-7 (bedrock), MW15-11 (overburden), and MW15-12 (bedrock) were sampled for sodium and chloride. All groundwater samples collected in 2021 exceeded for sodium and/or chloride in groundwater, with the exception of samples collected at MW15-12 (bedrock) and MW15-1 (overburden) exceeded the applicable Table 3 SCS. As

multiple rounds of groundwater sampling have occurred at the Site for sodium and chloride across the prior environmental investigations, the most recent rounds of sampling (i.e., 2019 and 2021) are considered most representative of the current groundwater conditions at the Site in relation to the salt impacts. Based on review of all recent groundwater analytical data analyzed for sodium and chloride collected between 2019 and 2021, the highest concentrations of sodium and chloride were identified to be within the southeast portion of the Site at MW15-6.

Concentrations of sodium and chloride appear to be decreasing as a function of time since Site decommissioning and source removal and impacts in groundwater appear to be migrating with distance from the anticipated source of salt related impacts.

Based on the above, salt impacts exist in both the overburden and bedrock horizons across the majority of the site extending from the source (northwest corner), and continuing downgradient to the southeast corner of the site. For the horizontal delineation, refer to Figure 25. For the vertical delineation, refer to Figures 25A and 25B.

One (1) volatile parameter was identified to exceed the Table 7 SCS in groundwater at the Site, cis-1,2-dichloroethylene. Cis-1,2-dichloroethylene was only identified to exceed the Table 7 SCS at one (1) monitoring well location, MW14-7, during the post-remedial sampling events. MW14-7 is screened within the native silty clay till soil at a depth of 1.3 – 4.3 m bgs and is located in the northeastern portion of the Site. It is noted that vinyl chloride was not identified at a measured concentration at this monitoring well or any others, indicating anaerobic degradation is not occurring at an appreciable rate. Concentrations of cis-1,2-DCE at MW14-7 appear to be decreasing since the post-remedial Site maximum identified in 2019.

The identified Table 7 exceedance of cis-1,2-dichloroethylene is likely associated with remnant impacts from the former garage located within the northeastern corner of the Site (APEC 1); It is noted that all post remediation groundwater sampling events met the Table 3 SCS for all VOCs analyzed.

The intention is to address the groundwater impacts through a Risk Assessment.

6.10 Lateral and Vertical Delineation of Groundwater – Salt Impacts

EXP has recommended the application of non-standard delineation at the Site as it related to vertical delineation in groundwater. A rationale for vertical delineation relief for sodium and chloride in groundwater is provided below.

Sodium (Na+) and Chloride (Cl-)

The distribution of salt related parameters in groundwater is shown on plan view in Figure 25 and on cross section Figures 25A and 25B.

Vertical delineation relief is requested by the MECP for sodium and chloride given the following rationale:

- All contaminants of concern are identified: Based on the historical activities conducted at the Site, the salt-related impacts in groundwater are likely attributed to the use of de-icing salts as a part of the public work operations that have occurred at the RA Property during operation as a public works yard, including bulk salt storage, use and transport at the Site. The historical use, storage and identified exceedances of salt related parameters were identified as PCA 4 resulting in APEC 4, as presented in Section 2.1 and 2.2. It is noted that the public works yard has not been in operation since the early 2000s and salt storage or use no longer occurs at the RA property, however upgradient and adjacent properties (i.e., municipal roadways and parking lots on Walkley Road) are still subject to salt application during winter months, which may contribute to groundwater concentrations through groundwater migration.

- Maximum concentrations are identified for all contaminants of concern: The area of highest sodium and chloride concentrations in groundwater for recent analytical data (i.e., 2019 – 2021) is identified to be at MW15-6 (screened at 3.0 – 6.0 in overbruden soils) at the southeastern portion of the RA proeprty. Given that significant depths have already been achieved at the Site as demonstarted with the instllation and sampling of MW15-5, it is the QP’s opinion that the maximum concentrations of sodium and chrloide in groundwater have been identified.
- All reasonable efforts to delineate to the applicable Site Condition Standards were undertaken: Several attempts have been made to collect clean groundwater from deep monitoring wells for vertical delineation purposes, including the installation of multiple bedrock monitoring wells, use of low-flow sampling techniques, multiple sampling events, and duplicate sampling. MW15-5 is installed within the bedrock groundwater unit screened at a depth of 16.6 – 18.1 m bgs and represents the deepest monitoring well at the RA property sampled for sodium or chloride. MW15-5 has been sampled four (4) times since installation in 2015. As such, EXP is of the opinion that adequate attempts have been made in order to vertically delineate salt related impacts in groundwater at the Site.
- The property is appropriately characterized: It is the QP’s opinion that PCA 4 associated with APEC 4 is adequately characterized, with sufficient distribution of monitoring wells across the property, and adequate groundwater sampling frequency. Groundwater monitoring for sodium and chloride has occurred at the RA property between 2008 and 2021, providing EXP with a robust understanding of the temporal trends of salt-related parameters in groundwater.
- Additional vertical delineation will not lead to an improved understanding of the distribution of contaminants: No risks were identified for either human or ecological receptors via the exceedances of sodium and chloride in groundwater at the Site. Further to this, sodium and chloride would not be expected to result in risk for human receptors, and any risk to ecological receptors would be primarily driven by shallow groundwater concentrations. As such, there is no material benefit in vertically delineating sodium and chloride in groundwater at the RA property.
- There are practical or negative environmental reasons that are impediments to further delineation to the applicable Site Condition Standards: Deep drilling in this area has the potential to promote fracturing of the bedrock, thereby creating preferential pathways, and increasing the likelihood of downward contaminant movement, which would unduly impact the deeper bedrock aquifer.

As indicated above, based on the rationale provided, EXP is of the opinion that any further vertical delineation is not warranted, and non-standard delineation has been applied for sodium and chloride in groundwater.

Table 6.8: Delineation of Soil and Groundwater Impacts

Parameter Group and Media	Horizontal Delineation	Associated Figures	Vertical Delineation	Associated Figures
Salt impacts in soil	Majority of Site	Figure 15	Up to limestone bedrock	Figure 15A, 15B, 15C, and 15D
Salt impacts in groundwater	Majority of Site	Figure 25	12 m (MW15-12) to > 18 m (MW15-5) below grade	Figure 25A and 25B

Parameter Group and Media	Horizontal Delineation	Associated Figures	Vertical Delineation	Associated Figures
VOC impact in groundwater	Northeastern portion of Site	Figure 19 (Pre-Remediation) and Figure 20 (post-Remediation)	Up to 4.3 m bgs at MW14-7	NA

6.11 Distribution and Source of Impacts

Based on the field and analytical testing, soil and groundwater impacts related to salt storage and handling were identified on the Phase Two Property. Details of the delineation, source and distribution of all impacts are summarized in Tables 12 and 13.

Table 6.9: Source and Distribution of Soil and Groundwater Impacts

Parameter Group and Media	Contaminants Associated with Each Group	What is Known About the Area	Distribution
Salt impacts in soil	SAR, EC	Likely associated salt storage and snow piles at the northwest portion of the Site (APEC 4)	Majority of the Site – from the surficial soil into native material, extending to bedrock
Salt impacts in groundwater	Sodium, Chloride	Likely associated salt storage and snow piles at the northwest portion of the Site (APEC 4)	Salt impacts in groundwater
VOC impacts in groundwater	Cis-1,2-DCE	Likely associated with the former garage operations (APEC 1)	Localized to MW14-7 (cis-1,2-DCE)

6.12 Contaminant Fate and Transport

The source of the SAR and EC impacts across the site was the former salt dome in the northwest corner of the site and snow piles/fill across the site. The salt impacts are also present in the groundwater. Relevant fate and transport mechanisms include advection, dispersion and molecular diffusion. The source of the salt has been removed and the concentrations will decrease with time because of dilution, dispersion and groundwater flow. The Phase Two Property and surrounding neighbourhoods are serviced with municipal water and therefore impacts to drinking water wells are not anticipated.

Contaminants of concern that remain on-site include those related to previous salt storage and handling on the Phase Two Property. For soil, specific contaminants of concern include SAR and EC, whereas in groundwater the contaminants of concern include cis-1,2-dichloroethylene, Na⁺ and Cl⁻. For both soil and groundwater, horizontal delineation been achieved, as much as practicable at the Site.

Details on the reason for discharge of the impacts are summarized in Table 6.10.

Table 6.10: Reason for Discharge Soil and Groundwater Impacts

Parameter Group and Media	Reason for discharge
Salt impacts in soil	Likely associated with road salt storage within the Quonset dome formerly located at the northwest portion of the Site and snow piles containing road salts throughout the entire Site. The road salts would have leached into the overlying ground surface and progressively leached deeper into the soil over time (APEC 4).
Salt impacts in groundwater	Salt impacts in soil would have leached into the vadose zone and shallow groundwater over time, and eventually dissolved in groundwater, dispersing throughout the Site (APEC 4).
VOC impacts in groundwater	The minor exceedance of the Table 7 SCS at MW14-7 are likely residual impacts associated with the remediation of soil and groundwater completed to address APEC 1 (former on-Site garage). VOC impacts are expected to naturally attenuate and breakdown overtime and are localized to one (1) monitoring well location.

6.12.1 Preferential Pathways

The preferential pathways for contaminants present in soil and groundwater media include underground utilities and surface features.

Considering that all underground services were removed during the soil excavation activities, these services are no longer considered conduits for contaminant migration. A storm sewer remains in the northeast portion of the site, however based on groundwater monitoring, it does not appear to be affecting groundwater flow. Refer to Figure 3B for the former Site Layout and Utilities Plan. Apart from the storm sewer, there are no surface water features that actively direct surface water flow.

Details on the preferential pathways for the impacts are summarized in Table 6.11.

Table 6.11 Preferential Pathways

Item	Detail
G. anything known about migration of the contaminants present on, in or under the phase two property at a concentration greater than the applicable site condition standard away from any area of potential environmental concern, including the identification of any preferential pathways,	Subsurface utilities in the northeast portion of the site (i.e. water and septic) were removed during the remediation activities. There is a storm sewer in the northeast portion of the site that exists beyond the extent of the remediation. There are no other subsurface utilities on the property that could act a preferred pathway.

6.12.2 Climatic Conditions

It is noted that climatic or meteorological conditions may influence the distribution and migration of COCs at the Site. Seasonal fluctuations in groundwater due to cyclical increases and decreases in precipitation can affect groundwater recharge. Groundwater levels may be elevated in the spring and fall due to snow melt and/or increases in precipitation; and, groundwater levels may be lowered in the winter and summer due to snow storage and/or increased evaporation. Such fluctuations can increase the vertical distribution of COCs in the capillary zone, as well as alter the direction of groundwater flow paths based on changes in infiltration rates. However, based on the conditions observed at the Site, it is not anticipated that the climatic or meteorological changes will result in significant alterations in the distribution of contaminants.

Details on the climatic or meteorological conditions are summarized in Table 6.12.

Table 6.12: Climatic and Meteorological Conditions

Item	Detail
H. climatic or meteorological conditions that may have influenced distribution and migration of the contaminants, such as temporal fluctuations in ground water levels, and	Some groundwater fluctuations are expected at the Site, but not significant variation.

6.12.3 Soil Vapour Migration

One (1) volatile COC was identified to exceed the Table 7 SCS, cis-1,2-dichloroethylene. All other COCS are not considered volatile. Given the low concentration of VOC impacts and localized distribution at the Site (i.e., impacts only identified at MW14-7) the potential for soil vapour migration from these groundwater impacts is considered to be low. Concentrations of cis-1,2-dichloroethylene in groundwater is anticipated to decrease over time through natural attenuation and degradation.

6.12.4 Areas Where Contaminants Are Present

A summary of each area of contamination (AOC) prior to and post remediation is presented in Appendix J.

6.12.5 Exposure Pathways

Human Health Receptors and Exposure Pathways

The Site is currently a vacant commercial/industrial property, with the intention for it to be re-developed as residential. Therefore, the potential on-Site human receptors that may be present include: property residents (all age groups), property visitors (all age groups), long-term indoor and outdoor workers (adults) and sub-surface/construction workers (adults).

The on-Site human health conceptual exposure model is attached as Figure 33A. As Risk Management Measures (RMM) have been identified as being required for the Site, the human health conceptual exposure model in the presence of RMM is provided as Figure 33B. The Off-Site human health conceptual exposure model is provided as Figure 33C and as Figure 33D for off-Site human receptors in the presence of on-Site RMM. Given the nature of the adjacent land uses, off-Site receptors are identified to be the same as those present on-Site

Ecological Receptors and Exposure Pathways

The Site was previously used for industrial purposes, with the intention for it to be re-developed as residential. Therefore, the potential on-site ecological receptors that may be present on-site comprise terrestrial vegetation, such as trees, grasses and shrubs; soil invertebrates, such as earthworms, millipedes and beetles; terrestrial birds, such as pigeons, sparrows and robins; and, terrestrial mammals, such as moles, voles and mice.

The COCs present at the Site were observed in soil and groundwater media. There is a potential for select on-site receptors to come into direct contact with impacted soil.

Given that the shallowest depth to groundwater at the RA Property is approximately 1.54 m bgs and ecological receptors are not anticipated to be present at depths greater than 1.5 m bgs, the exposure pathways relevant to groundwater COCs are incomplete.

Furthermore, the MECP evaluates exposure to aquatic receptors at properties within 5 km of a surface water body. Given that Sawmill Creek is located approximately 600 m south of the Site and McEwen Creek is located approximately 1.1 km to the south of the Site, aquatic receptors, such as aquatic vegetation, benthic and pelagic invertebrates, birds, mammals and fish are also considered.

The COCs present at the Site were observed in soil (EC and SAR) and groundwater media (cis-1,2-dichloroethylene, Na⁺ and Cl⁻). There is a potential for select off-site aquatic receptors to come into indirect contact with contaminated soil and groundwater media, through the leaching of contaminants into groundwater media, and eventually discharging to the downgradient water body.

The potential ecological receptors and exposure pathways will include the following:

- Terrestrial Vegetation
 - o Root uptake of soil and groundwater; and,
 - o Stem and foliar uptake of ambient vapour.
- Soil Organisms
 - o Dermal contact with soil and groundwater;
 - o Ingestion of soil and groundwater;
 - o Soil particulate inhalation;
 - o Inhalation of vapour; and,
 - o Ingestion of tissue residue from plants and other soil invertebrates.
- Terrestrial Mammals and Birds
 - o Dermal contact of soil;
 - o Ingestion of soil;
 - o Soil particulate inhalation;
 - o Inhalation of vapour; and,
 - o Ingestion of tissue residue from plants and soil invertebrates.
- Aquatic Receptors in nearest surface water body
 - o Root stem and foliar uptake of surface water (aquatic plants only), surface water dermal contact (aquatic invertebrates, birds and mammals, and fish), surface water ingestion (aquatic invertebrates, birds and mammals, and fish), ingestion of plant and animal tissue (aquatic birds and mammals, and fish) and, gill uptake (fish only).

The on-Site ecological conceptual exposure model is attached as Figure 33A. As Risk Management Measures (RMM) have been identified as being required for the Site, the ecological conceptual exposure model in the presence of RMM is provided as Figure 33B. The Off-Site ecological conceptual exposure model is provided as Figure 33C and as 33D for off-Site ecological receptors in the presence of on-Site RMM..

7 Conclusions

The Site investigative activities consisted of numerous investigations over several year and included the following:

- Test pit and surface sample advancement to facilitate the collection of soil samples for geologic characterization and/or chemical analysis.
- Borehole drilling to facilitate the collection of soil and bedrock samples for geologic characterization and/or chemical analysis; and,
- Monitoring well installation for hydrogeologic property characterization and the collection of groundwater samples for chemical analysis

The results and findings of the Phase Two ESA conducted at the Phase Two Property are summarized as follows:

9. The investigations included the advancement of 74 test pits into the sub-grade; 41 test pits into the soil berm, 53 boreholes (up to a maximum depth of approximately 18.6 m below grade) of which 47 were completed as monitoring wells and 16 surface soil samples.
10. Below the asphalt, topsoil layer, or sand and gravel granular sub-based, a layer of native silty clay was encountered across the Phase Two Property. The silty clay was approximately 1 m to 4 m thick. Below the silty clay layer was the silty clay till layer, which became progressively coarser with sand and gravel at depth. The final stratigraphic layer encountered on the Phase Two Property was the Carlsbad Formation, which is composed of shale bedrock. The bedrock was encountered at approximately 6.2 metres below grade.
11. Based on the field and analytical testing, much of the soil across the Phase Two Property was found to be impacted with SAR and EC. The source of this impact is attributed to the former storage and handling of road salt within the former works yard.
12. The intention is to address the soil impacts through a Risk Assessment
13. Overburden groundwater was detected between 1.54 m and 2.82 m bgs. Static elevations for bedrock groundwater ranged between 1.59 m bgs and 11.79 m bgs. Direction of groundwater flow was measured as southeast in the overburden and south in the bedrock.
14. Based on the field and analytical testing, salt impacts exist in both the overburden and bedrock horizons across the majority of the site extending from the source (northwest corner), and continuing downgradient to the southeast corner of the site.
15. Based on analytical testing one (1) volatile parameter was identified to exceed the Table 7 SCS in groundwater at the Site, cis-1,2-dichloroethylene. Cis-1,2-dichloroethylene was only identified to exceed the Table 7 SCS at one (1) monitoring well location, MW14-7, during the post-remedial sampling events. MW14-7 is screened within the native silty clay till soil at a depth of 1.3 – 4.3 m bgs and is located in the northeastern portion of the Site.
16. The intention is to address the groundwater impacts through a Risk Assessment

7.1 Current Site Conditions

Contaminants of concern that exist on-site include those related to salt storage and handling on the Phase Two Property and the former maintenance garage. For soil, specific contaminants of concern include SAR and EC whereas in groundwater, the contaminants of concern include Na and Cl⁻ and cis-1,2-DCE for Table 7 SCS.

With respect to receptor exposure to salt impacted soil, Table 3 generic standards are driven by ecotoxicity models as opposed to human health models. There are no human health standards for SAR and EC and consequently, there are no human health concerns associated with these parameters.

With respect to the receptor exposure salt impacted groundwater, Table 3 generic standards are driven by drinking water standards. The Phase Two Property and surrounding properties, however, rely on the municipal water supply for drinking water as opposed to local groundwater. Consequently, the exposure pathway for those parameters are incomplete.

With respect to the cis-1,2-DCE impacted groundwater, it is noted that vinyl chloride was not identified at a measured concentration at this monitoring well or any others. This indicates that anaerobic degradation is not occurring at an appreciable rate. Furthermore, the concentrations of cis-1,2-DCE at MW14-7 appear to be decreasing since the post-remedial Site maximum identified in 2019 and all post remediation groundwater sampling events met the Table 3 SCS for all VOCs analyzed.

As previously indicated, it is proposed that the Phase Two Property may be redeveloped, for parkland/residential land use, which will include some landscaping areas. The potential on-Site ecological receptors that may be present on-Site comprise terrestrial vegetation, soil invertebrates, birds and mammals.

The potential on-Site exposure pathways for terrestrial vegetation are via root uptake of soil or groundwater, and stem and foliar uptake of vapour. The potential on-Site exposure pathways for soil invertebrates are via soil dermal contact, soil ingestion, groundwater dermal contact, groundwater ingestion and inhalation of vapour. The potential on-Site exposure pathways for birds and mammals are via soil dermal contact, soil ingestion.

It is noted that the EC/SAR impacts in soil and the Na/Cl and cis-1,2-DCE impacts in groundwater remain on the Phase Two Property and will be managed as a part of the Tier III risk assessment.

7.2 Soil Management

The aforementioned RA provides risk management measures, including capping specifications, associated with managing soil in place.

It is noted that the linear soil berms previously located on the east side of the Phase Two Property has been relocated to the west portion of the 1770 Heatherington Road property and are suitable for use as fill, provided it meets geotechnical requirements.

It is recommended that any excess soil that is generated during the redevelopment of the site be managed in accordance with the MECP document entitled *Rules for Soil Management and Excess Soil Quality Standards* with particular reference to the conditions related to salt-impacted excess soil (Section D 1, (3)).

The Qualified Person can confirm that the Phase Two Environmental Site Assessment was conducted per the requirements of Ontario Regulation 153/04, as amended, and in accordance with generally accepted professional practices.

8 General Limitations

The information presented in this report is based on a limited investigation designed to provide information to support an assessment of the current environmental conditions within the subject property. The conclusions and recommendations presented in this report reflect Site conditions existing at the time of the investigation.

More specific information with respect to the conditions between samples, or the lateral and vertical extent of materials may become apparent during excavation operations. The interpretation of the borehole information must, therefore, be validated during any such excavation operations. Consequently, during the future development of the property, conditions not observed during this investigation may become apparent. Should this occur, EXP Services Inc. should be contacted to assess the situation, and the need for additional testing and reporting. EXP has qualified personnel to provide assistance in regard to any future geotechnical and environmental issues related to this property.

The environmental investigation was carried out to address the intent of applicable provincial Regulations, Guidelines, Policies, Standards, Protocols and Objectives administered by the Ministry of the Environment. It should also be noted that current environmental Regulations, Guidelines, Policies, Standards, Protocols and Objectives are subject to change, and such changes, when put into effect, could alter the conclusions and recommendations noted throughout this report. Achieving the study objectives stated in this report has required us to arrive at conclusions based upon the best information presently known to us. No investigative method can completely eliminate the possibility of obtaining partially imprecise or incomplete information; it can only reduce the possibility to an acceptable level. Professional judgment was exercised in gathering and analyzing information obtained and in the formulation of the conclusions. Like all professional persons rendering advice, we do not act as absolute insurers of the conclusions we reach, but we commit ourselves to care and competence in reaching those conclusions.

Our undertaking at EXP, therefore, is to perform our work within limits prescribed by our clients, with the usual thoroughness and competence of the engineering profession. It is intended that the outcome of this investigation assist in reducing the client's risk associated with environmental impairment. Our work should not be considered 'risk mitigation'. No other warranty or representation, either expressed or implied, is included or intended in this report.

This report was prepared for the exclusive use of the City of Ottawa. and may not be reproduced in whole or in part, without the prior written consent of EXP, or used or relied upon in whole or in part by other parties for any purposes whatsoever. Any use which a third-party makes of this report, or any part thereof, or any reliance on or decisions to be made based on it, are the responsibility of such third parties. EXP Services Inc. accepts no responsibility for damages, if any, suffered by any third-party as a result of decisions made or actions based on this report.

Phase Two Environmental Site Assessment
1770 Heatherington Road, Ottawa, ON
OTT-00018293-J5
April 25, 2024

Appendix A: Previous Report Summary

For the purpose of this Phase Two, potential contaminants of concern (COCs) were determined from a comparison of the analytical results from the soil and groundwater samples obtained against Table 3: Full Depth Generic Site Condition Standards [Ontario Ministry of the Environment document titled Soil, Groundwater and Sediment Standards for Use Under Part XV.1 of the *Environmental Protection Act*, March 9, 2004] for all Residential/Parkland/Institutional property use and fine textured soil. A parameter was selected as a potential COC if its maximum sample concentration exceeded its Table 3 SCS, or if a detected parameter has no Table 3 SCS.

Historically, the property was used for agricultural/vacant purposes until the current on-Site operations began sometime in the mid to late 1960s. Since then, the RA property has been used by the City of Ottawa as a Works Yard. The Works Yard included the use, storage and handling of road de-icing salts.

The following reports were reviewed for the preparation of the risk assessment, and the compilation of the analytical data sets. Complete, electronic copies of the reports are included in full on the USB in Appendix O.

12. *Phase Two Environmental Site Assessment Update, 1770 Heatherington Road, Ottawa, Ontario. Prepared by EXP Services Inc. In-Progress (EXP 2024b).*

The analytical data obtained from the previous site investigations was prepared by Trow (Trow, 2008a; b; c; 2009 and 2010) and Jacques Whitford Ltd. (JWL, 2008b). Laboratory analysis of soil and groundwater was performed by Caduceon Environmental Laboratories (Caduceon) and Paracel Laboratories Ltd. (Paracel). Caduceon and Paracel are accredited by the Standards Council of Canada/Canadian Association of Environmental Analytical Laboratories (Accredited Laboratory No. 2644 and A1262, respectively) in accordance with ISO/IEC 17025:1999 – “General Requirements for the Competence of Testing and Calibration Laboratories” for the analysis of all parameters for all samples in the scope of work for which SCS have been established under Ontario Regulation 153/04. The QP considers the analytical results to be suitable to support the conclusions made within the RA.

As revisions have occurred for the boundary of the RA property since the time of last submission, select reference within the previous reports may no longer apply to features or data collected from the current Site boundaries.

The analytical data sets obtained from the soil and groundwater samples that were compared with the Table 3 generic SCSs are discussed in the individual report summaries presented in this appendix. These data sets included analytical results for petroleum hydrocarbons (PHC including BTEX), volatile organic compounds (VOCs), polycyclic aromatic hydrocarbons (PAHs), polychlorinated biphenyls (PCBs) and metals, hydride forming metals and select other regulated parameters in both soil and groundwater. Analytical results for groundwater and soil pH are also included.

A summary of the analytical results obtained from the RA Property are included in Appendix E.

Sampling Program

Based on the historical operations that took place at the RA Property, and the review of the previous environmental investigations, the previous sampling programs were designed to include the collection of soil and groundwater samples for analysis of BTEX, PHC F1-F4, VOCs, PAHs, PCBs and inorganic parameters. Soil and groundwater samples were also collected and submitted for analysis of pH. In addition, summary tables are also provided with the rationale for the submission of soil samples for chemical analysis.

The sampling programs conducted by Trow and EXP (formerly Trow), which were relied on for this risk assessment, were conducted by EXP personnel using generally accepted scientific and engineering principles, and with the appropriate sampling equipment. Standard sampling procedures for soil and groundwater were used to ensure consistency in sample collection and the preparation of samples for laboratory submission. The Ontario Ministry of the Environment document titled *Guidance on Sampling and Analytical Methods for Use at Contaminated Sites in Ontario* (MOE, 1996a) was used as a reference.

Based on the statement provided in the Phase II ESA (JWL, 2008b), the JWL sampling programs were conducted in a similar manner.

The soil and groundwater sampling plans were prepared and executed based on the historical property use of the Site and on professional judgment at the time of sample collection. Field observations were made and documented in a field book in accordance with generally accepted practices.

The complete summaries of historic soil and groundwater monitoring programs, are provided for each investigation presented in this appendix. Refer to Appendix E for complete analytical summary tables. Refer to Appendix O (USB) for copies of the associated borehole logs, certificates of analysis, and PDF copies of the previous reports referenced herein.

The following samples were collected for the RA Property, which are deemed representative of existing site conditions.

Table D-1: Sample Collection Summary Prior to Remedial Activities

Parameter Test Group	Number of Analyses ^a	
	Soil	Groundwater
PHC	26	21
BTEX	26	37
VOCs	27	35
PAHs	25	6
PCBs	15	6
Metals	16	15
Sulphate	6	0
pH	33	6
Electrical Conductivity (EC)	103	NA
Sodium Adsorption Ratio (SAR)	103	NA
Sodium(Na ⁺)	NA	10
Chloride (Cl ⁻)	NA	16
Nitrite (NO ⁻²)	NA	16

^a Duplicates or blanks are not included in the number of analyses
NA = not applicable

Table D-2: Sample Collection Summary During and Following Remedial Activities

Parameter Test Group	Number of Analyses ⁽¹⁾	
	Soil	Groundwater
Electrical conductivity	18	NA
Sodium adsorption ratio	18	NA
Chloride	NA	20
Sodium	NA	23
PHCs	75	37
BTEX only	17	48

Parameter Test Group	Number of Analyses ⁽¹⁾	
	Soil	Groundwater
VOCs	23	52
PAHs	39	4
PCBs	0	0
Boron only	3	0
Cobalt only	5	0
Lead only	3	0
Vanadium only	5	0
Metals	19	4
pH	10	0

(1) Duplicates or blanks are not included in the number of analyses

NA = not applicable

An estimation of natural local background concentrations was not conducted as part of this risk assessment.

The QP considers this sampling program to be sufficient to support the conclusions made within the RA.

Quality Assurance/Quality Control

As shown in the individual report summaries, field duplicate samples were obtained for both soil and groundwater. The results of the field duplicates and the original samples show good correlation. The following table provides further information regarding the field duplicate samples submitted for the RA Property.

Table D-3: Field Duplicate Sample Summary

Matrix	Original Sample Identification	Duplicate Sample Identification	Sample Depth (m bgs)	Parameter	ESA (Appendix D)
Soil	TP08-51	TP08-15	0.91-1.37	BTEX, PHCs, Styrene, PCBs	JWL, 2008b
	TP08-132	TP08-231	0.78-0.91	PAHs, Metals, SAR, EC, pH	JWL, 2008b
	TP5B	TP50B	0.3	SAR, EC	Trow, 2008a

A field blank sample was collected during the February 2008 groundwater sampling round by JWL and submitted for analysis of BTEX, PHCs and VOCs. A trip blank sample was collected during the August 11, 2008 groundwater sampling round by Trow and submitted for analysis of BTEX, PHCs and VOCs. A trip blank sample was also collected during the August 30, 2010 groundwater sampling round by Trow and submitted for analysis of VOCs (including BTEX). Additionally, four (4) trip blanks were collected by EXP from April 2013 to August 2015 during groundwater sampling events and were submitted for analysis of VOCs (including BTEX). A trip blank sample was also submitted alongside groundwater samples collected in 2019 and 2022 for the analysis of VOCs or PHCs and BTEX. Most analyses were returned non-detect, indicating insignificant cross contamination in the field or during transport. One field blank sample during the February 2008 groundwater sampling conducted by JWL indicated a detected chloroform concentration of 1.8 µg/L; however, this detected concentration is within a factor of five (5) from the laboratory reported detection limit (0.3 µg/L), and this concentration is not considered a significant indication of contamination.

The laboratories used during this investigation, Caduceon Environmental Laboratories and Paracel Laboratories Ltd., are accredited by the Standards Council of Canada/Canadian Association of Environmental Analytical Laboratories (Accredited Laboratory No. 2644 and A1262, respectively) in accordance with ISO/IEC 17025:1999 – “General Requirements for the Competence of Testing and Calibration Laboratories” for the analysis of all parameters for all samples in the scope of work for which SCS have been established under Ontario Regulation 153/04.

Analytical test group specific field quality assurance and quality control procedures were incorporated into the sampling programs. These procedures included the use of the appropriate number and size of laboratory-prepared sample containers, the use of appropriate preservatives when required, the collection of field duplicate samples when required, and ensuring sample hold times and temperatures were not exceeded. The Ontario government document titled *Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act* (MOE, 2004a) was used as a reference.

The laboratory quality assurance program included the analysis of laboratory duplicate (replicate) samples, method blanks, spiked blanks, spiked samples and samples of reference materials in accordance with the Analytical Protocol. Caduceon’s and Paracel’s overall quality control for the analysis meets their acceptability criteria.

The QP considers the analytical results to be suitable to support the conclusions made within the RA.

Phase I Environmental Site Assessment – 1770 Heatherington Road, Ottawa, Ontario. Prepared by Jacques Whitford Limited. February 29, 2008.

A Phase I ESA was conducted by Jacques Whitford Limited (JWL) to evaluate the potential for environmental impacts at the Site related to historic activities and operations conducted on and off-Site. The findings of the Phase I ESA identified a number of issues of potential environmental concern related to past activities on and off-Site including:

- Storage and handling of hazardous waste materials at the Site, which included waste oils and lubricants, inorganic laboratory chemicals, landfill leachate, light fuels and oils, skimmings and sludges;
- The historic storage and handling of road salts at the Site;
- The presence of several fill/debris piles at the Site reportedly consisting of street sweepings;
- The storage and handling of halogenated solvents at a dry cleaning operation located adjacent to the northwest boundary of the Site;
- The age and conditions of the on-Site catch basins, the presence of oil in the eastern basin and observed staining on the floor of the on-Site garage;
- A former gasoline retail outlet located adjacent to the north boundary of the Site;
- The reported spill of 150 litres of motor oil off Site from an AST located at a former automobile dealership at the intersection of Walkley and Heatherington Roads; and,
- Historic operations associated with a former environmental contractor located north of the Site at Walkley Road.

Phase II Environmental Site Assessment, 1770 Heatherington Road, Ottawa Ontario. Prepared by Jacques Whitford Limited. March 24, 2008.

To address the potential environmental concerns identified in the JWL Phase I ESA, a Phase II ESA was conducted by JWL in February 2008 to evaluate soil and groundwater quality at the Site. The investigation consisted of the following:

- Advancement of eight (8) boreholes, all of which were instrumented as groundwater monitoring wells and the excavation of 16 shallow test pits.
- The monitoring wells were screened within the native silty clay/silty sand at depths from approximately 1.5 m to 6 m below grade.
- Soil and groundwater samples were collected for the laboratory chemical analysis of PHCs, volatile organic compounds (VOCs), polycyclic aromatic hydrocarbons (PAHs), polychlorinated biphenyls (PCBs), metals and general chemistry/inorganic parameters.
- The analytical results indicated elevated levels of EC and SAR in the majority of the surface soil samples (depths less than 1.5 m below grade) collected across the Site and in some subsurface soil samples (depths greater than 1.5 m below grade) above their respective MECP Table 3 SCS.
- Boron was detected in one (1) surface soil sample (MW08-2) at a concentration above the MECP Table 3 SCS (2.0 µg/g).
- One (1) surface soil pH measurement was above the applicable range of 5 to 9 for the MECP generic SCS.
- The results for the remaining parameters in both soil and groundwater met the MECP Table 3 SCS, where applicable.
- A hydrocarbon sheen was reportedly observed at two (2) monitoring well (MW08-1 and MW08-2) located in the vicinity of the on-Site maintenance garage.

- Groundwater samples collected from these monitoring well locations indicated concentrations of PHC Fractions F2 and F3 were in excess of the MECP Table 2 SCS protective of potable groundwater quality. It should be noted that there are no MECP Table 3 SCS for groundwater.

Supplemental Phase II Environmental Site Assessment and Remedial Options Review, 1770 Heatherington Road, Ottawa, Ontario. Prepared by Trow Associates Inc. September, 2008.

A supplemental Phase II ESA of the Site was conducted by Trow to further delineate the extent and magnitude of the soil and groundwater impacts previously identified at the Site, and to evaluate potential remedial options to clean up the Site. The investigation consisted of the following:

- Advancement of nine (9) boreholes at the Site, which included six (6) boreholes instrumented as monitoring wells and three (3) boreholes instrumented as piezometers.
- Soil samples were collected from the boreholes for laboratory chemical analysis of PHC Fractions, VOCs, and boron.
- Groundwater samples were collected for analysis of PHC Fractions and VOCs.
- The investigation also included the excavation of 26 shallow test pits for the collection of soil samples for the analysis of EC and SAR.
- Sixteen (16) surface soil samples were collected from various locations for the analysis of EC and SAR.
- The analytical results indicated levels of EC and SAR in surface soil above the MECP Table 3 SCS extending across the majority of the Site.
- The findings of the Trow investigation also indicated that the boron and pH soil impacts identified by JWL were isolated occurrences at single locations.
- The groundwater analytical results indicated that vinyl chloride was detected at one (1) monitoring well location (MW08-15) at a concentration (1.5 µg/L) above its MECP Table 3 SCS (1.3 µg/L).
- The analytical results also indicated the presence of PHC Fractions F2, F3 and F4 in groundwater at two (2) monitoring well locations (MW08-1 and MW08-2) at concentrations above the MECP Table 2 potable groundwater SCS.

Monitoring Well Installation and Groundwater Sampling, Ottawa Works Yard, 1770 Heatherington Road, Ottawa, Ontario. Prepared by Trow Associates Inc. December 16, 2008.

A monitoring well installation and groundwater sampling program of the Site was conducted by Trow to delineate the vertical and lateral extents of vinyl chloride-impacted soil and/or groundwater at the Site. The investigation consisted of the following:

- Advancement of two (2) boreholes (BH18 and BH19), both of which were instrumented with groundwater monitoring wells (MW18 and MW19).
- Two (2) soil samples were collected from the boreholes for laboratory chemical analysis of VOCs.
- Groundwater samples were collected from the newly installed monitoring wells, as well as six (6) previously installed monitoring wells (MW08-1 to MW08-3, MW08-14, MW08-16 and MW08-17) for laboratory chemical analysis VOCs.

- The soil analytical results did not indicate any VOC parameters in excess of MECP Table 3 SCS.
- The groundwater analytical results indicated that vinyl chloride was detected at two (2) monitoring well location (MW08-14 and MW19) at concentrations (6.1 and 1.5 µg/L, respectively) above its MECP Table 3 SCS (1.3 µg/L).

Test Pit Assessment and Groundwater Monitoring, Ottawa Works Yard, 1770 Heatherington Road, Ottawa, Ontario. Prepared by Trow Associates Inc. December 23, 2008.

A test pit assessment and groundwater sampling program of the Site was conducted by Trow to refine the volume of soil with pH levels outside of the acceptable range that will require removal from the property; and, to confirm the presence or absence of vinyl chloride impacted groundwater at the Site. The investigation consisted of the following:

- Excavation of twelve (12) test pits at the Site, to a depth of 1 m bgs, for the analysis of pH.
- Advancement of one (1) groundwater monitoring well (MW08-14) at the Site, for the analysis of VOCs.
- Sixteen (16) surface soil samples were collected from various locations for the analysis of pH.
- The analytical results indicated that none of the submitted soil samples had a pH value in excess of 9 pH units, and therefore satisfied MECP Table 3 SCS.
- The groundwater analytical results indicated that vinyl chloride was detected at MW08-14 at a concentration (16.7 µg/L) above its MECP Table 3 SCS (1.3 µg/L).

Replacement Monitoring Well Installation and Groundwater Monitoring Program, 1770 Heatherington Road, Ottawa, Ontario. Prepared by Trow Associates Inc. December, 2009.

A supplemental groundwater sampling of the Site was conducted by Trow to further delineate the extent and magnitude of the groundwater impacts previously identified at the Site, and to address the MECP comments on the PSF which expressed the need for more extensive groundwater sampling. The investigation consisted of the following:

- Replacement of two (2) monitoring wells at the Site, specifically MW08-10 and MW08-11.
- Groundwater samples were collected for analysis of sodium, chloride and nitrite.
- Although not detected in excess of the laboratory RDLs, the RDLs for ten (10) of the eleven (11) groundwater samples analyzed for nitrite were in excess of the MECP Table 3 SCS
- Although no Table 3 SCS exist, the analytical results indicated levels of sodium and chloride in groundwater above the MECP Table 2 potable groundwater SCS extending across the majority of the Site.

Groundwater Monitoring Program Field Notes, 1770 Heatherington Road, Ottawa, Ontario. Completed by Trow Associates Inc. August 2010.

A groundwater sampling program of the Site was conducted by Trow to further delineate the extent and magnitude of the groundwater impacts previously identified at the Site, and to address the MECP comments on the PSF which expressed the need for more extensive groundwater sampling. The investigation consisted of the following:

- Advancement of seven (7) monitoring wells (MW08-2, MW08-3, MW08-14, MW08-15, MW08-17, MW18 and MW19) for the laboratory analysis of VOCs. Groundwater samples collected from MW08-2 were also submitted for the analysis of PHCs.
- The groundwater analytical results indicated that vinyl chloride was detected at MW08-14 at a concentration (3.8 µg/L) above its MECP Table 3 SCS (1.3 µg/L).

Site Remediation, 1770 Heatherington Road, Ottawa, Ontario (EXP, October 2015)

This report was prepared to summarize all remedial activities completed on the site. Based on the soil and groundwater remediation activities completed at the Site and the analytical test results, the following summary and conclusions are provided:

- The Site underwent soil and groundwater remediation activities during the spring of 2012 and the winter of 2014;
- A total of approximately 9,190 metric tonnes of impacted soil that exceeded the MECP Table 3 SCS for Residential/Parkland/Institutional Property Use was excavated and transported off-Site licensed landfill sites in Ottawa;
- The excavation areas were backfilled and compacted with Granular B Type II material sourced from commercial quarries operated by Tomlinson and Karson aggregates.
- During the 2014 remedial efforts, approximately 620 m³ of backfill material consisted of segregated on-site soils that were determined to be acceptable based on laboratory analysis. Compaction testing efforts during the 2014 work was hindered by extreme cold temperatures;
- All confirmatory soil samples collected from the floor and walls of the excavations met the MECP Table 3 SCS; and,
- Post remediation groundwater monitoring analytical results met the MECP Table 3 SCS.

Based on the analytical results obtained following the excavation activities, the impacted soil and groundwater identified in Phase Two has been removed from the Site and the remaining soil and groundwater in the area of the excavation complies with the applicable MECP Table 3 SCS for Residential/Parkland/Institutional Property Use for fine textured soil.

Table D-4: Summary of Remedial Activities (2012-2014)

Location	Contaminants of Concern in Soil	Volume (Tonnage) of Soil Removed	Confirmatory Soil Analysis	Contaminants of Concern in Groundwater	Volume of Groundwater Removed (litres)	Confirmatory Groundwater Analysis
Pit 1	PHC, VOC, PAH, boron	4,025 m ³ (8,480 T)	All samples submitted for confirmatory analysis (ie; VOC [31 samples], PHC [29 samples], PAH [4 samples], boron and lead [3 samples] met the applicable criteria.	PHC, VOC, PAH	142,520	Eight (8) rounds of post remediation groundwater monitoring met the applicable criteria (2012 x2, 2013, 2014 x2,

Location	Contaminants of Concern in Soil	Volume (Tonnage) of Soil Removed	Confirmatory Soil Analysis	Contaminants of Concern in Groundwater	Volume of Groundwater Removed (litres)	Confirmatory Groundwater Analysis
						2015, 2019, 2022)
Pit 2	PHC, PAH	222 m ³ (380 T)	All samples submitted for confirmatory analysis (i.e.; PHC [29 samples] and PAH [4 samples] met the applicable criteria	None	None	2015 groundwater monitoring met the applicable criteria
Pit 3	Cobalt, vanadium	54 m ³ (90 T)	All samples submitted for confirmatory analysis (i.e. cobalt and vanadium) met the applicable criteria	None	None	2015 groundwater monitoring met the applicable criteria
Pit 4	PAH	42 m ³ (80 T)	All samples submitted for confirmatory met the applicable criteria	None	None	2015 groundwater monitoring met the applicable criteria
Pit 5	pH	36 m ³ (80 T)	All samples submitted for pH confirmatory analysis met the applicable criteria	None	None	Not applicable
Pit 6 ⁽¹⁾	pH	25 m ³ (60 T)	All samples submitted for pH confirmatory analysis met the applicable criteria	None	None	Not applicable

(1) – Pit No. 6 is Located Off-Site

Brief summaries regarding the remedial efforts completed at the Site and on the adjacent property (i.e., Pit No. 6) are summarized below under the sub-headings Pit 1 through Pit 6 Excavation details, below:

Pit 1 Excavation Details (On-Site, North-Eastern Portion of Site)

Between 2008 and 2012, exceedances of various PAHs, select metals (soil only), PHCs and VOCs (groundwater only) were identified in soil and groundwater were identified in samples collected from the vicinity of the former maintenance and storage garage located at the north portion of the Site.

Between 2012 and 2014 approximately, 8,480 tonnes of impacted soil that exceeded the MECP Table 3 SCS for Residential/Parkland/Institutional Property Use (medium - fine textured) was removed from this excavation and disposed of at a licensed landfill site. The final excavation for Pit No. 1 measured approximately 1,150 m² in total floor area.

Analytical results from the 2012 and 2014 confirmatory soil sampling met the applicable Table 3 SCS indicating vertical and horizontal delineation for soil impacts was achieved at all excavation areas. In brief the following confirmation samples were collected from Pit No. 1 to assess soil quality:

- **North Wall** – In 2012, nine (9) soil samples were collected from the north wall and analyzed for VOCs, PAHs, PHCs and/or select metals. Four (4) of the 2012 samples from the north wall failed to meet the applicable Table 3 SCS for PHCs F1-F2. No other exceedances were identified. As such, in 2014 the bounds of the north wall were extended and an additional five (5) soil samples and one (1) duplicate were collected from the new bounds of the north wall and analyzed for VOCs and/or PHCs no exceedances were identified and the north wall of the excavation had been determined to be appropriately delineated to the applicable SCS.
- **South Wall** – In 2012, three (3) soil samples were collected from the bounds of the south wall and were analyzed for VOCs and/or PHCs. No exceedances were identified in the soil samples collected from along the south wall. In 2014, two (2) additional soil samples were collected from the south wall and were analyzed for PHCs and VOCs. No exceedances of the applicable SCS were noted for the samples collected in 2014 from the south wall.
- **East Wall** – In 2012, five (5) soil samples and one (1) duplicate sample were collected from along the east wall and were analyzed for VOCs, PHCs and/or PAHs. Select exceedances of PHC F2 were identified in several soil samples collected from the east wall in 2012. As such, in 2014 the east wall was extended, and an additional five (5) soil samples and two (2) duplicates were collected from the new bounds of the east wall and analyzed for VOCs and/or PHCs. No exceedances of the applicable SCS were noted for the samples collected in 2014 from the east wall.
- **West Wall** – Between 2012 and 2014, seven (7) soil samples were collected from the west wall and were analyzed for VOCs, PHCs and/or select metals. One (1) exceedance was identified in a sample collected from the west wall in 2014 for PHC F3, the sampling location was subsequently removed, and additional confirmatory sampling indicated delineation of impacts had been archived.
- **Floor** – In 2012, eight (8) soil samples were collected from the floor of the remediation and were analyzed for PHCs, no exceedances of the applicable SCS were identified. In 2014 at the time of the north wall extension an additional ten (10) soil samples and two (2) duplicate samples were collected from the floor of the excavation and analyzed for VOCs and/or PHCs. No exceedances of the applicable SCS were identified for any of the 2012 or 2014 floor samples collected from Pit No. 1.

Throughout the excavating work at Pit 1, groundwater seeped into the base of the excavation and was pumped into a holding tank as needed. The holding tank was then emptied by Clean Water Works when filled. A total of 142,520 liters of groundwater from Pit No. 1 was hauled off-site by Clean Water Works. All groundwater was disposed of under provincial code description 251 L at the Clean Water Works disposal facility at Bantree Street in Ottawa.

Following the 2012 excavation activities, eight (8) overburden monitoring wells were constructed in the Pit 1 excavation (MW12-1 to MW12-5, MW08-8, MW08-10 and MW12-11). These wells were sampled on two (2) or three (3) occasions including July 2012 and/or October 2012, and April 2013.

Following the 2014 excavation and 2012-2013 groundwater sampling activities, eight (8) additional overburden monitoring wells were installed in and around Pit 1. These wells, plus several of the 2012 monitoring wells, were sampled on two occasions (July 2014 and November 2014). During these rounds of sampling and analyses, no exceedances of the applicable Table 3 non-potable criteria were detected for VOC, PHC, or PAH. As such it was deemed that the groundwater within the remedial Pit No. 1 footprint met the applicable Table 3 SCS.

Given that the final round of confirmatory sampling conducted in 2014 for Pit 1 yielded analytical results for soil and groundwater samples below the applicable Table 3 SCS, Pit No. 1 was not identified as a PCA for the Site and is considered to be remediated to the applicable Table 3 SCS as per the opinion of the QP_{ESA}.

Pit 2 Excavation Details (*On-Site, Central-West Portion*)

Between May 18 and May 22, 2012, Pit No. 2 was excavated on the western-central portion of the site to address PHC (F1-F4) and PAH soil exceedances identified at test pit location, TP08-15. On the 30th of January 2008, a marginal exceedance of benzo(a)pyrene (0.36 ug/g) and an exceedance of PHC F2 (1,740 ug/g) were noted at this sampling location, TP08-15, at a sampling depth of 0.3 m bgs.

Approximately 380 tonnes of impacted soil were removed from the Pit 2 excavation. The excavation was advanced to a depth of 1.2 m below ground surface. Groundwater did not enter the excavation. The final excavation for Pit 2 measured approximately 185 m².

To confirm the removal of soil impacts identified at TP08-15, a total of five (5) composite wall samples (i.e., NW1-1, SW2-2, EW2-1, EW5-1 and WW3-1) were collected from the, north, south, east and west walls of the excavation. In addition, three (3) composite floor samples (i.e., F2, F7, and F12) were collected from the base of the excavation. All confirmatory samples collected from Pit 2 met the applicable Table 3 SCS for the Site, indicating impacts had been removed and delineation achieved. Furtherer more, following the completion of the Pit 2 excavation, a monitoring well was installed, denoted as MW15-4, at the approximate location of the former TP08-15. MW15-4 was screened at a depth of 3.0 – 6.0 m bgs and was subsequently sampled for PHCs and BTEX and PAH parameters on the 25 of August 2015. No exceedances of either PHCs and BTEX or PAHs were identified in the groundwater sampling conducted at MW15-4.

Given that all confirmatory sampling conducted at this location yielded analytical results for PHCs and BTEX and PAHs below the applicable Table 3 SCS, Pit No. 2 was not identified as a PCA for the Site, and is considered to be remediated to the applicable Table 3 SCS as per the opinion of the QP_{ESA}.

Pit 3 Excavation Details (*On-Site, Southeastern Portion*)

On May 23, 2012, Pit No. 3 was excavated along the southern boundary of the Site, to address cobalt and vanadium soil exceedances identified at MW08-8 in a soil sample collected at a depth of 0.2 – 1.22 m bgs.

A total of approximately 90 tonnes of soil was excavated from the Pit 3 excavation. Initially the excavation was advanced to a depth of 1.2 m below ground surface and three (3) composite wall samples (i.e., WW1-1, EW1-1, and

NW2-1) and two (2) composite floor samples (i.e., F3 and Fla) were collected for laboratory analysis of cobalt and vanadium. One (1) of the submitted floor samples exceeded the criteria for both cobalt and vanadium. As a result, on May 30, 2012 the western portion of the excavation was advanced to a depth of 1.5 m below ground surface and re-sampled, the additional confirmational soil sample was found to meet the applicable Table 3 criteria.

Groundwater did not enter the excavation. The final excavation for Pit 3 measured approximately 36 m² in total floor area. Following remedial activities, a monitoring well denoted as MW15-6, was advanced within the center of the former remedial pit with a screen depth of 3.0 – 6.0 m bgs. MW15-6 was sampled on August 25, 2015 for metals and inorganics and no exceedances of the applicable Table 3 SCS were identified.

Given that the remedial Pit 3 is located at the downgradient portion of the Site, and that all confirmatory soil and groundwater sampling at this location yielded analytical results for cobalt and vanadium below the applicable Table 3 SCS, Pit No. 3 was not identified as a PCA for the Site and is considered to be remediated to the applicable Table 3 SCS as per the opinion of the QPESA.

Pit 4 Excavation Details (*On-Site, South-Central Portion of Site*)

On May 24, 2012, Pit No. 4 was excavated at the southern property boundary to address a PAH soil exceedance identified at TP08-1. Benzo(a)pyrene and fluoranthene were both identified as marginal exceedances of the applicable Table 3 SCS in a sample collected from a depth of 0.2 m bgs at TP08-1 in January 2008.

Approximately 80 tonnes (4 truckloads) of impacted soil were removed from the Pit 4 excavation. The excavation was advanced to a depth of 1 m below ground surface. Three (3) composite wall samples (i.e., NW2-1, EW3-1 and WW2-1) and two (2) composite floor samples (i.e., F1 and F4) were collected and submitted for laboratory analysis of PAH. All confirmatory samples collected from the remedial excavation yielded analytical results below the applicable Table 3 SCS.

Groundwater did not enter the excavation. The final excavation for Pit 4 measured approximately 42 m² in total floor area. Following remedial activities, a monitoring well denoted as MW15-9, was advanced within the center of the former remedial pit with a screen depth of 3.0 – 6.0 m bgs. MW15-9 was sampled on August 25, 2015 for PAHs and no exceedances of the applicable Table 3 SCS were identified.

Given that the remedial Pit No. 4 is located at downgradient boundary of the Site and that all confirmatory soil and groundwater sampling at this location yielded analytical results for PAHs below the applicable Table 3 SCS, Pit 4 was not identified as a PCA for the Site.

Pit 5 Excavation Details (*30 m southeast of Site*)

On May 31 2012, Pit 5 was excavated at the south-central portion of the Site to address pH exceedances identified in a soil sample collected from TP08-8 at a sampling depth of 0.6 m bgs on the 30th of January 2008.

Approximately 80 tonnes (4 truckloads) of impacted material was removed from the Pit 5 excavation and three (3) composite wall samples (i.e., WW1, EW1, and SW1) and two (2) composite floor samples (i.e., F1 and F2) were collected and sent for laboratory analysis of pH. All five (5) of the confirmatory pH samples were within the applicable Table 3 SCS pH range for surficial soils.

Groundwater did not enter the excavation. The final excavation for Pit 5 measured approximately 36 m².

Given that the remedial Pit 5 is located at the downgradient portion of the Site and that all confirmatory soil sampling at this location yielded analytical results for soil pH within the applicable Table 3 SCS, Pit 5 was not identified as a PCA for the Site and is considered to be remediated to the applicable Table 3 SCS as per the opinion of the QP_{ESA}.

Pit 6 Excavation Details (*Off-Site – Located 15 m east of the Site*)

On May 31, 2012, Pit 6 was excavated to the immediate east of the current Site boundaries to address a pH exceedance identified at a test pit in 2008. Based on revisions to the current Site boundary Pit No. 6 is now located off-Site, and analytical results for the remediation of Pit 6 are not presented in the current Phase two CSM or associated Figures. However, the approximate location and general details of the Pit 6 remediation are provided in the figures and below for transparency.

Approximately 60 tonnes (3 truckloads) of impacted surficial soil material was removed from the Pit 6 excavation up to a depth of 1.0 m bgs. Two (2) composite wall samples and three (3) composite floor samples including one (1) duplicate sample, for QA/QC purposes, were collected from Pit 6 and sent for the laboratory analysis of pH. On June 22, 2021, two (2) additional soil samples, S1 and S2, were collected from the bounds of the Pit 6 excavation, from the south and east walls of the former excavation, respectively. Soil samples S1 and S2 were collected at a depth of approximately 0.3 – 0.5 m bgs. All confirmational soil sampling for pH yielded results within the Table 3 SCS.

Groundwater was not encountered upon advancement of the excavation. The final excavation area for Pit 6 measured approximately 25 m². It is noted that no confirmatory groundwater sampling was conducted at Pit 6 given the nature of the initial soil exceedance identified (i.e., pH).

Phase One Environmental Site Assessment, 1770 Heatherington Road, Ottawa, Ontario (EXP, June 2016)

EXP was retained by the City of Ottawa to complete a Phase One ESA to update the environmental conditions of the site in support of filing a Record of Site Condition (RSC) on the Ontario Ministry of the Environment and Climate Change (MECP) Brownfields Environmental Site Registry. The need to file a RSC is to support a change in land use from industrial to residential.

The Phase One ESA identified the following areas of potential environmental concern.

Area of Potential Environmental Concern (APEC)	Location of APEC on Site	PCA Identifier & (Potentially Contaminating Activity)	Location of PCA (on-site or off-site)	Contaminants of Potential Concern (CPOC)	Media Potentially Impacted (Groundwater, Soil and/or Sediment)
APEC 1: Former garage in the northeast corner of the Phase One Property. All impacted soils and overburden groundwater were removed during various remediation programs (Pit 1). Further groundwater delineation is required.	Northeast Corner	PCA 1 (PCA #27: Garages and Maintenance and Repairs of railcars, Marine Vehicles, and Aviation Vehicles)	On-site	PHCs, VOCs, PAHs, metals	Soil and groundwater
APEC 2: Former UST. All impacted soils and overburden groundwater were removed during various remediation programs (Pit 1). Further groundwater delineation is required.	Northeast Corner	PCA 2 (PCA #28: Gasoline and Associated Products Storage in Fixed Tanks)	On-site	PHCs, VOCs, PAHs, metals	Soil and groundwater
APEC 3: Placement of surficial granular fill of unknown quality across the entire Site.	Across the Site	PCA 3 (PCA #30: Importation of Fill Material of Unknown Quality)	On-site	Metals, PAH, PHC	Soil and groundwater
APEC 4: Salt Dome and Use on-site. Previous Phase Two ESAs by both exp and others identified salt impacts in the shallow soil across much of the	Across the Site	PCA 4 (PCA #Other: Salt Use and Storage)	On-site	Soil (SAR and Electrical Conductivity), Groundwater (Na, Cl-)	Soil and groundwater

Area of Potential Environmental Concern (APEC)	Location of APEC on Site	PCA Identifier & (Potentially Contaminating Activity)	Location of PCA (on-site or off-site)	Contaminants of Potential Concern (CPOC)	Media Potentially Impacted (Groundwater, Soil and/or Sediment)
site. Vertical delineation in soil and groundwater is required.					
APEC 5: Former off-site dry cleaner	Northwest corner of site	PCA 5 (#37: Operation of Dry Cleaning Equipment where chemicals are used)	Off-Site	VOC	Groundwater
APEC 6: Former off-site retail fuel outlet and UST.	North central portion of site	PCA 6 (#28: Gasoline and Associated Products Storage in Fixed Tanks)	Off-Site	BTEX, PHC	Groundwater
APEC 7: Former fuel dispenser and remediation contractor	North central portion of site	PCA 7 (#28: Gasoline and Associated Products Storage in Fixed Tanks)	Off-Site	BTEX, PHC	Groundwater
APEC 8: Former automotive sales and services	Northeast portion of site	PCA 8 (#27: Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles)	Off-Site	PHC, PAH, metals, VOCs	Groundwater
APEC 9: Former reported motor oil spill	Northeast portion of site	PCA 9 (#Other: Spill)	Off-site	PHC, PAH	Groundwater

Phase Two Environmental Site Assessment, 1770 Heatherington Road, Ottawa, Ontario (EXP, June 2016)

The objective of the Phase Two ESA was to re-evaluate the areas of potential environmental concern (APECs) identified in EXP's (2016) Phase One ESA; and, to obtain soil and groundwater data to further characterize the Site to support the filing of a RSC on the MECP Brownfields Environmental Site Registry.

The need to file a RSC is in support of the planned redevelopment of the Site to proposed residential use. The Site investigative activities, as incorporated into this Phase Two ESA, were conducted between 2008 and 2015. Various remedial efforts were also completed at the site in 2012 and 2014.

The results and findings of the Phase Two ESA conducted at the Site are summarized as follows:

1. Advancement of 43 test pits (up to a maximum depth of approximately 1.5 m bgs); 49 boreholes, (up to a maximum depth of approximately 18.3 m below grade) of which 46 were completed as monitoring wells.
2. Below the asphalt or topsoil layer, fill material consisting of silt and sand with trace gravel was encountered between approximately 0.8 and 2.5 m bgs. A layer of native silty clay was encountered across the Site beneath the fill material during borehole drilling and soil excavation activities. The silty clay was approximately 1 m to 4 m thick. Below the silty clay layer was the silty clay till layer, which became progressively coarser with sand and gravel at depth. The final stratigraphic layer encountered on the site was the Carlsbad Formation, which is composed of limestone bedrock. The bedrock was encountered at approximately 5.5 to 7.0 metres below grade. The bedrock consists of grey fractured and moderately weathered limestone.
3. Direction of groundwater flow was measured as south/south east in both the bedrock and overburden.
4. Initial contaminants of concern (COCs) in the soil were petroleum hydrocarbons (PHC), volatile organic compounds (VOC), polycyclic aromatic hydrocarbons (PAH) and metals near the former garage area. Inorganics (pH), metals and PAH were also identified in the fill across the site.
5. In addition, much of the soil across the site was found to be impacted with sodium adsorption ratio (SAR) and electrical conductivity (EC). The source of this impact is attributed to the former on-site storage and handling of road salt.
6. Initial COCs in the groundwater were PHC and VOC in former garage area.
7. Salt impacted groundwater (i.e. sodium chloride) was identified in both the overburden and bedrock groundwater across the site.
8. The non-salt related COC in the soil have been removed through remedial excavations in 2012 and 2014. All of the VOC and PHC impacted groundwater was removed through remediation efforts in 2012 to 2014. Confirmatory groundwater samples from the overburden in former excavations showed that PHC, VOC, metals and PAH are less than the provincial standards.

Remediation Activities

The site remediation activities were completed in two phases in 2012 and 2014 to address APEC 1 to APEC 5, respectively. The remediation activities included: i) the excavation and disposal of impacted soil at licensed landfill facilities; and, ii) the pumping and disposal of impacted groundwater at licensed facilities.

Several environmental site assessments that were previously conducted on-site identified the following areas of environmental concern (AEC):

- Petroleum hydrocarbon (PHC) and volatile organic compound impacted (VOC) impacted soil and groundwater in the vicinity of the former maintenance garage building;

- Minor amounts of boron and lead impacted surficial soil beneath the former maintenance garage building footprint; and,
- Low levels of PHC, polycyclic aromatic hydrocarbon (PAH), metal and/or pH impacted shallow soils at various locations throughout the yard.

Based on the soil and groundwater remediation activities completed at the Site and the analytical test results, the following summary and conclusions are provided:

- The Site underwent soil and groundwater remediation activities during the spring of 2012 and the winter of 2014
- Six separate excavation zones or pits were completed to remediate the various contaminants of concerns;
- A total of approximately 9,190 metric tonnes of impacted soil that exceeded the MECP Table 3 standards for Residential/Parkland/Institutional Property Use was excavated and transported off-Site licensed landfill sites in Ottawa;
- The excavation areas were backfilled and compacted with Granular B Type II material sourced from commercial quarries operated by Tomlinson and Karson aggregates.
- During the 2014 remedial efforts, approximately 620 m3 of backfill material consisted of segregated on-site soils that were determined to be acceptable based on laboratory analysis. Compaction efforts during the 2014 work was hindered by extreme cold temperatures;
- All confirmatory soil samples collected from the floor and walls of the excavations met the MECP Table 3 standards; and,
- Post remediation groundwater monitoring analytical results met the MECP Table 3 standards.

Current Site Conditions

Contaminants of concern that remain on-site include those related to salt storage and handling on the Phase Two Property. For soil, specific contaminants of concern include SAR and EC whereas in groundwater the contaminants of concern include Na and Cl-. In both circumstances, vertical and horizontal delineation has occurred.

With respect to receptor exposure, soil exceedances of the MECP Table 3 generic standards are driven by ecotoxicity models as opposed to human health models. There are no human health standards for SAR and EC and consequently, there are no human health concerns associated with these parameters.

With respect to the groundwater, the exceedances are driven by drinking water standards. The Phase Two Property and surrounding properties, however rely on the municipal water supply for drinking water as opposed to local groundwater. Consequently, the exposure pathway for those parameters are incomplete.

Phase One Environmental Site Assessment Update, 1770 Heatherington Road, Ottawa, Ontario (EXP, *In-Progress*)

EXP completed a Phase One ESA Update for the Site in 2024 (*In-Progress*). EXP built on the findings of the 2016 investigation by conducting a follow-up Site visit and by reviewing additional municipal and regulatory records and any subsurface investigations carried out on the Site since 2016. The goal of the Phase One ESA update was to identify any new PCAs and APECS that have been introduced to the Site and the Phase One Study Area since the completion of the original Phase One ESA. It is noted that the boundaries of the Site have changed since the completion of the 2016 Phase One ESA.

At the time of the Site visit, the Site was vacant, and no structures were present. No significant changes in regard to on-Site structures or land use were noted at this time. A portion of the 1770 Heatherington Road property (no longer located on-Site) was under construction at the time of the Site visit.

Based on the visual observations made at the time of the Site visit and the information collected during the records review, no additional PCAs or APECs were identified for the Site, or the Phase One Study Area.

A summary of the revised APECs is provided below:

Area of Potential Environmental Concern (APEC)	Location of APEC on Site	PCA Identifier & (Potentially Contaminating Activity)	Location of PCA (on-site or off-site)	Contaminants of Potential Concern (CPOC)	Media Potentially Impacted (Groundwater, Soil and/or Sediment)
APEC 1: Former garage in the northeast corner of the Phase One Property. All impacted soils and overburden groundwater were removed during various remediation programs (Pit 1)..	Northeast Corner	PCA 1 (PCA #27: Garages and Maintenance and Repairs of railcars, Marine Vehicles, and Aviation Vehicles)	On-site	PHCs, VOCs, PAHs, metals	Soil and groundwater
APEC 2: Former UST. All impacted soils and overburden groundwater were removed during various remediation programs (Pit 1).	Northeast Corner	PCA 2 (PCA #28: Gasoline and Associated Products Storage in Fixed Tanks)	On-site	PHCs, VOCs, PAHs, metals	Soil and groundwater
APEC 3: Placement of surficial granular fill of unknown quality across the entire Site.	Across the Site	PCA 3 (PCA #30: Importation of Fill Material of Unknown Quality)	On-site	Metals, PAH, PHC	Soil
APEC 4: Salt Dome and Use on-site. Previous Phase Two ESAs by both exp and others identified salt impacts in the shallow soil across much of the site.	Across the Site	PCA 4 (PCA #48: Salt Manufacturing, Processing and Bulk Storage)	On-site	Soil (SAR and Electrical Conductivity), Groundwater (Na, Cl-)	Soil and groundwater

Area of Potential Environmental Concern (APEC)	Location of APEC on Site	PCA Identifier & (Potentially Contaminating Activity)	Location of PCA (on-site or off-site)	Contaminants of Potential Concern (CPOC)	Media Potentially Impacted (Groundwater, Soil and/or Sediment)
APEC 5: Former off-site dry cleaner.	Northwest corner of site	PCA 5 (#37: Operation of Dry Cleaning Equipment where chemicals are used)	Off-Site	VOC	Groundwater
APEC 6: Former off-site retail fuel outlet and UST.	North central portion of site	PCA 6 (#28: Gasoline and Associated Products Storage in Fixed Tanks)	Off-Site	BTEX, PHC	Groundwater
APEC 7: Former fuel dispenser and remediation contractor.	North central portion of site	PCA 7 (#28: Gasoline and Associated Products Storage in Fixed Tanks)	Off-Site	BTEX, PHC	Groundwater
APEC 8: Former automotive sales and services	Northeast portion of site	PCA 8 (#27: Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles)	Off-Site	PHC, PAH, metals, VOCs	Groundwater
APEC 9: Former reported motor oil spill	Northeast portion of site	PCA 9 (#Other: Spill)	Off-site	PHC, PAH	Groundwater

Phase Two Environmental Site Assessment Update, 1770 Heatherington Road, Ottawa, Ontario (EXP, *In-Progress*)
EXP completed a Phase Two ESA update for the Site in 2024 (*In-Progress*). EXP built on the findings of the 2016 investigation by conducting a follow-up Site visit to collect soil and groundwater samples from the Site.

The goal of the Phase Two ESA update was to identify any new COCs at the Site since the completion of the original Phase Two ESA in 2016 and to confirm the validity of the established Site conditions. As part of the activities

completed during the Phase Two ESA Update multiple surface soil samples were collected from on-Site soil berms composed of street sweepings and re-worked native soils from the Site. Soil samples were collected for the analysis of PHCs and BTEX, PAHs, metals, hydride forming metals and select ORPs. One (1) exceedance of select PAHs were identified in a sample collected at TP35, however a confirmatory soil sample was collected at the same location, and the averaged results were below the applicable SCS. Additionally, an exceedance of select metals was identified at TP30, and multiple confirmatory samples were collected from the same location, with the average of the original samples and the confirmatory samples below the applicable SCS. It is noted that vanadium exceeded the applicable SCS even upon averaging with confirmatory soil samples; however, this exceedance was attributed to naturally occurring concentrations of this parameter in the silty clay soils. Please refer to Appendix L for additional rationale. Finally, several test pit locations along the soil berms exceeded the applicable SCS for EC.

A total of six (6) grain size samples were collected by hand from across the Site in the surficial soils in 2022. The results of the grain size analysis confirmed that the predominant soil type at the Site was medium-fine textured. Several hand samples from the locations of grain size analysis were also submitted for the analysis of PAHs and metals. No exceedances of the applicable SCS were noted in any of the samples collected from BH22-1, BH22-2 and BH22-3.

Multiple rounds of groundwater sampling were conducted across the existing monitoring wells at the Site between 2019 and 2022. Groundwater samples were collected from pre-existing monitoring wells using low-flow sampling methodologies. Groundwater samples were submitted for the analysis of PHC and BTEX, PAHs, VOCs and/or sodium and chloride. No exceedances of the applicable Table 3 SCS were identified for PHCs, BTEX, VOCs or PAHs; however, select monitoring wells were identified to exceed the applicable Table 3 SCS for sodium and chloride. It is also noted that sodium and chloride concentrations appear to be decreasing in groundwater since the completion of the remedial efforts in 2015 and the decommissioning of the Site facilities.

Phase Two Conceptual Site Model

Refer to Appendix L for the Phase Two Conceptual Site Model.

Hydrogeological and Geological Interpretations

For the purpose of this risk assessment, certain geological and hydrogeological interpretations and assumptions were applied in the development of the Property Specific Standards (PSS). Some of these interpretations and assumptions differed from those applied by the MECP in the derivation of the current MECP (2011) generic Site Condition Standards (SCS). In accordance with Schedule C s.4(6) 4.iv, a summary of the geological and hydrogeological assumptions that differed from those applied by the MECP is provided in Table D-5, below.

Table D-5: Risk Assessment Assumptions

Geological/Hydrogeological Parameter	MECP (2011) Parameter Value	Parameter Value Used in Risk Assessment	Rationale for Use
Predominant Soil Texture & Type	Generic – Medium Fine	Medium-Fine – Sandy Clay (surficial soils) Silty Clay (subsurface soils)	Based on the laboratory grain size analysis and drilling observation presented in the borehole logs for the Site.
Distance to Surface Water Body	36.5 m	600 m	The Site is not located within 30 m of a surface water body; the nearest surface water body, Sawmill Creek is located approximately 600 m south of the Site.
Average hydraulic conductivity	3.0×10^{-5} m/s	1.6×10^{-5} m/s	Site-specific value estimated from slug tests used to assess contaminant transport in upper aquifer (overburden).
Average Horizontal Hydraulic gradient	0.003 m/m	0.009 m/m	Based on Site-specific groundwater elevation measurements and used to assess contaminant transport in the upper aquifer (overburden) at the Site.
Minimum depth to groundwater	3.0 m	1.54 m bgs	Minimum measured depth to groundwater table at Site used to evaluate the groundwater to indoor air pathway,

Geological/Hydrogeological Parameter	MECP (2011) Parameter Value	Parameter Value Used in Risk Assessment	Rationale for Use
Depth of groundwater below concrete slab	Minimum of 1 m	1.54 m	The minimum depth to groundwater measured at the Site between 2016 and 2021 is 1.54 m bgs. As such, a Site-specific attenuation factor was calculated using the J & E model for the GW-IA exposure scenario.

The QP_{RA} considers the assumptions used as part of the risk assessment to be suitable to support the conclusions made within the RA.

 ~ Indicates duplicate sample

(A) - MW08-1 - 1 x clean round of groundwater sampling was completed at this location in November 2014. Following decommission and during remedial activities, this well was replaced by MW12-3 (screened 3.1 - 6.1 m bgs) and was sampled 3x with clean sampling results. As such, MW08-1 was no longer considered impacted.

(B) - MW08-2 - 3 x clean rounds of groundwater sampling were completed at this location on August 11 and 30, 2008 and January 25, 2012. As such, the initial PHC F3 exceedance was no longer considered to be present.

(C) - MW08-13 - 1 x clean round of groundwater sampling was completed at this location in April 2012. Following decommission and remedial activities, this well was replaced by MW15-9 (screened at 3.0 - 6.0 m bgs) and was sampled 1x with clean sampling results. As such, MW08-13 is no longer considered to be impacted.

(D) - MW08-14 - This monitoring well location was not re-sampled prior to remediation at Pit No. 1. During and after remedial activities, MW12-2 (screened at 3.1 - 6.1 m bgs) was sampled 3x with clean sampling results. As such, MW08-14 is no longer considered to be impacted.

(E) - MW08-15 - 1x clean round of groundwater sampling was completed at this location in April 2012 during the completion of remedial activities. MW15-1 (screened 2.9 - 5.9 m bgs) was installed within proximity to MW08-15 and was sampled with clean results in August 2015 and in May 2022.

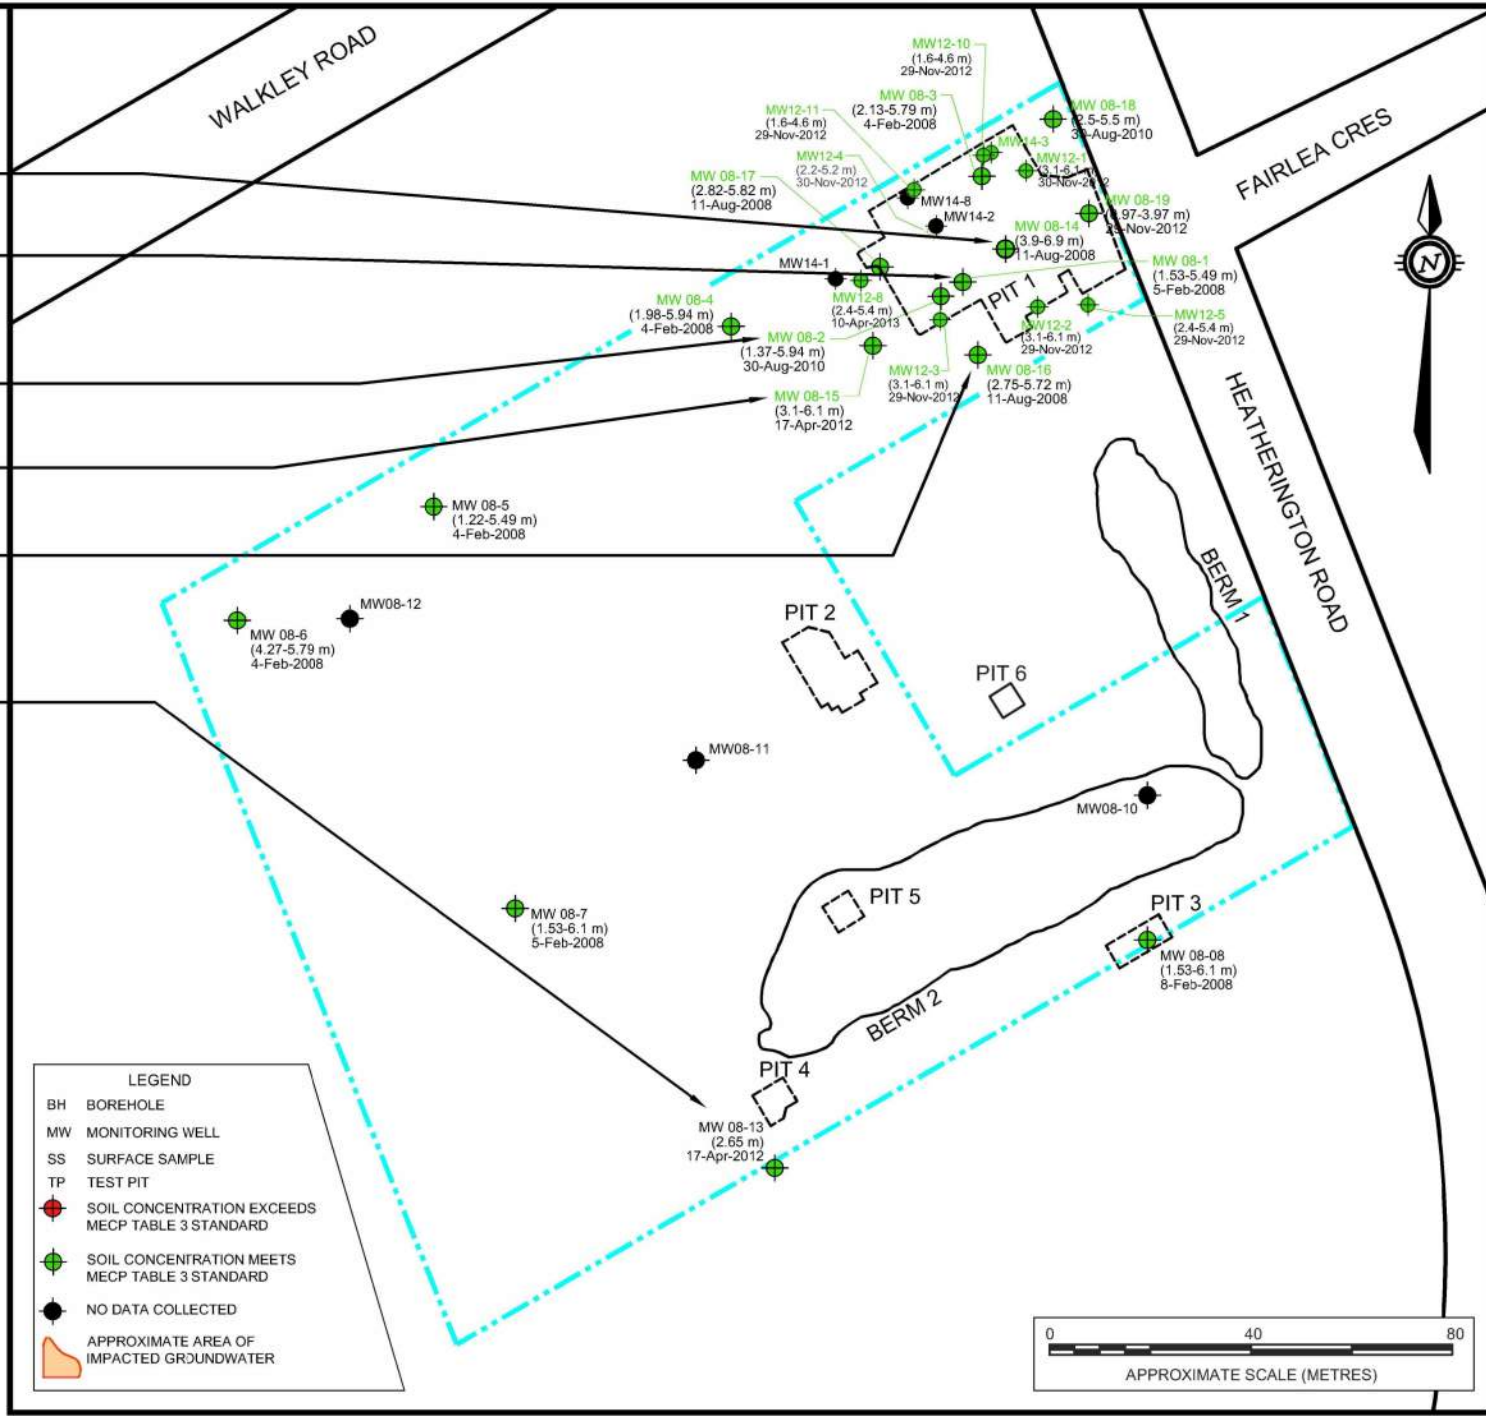

(F) - MW08-16 - This monitoring well location was not re-sampled prior to remediation at Pit No. 1. After remedial activities, MW15-1 (screened at 2.9 - 5.9 m bgs) was installed within proximity to MW08-16 and was sample 2x with clean results in August 2015 and May 2022.

Memorandum

Date: May XX, 2022
To: TBD
From: Samuel Patterson
CC: Chris Kimmerly; Henry Yee

RE: Phase Two Environmental Site Assessment Update –Confirmatory Soil and Groundwater Sampling Program, 1770 Heatherington Road, Ottawa, ON

Project Number: OTT-00018293-J5
Date(s) of Field Work: Groundwater Sampling – Approx. **Thursday April 7 to Monday April 11, 2022**
Soil Sampling – Approx. **May XX, 2022**
Site Address: 1770 Heatherington Road, Ottawa, Ontario
PM Contact: Chris Kimmerly, 613-863-1891
Samuel Patterson, 343-363-7366
Laboratory: Parcel Labs (parcel@paracellabs.com), Mobile: 1-800-749-1947

PROJECT OBJECTIVES:

The additional field work program will focus on surficial soil sampling using hand-held sampling devices and/or a backhoe and the re-sampling of existing monitoring wells, previously installed at the Site. The objective of the program will be to confirm groundwater quality at the Site in the location of former remedial excavations and to confirm soil quality at the Site.

Site Access:

Access off of Heatherington Road (south of Walkley Road) – see screen clip of site access below:

SCOPE OF WORK:**Soil Sampling:**

- Please refer to the attached figure set for the locations of soil sampling to be conducted at the Site – these are approximate locations and may be moved on as an needed basis. Prior to moving a sampling location please check in with the PM.
- Soil sampling will be conducted using the aid of a City of Ottawa provided Backhoe or Excavator (**To be Confirmed Prior to Sampling**).
- Please refer to Table 1 below for the soil samples to be collected from the Test Pits advanced at the Site.
- Please record Test Pit logs for each of the sampling locations and please take any photos of elements of interest during the Test Pitting.
- For grain size sampling – please submit these samples to the Ottawa EXP GeoTechnical Laboratory for Grain Size analysis. PAH and M & I Soil samples will be submitted to Paracel Laboratories of Ottawa.
- During grain size sample selection, please visually inspect soil sample to avoid collecting granular surficial material - please collect from native silty clay layer.
- Please ensure that dedicated and pre-cleaned sampling media and instruments are used during the collection of soil samples.

Table 1: Soil Sampling Summary

Task	Location	Parameters	Sample Numbers	Rationale
Soil Sampling for Grain Size Analysis	Across the Site	Grain Size	3x Surface (0 – 1.5 mbg) / 3x Sub-surface (>1.5 mbg)	MECP Comment Number 12 – Need for adequate Soil texture Characterization at the Site
Confirmatory Soil Sampling	Northwestern corner of the Tier III Property	Polycyclic aromatic hydrocarbons (PAHs)	3x Surficial Soil Samples (0.0 – 1.5 mbg)	MECP Comment No. 17 – Need Adequate sampling for PAHs to Assess APEC 3
Confirmatory Soil Sampling	Berm Number 2 (Southern Property Line) – Within 2 m of TP30 and Re-TP30	Metals (Cadmium and Thallium)	2x Confirmatory Soil Samples (0.0 – 0.5)	Assess if impacts detected at TP30 in the berm soil have leached to the soil remaining on-Site
Total Soil Sample Numbers = 2x Metals and Inorganics / 6x Grain Size / 3x PAHs / 1x Field Duplicate				

Groundwater Sampling

- Locate the six (6) existing monitoring wells at the Site to be re-sampled. Please note the condition of the monitoring wells, and if the monitoring wells are unable to be located please notify the PM.
- Prior to sampling, all groundwater monitors will be purged at least 3 well volumes or until stabilization of field parameters is achieved.
- Once purged, the groundwater monitoring wells will be sampled using **low flow techniques**; record stabilized field parameters for each monitor on sample form. Groundwater samples will be retrieved from the existing wells, using a **peristaltic pump**, as outlined in Table 2, below.
- Groundwater samples will be collected from the groundwater monitoring wells using new clean tubing. Collected groundwater samples will be submitted to Paracel Labs (**See City of Ottawa Pricing Agreement**) for analysis of the parameters indicated in Table 2, below.

Phase Two Environmental Site Assessment Update – Soil and Groundwater Sampling Program
1770 Heatherington Road, Ottawa, Ontario

- Use proper sampling techniques to avoid introducing contaminants into the groundwater sample. Use proper decontamination techniques between monitors. Please ensure the samples are as clear (little sediment) as possible. If samples contain visible sediment, please take **CLEAR** photographs of the samples showing sample ID for future reference.
- **QA/QC:** Collect one field duplicate sample per ten (10) samples submitted, for a total of one (1) duplicate per event. A trip blank will also be submitted for VOCs alongside the final laboratory submission of collected groundwater samples.
- Ensure all purge and washing water is disposed of in sealed drums or buckets.
- All samples are to be kept on ice and brought back to the office or dropped off at Parcel Laboratories (2319 St. Laurent Blvd, Ottawa, ON K1G 4J8). Please arrange a laboratory pickup from the office if samples are not being dropped off at the lab. Please ensure samples are properly preserved with ice in a storage cooler maintained below 10°C.

Table 2: Groundwater Sampling Summary

Task	Location	Parameters	Sample Numbers	Rationale
Confirmatory Groundwater Sampling	MW15-9 (Pit No. 4 Remediation)	PHCs	2x Confirmatory Groundwater Samples (Quarterly Sampling)	To assess a historical exceedance at MW/BH08-13 (destroyed) and confirm impacts are no longer present
Confirmatory Groundwater Sampling	MW15-1 (Pit No. 1 Remediation)	PHCs	1x Confirmatory Groundwater Samples	To assess a historical exceedance at MW08-15 (destroyed) and confirm impacts are no longer present
Confirmatory Groundwater Sampling	MW14-7 (Pit No. 1 Remediation)	VOCs	2x Confirmatory Groundwater Samples (Quarterly Sampling)	To assess a historical exceedance at MW14-7 and confirm impacts are no longer present
Confirmatory Groundwater Sampling	MW14-8 (Pit No. 1 Remediation)	VOCs	1x Confirmatory Groundwater Sample	To assess historical exceedance at MW12-11 (destroyed) via replacement well MW14-8
Confirmatory Groundwater Sampling	MW15-2 (Pit No. 1 Remediation)	VOCs	1x Confirmatory Groundwater Sample	To assess a historical exceedance of benzene at MW15-2
Groundwater Confirmatory Sampling	MW12-3 (Pit No. 1 Remediation)	PAHs	1x Confirmatory Groundwater Sample	To assess a historical exceedance at MW08-2 (destroyed) via replacement well MW12-3
Total Groundwater Sample Numbers = 6x Original Samples / 1x Field Duplicate / 1x Trip Blank				

Note: Based on the sampling frequency described in the Table above, one (1) soil sample duplicate, one (1) groundwater duplicate sample, and one (1) Trip Blank (for the analysis of VOCs / PHCs) are recommended to supplement the above-described field sampling program.

Notes:

- Sampling location MW15-9 and MW14-7 require a second set of confirmatory groundwater samples to be collected in the following quarter.

- Please include one field duplicate per 10 samples for each parameter group (VOCs). It is anticipated that one (1) field duplicates will be required per sampling event.

- Please include trip blank and submit for VOCs for the final laboratory submission of collected groundwater samples.

- Following completion of the sampling program please ensure that the PM is notified of the total number of drums that remain on-Site and the amount of purge water for disposal purposes.

- Please ensure that any damaged or broken monitoring well locations are noted and that adequate photographs are taken of each location.

Reminders

- Please ensure that the HASP paperwork is completed prior to any field activities.
- Complete FLRA either within the HASP or online (QR code provide below)
- Always wear hard hat, visi-vest and use pylons as needed. Discuss scope of work with any other relevant on-site personnel prior to the commencement of field work.
- Take photographs of the site during the investigation.
- Document any near miss incidents.

Chain of Custody Information

- Project number OTT-00018293-J5, Table 3 RPI Standards (soil texture = med-fine).
- Groundwater Analyses: see Table 2.
- Soil Analyses: See Table 1.
- Groundwater QA/QC: 1 x Field Duplicate / 1 x TB per Event.
- Soil QA/QC: 1 x Field Duplicate for PAHs or M & I.
- Ensure samples are submitted for **regular TAT**.

Soil and groundwater samples will be submitted on a regular (4-5 day) turn-around time.

Submit results to samuel.patterson@exp.com & Chris.Kimmerly@exp.com

All soil concentrations reported in µg/g.

'<' = Parameter below detection limit, as indicated

'NV' = No value

* Field duplicate

Bold Concentration exceeds MECP (2011) SCS.

Bold Concentration no longer considered due to re-sampling event, with concentration below SCS.

Bold Concentration within the background range for soils in Ottawa, not considered as an exceedance (Sterling et al., 2017). Refer to the Phase two CSM for additional information (Appendix L).

Bold Reported detection limit exceeds MECP (2011) SCS.

All groundwater concentrations reported in µg/L.
 'c' = Parameter below detection limit, as indicated
 'NV' = No value

* Field duplicate

Sampling results not considered in identification of maximum groundwater concentrations at the site (MW15-2 was re-sampled for VOCs, including BTEX, as presented in Table E.8b).

Concentration exceeds MECP (2011) SCS.
 Reported detection limit exceeds MECP (2011) SCS.

Notes:

- (1) - Sampling location MW12-10 was replaced with MW14-3, and was sampled for VOCs two (2) times in 2014 with results below the applicable Table 3 SCS.
- (2) - Sampling location MW08-19 was replaced with MW14-5, and was sampled for VOCs four (4) times between 2014 and 2019 with results below the applicable Table 3 SCS.
- (3) - Sampling location MW12-5 was replaced with MW14-7, and was sampled for VOCs four (4) times between 2014 and 2022 with result below the applicable Table 3 SCS.
- (4) - Sampling location MW12-11 was replaced with MW14-8, and was sampled for VOCs two (2) times between 2014 and 2022 with results below the applicable Table 3 SCS.

All groundwater concentrations reported in µg/L.

<5 = Parameter below detection limit, as indicated

NV = No value

* Field duplicate

Sampling results not considered in identification of maximum groundwater concentrations at the site as two (2) subsequent more recent rounds of groundwater sampling were completed at the applicable monitoring well location.

Concentration exceeds MECP (2011) SCS.
Reported detection limit exceeds MECP (2011) SCS.

- All groundwater concentrations reported in µg/L.

'<' = Parameter below detection limit, as indicated

'NV' = No value

* = Field duplicate

Sampling results not considered in identification of maximum groundwater concentrations at the site as two (2) subsequent more recent rounds of groundwater sampling were completed at the applicable monitoring well location.

Concentration exceeds MECP (2011) SCS.
Reported detection limit exceeds MECP (2011) SCS.

LABORATORY ANALYSES: TP08-161 was submitted for laboratory analysis of metals and general inorganics, and PAHs.

Test Pit logs for Heatherington Rd. 29/07/08

Test Pit Name	Depth (m)	Soil Analysis	Soil Description
TP 1	0 – 0.05		Grey, dry sand and gravel.
	0.05 – 0.40		Dark brown, dry, clay with sand and gravel.
	0.40 – 0.50		Grey, moist, coarse sand and gravel.
	0.50 – 0.70		Black, moist, clay and fine sand.
	0.70 – 1.0		Grey, moist clay.
TP 2	0 – 0.3		Grey, sand and gravel with some organics.
	0.3 – 0.5		Brown, sandy clay.
	0.5 – 0.6		Brown / grey. Fine sand dry.
	0.6 – 1.0		Grey, moist clay.
TP 3			No Test Pit done. Surface sample taken.
TP 4	0 – 0.15		Brown, dry, topsoil with organics.
	0.15 – 0.50		Brown, dry, coarse sand and gravel.
	0.50 – 1.0		Black, dry, clay.
TP 5	0 – 0.15		Dark brown, dry, topsoil (sod).
	0.15 – 0.5		Brown, dry, coarse sand and gravel.
	0.50 – 0.65		Brown, dry, fine sand.
	0.65 – 0.80		Light brown, dry, fine sand.
	0.80 – 1.0		Brown, dry, clay with trace silt.
TP 6	0 – 0.10		Black, dry, asphalt.
	0.10 – 0.40		Brown, moist, sand and crushed gravel.
	0.40 – 0.65		Dark grey, moist, sand.
	0.65 – 0.70		Grey, damp, silt.
	0.70 – 1.0		Grey/brown, moist clay.
TP 7	0 – 0.70		Brown, dry, mixed, topsoil with some sand and debris (asphalt).
	0.70 – 1.0		Grey/green, dry, clay with some sand.
TP 8	0 – 0.15		Brown, dry, topsoil with organics.
	0.15 – 0.40		Brown/grey, clay and sand.
	0.40 – 1.0		Brown, dry, clay.
TP9	0 – 0.15		Dark brown, dry, topsoil (sod).
	0.15 – 0.40		Dark brown, moist, clay with trace sand and organics.
	0.40 – 0.65		Light brown, moist, clay with trace sand and organics.
	0.65 – 1.0		Light brown, moist/wet, clay.
TP 10	0 – 0.15		Dark brown topsoil and grass.
	0.15 – 0.40		Dark brown, moist, clay with trace sand and organics.
	0.40 – 0.65		Light brown, moist, clay with trace sand and organics.
	0.65 – 1.0		Light brown, moist/wet clay with organics.

PHC F3 (>C16-C34)	µg/g	10	CWS Tier1	01-Feb-08/K	< 10			
PHC F4 (>C34-C50)	µg/g	10	CWS Tier1	01-Feb-08/K	< 10			
Comment-extractable	-	-	-	01-Feb-08	-			

1. Note: Elevated MDL due to high % moisture.

µg/g = micrograms per gram (parts per million)

F1 C6-C10 hydrocarbons in µg/g, (F1-btex if requested)

F2 C10-C16 hydrocarbons in µg/g, (F2-naph if requested)

F3 C16-C34 hydrocarbons in µg/g, (F3-pah if requested)

F4 C34-C50 hydrocarbons in µg/g

This method complies with the Reference Method for the CWS PHC and is validated for use in the laboratory.

Any deviations from the method are noted and reported for any particular sample.

nC6 and nC10 response factors are within 30% of response factor for toluene:

nC10, nC16 and nC34 response factors within 10% of each other:

C50 response factors within 70% of nC10+nC16+nC34 average:

Linearity is within 15%:

All results expressed on a dry weight basis.

Unless otherwise noted all chromatograms returned to baseline by the retention time of nC50.

Unless otherwise noted all extraction and analysis limits for holding time were met.

QC will be made available upon request.

1. Chromium (VI) result is based on total chromium
2. elevated detection limit due to high chloride
3. Note: Elevated MDL due to sample matrix.

Parameter	Units	M.D.L.	Reference Method	Date/Site Analyzed				
Comment-extractable	-		-	08-Aug-08	FO			

1 FO = Fuel Oil #2/Diesel, HO = Heavy Oil, NDP = No Distinct Pattern

µg/g = micrograms per gram (parts per million)

F1 C6-C10 hydrocarbons in µg/g, (F1-btex if requested)

F2 C10-C16 hydrocarbons in µg/g, (F2-naph if requested)

F3 C16-C34 hydrocarbons in µg/g, (F3-pah if requested)

F4 C34-C50 hydrocarbons in µg/g

This method complies with the Reference Method for the CWS PHC and is validated for use in the laboratory.

Any deviations from the method are noted and reported for any particular sample.

nC6 and nC10 response factor is within 30% of response factor for toluene:

nC10, nC16 and nC34 response factors within 10% of each other:

C50 response factors within 70% of nC10+nC16+nC34 average:

Linearity is within 15%:

All results expressed on a dry weight basis.

Unless otherwise noted all chromatograms returned to baseline by the retention time of nC50.

Unless otherwise noted all extraction and analysis limits for holding time were met.

QC will be made available upon request.

Sample and QC Qualifiers Notes

None

Sample Data Revisions

None

Work Order Revisions/Comments:

Revision 1 - This report includes an updated client Project Reference.

Other Report Notes:

n/a: not applicable

MDL: Method Detection Limit

Source Result: Data used as source for matrix and duplicate samples

%REC: Percent recovery.

RPD: Relative percent difference.

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.

Sample and QC Qualifiers Notes

1- QR-05 : Duplicate RPDs higher than normally accepted. Remaining batch QA\QC was acceptable. May be sample effect.

Sample Data Revisions

None

Work Order Revisions/Comments:

None

Other Report Notes:

n/a: not applicable

MDL: Method Detection Limit

Source Result: Data used as source for matrix and duplicate samples

%REC: Percent recovery.

RPD: Relative percent difference.

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.

Certificate of AnalysisClient: **exp Services Inc. (Ottawa)**

Client PO: 45064625

Report Date: 01-May-2012

Order Date: 18-Apr-2012

Project Description: OTT00018293J0/ 1770 Heatherington

Sample and QC Qualifiers Notes

- 1- GEN07 : Elevated detection limit because of dilution required due to high target analyte concentration.
3- QR-01 : Duplicate RPD is high, however, the sample result is less than 10x the MDL.

Sample Data Revisions

None

Work Order Revisions/Comments:

None

Other Report Notes:

n/a: not applicable

MDL: Method Detection Limit

Source Result: Data used as source for matrix and duplicate samples

%REC: Percent recovery.

RPD: Relative percent difference.

Soil results are reported on a dry weight basis when the units are denoted with 'dry'.

Where %Solids is reported, moisture loss includes the loss of volatile hydrocarbons.

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.

Certificate of Analysis

Client: **exp Services Inc. (Ottawa)**

Client PO: 45064625

Report Date: 25-Apr-2012

Order Date: 20-Apr-2012

Project Description: OTT00018293J1/1770 Hetherington

Sample and QC Qualifiers Notes

None

Sample Data Revisions

None

Work Order Revisions/Comments:

None

Other Report Notes:

n/a: not applicable

MDL: Method Detection Limit

Source Result: Data used as source for matrix and duplicate samples

%REC: Percent recovery.

RPD: Relative percent difference.

Soil results are reported on a dry weight basis when the units are denoted with 'dry'.

Where %Solids is reported, moisture loss includes the loss of volatile hydrocarbons.

Sample and QC Qualifiers Notes

1- QR-04 : Duplicate results exceeds RPD limits due to non-homogeneous matrix.

Sample Data Revisions

None

Work Order Revisions/Comments:

None

Other Report Notes:

n/a: not applicable

MDL: Method Detection Limit

Source Result: Data used as source for matrix and duplicate samples

%REC: Percent recovery.

RPD: Relative percent difference.

Soil results are reported on a dry weight basis when the units are denoted with 'dry'.

Where %Solids is reported, moisture loss includes the loss of volatile hydrocarbons.

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.

Sample and QC Qualifiers Notes

1- QR-04 : Duplicate results exceeds RPD limits due to non-homogeneous matrix.

Sample Data Revisions

None

Work Order Revisions/Comments:

None

Other Report Notes:

n/a: not applicable

MDL: Method Detection Limit

Source Result: Data used as source for matrix and duplicate samples

%REC: Percent recovery.

RPD: Relative percent difference.

Soil results are reported on a dry weight basis when the units are denoted with 'dry'.

Where %Solids is reported, moisture loss includes the loss of volatile hydrocarbons.

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.

Client: **exp Services Inc. (Ottawa)**

Client PO: 45064625

Project Description: OTT00018293J1/ 1770 Heatherington

Report Date: 05-Jul-2012

Order Date: 16-May-2012

Qualifier Notes:

None

Sample Data Revisions

None

Work Order Revisions / Comments:

Revision 1 - This report includes additional HWE Boron and Lead data.

Other Report Notes:

n/a: not applicable

MDL: Method Detection Limit

Source Result: Data used as source for matrix and duplicate samples

%REC: Percent recovery.

RPD: Relative percent difference.

Soil results are reported on a dry weight basis when the units are denoted with 'dry'.

Where %Solids is reported, moisture loss includes the loss of volatile hydrocarbons.

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.

Sample and QC Qualifiers Notes

1- QM-07 : The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on other acceptable QC.

Sample Data Revisions

None

Work Order Revisions/Comments:

None

Other Report Notes:

n/a: not applicable

MDL: Method Detection Limit

Source Result: Data used as source for matrix and duplicate samples

%REC: Percent recovery.

RPD: Relative percent difference.

Soil results are reported on a dry weight basis when the units are denoted with 'dry'.

Where %Solids is reported, moisture loss includes the loss of volatile hydrocarbons.

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.

Report Date: 24-May-2012

Order Date: 22-May-2012

Project Description: OTT00018293-J1/ 1770 Heatherington

Sample and QC Qualifiers Notes

- 1- ORG01 : GC-FID signal did not return to baseline by C50
- 2- QR-01 : Duplicate RPD is high, however, the sample result is less than 10x the MDL.
- 3- QR-04 : Duplicate results exceeds RPD limits due to non-homogeneous matrix.

Sample Data Revisions

None

Work Order Revisions/Comments:

None

Other Report Notes:

n/a: not applicable

MDL: Method Detection Limit

Source Result: Data used as source for matrix and duplicate samples

%REC: Percent recovery.

RPD: Relative percent difference.

Soil results are reported on a dry weight basis when the units are denoted with 'dry'.

Where %Solids is reported, moisture loss includes the loss of volatile hydrocarbons.

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.

Client PO: 45064625

Project Description: OTT00018293J1/ 1770 Heatherington

Report Date: 05-Jul-2012

Order Date: 25-May-2012

Qualifier Notes:

None

Sample Data Revisions

None

Work Order Revisions / Comments:

Revision 1 - This report includes additional HWE Boron and Lead data

Other Report Notes:

n/a: not applicable

MDL: Method Detection Limit

Source Result: Data used as source for matrix and duplicate samples

%REC: Percent recovery.

RPD: Relative percent difference.

Soil results are reported on a dry weight basis when the units are denoted with 'dry'.

Where %Solids is reported, moisture loss includes the loss of volatile hydrocarbons.

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.

- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.

Report Date: 05-Jul-2012
Order Date: 31-May-2012

Project Description: OTT00018293J1/ 1770 Heatiherrington

Qualifier Notes:

QC Qualifiers :

QR-01 : Duplicate RPD is high, however, the sample result is less than 10x the MDL.

Sample Data Revisions

None

Work Order Revisions / Comments:

Revision 1 - This report includes additional HWE Boron and Lead data

Other Report Notes:

n/a: not applicable

MDL: Method Detection Limit

Source Result: Data used as source for matrix and duplicate samples

%REC: Percent recovery.

RPD: Relative percent difference.

Soil results are reported on a dry weight basis when the units are denoted with 'dry'.

Where %Solids is reported, moisture loss includes the loss of volatile hydrocarbons.

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.

Other Report Notes:

n/a: not applicable

MDL: Method Detection Limit

Source Result: Data used as source for matrix and duplicate samples

%REC: Percent recovery.

RPD: Relative percent difference.

Soil results are reported on a dry weight basis when the units are denoted with 'dry'.

Where %Solids is reported, moisture loss includes the loss of volatile hydrocarbons.

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.

Sample Data Revisions

None

Work Order Revisions / Comments:

None

Other Report Notes:

n/a: not applicable
ND: Not Detected
MDL: Method Detection Limit
Source Result: Data used as source for matrix and duplicate samples
%REC: Percent recovery.
RPD: Relative percent difference.

Soil results are reported on a dry weight basis when the units are denoted with 'dry'.
Where %Solids is reported, moisture loss includes the loss of volatile hydrocarbons.

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.

Report Date: 09-Nov-2012

Order Date: 5-Nov-2012

Qualifier Notes:

None

Sample Data Revisions

None

Work Order Revisions / Comments:

None

Other Report Notes:

n/a: not applicable
ND: Not Detected
MDL: Method Detection Limit
Source Result: Data used as source for matrix and duplicate samples
%REC: Percent recovery.
RPD: Relative percent difference.

Soil results are reported on a dry weight basis when the units are denoted with 'dry'.
Where %Solids is reported, moisture loss includes the loss of volatile hydrocarbons.

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.

Report Date: 21-Jan-2014
Order Date: 20-Jan-2014
Project Description: OTT00018293J2/ 1770 Heatherington Road

Qualifier Notes:

None

Sample Data Revisions

None

Work Order Revisions / Comments:

None

Other Report Notes:

n/a: not applicable
ND: Not Detected
MDL: Method Detection Limit
Source Result: Data used as source for matrix and duplicate samples
%REC: Percent recovery.
RPD: Relative percent difference.

Soil results are reported on a dry weight basis when the units are denoted with 'dry'.
Where %Solids is reported, moisture loss includes the loss of volatile hydrocarbons.

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.

Qualifier Notes:

Sample Qualifiers :

2 : Surrogate recovery outside of control limits. The data was accepted based on valid recovery of the remaining surrogate.

QC Qualifiers :

QR-04 : Duplicate results exceeds RPD limits due to non-homogeneous matrix.

Sample Data Revisions

None

Work Order Revisions / Comments:

None

Other Report Notes:

n/a: not applicable
ND: Not Detected
MDL: Method Detection Limit
Source Result: Data used as source for matrix and duplicate samples
%REC: Percent recovery.
RPD: Relative percent difference.

Soil results are reported on a dry weight basis when the units are denoted with 'dry'.
Where %Solids is reported, moisture loss includes the loss of volatile hydrocarbons.

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.

None

Work Order Revisions / Comments:

None

Other Report Notes:

n/a: not applicable
ND: Not Detected
MDL: Method Detection Limit
Source Result: Data used as source for matrix and duplicate samples
%REC: Percent recovery.
RPD: Relative percent difference.

Soil results are reported on a dry weight basis when the units are denoted with 'dry'.
Where %Solids is reported, moisture loss includes the loss of volatile hydrocarbons.

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.

Report Date: 23-Jan-2014

Order Date: 22-Jan-2014

Qualifier Notes:

None

Sample Data Revisions

None

Work Order Revisions / Comments:

None

Other Report Notes:

n/a: not applicable
ND: Not Detected
MDL: Method Detection Limit
Source Result: Data used as source for matrix and duplicate samples
%REC: Percent recovery.
RPD: Relative percent difference.

Soil results are reported on a dry weight basis when the units are denoted with 'dry'.
Where %Solids is reported, moisture loss includes the loss of volatile hydrocarbons.

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.

n/a: not applicable
ND: Not Detected
MDL: Method Detection Limit
Source Result: Data used as source for matrix and duplicate samples
%REC: Percent recovery.
RPD: Relative percent difference.

Soil results are reported on a dry weight basis when the units are denoted with 'dry'.
Where %Solids is reported, moisture loss includes the loss of volatile hydrocarbons.

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.

Qualifier Notes:

QC Qualifiers :

QR-01 : Duplicate RPD is high, however, the sample result is less than 10x the MDL.

Sample Data Revisions

None

Work Order Revisions / Comments:

None

Other Report Notes:

n/a: not applicable
ND: Not Detected
MDL: Method Detection Limit
Source Result: Data used as source for matrix and duplicate samples
%REC: Percent recovery.
RPD: Relative percent difference.

Soil results are reported on a dry weight basis when the units are denoted with 'dry'.
Where %Solids is reported, moisture loss includes the loss of volatile hydrocarbons.

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.

Qualifier Notes:

None

Sample Data Revisions

None

Work Order Revisions / Comments:

None

Other Report Notes:

n/a: not applicable
ND: Not Detected
MDL: Method Detection Limit
Source Result: Data used as source for matrix and duplicate samples
%REC: Percent recovery.
RPD: Relative percent difference.

Soil results are reported on a dry weight basis when the units are denoted with 'dry'.
Where %Solids is reported, moisture loss includes the loss of volatile hydrocarbons.

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.

RPD: Relative percent difference.

Soil results are reported on a dry weight basis when the units are denoted with 'dry'.
Where %Solids is reported, moisture loss includes the loss of volatile hydrocarbons.

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.

Other Report Notes:

n/a: not applicable
ND: Not Detected
MDL: Method Detection Limit
Source Result: Data used as source for matrix and duplicate samples
%REC: Percent recovery.
RPD: Relative percent difference.

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.

%REC: Percent recovery.
RPD: Relative percent difference.

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.

Qualifier Notes:

QC Qualifiers :

QR-05 : Duplicate RPDs higher than normally accepted. Remaining batch QA\QC was acceptable. May be sample effect.

Sample Data Revisions

None

Work Order Revisions / Comments:

None

Other Report Notes:

- n/a: not applicable
- ND: Not Detected
- MDL: Method Detection Limit
- Source Result: Data used as source for matrix and duplicate samples
- %REC: Percent recovery.
- RPD: Relative percent difference.

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.

Qualifier Notes:

None

Sample Data Revisions

None

Work Order Revisions / Comments:

Revision 1 - This report includes additional pH data.

Other Report Notes:

n/a: not applicable

ND: Not Detected

MDL: Method Detection Limit

Source Result: Data used as source for matrix and duplicate samples

%REC: Percent recovery.

RPD: Relative percent difference.

Soil results are reported on a dry weight basis when the units are denoted with 'dry'.

Where %Solids is reported, moisture loss includes the loss of volatile hydrocarbons.

Order Date: 26-Aug-2015

Client PO: 45064625

Project Description: OTT00018293-J5/Heatherington Rd

Qualifier Notes:

Sample Qualifiers :

- 1 : Trip blank hold time based on preparation date for this QA sample and the associated analytical requirements. Hold time exceedances do not preclude the validity of the Trip Blank data.

QC Qualifiers :

- QR-05 : Duplicate RPDs higher than normally accepted. Remaining batch QA/QC was acceptable. May be sample effect.

Sample Data Revisions

None

Work Order Revisions / Comments:

None

Other Report Notes:

n/a: not applicable

ND: Not Detected

MDL: Method Detection Limit

Source Result: Data used as source for matrix and duplicate samples

%REC: Percent recovery.

RPD: Relative percent difference.

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.

Other Report Notes:

n/a: not applicable
ND: Not Detected
MDL: Method Detection Limit
Source Result: Data used as source for matrix and duplicate samples
%REC: Percent recovery.
RPD: Relative percent difference.

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.

Qualifier Notes:

Login Qualifiers :

Container(s) - Labeled improperly/insufficient information -
Applies to samples: TP51 S2

Sample Qualifiers :

- 2 : GC-FID signal did not return to baseline by C50
- 4 : The surrogate recovery for this sample is outside of established control limits due to a sample matrix effect.

QC Qualifiers :

QR-04 : Duplicate results exceeds RPD limits due to non-homogeneous matrix.

Sample Data Revisions

None

Work Order Revisions / Comments:

None

Other Report Notes:

n/a: not applicable
ND: Not Detected
MDL: Method Detection Limit
Source Result: Data used as source for matrix and duplicate samples
%REC: Percent recovery.
RPD: Relative percent difference.

Soil results are reported on a dry weight basis when the units are denoted with 'dry'.
Where %Solids is reported, moisture loss includes the loss of volatile hydrocarbons.

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.
- When reported, data for F4G has been processed using a silica gel cleanup.

Qualifier Notes:

QC Qualifiers :

QM-05 : The spike recovery was outside acceptance limits for the matrix spike due to matrix interference.

Sample Data Revisions

None

Work Order Revisions / Comments:

None

Other Report Notes:

n/a: not applicable

ND: Not Detected

MDL: Method Detection Limit

Source Result: Data used as source for matrix and duplicate samples

%REC: Percent recovery.

RPD: Relative percent difference.

NC: Not Calculated

Soil results are reported on a dry weight basis when the units are denoted with 'dry'.

Where %Solids is reported, moisture loss includes the loss of volatile hydrocarbons.

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.
- When reported, data for F4G has been processed using a silica gel cleanup.

ND: Not Detected
MDL: Method Detection Limit
Source Result: Data used as source for matrix and duplicate samples
%REC: Percent recovery.
RPD: Relative percent difference.
NC: Not Calculated

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.
- When reported, data for F4G has been processed using a silica gel cleanup.

Project Description: OTT00018293J5/1770 Heatherington

Qualifier Notes:

QC Qualifiers :

QR-07 : Duplicate result exceeds RPD limits due to non-homogeneity between multiple sample vials. Remainder of QA/QC is acceptable.

Sample Data Revisions

None

Work Order Revisions / Comments:

None

Other Report Notes:

n/a: not applicable

ND: Not Detected

MDL: Method Detection Limit

Source Result: Data used as source for matrix and duplicate samples

%REC: Percent recovery.

RPD: Relative percent difference.

NC: Not Calculated

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.
- When reported, data for F4G has been processed using a silica gel cleanup.

Appendix H: Grain Size Analysis Results

APPENDIX H: RATIONALE FOR SOIL TEXTURE SELECTION

Based on the subsurface investigations completed at the Site, the site stratigraphy is generally described as consisting of a surficial sand and gravel fill and re-worked native material which overlies the native soil overburden consisting of native silty clay and clay, becoming sandier with depth over a gravelly silty clay till layer. Weathered shale bedrock can be found beneath the native soils. It should be noted that the stratigraphy and depth to bedrock at the site was only derived based on the boreholes/monitoring wells installed by EXP.

Two (2) historical grain size samples were collected from the Site by EXP in August of 2015, in support of the Phase Two ESA investigative activities. Sample BH/MW15-9 SS1 and BH/MW15-5 SS4 were collected from the footprints of remedial excavation Pit No. 4 and Pit No. 2, respectively.

A total of six (6) soil samples analyzed for grain size were collected from the Site during the field work conducted in May 2022. Based on the 75-micron sieve of representative soil, the soil texture of the analyzed samples was determined to be predominantly medium and fine textured (refer to the 75-micron sieve analysis in the Certificates of Analysis – Appendix Q). More than 50% by mass of five (5) of the eight (8) total samples analyzed for soil texture, consisted of particle sizes less than 75 µm in diameter. Based on the observations recorded in the borehole logs and the cumulative grain size results for the Site, the soil texture at the Site was determined to be predominately medium and fine textured.

Based on the observations made during previous drilling investigations and the results of the grain size analysis, as per Section 42 of O. Reg. 153/04, the QPESA has determined that more than 1/3 of the soil at the property, measured by volume, consists of medium and fine textured soil and hence standards for medium and fine textured soil at the property are applicable.

As per Section 42 of O. Reg. 153/04, coarse textured soil means soil that contains more than 50 percent by mass of particles that are 75 µm or larger in mean diameter and medium and fine textured soil means soil that contains 50 percent or more by mass of particles that are smaller than 75 µm in mean diameter.

Please refer to Table H-1, below for a summary of grain size sample location, depth and sample description. Please refer to Figure 5B for a graphical depiction of the borehole locations sampled for grain size analysis at the Site.

Table H-1: Grain Size Analyses

Sample ID	Sampling Interval	Sampling Interval (m bgs)	Soil Description	Classification
BH/MW15-9	SS1	0.0 - 0.76	Silty Clay, trace sand	Fine Grained
BH/MW15-5	SS4	2.29 - 2.9	Silty Clay, trace sand	Coarse Grained
BH22-1	G2	0.9 – 1.1	Sandy Silt & Clay	Fine Grained
BH22-1	G3	1.2 – 1.4	Silt & Clay	Fine Grained
BH22-2B	G1	0.5 - 0.9	Silty Sand	Coarse Grained
BH22-3	G2	0.7 – 0.9	Silty Sand	Coarse Grained

BH22-3	G3	1.0 – 1.4	Silt & Clay	Fine Grained
BH22-3	G4	2.0 – 2.5	Silt & Clay	Fine Grained

SS – Split Spoon
G – Grab Sample

Surveying Elevations - PIESA Update 2021
1770 Heatherington Road, Ottawa
OTT-00018293-J5
 February 2021

(All units are in metres unless otherwise specified)

Survey of 2021 wells was completed by EXP using a Leica GPS Surveyor, well elevations were corrected from assumed elevation to geodetic. Using geodetic survey values from February 2021, the average difference was calculated and subtracted from the assumed elevations.

Appendix J: Summary of Areas of Contamination

Areas of Contamination and Location	COCs in excess of Table 3 SCS	Medium	Description of Area	Distribution of Contaminants	Discharge of Contaminants into the Natural Environment	Migration of Contaminants	Influence of Climatic or Meteorological Conditions	Vapour Intrusion Pathway Considerations
Pre-Remediation Site Conditions								
Northeastern portion of Site (Pit No. 1) and central portion of Site (Pit No. 2)	PHC F2 Visible Sheen/Odour*	Soil	Confined to the boundaries of Pit No. 1 and Pit No. 2.	<p>Pit No. 1.</p> <ul style="list-style-type: none"> Exceedances of PHCs (identified by visible sheen/odour at MW08-1 and MW08-2) were delineated by clean confirmatory wall samples and vertically by clean floor samples at a depth between 3.2 and 3.5 m bgs. <p>Pit No. 2</p> <ul style="list-style-type: none"> Exceedances of PHC F2 at TP08-15-A1 (0.8 m bgs) were delineated by clean confirmatory wall samples and vertically by clean floor samples at a depth of 1.2 m bgs. <p>All PHC soil impacts were removed from the Site through the completion of remedial excavations at Pit No. 1 and Pit No. 2.</p>	The source of contamination is associated with the former UST (APEC 1) or former on-Site garage (APEC 2).	Given that soil is immobile, no significant migration of the soil contamination is anticipated. Migration of contaminants in soil via leaching of contamination to groundwater is a possible migration pathway.	Given the fine soil and low hydraulic conductivity at the site, surface infiltration would be limited in extent. Therefore, climatic and meteorological conditions at the site are not expected to have a significant influence on the contaminants or contaminant migration.	PHC F2 is volatile and may present a risk to receptors via vapour intrusion.
Northeastern portion of Site (Pit No. 1), central portion of Site (Pit No. 2), and southcentral portion of the Site (Pit No. 4)	Anthracene Benzo(a)anthracene Benzo(a)pyrene Benzo(b)fluoranthene Dibenzo(a,h)anthracene Fluoranthene 1,1'-Biphenyl 1-methylnaphthalene 2-methylnaphthalene Naphthalene	Soil	Confined to the boundaries of Pit No. 1, Pit No. 2, and Pit No. 4.	<p>Pit No. 1.</p> <ul style="list-style-type: none"> Exceedances of anthracene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene, and fluoranthene were identified at MW08-3-C1 (0.7 m bgs) and exceedances of benzo(a)pyrene were identified at MW08-3 (0.2 – 1.22 m bgs). PAH exceedances were delineated by clean wall samples at Pit No. 1. <p>Pit No. 2</p> <ul style="list-style-type: none"> Exceedances of benzo(a)pyrene were identified at TP08-15 (0.3 m bgs), 1,1'-biphenyl, 1-methylnaphthalene, 2-methylnaphthalene, and naphthalene at TP08-15-A (0.8 m bgs), and 1-methylnaphthalene, 2-methylnaphthalene, and naphthalene at TP08-15-B (0.5 m bgs). PAH impacts were delineated by clean confirmatory wall samples and vertically by clean floor samples at a depth of 1.2 m bgs. <p>Pit No. 4</p> <ul style="list-style-type: none"> An exceedance of benzo(a)pyrene and fluoranthene was identified at TP08-1 (0.2 m bgs). PAH impacts were delineated by clean confirmatory wall samples and vertically by clean floor samples at 1.0 m bgs. 	The source of contamination is associated with the former UST (APEC 1) or former on-Site garage (APEC 2) at the northeastern portion of the Site. The source of contamination is likely associated with the importation of fill of unknown quality at the Site (APEC 3) at the central and southcentral portions of the Site.	Given that soil is immobile, no significant migration of the soil contamination is anticipated. Migration of contaminants in soil via leaching of contamination to groundwater is a possible migration pathway.	Given the fine soil and low hydraulic conductivity at the site, surface infiltration would be limited in extent. Therefore, climatic and meteorological conditions at the site are not expected to have a significant influence on the contaminants or contaminant migration.	<p>Volatile PAHs may be present under buildings constructed on-Site may present a risk to receptors via vapour intrusion.</p> <p>However, please note that the PAH impacted soil has been removed and disposed off-Site and no potential for vapour intrusion remains from PAHs in soil.</p>
Northeastern portion of Site (Pit No. 1) and southeastern portion of the Site (Pit No. 3)	Lead Cobalt Vanadium	Soil	Confined to the boundaries of Pit No. 1 and Pit No. 3.	<p>Pit No. 1.</p> <ul style="list-style-type: none"> An exceedance of lead was identified at MW08-2 (0.2 – 1.22 m bgs). The lead exceedance was delineated horizontally by clean confirmatory wall and vertically by a floor sample at 3.2 m bgs at Pit No. 1. <p>Pit No. 3</p>	The source of contamination is likely associated with the importation of fill of unknown quality at the Site (APEC 3) at the central and southcentral portions of the Site.	Given that soil is immobile, no significant migration of the soil contamination is anticipated. Migration of contaminants in soil via leaching of contamination to groundwater is a possible migration pathway.	Given the fine soil and low hydraulic conductivity at the site, surface infiltration would be limited in extent. Therefore, climatic and meteorological conditions at the site are not expected to have a significant influence on	<p>Metals are non-volatile and therefore are not considered to pose a potential risk via vapour intrusion.</p> <p>However, please note that the metal impacted soil has been removed and disposed off-</p>

Areas of Contamination and Location	COCs in excess of Table 3 SCS	Medium	Description of Area	Distribution of Contaminants	Discharge of Contaminants into the Natural Environment	Migration of Contaminants	Influence of Climatic or Meteorological Conditions	Vapour Intrusion Pathway Considerations
				<ul style="list-style-type: none"> Exceedances of cobalt and vanadium were identified at MW08-8 (0.2 – 1.22 m bgs), and vanadium at MW08-8-C2 (1.0 m bgs). Metal impacts were delineated horizontally by clean confirmatory wall samples and vertically by clean floor samples at a depth of 1.4 – 1.5 m bgs. 		<p>Additionally, it is noted that soil metal impacts have been remediated and the potential for migration no longer exists.</p>	the contaminants or contaminant migration.	Site.
Northeastern portion of Site (Pit No. 1)	Boron Hot Water Soluble (HWS)	Soil	Confined to the boundaries of Pit No. 1	<p>Pit No. 1</p> <ul style="list-style-type: none"> An exceedance of boron (HWS) was identified at MW08-2 (0.2 – 1.22 m bgs). Boron (HWS) impacts were delineated horizontally by clean confirmatory wall samples and vertically by a clean floor sample at a depth of 3.2 m bgs at Pit No. 1. 	The source of contamination is associated with the former UST (APEC 1) or former on-Site garage (APEC 2) at the northeastern portion of the Site.	<p>Given that soil is immobile, no significant migration of the soil contamination is anticipated. Migration of contaminants in soil via leaching of contamination to groundwater is a possible migration pathway.</p> <p>Additionally, it is noted that boron HWS impacts have been remediated and the potential for migration no longer exists.</p>	<p>Given the fine soil and low hydraulic conductivity at the site, surface infiltration would be limited in extent. Therefore, climatic and meteorological conditions at the site are not expected to have a significant influence on the contaminants or contaminant migration.</p>	<p>Boron HWS is non-volatile and therefore is not considered to pose a potential risk via vapour intrusion.</p> <p>Please note that the boron HWS impacted soil has been removed and disposed off-Site.</p>
Southcentral portion of the Site (Pit No. 5)	Soil pH	Soil	Confined to the boundaries of Pit No. 5	<p>Pit No. 5</p> <ul style="list-style-type: none"> An exceedance of the Table 3 surficial soil pH range was identified at TP08-8 (0.60 m bgs). Soil pH exceeded the upper range of allowable values for use of the Table 3 SCS. However, soil pH exceedances were horizontally delineated by the clean wall samples and vertically delineated by clean floor samples at a depth of 1.2 m bgs at Pit No. 5. 	The source of contamination is likely associated with the importation of fill of unknown quality at the Site (APEC 3) at the central and southcentral portions of the Site.	<p>Given that soil is immobile, no significant migration of the soil contamination is anticipated. Migration of contaminants in soil via leaching of contamination to groundwater is a possible migration pathway.</p> <p>Additionally, it is noted that elevated soil pH impacts have been remediated and the potential for migration no longer exists.</p>	<p>Given the fine soil and low hydraulic conductivity at the site, surface infiltration would be limited in extent. Therefore, climatic and meteorological conditions at the Site are not expected to have a significant influence on the contaminants or contaminant migration.</p>	<p>Soil pH is a physical test of soil properties and not related to vapour intrusion.</p> <p>Please note that the pH impacted soil has been removed and disposed off-Site.</p>
Northeastern portion of Site (Pit No. 1)	Indeno(1,2,3-cd)pyrene	Groundwater	Confined to the boundaries of Pit No. 1	<p>Pit No. 1</p> <ul style="list-style-type: none"> An isolated exceedance of indeno(1,2,3-cd)pyrene was identified at MW08-2 (1.37 – 5.94 m bgs). MW08-2 was not resampled for PAHs prior to the completion of the remedial activities within Pit No. 1. MW08-2 was not re-sampled prior to the completion of remedial activities in 2012 for PAHs. Following monitoring well decommissioning and the initiation of remedial activities at Pit No. 1, MW12-3 was installed within proximity to MW08-2 and was sampled in December 2015 with clean sampling results. Indeno(1,2,3-cd)pyrene was not detected above the laboratory RDL in any groundwater samples collected from the Site 	The source of contamination is associated with the former UST (APEC 1) or former on-Site garage (APEC 2) at the northeastern portion of the Site.	<p>Groundwater impacts are expected to be migrating with groundwater flow (predominantly south/southeast). Given that all post remediation groundwater results in proximity to MW08-2 and downgradient of this location are below the Table 3 SCS for PAHs, no migration of PAH impacts is identified to have occurred.</p>	<p>Given the fine soil and low hydraulic conductivity at the site, surface infiltration would be limited in extent. Therefore, climatic and meteorological conditions at the Site are not expected to have a significant influence on the contaminants or contaminant migration.</p>	<p>The PAH parameter identified in groundwater is a high-molecular weight PAH and is non-volatile, therefore no potential for vapour intrusion is identified.</p> <p>Please note that PAH groundwater exceedances have been addressed via the completion of remedial Pit No. 1.</p>

Areas of Contamination and Location	COCs in excess of Table 3 SCS	Medium	Description of Area	Distribution of Contaminants	Discharge of Contaminants into the Natural Environment	Migration of Contaminants	Influence of Climatic or Meteorological Conditions	Vapour Intrusion Pathway Considerations
				following the completion of remedial activities. As such, it is the opinion of the QP that the isolated PAH impacts identified in groundwater in 2008 no longer remain at the Site.				
Northeastern portion of the Site (Pit No. 1)	PHC F2 PHC F3 PHC F4	Groundwater	Northeastern portion of the Site	<p>Northeastern Portion of Site</p> <ul style="list-style-type: none"> • Prior to the completion of remedial activities at the Site, exceedances of select PHC fractions were identified at six (6) monitoring well locations across one (1) or more sampling events. All groundwater exceedances for PHCs were localized to monitoring wells installed within the northeastern portion of the Site, in the vicinity of the former garage and UST. • Exceedances of PHCs in groundwater were addressed via the completion of the remedial excavation at Pit No. 1. • MW08-1 – After an initial exceedance of PHC F2, F3 and F4 in samples collected between February 2008 and November 2008, one (1) clean round of groundwater sampling was completed at this location in November 2014. Following decommission and during remedial activities, this well was replaced by MW12-3 (screened 3.1 - 6.1 m bgs) and was sampled three (3) times with clean sampling results. As such, MW08-1 was no longer considered impacted. • MW08-2 – After an initial exceedance of PHC F3 in February 2008, three (3) clean rounds of groundwater sampling were completed at this location on August 11 and 30, 2008 and January 25, 2012. As such, the initial PHC F3 exceedance was no longer considered to be present. • MW08-13 – Following an initial exceedance of PHC F2, F3 and F4 in August 2008, one (1) clean round of groundwater sampling was completed at this location in April 2012. Following decommission and remedial activities, this well was replaced by MW15-9 (screened at 3.0 - 6.0 m bgs) and was sampled once with clean sampling results. As such, MW08-13 is no longer considered to be impacted. • MW08-14 – A PHC F3 exceedance was identified in August 2008. This monitoring well location was not re-sampled prior to remediation at Pit No. 1. During and after remedial activities, MW12-2 (screened at 3.1 - 6.1 m bgs) was sampled three (3) times with clean sampling results. As such, MW08-14 is no longer considered to be impacted. 	The source of contamination is associated with the former UST (APEC 1) or former on-Site garage (APEC 2) at the northeastern portion of the Site.	Groundwater impacts are expected to be migrating with groundwater flow (predominantly south/southeast). Given that all post remediation groundwater results in proximity to the identified impacts and downgradient of these locations are below the Table 3 SCS for PHCs, no migration of PHC impacts is identified to have occurred.	Given the fine soil and low hydraulic conductivity at the site, surface infiltration would be limited in extent. Therefore, climatic and meteorological conditions at the Site are not expected to have a significant influence on the contaminants or contaminant migration.	PHC F2 is volatile and may present a risk to receptors via vapour intrusion. PHC F3 and PHC F4 are not considered to be volatile. Please note that PHC groundwater exceedances have been addressed via the completion of remedial Pit No. 1.

Areas of Contamination and Location	COCs in excess of Table 3 SCS	Medium	Description of Area	Distribution of Contaminants	Discharge of Contaminants into the Natural Environment	Migration of Contaminants	Influence of Climatic or Meteorological Conditions	Vapour Intrusion Pathway Considerations
				<ul style="list-style-type: none"> • MW08-15 – An initial exceedance of PHC F3 was identified in August 2008. One (1) clean round of groundwater sampling was completed at this location in April 2012 during the completion of remedial activities. MW15-1 (screened 2.9 - 5.9 m bgs) was installed within proximity to MW08-15 and was sampled twice with clean results in August 2015 and in May 2022. • MW08-16 – An initial exceedance of PHC F3 and F4 was identified in August 2008. This monitoring well location was not re-sampled prior to remediation at Pit No. 1. After remedial activities, MW15-1 (screened at 2.9 - 5.9 m bgs) was installed within proximity to MW08-16 and was sample twice with clean results in August 2015 and May 2022. <p>Given that approximately twenty-six (26) groundwater samples have ben collected from the Site across sixteen (16) monitoring well locations following completion of the remedial activities in Pit No. 1 with no exceedances of the Table 3 SCS identified, the historical PHC impacts in groundwater are no longer considered to be present at the Site.</p>				
Northeastern portion of the Site (Pit No. 1)	Cis-1,2-dichloroethylene Vinyl chloide	Groundwater	Northeastern portion of the Site	<p>Northeastern Portion of Site</p> <ul style="list-style-type: none"> • Prior to the completion of remedial activities at the Site, exceedances of cis-1,2-dichloroethylene and vinyl chloride were identified at two (2) monitoring well locations across one (1) or more sampling events. All groundwater exceedances for VOCs were localized to monitoring wells installed within the northeastern portion of the Site, in the vicinity of the former garage and UST. • Exceedances of VOCs in groundwater were addressed via the completion of the remedial excavation at Pit No. 1. • MW08-14 – An exceedance of cis-1,2-DCE and/or vinyl chloride was identified at MW08-14 in October 2008, November 2008, and August 2008. During completion of the remedial excavation sampling location MW08-14 was replaced with MW12-2 (screened at 3.1 - 6.1 m bgs) and was sampled for VOCs five (5) times between 2012 and 2014 with clean sampling results. • MW08-19 – An exceedance of cis-1,2-DCE and vinyl chloride was identified at MW08-19 between July 2012 and April 2013, during completion of the remedial activities at Pit No. 1. Following decommissioning of MW08-19, sampling location MW08-19 was 	The source of contamination is associated with the former UST (APEC 1) or former on-Site garage (APEC 2) at the northeastern portion of the Site.	Groundwater impacts are expected to be migrating with groundwater flow (predominantly south/southeast). Given that all post remediation groundwater results in proximity to the identified impacts and downgradient of these locations are below the Table 3 SCS for VOCs, no migration of VOC impacts is identified to have occurred.	Given the fine soil and low hydraulic conductivity at the site, surface infiltration would be limited in extent. Therefore, climatic and meteorological conditions at the Site are not expected to have a significant influence on the contaminants or contaminant migration.	Vinyl chloride and cis-1,2-DCE are both volatile and may present a risk to receptors via vapour intrusion. Please note that VOC groundwater exceedances of the Table 3 SCS have been addressed via the completion of remedial Pit No. 1.

Areas of Contamination and Location	COCs in excess of Table 3 SCS	Medium	Description of Area	Distribution of Contaminants	Discharge of Contaminants into the Natural Environment	Migration of Contaminants	Influence of Climatic or Meteorological Conditions	Vapour Intrusion Pathway Considerations
				<p>replaced with MW14-5 (screened at 1.3 - 4.3 m bgs) and was sampled for VOCs four (4) times between 2014 and 2019 with clean sampling results.</p> <p>Given that approximately thirty (30) groundwater samples have been collected from the Site across thirteen (13) monitoring well locations following completion of the remedial activities in Pit No. 1 with no exceedances of the Table 3 SCS identified, the historical VOC impacts in groundwater are no longer considered to be present at the Site in exceedance of the Table 3 SCS.</p>				
Post-Remediation Site Conditions								
Majority of the Site (Overburden soils up to bedrock)	Electrical Conductivity (EC) and Sodium Adsorption Ratio	Soil	Majority of Site	<p>Overburden Soils (Majority of Site)</p> <ul style="list-style-type: none"> Exceedances in overburden soil at the Site for either EC or SAR have been identified up to a sample depth of 6.1 m bgs. No vertical delineation of EC or SAR impacts was identified during prior sampling programs. It is assumed that EC and SAR soil impacts extend up to bedrock at the Site. Lateral delineation of the EC and SAR impact in Site soil was assumed to extend from Site edge to Site edge. It is noted that approximately twenty-two (22) soil sampling locations had concentrations of EC or SAR below the applicable Table 3 SCS. However, lateral delineation was not achieved. <p>EC and SAR impacts remain present at the Site following the completion of remedial activities and will be addressed through completion of the Risk Assessment.</p>	The source of contamination is associated with the historical salt related exceedances, former salt dome, salt use and salt storage (APEC 4)	Given that soil is immobile, no significant migration of the soil contamination is anticipated. Migration of contaminants in soil via leaching of contamination to groundwater is a possible migration pathway.	Given the fine soil and low hydraulic conductivity at the site, surface infiltration would be limited in extent. Therefore, climatic and meteorological conditions at the site are not expected to have a significant influence on the contaminants or contaminant migration.	EC and SAR are non-volatile and therefore are not considered to pose a potential risk via vapour intrusion.
Majority of the Site	Sodium (Na+) and Chloride (Cl-)	Groundwater	Majority of Site	<p>Overburden and Bedrock Groundwater (Majority of Site)</p> <ul style="list-style-type: none"> Exceedances in groundwater at the Site for sodium and chloride have been identified up to a depth of 18.1 m bgs at MW15-5. It is noted that clean samples were collected at an interval of 10.6 – 12.1 m bgs from MW15-12. Vertical delineation of sodium and chloride groundwater impacts was not achieved at the Site. Lateral delineation of the sodium and chloride impacts in groundwater was assumed to extend from Site edge to Site edge. It is noted that approximately ten (10) monitoring well locations had concentrations of sodium or chloride below the applicable Table 3 SCS. However, lateral delineation was not achieved, and impacts are assumed to extend to the property boundary. 	The source of contamination is associated with the historical salt related exceedances, former salt dome, salt use and salt storage (APEC 4)	Groundwater impacts are expected to be migrating with groundwater flow (predominantly south/southeast).	Given the fine soil and low hydraulic conductivity at the site, surface infiltration would be limited in extent. Therefore, climatic and meteorological conditions at the Site are not expected to have a significant influence on the contaminants or contaminant migration.	Sodium and chloride are non-volatile and therefore are not considered to pose a potential risk via vapour intrusion.
